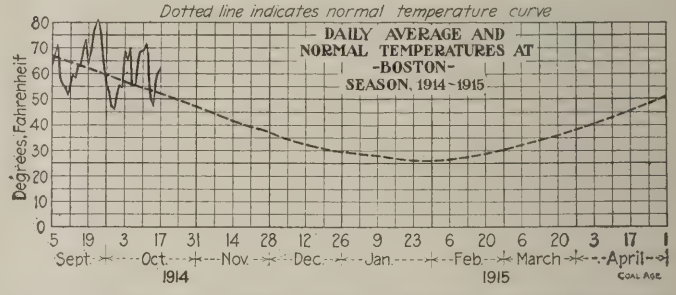
The Pittsburgh situation continues in a distressing condition and there is no change in sight, with the exception of the coming close of navigation on the Lakes. Canadian business still remains abnormally flat, and the difficulty in moving slack continues one of the most serious problems for the time being. A more favorable movement in the Lake trade of Ohio has helped the situation there, especially as it was expected there would not be enough business to finish up the season. But in other lines, the outlook is most discouraging. The warm weather and curtailed steam consumption, due to the general heaviness in all lines of business, have reduced the demand to practically nothing.

The Southern market is under heavy pressure and the outlook is regarded as most discouraging; the market is even worse, if anything, and operations are heavily restricted. In the Middle West, a slight improvement is noted in spots, due to an occasional cool day creating a mild rush for coal. But on the whole, the October weather has been distinctly adverse to a good coal consumption, and the steam fuels are not being taken so well. One encouraging feature is that the producers were successful in resisting a determined effort on the part of the buyers to break the screenings market.

ATLANTIC SEABOARD



BOSTON

Pocahontas and New River situation critical. No spot market anywhere; contractors backward in taking coal. Slight improvement in demand for Pennsylvania grades. Georges Creek dull.

Bituminous—The export market having dwindled to small proportions, the Pocahontas and New River shippers are facing a rather critical time. Contractors are not taking anything like their normal requirements for October and there is no spot market anywhere. Cargoes here on the market meet with no response at all and there are several that have been awaiting disposal for ten days or a fortnight. Meanwhile, the volume on hand at the Hampton Roads loading ports continues to increase rather than diminish. If it were not for the conviction on the part of selling agents that even a radical cut in prices would not bring results, the $2.85 figure would have been seriously slashed. Efforts have been made looking to a general curtailment at the mines but it is too soon to expect any results.

Trade is somewhat improved for the better grades from Pennsylvania, especially in the all-rail sections. From Philadelphia there is a fairly steady movement in conjunction with anthracite shipments but the tonnages are small. Prices are fairly steady on all the coals that are favorably known.

Georges Creek is beginning to share the situation of Pocahontas and New River, so far as seeking orders is concerned, but f.o.b. prices remain firm at the contract figure.

Anthracite—The warm weather has had a depressing effect on retail trade and new business is rather slow coming in. The wholesale trade, however, is in a healthier state and with most of the shippers there is a little delay in getting cargoes cleared. Stove size is still in short supply, which is the reason for most of the slow dispatch.

Retail prices in Boston on bituminous were advanced Oct. 19, from $4.65 to $4.90 net ton, delivered. Anthracite screenings are quoted at $3.25.

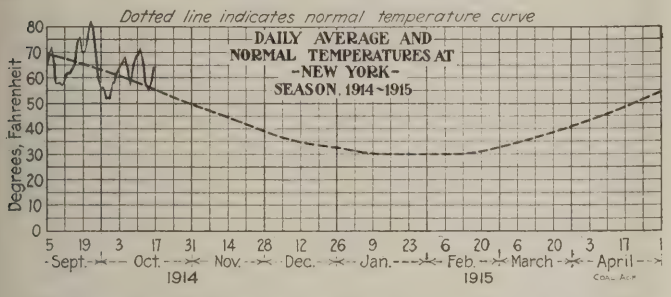
Bituminous prices at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*.....	$0.90@1.50	$1.25@1.65	$1.67@1.77	
Philadelphia*.....	2.15@2.80	2.50@2.90	2.92@3.02	
New York*.....	2.40@3.10	2.80@3.20	3.22@3.32	
Baltimore*.....	.....	.....	2.85@2.95	
Hampton Roads*.....	.....	.....	.....	$2.80@2.85
Boston†.....	.....	.....	.....	3.60@3.78
Providence†.....	.....	.....	.....	3.63@3.73

* F.o.b. †On cars.

NEW YORK

More cancellations of bituminous orders and a further general contraction. Mining operations heavily curtailed. Anthracite under pressure due to the mild temperatures. Stove coal now plentiful.



Bituminous—Even the most cheerful optimists are discouraged over the current situation in soft coal. Though not hopeful of any immediate improvement, it has been felt for some time that the situation would not contract any further, but the trade has experienced a severe disappointment in this respect. The past week has witnessed heavy cancellations, domestic consumers apparently restricting orders still further, while the general manufacturing and steam demand is notably reduced. There is practically no spot demand whatever, and the movement on contract is only fair. The necessity on the part of sellers to exert some pressure as regards credits is further aggravating the situation.

Operations in the mining regions are down to half capacity, and it is now agreed on all hands that the current situation could scarcely be worse. The only features of a constructive nature are the comparative absence of demurrage coal and the excellent manner in which prices are being maintained. Operators are rigidly curtailing production, so that accumulations are relatively insignificant considering conditions, while prices continue at a profitable figure, probably more because it is fully realized that concessions would not be productive of any results.

Occasional sales are reported at off figures, but the nominal market is not quotably changed from the prevailing level of the past few weeks, which we quote as follows: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—A continued absence of the customary cool fall weather has exerted a depressing influence upon the

hard coal market. The effects of this are being felt particularly in the line trade, and this has resulted in diverting an excessive tonnage of the individual prepared grades to Tidewater. Egg coal is suffering particularly, it being almost impossible to move it even when offered down to the full May circular. The heavy pressure for stove coal has also eased up notably, straight cargoes being readily obtainable at the circular. Nut coal is about normal.

Pea coal is moving rather freely, but the smaller sizes are heavy and difficult to dispose of. All the local dealers are complaining of the adverse weather conditions, and are anxiously awaiting lower temperatures. There are considerable tonnages going to Down East points, vessels being plentiful, with rates about normal. There are persistent rumors current to the effect that a move is on foot to advance the price of stove coal to the same as chestnut. No confirmation of this can be obtained at this time.

The New York hard coal market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.65@5.10	$5.05	$4.60@5.05
Egg	5.35	5.10@5.35	5.30	4.85@5.30
Stove	5.35	5.35	5.30	5.30
Chestnut	5.60	5.50@5.60	5.55	5.45@5.55
Pea	3.55	3.45@3.55	3.50	3.40@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.25@2.75
Rice	2.30	2.05@2.30	2.00@2.25	1.60@2.25
Barley	1.80	1.70@1.80	1.75	1.55@1.75

PHILADELPHIA

Anthracite inclined to lag, owing to unseasonable weather conditions. Partial suspension is expected, unless conditions change. Companies hampered with small sizes. Depression still marks bituminous situation, with little prospect of improvement.

Anthracite—The unseasonable weather has depressed the anthracite trade. It was expected that the month of October would compare favorably with the year previous, when uninterrupted operations were the rule and all sizes from broken to barley, found a ready market. Retailers who were induced to take on coal during the flurry late in September, still find themselves in possession of a good supply. The summer-like weather has restricted new business, many orders being cancelled, and the dealers are rather loth to take on additional supplies, until there is some prospect of disposing of what they have.

Outside of stove coal, the market is long on the other sizes. It is particularly hampered with the small grades which will not commence to move until the furnaces of the large apartment houses, hotels and office buildings are placed in operation. The individuals are also making things interesting for the large companies by substantial concessions on all sizes, but even at that, it is understood that the volume of business they are doing is not great. Unless conditions materially change, a curtailment in output is looked for.

Prices at Tidewater are about as follows:

	Circular	Individual
Broken	$4.75	$4.50
Egg	5.00	4.90 @ 5.00
Stove	5.00	5.10
Chestnut	5.25	4.80 @ 4.90

Bituminous—There is a depressed feeling in the trade. While considerable coal is moving on contracts, the spot business amounts to nothing at all, and the prospects for improvement are not satisfactory.

BALTIMORE

Bituminous market very flat. Industrial curtailment hits fuel business locally. Anthracite fairly satisfactory.

Anthracite is the best feature of a poor fuel situation generally. A slowly awakening demand on domestic account is being noted, and steaming coals, while in poor call, are not losing any ground and it is felt that purchasing for heating purposes can not be delayed much longer. Since Oct. 1 the trade has merely waited for cold weather.

There is little encouragement to be found in the soft-coal market. In West Virginia and Pennsylvania many mines are still on a heavily curtailed basis. Car supply is more than sufficient under the existing circumstances. Cheap fuel is noted in all directions. West Virginia steam coals are selling around 80 to 90c. and three-quarter gas is freely offered around 90c. Slack holds its own at about 40c. The best Pennsylvania coals are still commanding $1.35, but sales are relatively small. Lower grades are struggling along at from 95c. to $1.15, with numerous partial cancellations reported.

The export trade will be about a fair average for the month. From charters now contracted, November seems likely to see another increase.

HAMPTON ROADS

Coastwise shipments from Hampton Roads fair. Foreign movement light and bunkering demand less than normal.

Coastwise shipments are only fair, while the movement foreign has been light and dumpings are consequently not showing up so well. So far as can be ascertained, practically all coastwise cargoes have been on contract and the foreign shipments are cargoes which were sold some weeks back. There are some inquiries in the market from foreign buyers but no reports have been made of any large spot sales for either coastwise or foreign shipment. There has been a fair movement of bunker coal, considering the war conditions, but it is not up to usual tonnage.

Prices on all grades remain about the same as they have been and although the supply of coal in the railway yards is perhaps still above normal, there is little prospect of any cut being made.

Of the cargoes cleared during the week the schooner "E. Starr Jones" took 1350½ tons for San Juan, Porto Rico. Large cargoes seldom move from Hampton Roads to Porto Rico, the average movement being by schooner and in small parcels.

COAL CHARTERS

The "Journal of Commerce" reports the vessel situation as follows:

Full cargo steamers are in good demand for October and November loading, particularly neutral boats, and as the supply available for prompt loading is exceedingly light, rates are decidedly strong and in some trades are quotably higher. The greater part of the prevailing demand continues to come from shippers of grain, coal and other cargo to transatlantic destinations, and there is also an increased demand for boats for South American business. A considerable number of boats were closed for grain and coal to Mediterranean ports and two neutral boats for coal to the River Plate, the rates in all cases being equal or better than the last previous fixtures of the kind. The sailing vessel market continues exceedingly slow in all trades and but little was done in chartering. Rates remain unchanged and the supply of available vessels is more than sufficient for the limited needs of charterers.

Coal charters have been reported as follows:

Vessel	Nationality	From	To	Tons	Rate
Bayard Barnes	.....	Newport News	Cay Francis	954	....
George F. Scannell	.....	Philadelphia	St. Croix	475	....
Humarock	.....	Philadelphia	Galveston	399	....

Note—Steamers are indicated by **bold face** type, all others being schooners.

LAKE MARKETS

PITTSBURGH

Market continues quiet and prices irregular, slack still at 40@50c. Operations at about 50% capacity and Lake shipments likely to decrease soon.

Demand from retail dealers has been lighter the past week, on account of warmer weather. The dealers evince no disposition whatever to stock coal, and are buying merely as they distribute. Manufacturing demand shows little change, and there is no prospect of any improvement in this direction. The steel mills are constantly reducing their output. While their production is stated to be about 50% of

capacity the coal consumption is more than 50% of full requirements since coal consumption does not decrease as rapidly as output. Lake shipments are approximately holding their own, as compared with September but there are no signs of the long expected final spurt and it is not improbable that shipments will dwindle rapidly after Nov. 1.

Coal production in the Pittsburgh district is at about 50% of capacity, though on the basis of the best rate of shipment attained, operations are perhaps between 60 and 65%, the difference in the proportions being due to the fact that at best the mines are never able to work at capacity on account of car scarcity. Prices are fully as irregular as ever, and an evidence of the market weakness is that slack has shown no tendency whatever to firm up, even though the end of the Lake shipping season is near at hand. Slack is obtainable at 40@50c., or as low as at any time in the season. Excellent grades of coal are obtainable in prompt lots at $1.15 for mine-run, and considerably below this is sometimes done. There is a little talk about circular prices being named for the new selling season, but it will likely be some time before the market definitely shapes itself and it is possible that no definite price announcement will be made. The old circular prices, purely nominal for months, were: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

BUFFALO

Bituminous dealers believe prices and demand are at the lowest point. Slack very difficult to sell. Fair movement of soft coal. Lake trade drawing to a close.

Bituminous—There is nothing in sight likely to change the condition of the bituminous market except the closing of the Lake trade. It is a little early for that as yet but the making of an excessive amount of slack will soon be at an end for this year and it will then be a question whether the increase in the output of three-quarter will offset the decrease in slack.

The trade in Canada is quite dead; furnaces and factories are largely idle and the weather has been so warm all the fall that very little coal is needed for heating. These conditions will improve somewhat but the trade does not look for anything that will materially advance the price of coal. The prices on bituminous continue at the bottom, where they have been about all the year. Quotations are $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack with slack quite often going at most any price. Allegheny Valley sizes sell at 25c. lower than Pittsburgh. Youghiogheny slack commands a slight premium over almost anything else.

Anthracite—The demand is good, considering the warm weather. Shippers have sold about as much as they commonly do without the aid of cool weather and find that there is a steady improvement in the demand. The local trade is not quite as good as the line business, but it is bound to pick up. The demand for independent anthracite is active, though no premium is obtained for it.

Shipments of anthracite by Lake from this port are in fair quantity, though not by any means what they were last season. For the week they amounted to 104,000 net tons. Reports differ as to the Western anthracite trade. The latest statements are that it is very dull, so that it would be poor policy to rush any more than an ordinary amount in that direction till there is a better movement away from the docks.

CINCINNATI

Demand lighter in all departments and there is little prospect of improvement. The industrial situation is improving very slowly.

The demand during the past week has been even less than during the week before, if possible. Several cool days brought hopes of improvement in the retail trade, but it did not get cold enough and the movement remains very sluggish. Some of the local industrial consumers seem to be again receiving orders, but so far there has been no increase in the steam demand as has been hoped for. On the contrary, there is a marked hesitancy on the part of large consumers to either accept deliveries on contracts or buy spot coal. With both branches of the market in this non-buying humor, the trade seems to be in a deep rut.

COLUMBUS

Domestic trade is quiet due to warm weather. Price list weak but not demoralized. Lake trade continues active but steam grades dull.

Cancellations have been the rule among retailers, whose stocks are generally large. Their bins are full and orders booked for October are either being canceled entirely or shipment is being held up. Demand from the rural districts is small while a larger tonnage is being sold in the cities and larger towns. Retail prices are fairly well maintained despite the weakness. Preference is still being shown for the fancy varieties such as Pocahontas and West Virginia splints. Anthracite is also moving quite freely in Columbus and vicinity.

The Lake market is still active and, on the whole, the best feature of the trade. A considerable tonnage is moving from Ohio mines to the upper Lake ports and congestion on the docks is not interfering to any great extent. Chartering of boats is still going on and there is every indication of an active Lake trade up to the closing of navigation. The Toledo docks of the Hocking Valley Ry. have loaded more than 2,000,000 tons since the opening of navigation in spite of the long suspension.

Production has fallen off because of the unfavorable weather conditions. The Hocking Valley is producing only about 65% of normal and the same is true of Crooksville and Jackson. Massillon and Cambridge is even lower. In the Pomeroy Bend district, which had held up well until recently, the output is estimated at 80% of the average.

	Hocking Valley	Pomeroy	Kanawha
Re-screened lump	$1.76	$1.75	.....
Inch and a quarter	1.60	1.60	$1.50
Three-quarter inch	1.45	1.45	1.45
Nut	1.15	1.40	1.15
Mine-run	1.15	1.15	1.15
Nut, pea and slack	0.30	0.25	0.30
Coarse slack	0.20	0.25	0.20

TOLEDO

Lake movement much heavier during the past few weeks. Warm weather has caused a depression in the domestic market.

The domestic business has been practically at a standstill owing to the extremely warm weather. There does not seem to be any demoralization as yet, it simply being a dearth of demand. The steam business is not showing much improvement due to the fact that the money scarcity has brought about slow business conditions which are felt in every department of business. It was thought that business would improve when the crops began to move but the farmers concluded to hold their products for more money. The Lake trade is the one bright spot; there has been a good movement of coal in this direction, especially at the T. & O. C. docks.

Prices quoted in Toledo are:

	Hocking Valley	Cambridge	Pomeroy	Massillon	W. Va. Splint	Pocahontas
Lump	.....	.....	.....	$2.50	.....	$2.25
Re-screened Lump	$1.70	.....	$1.75	.....	.....	....
Domestic Lump	1.60	.....	1.85	.....	$1.60	....
1½ Lump	.....	$1.40	.....	.....	.....	....
¾ Lump	.....	1.20	.....	.....	.....	....
Egg	1.25	.....	1.35	.....	1.15	2.25
4-in. Block	.....	.....	.....	.....	1.75	....
Nut	1.25	.....	1.25	.....	.....	....
Washed Nut	.....	.....	.....	2.50	.....	....

CLEVELAND

Prices stronger due to the scarcity of coal. Market cleaned up Monday night for the first time in several weeks.

Slack prices have advanced from 5 to 15c. the last few days and spot coal is moving readily at $1.60 to $1.65 with shipment quotations at the higher prices rather than the lower. Even Hocking slack, that a week ago was sold as low as 5c. a ton at the mines, was stronger and high grade nut and slack were quoted $1.55 to $1.60. In this coal the advance is fully 20c. a ton.

Smokeless coals are holding at last week's prices because of the continued warm weather and a good supply. In Ohio and Pennsylvania domestic coals, the trading is at last week's prices, but the market is firm because of the small offerings. More than 200 cars of fine coal and steam size coarse coal came into the city over Sunday. A week ago it could not have been disposed of because of the large amount left on track, but late Monday afternoon the spot coal was all sold and Tuesday receipts were looked for to take care of additional business.

The real reason for the brisk market and the higher prices is the lack of orders for domestic sizes and for Lake shipment. The Lake business is practically over and only boats that can be held two to three weeks at the docks are being loaded. This has resulted in mines curtailing production.

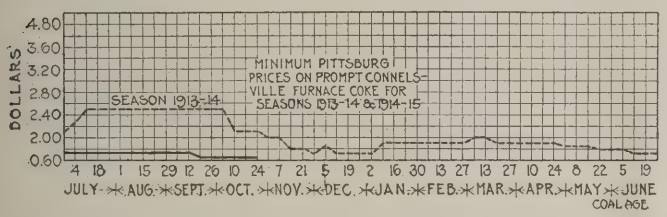
Prices for current shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmount	W. Va. No. 8
Lump	$3.75	.....	.....	.....	.....
Lump, 6 in.	.....	.....	$2.45	.....	.....
Egg	3.75	.....	.....	.....	.....
Egg, 6 in.	.....	.....	2.10	.....	.....
Lump, 1½ in.	.....	$2.40	2.25	.....	.....
Lump, ¾ in.	.....	2.30	2.10	$2.00@2.05	$2.05
Mine run	2.75	2.15	1.95	1.90	1.95 65
Slack	2.40	1.60@1.65	1.60@1.65	1.55@1.65	1.60@1.

LOUISVILLE

The market is even worse, and operations are heavily curtailed. Outlook is regarded as discouraging.

The return of cool weather has had the effect of stimulating the demand for domestic coals in the Kentucky market but otherwise conditions have shown little or no change.



Although return of better conditions is spoken of with some optimism there is no immediate prospect of any industrial recovery that would put this market on its feet again. Some hope is expressed that the cotton will be moved and this would help the demand. Prices are not definitely quotable, whatever reasonable offer the operators can get usually being sufficient to close any deal.

COKE

CONNELLSVILLE

Coke market stagnant, with prices not seriously tested, but evidently a shade lower. Production and shipments declining.

There is no inquiry for foundry or furnace coke, and shipments on contracts are tending downward rather than upward, as consumptive requirements decrease. A little buying of November furnace coke is expected, but no inquiries are out yet. Prices are not being definitely tested, but would doubtless be found somewhat softer upon actual inquiry, and we reduce our range of quotations slightly, it being remembered that they are largely nominal: Prompt furnace, $1.65; contract furnace, $1.75; prompt foundry, $2.25; contract foundry, favorite brands, $2.35@2.50, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Oct. 10 at 246,110 tons, a decrease of 3042 tons, and shipments at 244,593 tons, a decrease of 9259 tons.

BUFFALO

The coke trade is about as quiet as it could well be. The demand is so light that a great many dealers in coal are paying no attention to it. The movement is at a mere routine stage, with prices on the basis of $4.25 for best Connellsville foundry and stock coke at $3.30.

CHICAGO

Because of the let-up in the demand for furnace and foundry coke, most of the ovens are making storage piles. There has been a little better demand for domestic coke. Prevailing prices in Chicago are: Connellsville, $4.75@4.90; Wise County, $4.75; byproduct egg, stove and nut, $4.95; gas house, $4.35.

MIDDLE WESTERN

INDIANAPOLIS

Slight increase in the movement of domestic coal is noted. Screenings selling very low. Operators not expecting much before first half of November.

The weather has been adverse to the coal trade, except for two days when it was wet and inclined to be chilly. This caused a better movement of domestic coal from retailers' yards and had a corresponding effect at the mines. But outside of this, the October situation has been bad and the trade is not now expecting much before November. The screenings situation is about as poor as it could be and steam coals are not moving so well. Mines are on about half-time and cars are plentiful.

Screenings are selling at 30@50c. though a much higher price is obtained on contracts. The price of lump holds up well to $1.75, although there are markets that will not take it at that figure.

CHICAGO

Conditions improving. Increase in the buying of both domestic and steam coal. Price on steam fuel advanced as a result of the curtailed production. Anthracite market stronger.

There has been a slight improvement in the Chicago market. Dealers report better buying of domestic coal and an increase in the demand for steam fuel. Steam prices have advanced as a result of a curtailed output, and the anthracite market has been improved by the raw weather. Prices are firmer, but no advances have been made. The smokeless market is active, due to a steady demand from apartment houses.

The major operators are getting $1.40 at the mines for mine-run coal, while some of the smaller shippers are quoting $1.25 as their minimum. There is a very light demand for splint coal. Carterville operators report a slight improvement in both domestic and steam trade. The Franklin County market is stronger, the domestic lump price being $2 a ton.

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.57	$3.05	$2.27@2.37	
Steam lump	2.02		1.97@2.02	
Egg		2.80	2.17@2.27	$4.30
Mine run	1.87	2.15@2.25		
Screenings	1.07@1.12	1.40@1.50	1.07@1.12	$3.30@3.45

Harrisburg quotations are: Domestic lump and egg, $2.80; steam lump, $2.20; mine run, $2.15; screenings, $1.40@1.50; No. 1 Nut, $2.80; No. 2 nut, $2.40.

Carterville prices are: Lump, $2.80; egg, $2.55@2.80; No. 1 washed, $2.65@2.80; No. 2 washed, $2.30@2.40.

ST. LOUIS

Market flat on both steam and domestic grades. Most prices are less than production cost.

The depression in the coal trade still continues, with the exception of prices on the high-grade lump coals. In past years, when the steam market had gone to pieces at this particular time, the lump or domestic market was in good shape, but this year not only is the steam market flat, but there is absolutely no demand for the domestic sizes.

In the Standard field prices have gone to that point where there is no money in mining or producing coal. Screenings are sold at from 10 to 20c., and lump coal can be bought as low as 95c. The only thing that maintains the steam market is the fact that half the operators are dumping their steam sizes on the ground and this is not justified by a heavy domestic demand for lump coal as is usually the case at this particular season.

The prevailing circular is:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	....	$1.30	$1.00@1.10	$1.15@1.20
3-in. lump	.....	....	1.40	....	.....
6-in. lump	$1.50@1.85	....	1.50	1.25@1.35	1.30@1.35
Lump and egg	1.85@2.15	$2.25	.....	....	1.35
No. 1 nut	1.25@1.40	....	.....	0.75@0.80	.....
Screenings	0.30@0.40	....	0.80@0.85	0.10@0.20	0.20
Mine-run	1.05@1.10	....	.....	0.75@0.80	.....
No. 1 washed nut	1.50@1.60	2.25	1.50	....	.....
No. 2 washed nut	1.25@1.35	....	1.35	....	.....
No. 3 washed nut	1.10@1.15	....	.....	....	.....
No. 4 washed nut	1.00@1.05	....	.....	....	.....
No. 5 washed nut	0.15@0.20	....	.....	....	.....

KANSAS CITY

Domestic trade has been slightly brisker, but the usual fall demand is not fully under way.

Most business and office buildings have started their furnaces, but, although the weather was cold enough to demand fires in homes, many depended on gas to remove the chill, and there has been little demand in this direction. However, the cold snap proved that the gas supply will be inadequate this winter.

Coal Contracts Pending

Contract No. 2—Norfolk, Va.—The United States Government is in the market for 2000 tons of bituminous coal for use in waterway improvement work. Bids opened Oct. 12 were as follows: Pocahontas Fuel Co. (14,850 B.t.u.), $2.63. Castner Curren & Bullitt, (14,600 B.t.u.), loading at city pier: Lump, $3.545; mine-run, $2.545; for loading at Lamberts Point: Lump, $3.545; mine-run, $2.59. New River Coal Co. (14,800 B.t.u.), $2.55. Smokeless Fuel Co. (14,800 B.t.u.), $2.53. C. G. Blake Co. (14,850 B.t.u.), $2.55. Nottingham & Wrenn Co. (14,800 B.t.u.), $2.58. Chesapeake & Ohio Coal & Coke Co. (14,850 B.tu.), $2.59 trimmed and $2.57 not trimmed. Johns Bros. (14,800 B.t.u.), $2.53. All communications should be

addressed to E. Eveleth Winslow, Lieutenant Colonel of Engineers, United States Engineer Office, Norfolk, Virginia.

Contract No. 4—Boston, Mass.—Rhode Island Co. is in the market for 90,000 to 100,000 tons of Pocahontas, New River, Georges Creek, or Somerset run-of-mine. Shipments are to be made in about monthly proportions for a year, and the point of delivery is Providence, R. I. All communications should be addressed to E. H. Raquet, Engineer of Tests, South Station, Boston, Massachusetts.

Contract No. 5—Boston, Mass.—New York, New Haven & Hartford R.R. is in the market for 250,000 tons of West Virginia (locomotive) coal, run-of-mine. Shipments are to be made in about monthly proportions for one year, the quotation to be either f.o.b. loading port or delivered alongside N. Y., N. H. & H. R.R. wharf, South Boston, Mass. All communications should be addressed to E. H. Raquet, Engineer of Tests, South Station, Boston, Massachusetts.

CONTRACTS LET

Contract No. 1—Columbus, Ohio—The Ruggery Building has contracted for 300 tons of West Virginia slack coal. Shipments are to be made at the rate of 25 tons per day, beginning Nov. 1, delivery to be made at Columbus, Ohio.

FOREIGN

Guayaquil, Ecuador, South America—La Compania de Alumdrado (Lighting Company) is in the market for 3500 tons of gas coal. Prospective bidders should state the specific gravity, weight per cubic foot, and space occupied by one ton of gas coal. Give approximate analysis including moisture, fixed carbon, sulphur and ash, and a commercial analysis showing the gas per ton of coal, gas per cubic foot of coal, illuminating power of the gas in standard sperm candles, value of one cubic foot in grains of sperm, sperm value per ton of coal, coke per ton of coal (good quality), coke per cent. of coal, ash in coke, sulphur eliminated with the volatile products, sulphur in the coke, tar per ton of coal. Quotations should be c.i.f. Guayaquil. Address The Manager, Compania de Alumdrado, Guayaquil, Ecuador, South America.

South America—An American consular officer in that country has transmitted detailed information relative to tenders which will be received, until Nov. 1, for the supply of coal for government steamer service. American coal dealers who are interested should apply to the Bureau of Foreign and Domestic Commerce, mentioning item No. 14,016 for the reserved information.

South America—Supplementing a previous notice, the Bureau of Foreign and Domestic Commerce at Washington states that details regarding a certain inquiry from South America have been forwarded to the department, and that complete information, including blank forms on which to submit bids for supplying coal under the conditions specified can be had on application. All inquiries should mention item No. 14048, and be addressed to the Bureau of Foreign and Domestic Commerce, at Washington, D. C.

Santiago, Chile, S. A.—Bids are wanted on 400,000 tons of coal, deliveries to be made during the next three years, according to press reports. The coal is to be used on the Chilean Railway. All communications should be addressed to the Department of Materials, Santiago, Chile, S. A.

FOREIGN MARKETS

GREAT BRITAIN

Trade slow and circulars difficult to maintain. Shipping further delayed by naval maneuvers in the North Sea. September exports make a substantial recovery.

The Spanish Government has reimposed the customs duties on imported coal.

The war has caused serious inroads into the funds of trade unions, owing to the increase of members requiring unemployment benefits. The Board of Trade now intimate willingness to make special grants to such bodies.—"The Colliery Guardian."

Oct. 9—Second class Admiralty List coals are in better demand and prices are harder. Monmouthshire large and Cardiff smalls are fairly plentiful. Quotations are approximately as follows:

Best Welsh steam	$4.92@5.16	Best Mountmouthshires	$3.96@4.14
Best seconds	4.32@4.56	Seconds	3.84@3.96
Seconds	4.20@4.32	Best Cardiff small	1.98@2.04
Best dry coals	4.56@4.80	Seconds	1.32@1.56

Freight—Chartering is quiet, but rates remain firm for the Mediterranean, while for South America they are unchanged. Rates are approximately as follows:

Gibraltar	$1.68	Aden	$2.22
Malta	1.68	Colombo	2.34
Marseilles	1.76	Sabang	2.34
Algiers	1.56	Singapore	2.52
Genoa, Savona	1.96	Las Palmas	1.68
Naples	1.74	St. Vincent	1.80
Venice, Ancona	2.88	Rio Janeiro	3.12
Alexandria	1.92	Monte Video	2.82
Port Said	1.86	Buenos Ayres	3.06

British exports for September and the first nine months of the past three years were as follows:

	September			Nine Months		
To	1912	1913	1914	1912	1913	1914
Russia	592,060	668,472	17,398	3,107,885	4,462,660	3,066,925

COAL AGE

Vol. 6 NEW YORK, OCTOBER 31, 1914 No. 18

"BE VERY SLOW TO BELIEVE THAT YOU ARE WISER THAN ALL OTHERS; IT IS A FATAL BUT COMMON ERROR."

FEW people are so constituted that they can accept advice with sparkling eyes, but any man who will balk at the aphorism quoted above, needs watching. If he is allowed to follow his own inclinations long enough he'll probably come to a sudden and violent end.

Reading *between the lines* on tombstones will recall many examples to mind.

Here are a few we discovered in a twenty-acre lot, and it was not entirely filled at that:

A miner who couldn't agree with his "buddy" and the mine foreman about the danger of a piece of loose draw slate in his room.
A driver who knew that all mules would not kick.
A fireboss who could detect gas with a naked light.
A salaried union official who was on a company payroll as well.
A mine foreman who made a practice of riding loaded trips.
A checkweighman who developed a system of dummy check numbers.
A miner who used steel tamping bars.
A trip rider who enjoyed being tickled with the 550-volt current.
A fireman who depended on check valves on a high-pressure boiler.

Then there were several we were not quite sure about:—

A fellow killed in a drunken brawl.
A trapper run down by an electric locomotive.
A machine-runner electrocuted.

We gave them the benefit of the doubt, recalling the words, "Be very slow to believe."

Since making the gruesome journey through the twenty-acre lot, we have discovered an even more distressing obituary, illustrating the truth of the aphorism quoted.

The Rev. Caleb Colton, who wrote the precept and published it in 1821, blew out his own brains in 1832, principally because he lost a large sum of money in gambling hells.

This in spite of the fact that he was a clergyman and a man of brilliant mind. Surely his advice, backed up as it is by the tragedy of his life, rings true.

Discussion of Mining Laws, Legislation and Mine Regulations

By J. T. Beard

IN THE CAMPAIGN FOR IMPROVEMENT *and the securing of higher efficiency and safety in mining, nothing is of greater importance than the careful consideration of those features and elements that relate to and control the management and operation of mines. These controlling features are quite generally included in the various requirements of mining laws and mine regulations.*

o o o

It is a deplorable fact that state mining laws are, in many cases, the result of unwise and biased legislation. Too often has mine legislation been influenced if not controlled by lobbyists whose main object and purpose is to secure the enactment of laws that will favor their own selfish ends. Even the appointment of committees and commissions to draft suitable laws for presentation to legislative bodies has not secured the desired freedom from the same undermining influences; and "minority" and "majority reports" have, alike, been presented to legislatures for their action.

While our law-makers cannot always be expected to be well informed in regard to the practical requirements of mining, their purpose as honest legislators should be to eliminate from their enactments all discriminating features, so that the laws they enact will secure greater safety to mine workers and equal justice to all.

A mining law that imposes unequal burdens on the industry in different districts of the same state, or makes it impossible for coal operators in one state to compete successfully with those of another state tributary to the same market is justly open to criticism. A law that discriminates between mines, in respect to their classification, so as to make it impossible for one mine to operate successfully in competition with other mines working under the same conditions and supplying the same market would be discriminative and likewise open to just criticism. Much of the difficulty from this source has fortunately been removed through the efforts and work of the various interstate commissions. A law that permits the domination of any class or individual over another class or individual, or restricts individual rights and freedom without sufficient cause or reason is unwise and again open to criticism.

There is no work more constructive or more important in journalism, especially in a paper devoted to the welfare and interests of a single industry, than the work of simplifying and improving existing mining laws, to the end that greater safety and justice may be secured in all branches of the work. In the accomplishment of this task, the editors of Coal Age ask the earnest coöperation of all practical mining men, in every branch of the industry. We invite such criticisms of existing mining laws as have appeared from time to time in Coal Age; and ask that correspondents draw attention to inconsistencies, omissions or lack of clearness, in the wording or intended meaning of laws as they appear on the statute books of their respective states.

A question was recently asked, Coal Age, Oct. 3, p. 563, in respect to the meaning of the designation "gaseous mine," in the Bituminous Mining Law of Pennsylvania. In the present issue of the paper, a correspondent questions the justice of the requirement of the Bituminous (Penn.) Mining Law, Art. 24, Sec. 7, under which all examination papers of candidates must be filed in the Department of Mines at Harrisburg and not returned to the candidate.

Let us have a full discussion of all points relating to mining laws, legislatian or mine regulations, by those affected by such laws. Much good can be done by such a frank discussion.

Test of Rice Barriers at Experimental Mine

By Geo. S. Rice* and L. M. Jones†

SYNOPSIS—The explosion, specially arranged for the visit of the American Institute of Mining Engineers on Oct. 9, was of a mild order. This type of explosion is hard to stop, and the ordinary barriers which have proved efficacious in the most violent explosions often fail to restrain those which are less violent. The Rice barriers were proved equal to the demands made on them by the conditions of the experiment.

One of the excursions arranged for the recent meeting of the American Institute of Mining Engineers at Pittsburgh was to the U. S. Bureau of Mines experimental mine, near Bruceton, Penn. This trip was made on the afternoon of Oct. 9. Many members of the Institute, accompanied by some of the Pennsylvania state inspectors, and other mining men, probably about 200 in all, went out to the mine by train and automobiles. They first entered the workings to inspect the arrangements for an explosion test and the "barriers" that had been erected to limit the explosion. Outside the mine, they saw demonstrations with full-size models of two of the rock-dust barriers, which had been erected to show how a cloud of rock dust is discharged from them by the force of an explosion.

Cement-Gun Work

Afterwards, a "cement gun" was used to cover with a layer of concrete some boards set up like a mine stopping. The concrete consisted of 2 parts sand and 1 part cement and was reinforced with wire mesh which had been previously tacked on the boards. This gun had recently been used in the mine to repair countless breaks in the concrete lining of the mine, caused during previous explosion tests; it had also been used to coat the inner part of the entries with a thin layer of 2 parts sand and 1 part of cement without any reinforcement. The object of the coating was twofold; to enable the entry to be more easily cleaned after each test, and to see whether the coating would protect the shale and bone-coal roof from air slaking.

The conditions are somewhat severe at this mine on account of the explosion experiments, so it is hardly a fair test of the durability of the coating. It is hoped that this method of protecting the roof and walls may be durable in commercial mines, and if so, it would be a great economy to employ it and indirectly it would add to safety in the prevention of falls.

After these exhibits the visitors moved up on the hill over the main entries to witness the explosion test. After the word had been given that the electrical connections had been made into the mine, and the physicist had made his tests to determine that the electric circuits were complete, warning whistles were blown, and 30 sec. later the explosion was started by throwing an electric switch in the observatory.

Evidences at the Surface

The first evidence of the explosion was a puff of light dust, accompanied by a muffled sound coming from the mouth of the air course. This was followed by a stronger and more continued puff of dust and smoke from the same point. While this was issuing there was a puff of light dust from the main entry, and after an interval of several seconds this was followed by a prolonged outburst of dust and smoke accompanied by a crashing or booming sound.

The explanation of these separate puffs and sounds appears to be that the first small puff coming from the air course was the shock wave from the cannon; the second and larger one was when the pressure wave issued from the explosion in the butt entry; the first puff from the main entry appeared to be caused either by the shock wave from the cannon, or the shock wave from the explosion itself in the butt entries; the larger burst of

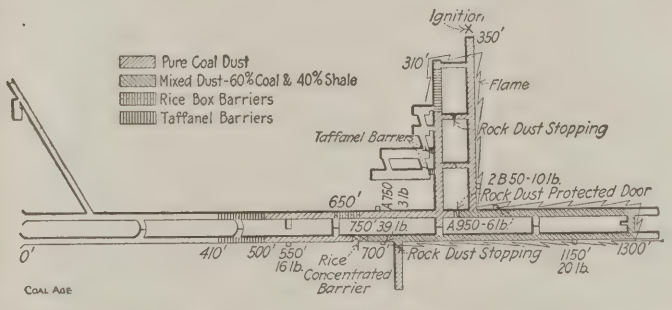

Fig. 1. Test at the U. S. Experimental Mine to Prove Efficacy of New Rock-Dust Barriers

dust and smoke was due to the explosion in the main entry, which as the manometer records later showed attained its maximum immediately before striking the concentrated barrier.

Perhaps one of the most striking features of this experiment was the demonstration of the present knowledge of dust-explosive phenomena which enabled those in charge to plan the conducting and limiting of an explosion along a predetermined path.

A Large Part of the Mine Was Free from Afterdamp

Owing to the explosion being well in the interior of the mine, and as the fan was set to barely turn around, no smoke or dust was observed from either entrance after the outbursts above mentioned. A demonstration was then given of the oxygen breathing apparatus by two Bureau mine-rescue crews of five men each. The advance party entering the main entry carried a guide rope, also a canary to observe whether or not it would be affected by the fumes.

Owing to the retraction of the gases after the explosion the party had to go in 600 or 700 ft. before encountering the afterdamp, which showed its presence by overcoming the canary. After the squad had returned, the fan was started, so as to blow out a large amount of smoke and gas from the main entrance. Then ventilation

*Chief mining engineer, Bureau of Mines, Pittsburgh, Penn.

†Mining engineer, Bureau of Mines, Pittsburgh, Penn.

was reversed and many of the visitors including inspectors entered and observed the effects of the explosion.

Details of Arrangements of Test

Referring to Fig. 1, the explosion was initiated by a blown-out shot of 4 lb. of black powder located at the face of the second butt entry, 350 ft. from the air course. Pure Pittsburgh coal dust was distributed for the 350 ft. between the face and the air course at the rate of 2 lb. per lin.ft. For the first 50 ft., and in the inner crosscut it was placed on side shelves but in the balance of the zone, the dust was concentrated on shelving placed across the airway. It has been found that the maximum intensity of explosion is obtained by this method of loading.

In the air course between the second and first butt, there was a rock-dust protected ventilating door, which was located here with the expectation that it would not permit the explosion to pass through it and travel outbye along the air course. On the inbye side up to the last crosscut of the airway, a mixture of 60 per cent. coal dust and 40 per cent. shale was loaded at the rate of $3\frac{1}{3}$ lb.

Fig. 2. View from No. 1 Butt of Remains of Rock-Dust Stopping in 200-Ft. Crosscut

per lin.ft., the mixture being concentrated on cross shelves. This distance is 350 ft. There was a like loading in the last crosscut to the main entry, and out along the main entry 550 ft. At the end of this loaded length of entry was a concentrated barrier. Thus there was a total length of 1300 ft. that the explosion was expected to follow from the origin to the point of extinguishment of the flame.

Coal Dust to Test Value of Barriers

In order to test the efficiency of the various stoppings, pure coal dust was placed in the first butt and in the air course outby the protected door between the butts, also in the main entry outby the concentrated barrier, and in the right butt. For if the flame of the explosion had passed the barriers and caused the ignition of the pure dust beyond, it would have made a much more extensive explosion, and the flame might possibly have issued from the entrances.

Neither the instruments nor other records gave indication of ignition of the pure coal dust in the zones beyond the barriers. Besides the barriers which limited the explosion there were others supplementing these placed outbye the several extra zones of pure dust, for the purpose of exhibiting these types of barriers and also as a safeguard to the mine portals in case the limiting barriers previously described failed to extinguish the explosion. These supplemental barriers were a Rice box barrier in the air-course outby the butt entries and Taffanel barriers in the air course and main entry. The Taffanel barriers were loaded with shale dust and limestone dust was placed on the other barriers.

The Stone Dust Mixed with the Coal Did Not Wholly Prevent Increase of Pressure as Explosion Progressed

The pressures were registered on three French and three British manometers. The registration of the passage of the flame was recorded by strips of tinfoil in the various stations, which, except in the butt entries, are 100 ft. apart. To check these records tufts of gun cotton and matches were placed at intervals in the roof. However, it was found that the latter were not trustworthy with the method of loading on cross shelves which had been adopted. Judging from surface-gallery effects, probably the cloud of coal dust and mixed dust make a thick barrier or veil along the roof, through which the flame cannot penetrate. In order to obtain the maximum effect a great excess of dust was used.

The stations in which pressure manometers were placed and the maximum pressures obtained are as follows:

PRESSURES ATTAINED AT VARIOUS POINTS IN MINE

Station	Lb. per Sq.In.	Location and Remarks
2B 50	10	300 ft. from origin.
A 950	6	In air course after right-angle turn.
A 750	3	In air course outbye the door barrier.
E 1150	20	In main entry 100 ft. outbye the last crosscut.
E 750	39	In main entry inbye the concentrated barrier.
E 550	16	In main entry inbye the concentrated barrier.

(These pressures may be slightly revised upon more thorough measurement and calculation of the records.)

It will therefore be observed that the pressure of the explosion after passing out of the butt entry increased in intensity on its passage along the predetermined path until the flame was extinguished by the limiting barriers.

The Seat of the Explosion Developed Little Pressure

It is worthy of note that the pressure in the entry in which the explosion originated did not rise very high. The explanation that might be made of this is that the entry was not long enough and in a sense the area was restricted. The outlets were choked momentarily, at the mouth, by the blast striking against the rib of the air course, on the outbye side by the ventilating door, and, inbye because it was approaching a dead end.

Had the explosion been well under way, this restriction in outlets would not have checked the intensity of the explosion. The inertia of the air had to be overcome in order to stir up and mix the dust and air.

The Rock-Dust Stopping Was Instantaneously Effective

The flame penetrated into the Taffanel barrier in No. 1 butt about 50 ft. but did not pass through it. It did not pass through the rock-dust stopping in "200" crosscut. This stopping consisted of two sets of six shelves each, with a vertical spacing of one foot, supported by posts. There was a space between the two sets of shelves about a foot wide. This space and the shelves were filled with limestone dust.

The theory on which the device was designed is that if a set of such shelves was placed on each side of a stopping, an advance air wave might overthrow the stopping and the shelves on the far side, but the shelves on the near side would remain up and the explosion wave proper would blow the dust off, forming a cloud which would quench the flame.

The space filled with rock dust in this test acted like a solid stopping and overturned the shelves on the No. 1 butt side. The other set on the No. 2 butt side remained up and most of the dust was blown off the shelves. Notwithstanding the coal-dust loading in this crosscut on both sides of the stopping, the flame failed to pass beyond.

The Other Rock-Dust Barriers Also Proved Effective

The protected ventilating door in the air course also checked the flame. The planks of the rock-dust side-compartments were blown outbye but most of the floor boards of the upper compartment still hung from chains. Some flame passed through the barrier but died away 50 ft. beyond. Evidently it took this distance for an effective dust cloud to be formed and to cool the gases below the ignition temperature of the dust carried along by the explosion. As the pure coal dust placed outbye the door was not ignited, evidently the rock dust blanketed the flame too quickly to permit ignition.

No evidence of flame was noted in No. 1 right butt inbye the rock-dust stopping which was entirely thrown down. The concentrated barrier in the main entry was dismantled, some of the timbers being carried 150 ft. and the limestone dust well scattered. No evidence of flame was noted outbye its original position.

In the air course the boxes of the box barrier, which terminated the coal-dust zone outbye the ventilating door, but which were not called on to extinguish the explosion, were all on the floor, but the bottom boards were still suspended from chains and still held much limestone dust. Three of the boxes were found 25 ft. inbye the position of the first box before the explosion; presumably these were carried inbye by the inrush of air from outside after the explosion had occurred.

There was little coked dust along the course of the explosion. This is not necessarily to be regarded as indicating that there was little heating effect. The ribs, roof and posts were all damp and it is known that coke deposition seldom is found under these conditions.

Taffanel Barriers Have Failed in Slow-Moving Dust Explosions

In conclusion, it might be stated that all the explosion-checking devices used in this explosion test have been tried many times in the Experimental Mine explosions and all of them with the exception of the Taffanel barrier, which has failed in low-pressure slow-moving explosions, have always proven effective in stopping the phenomena. Installation of any of these types for separating different splits, panels or sections of a mine from each other or the balance of the mine would undoubtedly be a big step in advance toward reducing the number of lives lost in large explosions. The Bureau engineers are now preparing a publication describing these devices and it is strongly recommended that they be installed in bituminous mines in connection with a definite plan for making coal dust inert by watering or rock-dusting.

Extracts from a Superintendent's Diary

The most difficult position about our diggings to fill and keep filled, is that of school teacher. We have had them of every height, weight, sex and disposition, but we have never had but one who stayed an entire school year. That one left today, this being the last day of the term. During the last four weeks, however, she has been without an assistant, having tried four during the year and at last deciding to complete the year single-handed rather than break in another one for so short a time.

The old story about "give a dog a bad name" has undoubtedly been responsible in a way for many of our troubles in this respect during recent years, and has had a marked effect no doubt on the type of applicants who apply for our school.

Each new crop of boys and girls seems to have an original way of making life miserable for the teacher, and in spite of all warnings handed down from year to year, each succeeding teacher seems always to have plenty of surprises awaiting her.

Nor are all of the misunderstandings and hasty departures chargeable to the pupils. Several of the teachers (I recall a man and a woman during my reign) have been vanquished by irate mothers who objected to having their sons flogged. We have had a few rather good-sized teachers at that, but some of the mothers of our camp wouldn't consider size or sex of any opponent as a drawback if once they were determined to breathe revenge.

I was much amused at the comments of one of my sons several days after the arrival of the teacher who has just closed her year's work; and reading between the lines I decided that here at last was a teacher who could keep them guessing. My youngster remarked that the teacher was crosseyed and they couldn't tell whom she was looking at, and besides that she was bigger than any boy in the room.

The boys had a way of working in pairs; one boy would attract a teacher's attention and while she was looking at him, he would telegraph instructions with his feet to his partner who would immediately get into action. But with the new teacher, every boy imagined that she was always looking straight at him and he hesitated about making a move.

And then to add to the discomfiture of the boys, she had a way of working into the good graces of all of the parents of the camp. Among other things, she organized a School Improvement Association in which everybody has become much interested, and as a result, as one might expect, all of the parents are much impressed by the teacher.

Several of the boys were foolish enough to appeal to their mothers, as they had long been in the habit of doing, before they realized just how matters stood between the teacher and the mothers; the results were far from satisfactory from the standpoint of the boys, and from that time on, the pupils when in trouble were content with the best settlement they could obtain from the teacher without outside intervention.

And now at night as the boys gather to talk over past events and make plans for the future, they tell the younger lads about how they used to scare away teachers by threatening to blow them up with dynamite, but they always cleverly change the subject when the listeners begin to ask questions about recent history and the crosseyed one.

The Hampton Roads Coals--I

By F. R. Wadleigh*

SYNOPSIS—This is the first of a series of articles that will cover in detail all phases of marketing and shipping the different coals handled at Hampton Roads. This installment gives a brief historical sketch of the port and a general review of coals handled.

It has been impossible to ascertain the exact date of the first coal shipments from Hampton Roads, but it is certain that these shipments were from the mines in the Richmond, Va., coal basin. These mines were opened in 1750, and in 1832 had their maximum output of 132,000 tons, which gradually decreased until in 1882 it was only 54,000 tons.

For years this coal had a monopoly of the coastwise trade in bituminous coal, barges being brought down the James River and through Hampton Roads to New York and Philadelphia. In 1842, the coal was used at the Portsmouth, Va., Navy Yard, the Navy Department having a contract with the Clover Hill mines for 800 tons in that year.

During the Civil War, some of this fuel was used by the Confederate ships and blockade runners. Either this coal, or that from the semi-anthracite mines in Montgomery County, Va., was also sent to Norfolk at that time and was used by the Merrimac in her fight with the Monitor in Hampton Roads.

The Early Operations

The Chesapeake & Ohio R.R. began shipping coal from Newport News a short time previous to 1882, and before this they had loaded coal at Richmond, and sent it down the James River. In the fall of 1882, they were doing quite a large shipping business to Northern ports as well as in bunkering steamships, something over one hundred ships calling for bunkers between October, 1882, and May, 1883.

In 1884, the Norfolk & Western R.R. started work on its first pier at Lamberts Point, but the first regular shipment of Pocahontas coal to Norfolk was made in March, 1883. Between this time and the completion of the new pier, the coal was dumped over a small pier at Norfolk, which could only accommodate barges; any large ships had either to go to Newport News for bunkers or be coaled from barges.

The Newport News and Lamberts Point terminals were gradually enlarged, five more coal piers being installed up to 1914 when two more, the largest on the Atlantic Coast, were put in operation.

For some time previous to 1882, bunker coals for Norfolk were brought down by barge from Baltimore, but the first regular bunkering business in Hampton Roads was started by Belloni & Co., of New York, who in October, 1882, sent F. E. Tweddell to Newport News, to open an agency there for supplying steamships with coal. As the good qualities of the West Virginia and Virginia coals became better known, aided by judicious advertising methods, the shipments from Hampton Roads increased rapidly from less than 60,000 tons in 1883 to 11,994,665 tons in 1913.

A Comparison with the World's Largest Coaling Ports

Taking the three Hampton Roads coaling stations together, Lamberts Point, Sewalls Point and Newport News, the shipments from the Roads are exceeded by only two tidewater coal-shipping ports in the world. Cardiff with its five docks and basins, Roath, Queen Alexandra and Bute Docks, Barry and Penarth exporting 22,574,592 tons in 1913 and Newcastle with its River Tyne docks and export shipments of 15,407,796 tons in 1913, both including foreign bunkers.

If we consider foreign shipments alone, the Hampton Roads tonnage does not stand so well as the following table shows, all of the tonnage being for 1913:

GREAT BRITAIN

Port	Cargo	Bunker	Total
Cardiff	19,282,496	3,292,076	22,574,572
New Castle	13,316,437	2,091,359	15,407,796

		Total	11,993,410

The Hampton Roads Coals

The coals that have made Hampton Roads known all over the world are the high-grade semi-bituminous steam fuels from the New River-Pocahontas coal area of Virginia and West Virginia. These are known to the trade as "Pocahontas" and "New River" coals, names derived from the geographical location of the coal beds, "Pocahontas" from the town where the first mine was opened, and "New River" from the river of that name. Of a similar nature, structure, appearance and quality and coming from the same geological measures, these are the standard for steam coals in this country. They are also the only ones that can compete on equal terms with the famous steam coals of South Wales, which have so long had a monopoly of the coal markets of South America and the Mediterranean, though they are now being displaced to some extent by our coals. Their high-heating value, purity and comparative freedom from smoke of combustion, make them of especial value and it is of the greatest importance that their possibilities should be fully recognized; the manner in which they are mined and handled should also be given close attention so that they will last as long as possible.

These coals are part of the Great Appalachian Coal Field, which is about nine hundred miles long, and from thirty to one hundred and eighty miles wide. Beginning near the northern line of Pennsylvania, Latitude 42 deg., Longitude 77 deg., it extends southwestward through West Virginia, Maryland, southeastern Ohio, eastern Kentucky, Virginia and central Tennessee, ending in western Alabama, Latitude 33 deg., Longitude 88 deg. About half-way down and on the eastern border of this field, lies the New River-Pocahontas coal area, covering approximately 2575 square miles.

To give the clearest possible idea of the production, quality and handling of these coals, the beds and fields from which they come, the data given is grouped under each railroad system, with a general classification as follows:

Norfolk & Western	Chesapeake & Ohio	Virginian Railway
Pocahontas Flat Top	New River	New River
Tug River (Pocahontas)	Kanawha	Kanawha
Thacker, including Kentucky coals along Tug River	Thacker	
Clinch Valley		
Kenova		

Norfolk & Western Ry., at Hampton Roads, Va.

The mining methods and preparation are similar in all the fields and will be described under one general heading.

It will be noticed that the New River field is served by both the Virginian and Chesapeake and Ohio roads. Most of the New River coal mined on the Virginian alone is from the Beckley bed, while some of the mines are served by both roads, as given in the following list:

Cranberry	Beckley	Winding Gulfg
Lochgelly	Sprague	Mac Alpin
Beech Creek	Prosperity	Tams
Summerlee	Raleigh C. & C. Co.	Eccles
Carlisle	Sullivan	Glen White
Oakwood	Wood-Peck	Wingrove
Mabscott	Pemberton	Scarbro

The Kanawha, Glen Jean & Eastern R.R., a small line (16 miles) owned by one of the large New River coal interests, connects the Chesapeake & Ohio and Virginian, so that some mines can ship coal over either of the two trunk lines; these mines are as follows:

Sherwood	Kilsyth
Price Hill	Derryhal
Mt. Hope Coal Co.	Nichol
Tamroy	Sun
Graham	Sugar Creek
Oswald	

The following tables will serve as a summary of gen-

eral data regarding the Hampton Roads coals, their distribution as to fields and districts and their handling on the market. The division into districts or fields is an arbitrary one adopted by the railroads, but it corresponds quite closely to the actual division as regards the kinds of coal.

Although there are eight railroads with terminals on Hampton Roads, all of the coal is brought in over three, the Norfolk & Western Ry., Chesapeake & Ohio Ry., and the Virginian Ry. Each has its own districts and coals.

All coal for Tidewater or Eastern points is hauled from the mines to Bluefield, W. Va., where it is weighed and classified. Bluefield is 363 miles from Hampton Roads and 12 miles from the nearest mine, the Pocahontas Field extending 422 miles by rail west of Norfolk, so that the average haul to Tidewater is about 386 miles, from the center of traffic.

The freight rate now applying is $1.40 per gross ton.

No. of Piers	Depth of Water (Feet)	Maximum Capacity (Tons)	Tonnage 1913	District	Location	Freight Rate	Max. and Min Dist. from Hampton Roads Minimum	Maximum

				VIRGINIAN RAILWAY				
1	32	1500	3,283,677	(One district only)		$1.40	388	427

Norfolk & Western Railway

This was the first of the three roads to build large coal piers at Hampton Roads, the No. 1 pier having been put into operation in 1885. This road, originally the Atlantic, Mississippi & Ohio, the main line running from Norfolk, Va., to Bristol, Tenn., 408 miles, built a branch line to the Pocahontas coal field in 1882-3, when the first mine was opened. This branch was gradually extended toward the Northwest, with the opening of more mines, until in October, 1892, the entire line was completed to Columbus, Ohio. At that time, there were 25 mines in operation with an output of 2,528,000 tons, all mining being in the No. 3 Pocahontas bed, with the exception of four small operations near Kenova, in the Kanawha measures.

Today, this road has 2037 miles of main line and serves a total of 248 mines, of which 160 are in the Pocahontas coal beds, the others mining the higher volatile gas and splint coals of southwest Virginia, West Virginia and Kentucky.

To the foresight and sagacity of President F. J. Kimball, of the Norfolk & Western, is due a large share of the credit for the opening and development of the Pocahontas coal field. Far-seeing, clean, upright, a tireless worker, he carried out his ideas in the face of a great many discouragements, building to the coal fields, bringing in capital for and encouraging, their development, then extending his road so as to enter Western markets. The present size and prosperity of his road is largely due to the final carrying out of his plans by men trained under him and in sympathy with his ideas.

The total shipments of the Norfolk & Western for 1913 amounted to 20,768,850 tons, of which 16,000,739 came from the Pocahontas beds. The distribution of these shipments was: Tidewater, 22.3 per cent; Eastern Line Trade, 13.4 per cent.; Western Line Trade, 64.3 per cent. To haul this immense tonnage, which is 60 per cent. of its total freight movement, 1065 locomotives are used and coal cars as follows:

60,000 lb. capacity 1067	100,000 lb. capacity 13,272
80,000 lb. capacity 925	115,600 lb. capacity 13,599
85,000 lb. capacity 2914	180,000 lb. capacity 750

The standard train handled into Lamberts Point weighs 1200 net tons, excluding the locomotive.

THE NEW STEEL PIER OF THE C. & O. RY.

on all coal from the Pocahontas fields, destined to points outside of the limits of Chesapeake Bay. This is the lowest rates in existence, on any commodity, being only 3.7 mils per ton-mile. On the high volatile coals from the Thacker Field, the rate per gross ton is $1.50.

NORFOLK & WESTERN TERMINALS AT HAMPTON ROADS

Yards—The Lamberts Point Yards contain 52.5 miles of track altogether; the receiving yard will hold 3300 cars of coal, No. 3 pier yard 60 cars, and the No. 4 pier yard 400 cars. There is also a yard for empty cars at the new pier with capacity of 400, and a separate coke car yard holding 130 cars.

Coal Piers—This road now has three piers at Lamberts Point, 17 miles from the ocean, with an hourly capacity of 6800 tons, No. 1 pier having been torn down to make room for the new No. 4 pier.

Pier No. 4 put in operation this year, is one of the two largest in the world, and has already made some notable records in loading ships. Until the completion of the new C. & O. coal pier at Newport News, it had the greatest handling capacity and was the largest in the world, 1200 ft. long, 90 ft. above low water, 32 ft. of water alongside, and 30 ft. wide at the water end. It has a handling capacity of 4500 tons per hour into ships, from four to six of which can be coaled at one time. This pier has loaded 3826 tons into a ship in two hours and a half, 7500 tons in four hours and ten minutes and 12,000 tons in twenty hours.

The car to be unloaded is dropped from the pier classification yard by gravity to the car-dumper incline, first going over the scales; here a barney and rope haulage takes it to the dumping cradle of one of the two car dumpers. It is then turned over, dumping the coal bodily into a pier or transfer car, each of which holds 110 tons; the transfer car is then run on the elevators and lifted straight up to the floor of the coal pier, where it is run by its own power (electric) over the pockets into which the coal is discharged through bottom doors, operated by air. There are 62 pockets, each with a telescopic movable chute, down which the coal goes to the ship's hold.

Coal Mines—The coal operations on the Norfolk & Western are divided by the railway company into five fields, as follows:

Field	Daily Capacity	No. of Mines	Kind of coal	Commercial Shipments, 1913
Pocahontas Flat Top	104,225	99	Semi-bituminous	13,925,397
Tug River	19,225	43	Semi-bituminous	2,075,342
Thacker	20,825	42	Bituminous	2,189,422
Kenova	6,475	12	Bituminous	818,147
Clinch Valley	9,500	27	Bituminous	1,708,951

The shipments over the N. & W. coal piers at Hampton Roads are made up of coals from all these fields, with the exception of the Kenova, but over 90 per cent. comes from the Pocahontas and Tug River Field, all sold under the trade name of Pocahontas.

Recent Legal Decisions

Effect of West Virginia Mine Foreman Law—The provisions of the West Virginia Mine Foreman Law do not exonerate operators from the duty of using a reasonable degree of care to provide safe and suitable appliances for use by their miners. (West Virginia Supreme Court of Appeals, Cheeks vs. Virginia-Pocahontas Coal Co., 82 Southeastern Reporter 756.)

Discrimination in Furnishing Freight Cars—The distribution of coal cars to shippers, including cars owned by the shippers and those used by a railway company for its own fuel, in interstate commerce, is a matter involving preference and discrimination, and one for investigation by the Interstate Commerce Commission. (United States Supreme Court, Texas & Pacific Ry. Co. vs. Abilene Cotton Oil Co., 27 Supreme Court Reporter 350.)

Lien for Price of Mining Machinery—A manufacturing company which sold mining machinery to a coal company, under an agreement that title should remain in the manufacturing company until payment of the price, by failing to record the contract does not lose rights to retake the machinery, as against a lien for rent or royalties claimed by the owner of the land on which the machinery was installed. (United States District Court, Northern District of West Virginia; Jeffrey Mfg. Co. vs. Mound Coal Co.; 215 Federal Reporter 222.)

When Oral Contracts Are Enforceable—The Statute of Frauds, under which contracts not to be performed within the space of one year are made unenforceable unless evidenced by a written memorandum signed by the party to be bound thereby, does not invalidate an oral contract to cut mine props and ties from a tract of land, although the contractor contemplates that more than a year will be consumed in the work, if the contract can be performed in less than a year, and if no time is specified in the agreement. (McClanahan vs. Otto-Marmet Coal & Mining Co., 82 Southeastern Reporter 752.)

The Conservation of Anthracite Coal

By R. V. Norris*

SYNOPSIS—The writer shows how anthracite coal is being conserved in its extraction, preparation and colliery use. The degradation of sizes in the retail yards may increase the amount of pea, buckwheat and dust as much as 10 per cent.

Conservation is such a use of a natural product that the largest proportion commercially possible may ultimately be available. It certainly is not the locking up of all such material for the use of future generations. Anthracite coal, because of its limited quantity, particularly requires conservation methods in its exploitation, and such methods are properly classified into: Mining, preparation, power production and marketing:

Mining Methods

The two general factors modifying conservation in mining are the minimum thickness of the bed mined and the percentage of recovery:

Thickness of Bed Mined

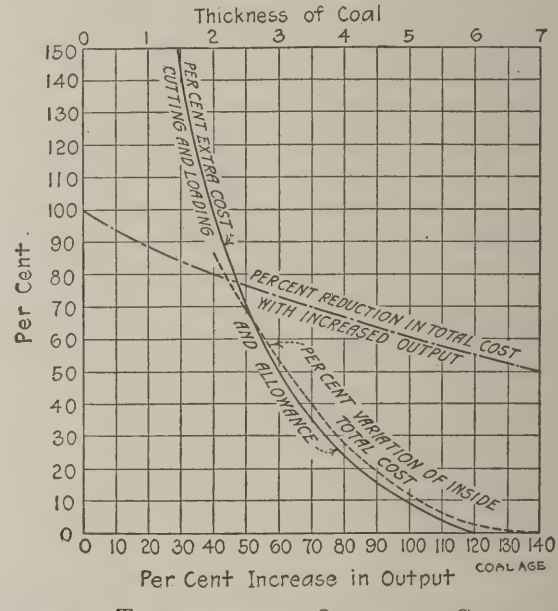
In deciding which beds are and which are not mineable, we face, at once, the question of profitable operation, and it may be conceded that other things being equal, beds which are 6 ft. and over in thickness are more cheaply mined than those which are thinner. If we eliminate all variations other than cutting and loading in making our calculations, the relative cost of mining for varying thicknesses is a matter of simple calculation.

Let

- a = Allowance for rock in cents per inch per yard;
- h = Normal required thickness, in inches, on which allowance is based;
- x = Thickness of coal, in inches, as measured for allowance;
- x^1 = Net thickness of coal, in inches;
- f = Capacity of mine car, cubic feet;
- w = Width of chamber in feet;
- s = Thickness, in inches, which will give one mine car per yard of chamber. Assume loose coal occupies 1½ times the volume of an equal weight of solid;
- c = Cents per car allowance;
- m = Mining price per car, no allowance.

Then

$(h - x)\,a$ = Allowance per yard of chamber;



$f = \frac{3\,w\,s}{12} \times 1\frac{1}{2}$ $\therefore$ $s = \frac{8\,f\,x^1}{3\,w\,s}$ = Number cars per yard of chamber width;

$$c = \frac{\frac{(h-x)\,a}{\frac{x^1}{s}}}{} = \frac{h\,a\,s - a\,s\,x}{x^1}.$$

From this, for any particular conditions, the cost for each thickness may be calculated, and a curve constructed showing the relation between cost and thickness, as shown in diagram.

Unfortunately, all the costs which vary with the thickness of bed are not susceptible to calculation, but in general the inside costs increase rapidly with the mining of thinner coal, and the diagram showing the variation of cost with thickness is believed to represent fairly the average conditions in this district. It was constructed by plotting a large number of actual costs and then drawing the average curve.

We find ourselves facing the dilemma whether we shall mine the coal which is profitable in itself or a mixture of profitable and unprofitable coal which, through the preponderance of the latter, will result in a profitable output. Our first thought would naturally be that only the coal which is actually profitable should be mined, but when we make a more complete inquiry we find another condition in the relation of output to cost. As but approximately one-third of the inside cost is expended in actual cutting and loading, and as the greater part of the outside cost is but slightly dependent upon output, the cost per ton will be found to vary greatly with the coal production, even with a fixed unit cost for cutting and loading. How great this variation may be is indicated on the diagram, and it is apparent that a large output

Relation of Thickness and Output to Cost of Coal

from beds which show a relatively high mining cost may be actually more profitable than a much smaller output exclusively from the larger and cheaper beds.

Hence, it is apparent that, even from the standpoint of immediate profit, it may be advisable to mine the thinner beds with the thicker, and considering the ultimate yield of a property, there can be no question as to the advisability of such a course. The actual minimum mineable thickness being dependent upon so many conditions is not susceptible to general determination and should be studied for each individual case.

Pillar Sizes and Distribution

The general method of mining in the anthracite region is by room and pillar, with modifications adapting it to the mine conditions or too often to the idiosyncrasies of the superintendent or foreman. The early mining was done largely by haphazard, leaving irregular chambers and pillars with the result that squeezes were frequent,

Note—Article read before the Engineering Society of Northeastern Pennsylvania, Oct. 15, 1914.

*Consulting engineer, 520-524 Second National Bank Bldg., Wilkes-Barre, Penn.

extensive and disastrous. It is evident that if a given percentage of regularly distributed pillar is required to support overlying strata, the same or even a much greater percentage irregularly distributed may fail to accomplish the result.

Therefore, in chamber and pillar mining, a regular distribution of pillars is essential, involving the careful layout of the workings and the driving of all chambers on line. Further, to obtain the greatest ultimate output, the first mining must be planned so as to leave pillars of sufficient strength to assure support to the overlying strata until second mining can be prosecuted. Under normal conditions the pillar width for first mining may be calculated by Bunting's formula, which, transposed, gives:

$$p^2 + \left(\tfrac{2}{3}\,T - \frac{DT}{300}\right) p = \frac{CDT}{300}$$

where p = pillar width; C = chamber width; T = total thickness of bed; D = depth.

The advantage of carefully projected mining over excavation by hit-or-miss methods is shown in the increase of yield from former performances, in which the output averaged was less than 50 per cent. The maximum extraction was only 65 per cent. on first mining. Under old methods there was but little hope of appreciable recovery from second mining and the percentage accepted in February, 1913, for the estimation of assessment values, ranged for flat measures under 500 ft. deep from 79 per cent., where the coal measure was less than 6 ft. thick down to 65 per cent. where the bed was as much as 30 ft. in thickness.

Removal of Beds in Order

While the mining was largely in individual hands, each operator desiring the greatest possible immediate return, no attention was paid to the order in which beds were mined. The larger or more accessible beds were opened, mined and caved without regard to overlying coal, with the result of injuring, and in some cases irretrievably ruining overlying beds relatively close to those mined, and often seriously cracking beds even more distant.

It is now a recognized principle that overlying coal should be fully removed before second mining is started beneath it, and present knowledge would indicate that first and second mining should follow each other as rapidly as possible to avoid the deterioration of timber and the loss of coal from spalling, as well as to minimize the cost of reopening the workings and relaying the track.

Use of Shaft and Check Pillars

Modern mining systems laid out to obtain the greatest ultimate yield include provisions for the safety of mine openings and the localization of troubles, such as ample shaft support and the now usual provision of check pillars left throughout a property. Every tenth or twelfth chamber is omitted for the purpose of localizing any difficulty and avoiding the old-time extensive squeezes. Further, safety pillars are now usually left beside and under important openings, such as tunnels and slopes. As all this coal is ultimately gained in second mining, such safety provisions are true conservation and operate materially to increase the ultimate yield.

Flushing

While culm flushing has been thus far utilized primarily for support, or rather to prevent the disintegration of pillars, the practice will unquestionably result in larger ultimate yields, and will minimize damage to the surface and to overlying beds by decreasing the settlement from the removal of coal. Further, sand flushing appears to promise excellent support, and its use, hardly warranted by the present small margin of profit, should result in the recovery of much coal not at present considered available.

Mining from Underlying Beds

Where beds are relatively close together, it is often found practicable to remove the overlying bed through rock holes from the underlying, decreasing the development expenses, halving the cost of maintaining gangways and increasing the ultimate yield.

This is particularly effective in the steep-pitching measures and large beds of the southern field. The Lehigh Coal & Navigation Co. is now recovering stupendous amounts of coal in the Panther Creek Basin in the Mammoth bed, which is here standing vertical and 60 ft. thick, by driving gangways in the underlying Skidmore, and opening in a bottom split of the Mammoth, which was disregarded in first mining. This method was detailed in W. G. Whildin's paper, on "Steep-Pitch Mining," which was read at the Pottsville meeting of the Anthracite Section of the A. I. M. E. He reports that by present methods a yield of 65 per cent. of the total contents is obtained against less than 40 per cent. under older systems.

Similar methods in mining the Mammoth bed in the Shenandoah basin have disclosed the fact that in the original mining, to avoid annoyance from an insufficient pitch, the chambers were driven so as to leave, near the gangway, half or more of the coal in the top and at the top of the chambers as much or more in the bottom. Actually, over 50 per cent. of the present output of the William Penn colliery is from such workings in the Mammoth, the coal coming almost entirely from areas in which second mining had been considered completed and which were marked as exhausted on the old maps.

Use of Undercutting Machine

Within the last two or three years, extensive experiments have been made in the use of undercutting machines, especially in thin beds in the Lackawanna field, and the results give bright promise of economies sufficient to warrant the mining of beds too thin to be workable at a profit under present methods. Under average conditions, it is at present usually unprofitable to mine less than 2 ft. 8 in. to 3 ft. of coal by itself, though thinner beds are occasionally mined to increase output and thus lessen fixed charges, and in this way may actually be profitable, though if bearing their full share of such charges they show a loss.

Further, the use of undercutting machines should result in a larger percentage of prepared sizes, thus increasing the average return and permitting greater cost in mining. The employment of mining machines also leads to the adoption of modified longwall methods promising an increased ultimate percentage of removal.

General Observations on Mining

The details of improved mining methods and of possible further improvement might be extended almost indefinitely, including such items as improved transporta-

tion, the use of steel and concrete for roof support, the consolidation of pumping and hoisting operations, and the better laying out of development aided by extensive borehole exploration of difficult territory in advance of actual mining. As every saving in cost permits a higher cost of actual mining, the result of such improvements must be the recovery of larger percentages of the coal in the ground.

Preparation

From the hand breaking and fluke roll of the sixties, with the rejection of all small coal, to the present perfection of economical preparation is a wide step, resulting in not only saving fully 30 per cent. of the coal which was formerly rejected on account of size, but in making possible the mining and sale of coal from the impure beds, which is of such a character from stratification with impurities that its preparation for market was impossible even twenty-five years ago.

Screens

Among the breaker improvements tending to a greater recovery may be mentioned screens; first, round, which were inefficient on sizes below ¼-in. mesh, then the Coxe gyrating screen, which, on larger sizes, is today the most economical, but which presents inherent structural and operative difficulties preventing its general adoption, and now the shaking screen at its maximum development. Whether the ultimate in screening has been reached, the future only will show, but, personally, I believe that, in future, better methods, minimizing the present attrition, will be found.

Slate Pickers and Jigs

In removing impurities the advance has been even more marked than in screening practice. From the hand-picking of a short generation ago, has developed the various dry pickers adapted to certain classes of coal and the jigs, also due for their first introduction to that pioneer in preparation, Eckley B. Coxe. The lines of future advance appear to be more in the line of perfection of details and reduction of attrition losses than in new principles, though there are still possibilities in a steady upward current of water, which has proved most efficient in copper practice.

Breaking

Perhaps the greatest advance in conservation in the preparing of coal has been in the breaking of the mineral. When the demand was sufficient for lump and larger sizes, the economy of rolls was relatively unimportant, but as the market conditions have changed, so that fine sizes of anthracite now replace the more costly lump, steamer and broken coal, the necessity has developed for breaking down all large coal to relatively small sizes.

A realization of the great losses formerly involved in the use of rolls of convenient sizes with poorly placed and dull teeth, resulted first in the more scientific placing of teeth and the design of separate rolls suitable for the work required of each. Then it was realized that the losses due to dull teeth were important and unnecessary. Later a study was made of the effect of speed on economy in crushing. A reduction of the peripheral speed of the rolls from about 950 ft. per min., the usual practice, to 250 ft., is shown by Paul Sterling, Trans. American Institute of Mining Engineers, Vol. 42, p. 286, to have reduced the percentage of pea and under, made in crushing lump coal from 20 per cent. to 12, a saving in this one item of 40 per cent. of the loss in fines.

One further factor remains to be studied in crushing practice, the diameter of the rolls. This is a difficult and costly matter to determine and has not thus far been scientifically considered, but it seems probable that there should be a particular diameter of roll best suited to each size of coal and it would appear that investigation on this factor in coal crushing would result in an increase of efficiency.

Breaker Construction

Further economies have been and can be made in the handling of coal in the breakers. Drops can be reduced, the speed of sliding decreased so as to reduce losses by impact. The handling, particularly of large-sized coal, can be largely avoided.

The breakage in elevators is greater than in conveyors, due to necessary attrition and impact in loading and discharge. Slow-moving belts are ideal, but the high-speed belts, such as are usually installed, probably cause more loss in breakage from the impact of delivery than they save because of the more gentle loading and carrying.

Loading

In car loading, the installation of tilting box-car loaders unquestionably reduces breakage, while the conveyor loaders throwing coal to the ends of the car increase it.

Bone

Further, modern practice has made possible the mechanical cleaning of coal and the elimination of the slate almost entirely thereby. Thus, anthracite as delivered to the market is free from impurity, though containing most of the coal content of the boney layers. Instead of crushing the bone or actually rejecting it, it is now cleaned of its impurities and this has added materially to the ultimate yield.

Power Production

The percentage of the whole coal mined which is used as fuel at the collieries has risen within the last 25 years from about 5 per cent. to a present average of nearly 12 per cent. of the shipments. The extension and increasing depth of the mining operations would have caused a larger increase in consumption than has taken place had it not been for the introduction of improvements in practice.

Boilers

In the early eighties, practically all boilers were of the cylinder type, evaporating as an average not over 6 lb. of water per pound of combustible, and burning pea and No. 1 buckwheat coal. At present nearly all are of tubular type, evaporating 9 to 10 lb. of water per pound of combustible, and usually burning the finest sizes of coal mixed with ground breaker refuse.

Engines

The engines used at that time were all of the plain slide-valve type, taking steam throughout the stroke and using on the average over 60 lb. of steam per hp.-hr., and in some cases as much as 135 lb. Today high-grade engines for continuous work are the rule rather than the exception, and in these the steam consumption has been

reduced nearly to 30 lb. per hp.-hr. In hoisting engines, while steam economy has not progressed as far, owing to the necessity for absolute control and for rapid starting and stopping, great improvements have been made in designing engines with ample valve area, and with cylinders properly proportioned to their work, but there is still opportunity for economy in the introduction of compound condensing hoists, at least in the deeper shafts, as has been done under the impetus of costly fuel in our Western states.

Pumps

The greatest improvement in steam consumption has, however, been in the pumping plants. The simple direct-acting pumps designed for low steam pressure have been replaced by multiple-expansion engines. These are, in many cases, condensing and designed for high steam pressure. As a result the steam consumption is reduced from an average of over 70 lb. to 20 and in some notable examples to as low as 14 lb. per hp.-hr.

Pipe Covering

The covering of steam lines, too, has removed a tremendous loss, which, in a single colliery examined some years ago, would have aggregated nearly 400,000 lb. of steam in each 24 hr. As a result, 1330 b.hp., which would have been required had the pipes been uncovered, was not needed. This saving was almost equal to the 1366 hp. actually in use.

Electricity

The substitution of electric for steam and animal power, particularly for haulage and pumping, has also resulted in great economies, and the present trend toward central generating stations with the highest grade of machinery, will further help balance the fuel consumption of collieries, which is necessarily increasing steadily.

Drainage Tunnels

Beside the improvements in pumping machinery, much fuel has been saved by the driving of drainage tunnels, such as the Jeddo and Beaver Meadow, and that of the Lehigh Coal & Navigation Co.; these, beside freeing the collieries from the danger of flooding, save much fuel, which would otherwise be required to actuate the pumps.

Marketing

In the transportation from the mines to the market, the carriage itself is beyond reproach. Careful tests made some years ago absolutely failed to show any breakage in the car itself. On the other hand, the handling of the retailer is about the worst example of inefficiency conceivable.

Beginning at the terminal, coal is generally dumped directly from the car into pockets, with a vertical drop of many feet. From these it is drawn by chutes extending over barges, into which it falls, making a clear drop often averaging 20 ft. or more. Then it is removed in grab buckets, hoisted into a tower, dropped into cars or onto a belt conveyor, dropped again vertically into further pockets or onto piles; finally it is drawn under pressure into wagons and dropped into the consumer's cellar.

At each of these brutal transfers, screening is required and the resultant screenings are sold at a low price as "pea and dust." All this unscientific handling adds to the cost to the consumer without advantage to anyone. Tests have shown average loss in passing through pockets and into boats of 10 per cent. of egg coal converted into pea and under.

Storage Plants and Mechanical Handling

In contrast to this, witness the losses in properly designed storage plants, which, on prepared coal in three large plants, averaged but 2.84 per cent. converted into pea and under, and the excellent handling in places in New York harbor, where, by the use of McMyler car dumpers and telescoping chutes, coal is transferred from cars to boats with but slight deterioration in size.

Retail Yards

In general, the point in marketing toward which attention from the standpoint of conservation should be directed, is the handling by the retail dealers. Some of the wholesalers also break and otherwise reduce the sizes of the coal unnecessarily, in their yards. It is in the distributing yards that one of the greatest and most easily avoidable losses in the business is found.

Conclusions

In the above an attempt has been made to outline the improvements made and to indicate possible future developments tending to reduce the waste and thereby conserve coal resources. But this paper would be not merely incomplete but unjust, did it fail to call attention to the wonderful conservation now being practiced by the great coal companies, in mining all possible coal almost regardless of present profits and in endeavoring to attain the ultimate possible output from the lands entrusted to their charge. Furthermore, they have made persistent efforts for the larger conservation of human life and have sought diligently to take from coal mining the stigma of being one of the hazardous occupations.

Coal Docks on Lake Erie

Appended herewith is a table of coal docks at lower Lake ports, giving the name of the port, the name of the railroad owning the dock, the type of machine used in loading coal aboard vessels, together with the capacity of the machine per hour. The information contained in the table was obtained direct from the operators and is accurate and uptodate.

Power Department

The Coal-Mine Power Plant

SPECIAL CORRESPONDENCE

SYNOPSIS—In coal mining, the power plant is frequently grossly neglected. It is in reality the mainspring of the whole coal-producing equipment and no pains nor means should be spared to render it as reliable as possible.

Much attention has been given during recent years to the application of electricity to colliery purposes. Efforts have been put forth by electrical manufacturers toward securing apparatus which should be as far as possible mistake proof, and at the same time rugged, simple and especially designed to withstand the neglect and rough handling inherent to operation underground. Simultaneously, progress has been made in the education of men employed in the mine regarding the proper use of electrical apparatus and the dangers attendant upon carelessness or misuse. As a result, much of the prejudice which at first existed with reference to the employment of electricity in mining operations has disappeared.

Attention should now, however, be drawn to a matter which may well become of greater and greater importance as electricity becomes more extensively used. This is the question of the power house, which supplies the energy to the colliery.

This may at first sight appear to warrant no great consideration. It is usually, however, the matter which is passed over as being too simple for comment, which affords the opportunity for trouble, and the mining power plant at the present time occupies for the most part a rather dangerous position.

At the beginning of electrical application, a small plant sufficed for the needs of the colliery, and an installation of this description could be attended by a comparatively small staff, who possessed no great experience. Today, however, a gradual process of extension in electrical application is going on in most mining developments involving an increase in the size and output of the power units. Conjointly, there is a distinct tendency to connect more than one mine onto a general system supplied from the main generating station.

This brings about some important changes in conditions. The power station is greatly increased in size and usually in complexity, with the result that unless great care is taken to standardize equipment and simplify operations, as the use of electric power increases the problem of supervision becomes considerable, with the result that a man possessed of a much higher order of technical knowledge and experience is required therefor than was formerly the case.

In many instances, especially where several mines are connected to one power house, due to heavy transmission losses incident to the use of direct current a change of the method of distribution to polyphase alternating current is being made, and for the operation of this latter much technical knowledge is necessary.

CONTINUITY OF SERVICE IS IMPORTANT

In installations which supply light, heat and power to industrial communities, it is readily recognized that the supervision and operation must be of a highly skilled nature. Colliery plants as a rule are smaller in output than the average power plant for a community, and there is a tendency to cheapen the cost of operation by utilizing services of men who may not have the same technical qualifications.

It is at once apparent that it is important to maintain continuity of supply on an industrial lighting and power circuit. It is, however, even more important to maintain continuity and reliability in a colliery plant, even though its size may be smaller and its operation local, because much depends on such continuity.

It is not necessary to elaborate on the serious consequences, both as regards life and property, which might be involved in an undue stoppage of a ventilating fan. The mine output is also vitally affected by the continuity of power supply, for at the present time when electric coal cutters and locomotives, electrically operated screens and washing plants are the order of the day, failure of power supply at any point involves dislocation of the work, a reduction of efficiency, and the loss of output.

To accomplish continuity of supply, two main factors are essential. The first is reliable equipment in the power house simplified as far as possible, and standardized to the utmost limit so as to reduce the difficulty of supervision to a minimum. The second is due provision for an adequate staff possessed of a proper degree of technical knowledge working under conditions promoting bodily health and mental clearness.

It is not proposed to here consider examples where such conditions are not fulfilled, although it would be by no means a difficult stretch of the imagination to believe that some colliery plants do not wholely measure up to these requirements. It may, however, be pointed out that a mining power plant should be designed with liberal ground space and due provision for systematic extension both as regards boilers, engines and electrical machinery.

THE SWITCHBOARD IS AN IMPORTANT ELEMENT

As a rule, the chief danger arises at the switchboard. An equipment of this kind designed on the principle of standard panels, properly safeguarded at the front, and so wired that any switchboard attendant can, either by reference to a wiring diagram or by a quick inspection of the connections at the rear of the board ascertain the course of the current at any time is the one to be preferred.

The switchboard should be capable of being easily kept clean without danger at any time and due space should be provided both in front of and behind it to allow an attendant to work in a perfectly uncramped manner.

In reality, the switchboard is the pivoting point of the whole station, because here the entire power output is concentrated and from this point it is distributed. Consequently, no reasonable expense should be spared in making it both safe and convenient. Above all, no portion of a switchboard or any switching apparatus about the power house which has been erected in a temporary manner should be allowed to become permanent. This remark applies with equal forcibility to cables connecting the various parts of the electrical apparatus.

One of the most important objects to be kept in view in designing a mining power plant is the comfort of the employees. This is not urged from any philanthropic or humanitarian motive, but simply as a matter affecting the reliability of power supply. The chief dangers are insufficient light, undue heat, awkward corners, cramped conditions, and waste products.

The power house which has dark places and corners invites break-downs. It is impossible to maintain the requisite amount of cleanliness and safety when the only possible way of thoroughly examining the plant is by the light of a portable torch. This condition leads naturally to leaks of steam and hot water in the piping, and to loose screws, bad insulation and other troubles in the electrical equipment.

Light is essential to observation and maintenance and the management has only itself to blame if the plant fails owing to bad design from this cause. Moreover, darkness conceals filth and dirt which whether found in a deposit of dust on bearings, or a greasy film on electric contacts and insulators are the forerunners of more or less serious disaster.

A High Temperature Should Be Avoided

A common fault in power houses, particularly those operated by steam, is the prevalence of too high a temperature, both in the boiler house and engine room. This has a bad effect not only upon the insulation but the electrical output as well. It is even more marked in its effect on the condition of the operating staff. No man can work properly when placed under conditions where he continually feels limp. Under such circumstances supervision is relaxed and there is a tendency to shirk. Jobs that ought to be done are put off indefinitely with the result that repairs are not executed until they become unduly costly.

Parsimony in proper ventilation is paid for by increased maintenance cost and the highest grade of workman regardless of whether he be a fireman, engine driver or switchboard operator, will not long remain in places where he is subjected to a maximum amount of discomfort. The result of all this is that the only men available for continuous employment in badly designed stations, are those that are the least competent to operate the machinery.

A due consideration of the comfort of employees means that better attention is paid to apparatus, and breakdowns are minimized. If the apparatus is so arranged that it can only be attended to by a vast amount of running about for the inspection of meters, steam and water gages and the like, it is practically certain that something will be neglected. For this reason awkward corners and inconvenient levels should be avoided, and gages as far as possible be brought as near as local conditions will permit to the eye level of the attendant.

A power plant which can only be operated by climbing over or crawling under pipe work, or threading a precarious trail, past festoons of temporary cable, is not only a death trap to the men operating it, but may be the cause of various disasters among those in the mine who are dependent upon a continuous and efficient supply of electrical power.

Careful Provision for Waste Disposal

An item which is often overlooked in power plants, particularly those of medium size, which cannot indulge in elaborate systems of fuel and ash conveyors, is that of the proper disposal of waste products from the boilers. The result of neglect, particularly if the plant is undermanned, is that accumulations of clinkers and ash are found on the boiler-house floor, impeding the work of the firemen, providing a good distributing center for pernicious dust and dirt throughout the building and heating an already uncomfortable atmosphere.

If wheelbarrows have to be employed to get rid of the ashes, the track to the dump should be wide and direct and not too long. Due provision in the shape of man power should be made to get rid of the ashes as quickly as possible after they are drawn from the furnaces. A fireman cannot work properly if he has to contend with an uneven floor, and crumbling masses of clinker.

Other points could be enumerated which result from conditions attendant upon mismanagement of even such medium-sized plants as are required at coal mines. The above, however, may suffice to draw attention to the fact that because a plant is situated upon the surface and not in the heart of the mine, it must not therefore be treated with disrespect. Such a plant is the central point upon which the whole operation of an electrically driven mine depends, and sufficient care should be taken both as regards equipment and working conditions, to insure that no possible chance can be given to breakdowns other than those caused by such gross carelessness that the services of the man responsible therefor may be immediately dispensed with.

Many a man is reasonably efficient under reasonable conditions. Few are sufficient geniuses to guarantee results when proper means for procuring the same are not afforded.

Engine and Small Passenger Coaches Used to Convey the Men Three Miles from Tipple to Mine, Mill Creek Coal and Coke Co., Cooper, West Virginia

Developing a Sixteen-Inch Coal Seam

By J. F. K. Brown*

SYNOPSIS—Description of a small operation managed by one man who is averaging a profit of about 30c. per ton. The methods of mining and handling the coal are unique. Each miner not only cuts his coal, but loads and trams it to the tipple.

The scene of this exploit is in Central New Brunswick, Canada, and its successful operator, a self-taught miner. It is true that he is making only his living out of his efforts, but his methods point the way to future success. Furthermore, he has accomplished what "legions" of American engineers have failed to do.

A section of the seam is shown in Fig. 1. It is generally considered to be in the non-productive Millstone grit, of the Carboniferous system. The overlying stratum averages about 100 ft. in thickness and is made up mainly of a heavy blocky sandstone and beds of shale. One of these beds lies directly over the coal. This shale is impervious to water, and this fact apparently preserves the workings dry.

The coal outcrops in the bed of the river, but being

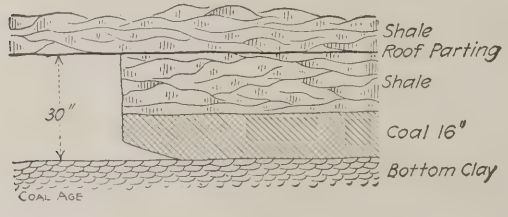

Fig. 1. Showing Section of the Coal Seam

itself together with the shale weathered by many seasons of frost and rain, the actual outcrop is entirely concealed by vegetation.

Fig. 2 shows the entrance to one of the main levels. At this point the banks of the stream fall roughly from the tableland above in a heavily wooded bluff, at an angle of about 45 degrees, the bed of the stream being about 140 ft. below the seam. A section is shown in Fig. 3.

In working, the main level is driven in on the coal a width of approximately 10 ft., enough to provide a double track if needed. Owing to the shape of the areas, this level was at first driven south and at an angle to the teeth of the coal. At a distance of 300 ft. in, levels are turned at right angles about 30 ft. apart. Thereafter, in the usual American practice, these levels are opened out 20 ft. from the main roadway, to a width of 15 ft., forming a room on one side of the roadway. This is continued for a distance of 30 ft. when the men turn and take 30 ft. out of the other side of the road, narrowing down again when they approach the main roadway. Under this system any pillars that are formed are immediately taken out, and further it has the advantage of operating what is practically a piece of a longwall section in which some area is left to dispose of surplus stone,

*Sydney, N. S., Canada.

Method of Mining

The height of the actual working is about 30 in. This leaves 14 in. of stone, which must be mined as well as the coal, and sent away. Three cars of stone, more or less, to one of coal is the collier's usual production. The undercutting of the coal takes place above the coal seam. At the parting between the coal and the shale there are a few inches of a finer grained and softer shale, and this is easier to mine than in the coal, besides having the very important advantage of leaving all the coal intact for market purposes.

The miner's picks when used to mine at either the

Fig. 2. Looking up Hoisting Trestle. Entrance to Level on Left

bottom or top of the seam soon become blunt in comparison with those used in mining the shale. This appears to be due to the presence of an occasional thin band of iron pyrites which appears at this point. No explosives are used, the coal parts perfectly from the pavement. In working, the shale is mined and taken down first, trammed or filled out of the way. Timber as required is next set, after which the coal is in turn lifted and run outside. The roof would seem to be of a short-break nature, but certain partings if taken and maintained will stand well. Fig. 4 shows a section of the workings at present being operated.

Past operations have never gone very far from the outcrop, with the result that there are a great number of old tunnels dotted along above the bed of the stream wherever the cover has been strong enough to permit working. A little water leaks through from the old areas into the

present areas. The dip is slight, the field forming what would be termed elsewhere a level field.

Handling the Mine Water

Pumping troubles are avoided by arranging a ditch which is cut to a considerable depth in the center or side of each entry with just enough grade for free water drainage. This, of course, will serve only a limited area, but there is ample fall from the mouth of the mine to the bed of the stream to allow of the use of a siphon which will take care of all the water made in the mine for many years to come. There are also indications that once the present development gets past the limits of the old workings, the mine will in all probability be dry, and it is to be hoped, not too dry.

Up to the present, as all the operations are near the mouth of the level, the miners tram both their coal, and what stone they cannot stow, outside. Here the slope to the bed of the stream forms a convenient dumping ground, and doubtless in the past, many hundreds of tons of shale have been weathered away by the stream, and carried out to the ocean. The coal is trammed in small boxes holding about 700 lb. each. Although these boxes are very small, they are a convenient size, considering the height of the workings. One man can attend to running them out to the surface, and, in case of a derailment, they are easily put back upon the track. Light rails are used and since this steel is placed by men unacquainted with the work, derailments are frequent.

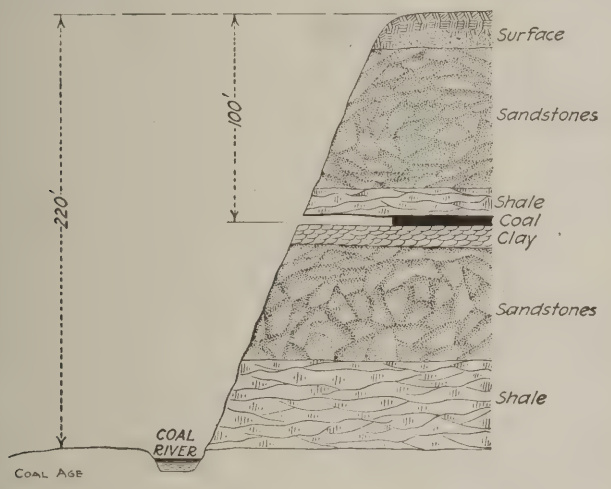

Fig. 3. The Seam Lies about 140 Ft. above the River

Handling the Coal

The coal from the mine is weighed and is then tippled into a two and a half ton hopper truck. An incline laid on a 3-ft. gage rises at an angle of 45 deg. to the top of the river bank, and the truck when full is hoisted to the top by a small steam hoist. At the top, and on the general tableland, a larger storage hopper has been built, and into this the small hopper truck automatically discharges. From here the coal is carried away by wagon a distance of over a thousand yards before it finally reaches the railway siding and is deposited in railway cars.

These would appear to be insurmountable objections to profitable working in other regions, but despite the thin seam, the mining of three boxes of stone to two of coal, the extra handling of the fuel, and the carting of it by teams, there is a profit on the operation. There are, of course, no pumping costs, no haulage costs, no winding costs, and no ventilation questions.

The quality of the coal is excellent, that is, as measured by the standard of the fuels against which it has to compete. Its ash content is high as compared with American coals, but not as compared with a number of the Canadian seams. A comparative table is given below, the first column being the thin coal:

ANALYSIS OF CANADIAN COALS

	Thin Coal	Joggins	Spring-hill	Vale	Drum-mond
Water	4.300	.....	.....	1.40	0.72
Volatile matter	31.275	40.89	34.09	28.80	25.73
Fixed carbon	53.175	48.33	54.33	55.30	65.35
Ash	11.250	10.78	11.58	14.50	8.20

In addition, the analyst gives the heat units as 14,148 (Thomson), and says "The coal possesses excellent coking qualities and forms a hard coke, well fused and bright in appearance. The evaporative power of the coal is high and compares favorably with the best Welsh bunkering coals."

The main fault of the seam is its tendency to break in handling, although doubtless this is aggravated by the unnecessary number of times during mining that it is thrown from one conveyance to the other. The price obtained for the coal, while high as compared with the majority of American mines, is actually less than the sum received by the Nova Scotia collieries with their thicker seams, by approximately 25c. The coal mined from this thin seam sells for $2.55 per ton on the railway cars.

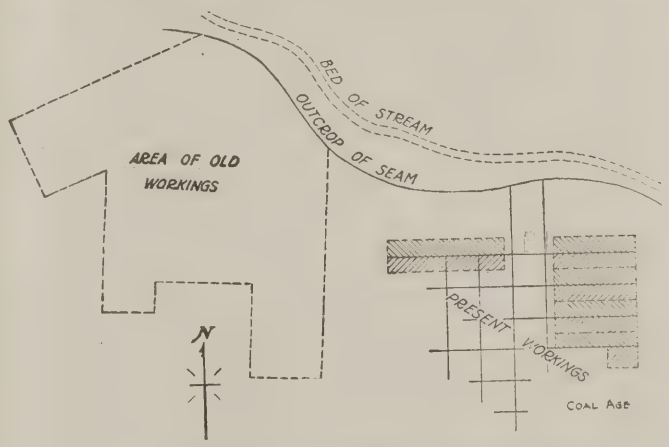

Fig. 4. A Section of the Workings Now Being Operated

Reasons for Success

While quite a number of little matters have helped to bring about the success of this tiny mine, there are two main reasons, and these are low capital outlay and low supervision costs. That these points are important cannot be denied, but it is a strange thing that other people with more money and better training appear to forget their significance the moment the first sod of a new enterprise is turned.

The wages earned by the men working, none of whom have any knowledge of mining except what they have learned through experience in this coal, average about $3 per day. In the mine the money is earned on the tonnage put out, and the rate paid is $1.34 per ton of coal extracted. For this the miner undercuts his coal, takes down the stone, trams it to the dump, sets his

timbers, lifts and gets his coal to the mouth of the mine, an average distance of say 500 ft. Therefore the total mining cost is entirely covered by this extremely modest figure.

Administrative Duties

Then come the duties of the management, which start at this point. The management, represented in the singular by the operator himself, weighs the coal, hoists the self-dumping car when full, and attends to all the questions of time and tonnages. When the hopper at the top of the incline is full, cars are called for on the railway line up to the capacity required, and a double team requisitioned; the coal is then carted over to the railroad. This operation costs 25c. per ton.

Timber grows on the estate, at the mouth of the mine in abundance for the requirements of the squad employed. The price paid is 85c. per 100 ft. for 4-in. stuff, and $1 for 6-in. timbers. The cost of this item approximates 10c. per ton of coal mined.

Cost of Mining

Overseeing, weighing, hoisting, clerking and any other odd matters occupy only part of one man's time, and that man in this case is the proprietor. Then there are sundry items, such as lamp oil, lamps, tools and sundry repairs, blacksmith work, and the small amount of supplies required. Altogether the actual cost of getting the coal can, with fair accuracy, be tabulated by one who was on the ground, somewhat as follows:

Mining	$1.34
Timber	0.10
Repairing and blacksmith work	0.12
Surface trucking to railway spur	0.25
Sundry supplies	0.13
Overseeing	0.30
Total	$2.24

We have left about 30c. on the ton, which may be called legitimate profit.

As the photographs will readily show, there has not been much capital expended, and this sum together with the little required for the initial development of the mine, over and above the value of the coal extracted, I estimate at $2800. Twenty tons a day is the output maintained, and this amount about represents the limits of one man's activities in the direction of attending to all the duties above described. At these figures, however, with increased output, there could be quite a nice little profit.

It is now proposed to equip this small mine with modern mining appliances underground, which will be described at some future date.

The owner also has the further advantage, in that he sells to only one customer, the owner of the leasehold, and so has no bad debts to meet, and only one account to keep. The owner of the lease resells at a profit sufficient to at least cover the government royalty. The operator, therefore, instead of having to pay a royalty, accepts a fixed sum for the coal mined.

While it is agreed that the circumstances are exceptionally favorable to the thin seam working, it must also be agreed, that in this mine the case was made to suit the circumstances. There are no particularly striking innovations in methods of operation, and that being so, the successful initial work is mainly a triumph of common sense.

The Labor Situation

The principal development in the labor situation of Ohio during the past week was the movement started in the miners' organization demanding a referendum vote on the proposition of accepting the operators' offer of 44.61c. for machine-mined coal on the mine-run basis in the eastern Ohio district. The local of the union at West Wheeling adopted such a resolution recently and it is said a similar preference was expressed by the miners' union at Glencoe. These actions show the temper of the rank and file of the miners' organization, which is anxious to return to work despite the effort of officials to keep them in line on the strike proposition. So far no efforts have been made to resume the wage-scale conferences. Among the families of the miners in eastern Ohio, there is much suffering reported, which is being relieved by local committees and the Ohio mining department.

Rebuilding of Tipples to Conform with Mine-Run Law

Many of the larger operators in the Hocking Valley district have secured plans and figures on the rebuilding of tipples to conform to the new law but contracts have not yet been made. The market is weak and it is hard to raise money for such rebuilding of equipment. This is especially true of the Sunday Creek Co., where efforts are being made to conform to the decree of the court separating the companies from railroad control by Nov. 4. Until the reorganization is effected, it is believed that nothing will be done toward rebuilding the tipples of the company. It is estimated that the cost to that corporation alone will be $250,000.

Governor Cox Promises Resumption after the Election

Governor Cox in his campaign for reëlection promised that the strike would be ended the day after the coming November election. This statement was made to the idle miners in an effort to secure their votes and to prejudice them against the operators. Just how the strike would be settled he failed to say but inferred that the operators would be glad to give the miners their demands after the election. This statement which was repeated several times roused the ire of some of the operators who object to the governor playing politics in that manner.

In the meantime, the miners' officials are busy securing loans in an effort to finance the strike during the winter months. This is taken to indicate that the miners' officials do not believe the governor's statements, as they would not need to lay plans for securing money if the strike was to end the day following the election.

The Royalton Explosion

A gas explosion followed by fire occurred early Oct. 27 in the mine of the Franklin Coal & Coke Co., Royalton, Franklin County, Ill. Shortly before the explosion, 300 men entered the mine; only a cageful of the day force remained on the surface. At the present writing, 47 bodies have been recovered and it is believed that there are now no more left in the workings. More than 80 men taken from the mine living are said to have been overcome by afterdamp, and of these two died at the surface.

Editorials

The Mulga Inquest

The prevailing opinion is that an inquest at a mine disaster is a liberal coat of whitewash over a corporational crime. We note nothing so generous in the award of C. L. Spain, the coroner of Jefferson County, Ala., on the Mulga disaster.

He shows that employees most carelessly broke down an important ventilating door, that they did nothing to replace it and that as a result the mine was the scene of a disastrous explosion. But he forgets to censure them.

No! The men are not dead; they killed their fellows by the most wanton folly and, still living, the coroner hesitates to censure them. But he does not hesitate to censure the company's management for failing to call the men out of the mine. Though he omits to declare it, the company officials *may* have known the door was down and would be consequently rightly participants in the charge of carelessness. But why omit the colored men, Lee and Rodgers, in the indictment? Surely a motorman and a trip rider should know the danger of leaving a door open.

The inquest does not whitewash the company, but rather applies the brush liberally to the colored help.

The last clause of the verdict, requiring that every working place be examined three hours before it is entered by the workingman, seems to suggest that there is a doubt in the mind of the jury as to whether the gas accumulation really arose from the broken door or resulted from conditions existing long prior to its destruction. For, as the door was broken only an hour before the explosion, what good would an examination do, however carefully conducted, if made about five hours before the explosion occurred? The disaster happened at 9 a.m., and the examination of the place which exploded should, according to the coroner, have been made not later than 4 a.m., three hours before anyone went to work.

Nevertheless the coroner is right in his recommendation, even if his advocacy of the change throws a doubt on his finding as to the cause of the explosion.

The British Coal Exports in September

The British coal exports for September show a substantial recovery from the low figures immediately succeeding the first shock of the war in August. The movement in September showed an increase of about one-third over that for August, the respective figures being 4,096,453 tons in September, as compared with 3,209,399 tons during the preceding month. However, the tonnage is still only about two-thirds normal, the September movement in 1913 aggregating 6,501,578 tons. But in view of the unfavorable conditions prevailing in manufacturing circles, this loss is by no means as heavy as might have been expected, particularly since exports to Germany and Austria-Hungary have been cut off entirely.

In the movement to the South American trade, there has been a particularly heavy decline; for example, the Argentine Republic, which took 267,142 tons in September, 1913, this year only imported 153,016 tons. The respective exports to Brazil during the same periods were 158,896 tons in 1913, and 69,528 tons in 1914. This would seem to present a golden opportunity for the American exporters. But, as a matter of fact, it is highly probable that this reduction in fuel imports is but the inevitable reaction incident to a reduction in South American exports to England. In other words, it is essentially a curtailing in demand rather than any permanent loss of market.

A further interesting phase of the British exports is the enormous increase in tonnage to countries immediately contiguous to Germany. Thus the exports to Denmark increased from 255,724 tons in September, 1913, to 405,842 tons last month. Some three or four other countries show a like heavy increase, and at first glance it would seem that Great Britain apparently is supplying Germany with fuel. As a matter of fact, however, these countries have all been large importers of German coal, and this increase no doubt accounts for the displacement of the German product in these markets.

"When That I, Deborah, Arose"

The purposes of the present incumbent of the presidency of the United States are animated by the most noble of sentiments. And it is in the fact that the people have such unbounded faith in him as an honest, unimpeachable man that the danger lies. He may, we fear, violate the laws and the spirit of legislation without any protest being raised. We have seen how ready he is to withdraw forces from Colorado, despite the fact that the United States is bound by the constitution to guarantee domestic order in the states.

The fault with Mr. Wilson is that he believes that he and all good men in office should be above the law, but only on Oct. 20 at the meeting of the American Bar Association did he openly declare it. We will quote his words just as they are, and ask the reader to note their occasional faulty construction, and one instance where a slang expression has crept in. We recall to his remembrance that President Wilson normally writes almost perfect English. Few there are who have a more complete command of language. We surmise therefore that the President did not read his address, and so his statements in it might not meet unquestioned his own more careful consideration if he pondered them at his leisure.

> What I wanted to suggest to this association is whether we sufficiently apply those same ideas to the municipal law we seek to administer. Citations seem to play so much larger role than principle. There was a time when the thoughtful eye of the judge rested upon the changes of social circumstance and almost palpably saw the law rise out of human life. Have we got to a time when the only way to change law is by statute?
>
> The changing of law by statute seems to me like mending a garment with a patch; whereas law should grow by the

life that is in it, not by the life that is outside it. I should hate to think that the law did not derive its impulse from looking forward rather than from looking backward; or rather that it did not derive its instruction from looking about and seeing what the circumstances of men actually are and what the impulses of justice necessarily are.

Understand me, gentlemen, I am not venturing in this presence to impeach the law. For the present by the force of circumstances I am in part the embodiment of the law, and it would be very awkward to disavow myself. But I do wish to make this intimation, that in this time of world change it is worth while looking inside our municipal law and seeing whether the moral judgments of mankind are made square with every one of the judgments of the law itself.

Public life, like private life, would be a very dull and dry matter if it were not for this belief in the essential beauty of the human spirit and the belief that the human spirit could be translated into action and into ordinance. Not entire. You cannot go any faster than you can advance the average moral judgments of the mass, but you can go, at least, as fast as that, and you can see to it that you do not lag behind the average moral judgments of the mass.

I have in my life dealt with all sorts and conditions of men, and I have found that the flame of moral judgment burned just as bright in the man of humble life and limited experience as in the scholar and the man of affairs. And I would like his voice always to be heard, not as a witness, not as speaking in his own case, but as if he were the voice of men in general, in our courts of justice, as well as the voice of the lawyers, remembering what the law has been.

My hope is that being stirred to the depths by the extraordinary circumstances of the time in which we live we may recover from those depths something of a renewal of that vision of the law with which men may be supposed to have started out in the old days of the oracles, who communed with the intimations of divinity.

President Wilson is a student. He remembers how the Court of Chancery started. Laws were few and did not assure anything resembling equity between man and man. The king therefore took a churchman and left it to his conscience to decide right from wrong wherever the statutes were silent. Gradually precedents arose and the court which was founded at first on private judgment became largely a tribunal with decisions which were dependent on previous rulings and was therefore as reliable as the courts which based their decisions on the statute law.

But the struggle between precedent, which is reliable, and conscience, which is dependent on the point of view of the individual, was long and bitter. Selden died in 1584 and his "Table Talk" shows the attitude toward equity as it was then administered, the chancellors then contrasting themselves boldly with the lawyers and claiming unlimited freedom of moral action.

Equity is a roguish thing. For law we have a measure—know what to trust to; equity is according to the conscience of him that is chancellor, and as that is larger or narrower, so is equity. It is all one as if they should make the standard for the measure we call a foot a chancellor's foot. What an uncertain measure would this be! One chancellor has a long foot, another a short foot, another an indifferent foot; it is the same thing in the chancellor's conscience.

As the equity court was originally created, it would have been utterly foreign to American notions, as also to English, at the time of the American revolution. But as it had evolved into a court based on tangible precedents, and as its pronouncements had been for centuries modified by legislation wherever the conscience of the people opposed the opinion or precedent of the court, it was found not to be at variance with the ideas of a democratic people and was suffered to exist.

But if the court is again to be given a conscience or rather a permission to gage the "moral judgment of the mass" and decide issues on that basis, the end will be as uncertain as the judgments of men or rather, should we say, as the judgments of the judgments of men.

Worse yet will it be if the foundation of our interpretation of the constitution and the laws is to be assailed and we are going to ask, not what the writers meant and what the words actually conveyed when written and approved, but what we think the moral judgment of the public might perchance have them mean today.

Are we to leave to judges and the executive this momentous decision? If so let them write the laws direct without such trifling restrictions. What have the people to do with legislation anyway if the President is to be followed in his erratic yet well meant suggestions?

President Wilson seems tired both of law and of equity. He desires that his judicial appointees, as well as himself, may be to the American people as Moses, Aaron, Deborah and Kun-fu-tse. He would not have them trammeled with statutes or even with precedents. As he says, they will decide as of the "oracles" of God and the "intimations of divinity." In fact, only Deborah who left no precedents behind would truly meet with the approval of Mr. Wilson.

Some such divinity must hedge President Wilson when he, in violation of the provisions of the Constitution, threatens to remove the troops from Colorado, which would have otherwise nothing to do, and proposes to leave the workmen engaged there subject to the ruffianism of the undesirables from the Balkan States. Most of these men have never worked in the Colorado mines, yet they are permitted to destroy the property by which American workingmen desire to acquire a living.

For him we wish another vision and prompting him we hope he will have another prophet than W. B. Wilson of the Department of Labor. We fear that it is the latter voice prejudiced by years of professional agitation which the President regards "as not speaking in his own case but as if he were the voice of men in general."

The Necessity for Caution

Firebosses cannot be too careful when going their rounds just previous to the time when the working shift goes on duty. A case which supplies a lesson occurred at a mine in Scotland, where a fireboss met death by an explosion while inspecting the pit. No one living saw the accident, but it transpired that the man had been suffocated by the afterdamp. Near his body was found a safety lamp, together with an ordinary naked pit lamp. The jury found that the explosion had been caused by the presence of the naked light. Other instances have occurred of firebosses taking naked lamps with them on their round of inspection, although it is a contravention of most mine laws. Many explosions have been caused by lights of this description. It is a dangerous as well as a reprehensible practice "when looking for gas."

Branches of the Northumberland Miners' Association are urging the insertion in the British Coal Mines Act of a clause making it compulsory that every mine shall "rest" for a period of not less than four hours per day, so that the air may be purified. They are of the opinion that the growth of nystagmus is due to the methods which prevent the mines from being cooled and cleaned every day. They also assert that the atmosphere in mines has been made worse by the poisonous fumes arising from high explosives now in use. Some food for thought here.

Sociological Department

More West Virginia Gardens

The Elk River Coal & Lumber Co., at Widen, Clay County, W. Va., recently held a garden competition for the miners in the Rich Run mine, with the following result:

First prize for prettiest front yard, B. C. Gallimore, $10.
Second prize for prettiest front yard, Dr. R. H. Eanes, $5.
First prize for best vegetable garden, Louis Buratti, $10.
Second prize for best vegetable garden, T. J. Young, $5.
First prize for neatest and cleanest premises, Harley Booth, $10.
Second prize for neatest and cleanest premises, Frank Nagle, $5.
First prize for best combination vegetable and flower garden, J. L. Williams, $10.
The $10 prizes were equally divided between the tenant and his wife, and the $5 prizes were awarded to the wives of the tenants. The judges were: R. S. Strickland, J. C. Hiltabidle, J. Swan and J. A. Murphy.

Widen is near the center of West Virginia, at the head of the Buffalo Creek & Gauley R.R., a branch of the Coal & Coke R.R. It is a long way distant from the Weyanoke and Gary mines, the gardens of which have received recognition in these columns.

Testing the Eyesight of Mine Foremen and Firebosses

The eyesight of all mine foremen and firebosses in West Virginia is being tested, so that they will be fully qualified to detect gas in any place in the mines they examine.

An order to this effect was issued a few days ago by Earl A. Henry, chief of the mining department, after a conference with coal operators in various sections of the state. The operators fully approve of Mr. Henry's ideas on the subject, and advised him to issue an order to have them carried out, and they promised their hearty cooperation.

"It is apparent," says Mr. Henry, "that the men charged with the work of making mine examinations should have eyesight as nearly perfect as locomotive engineers, who are required to be able to distinguish the difference in colors of danger signals along the railroads. This is only a matter of taking the necessary precautions to have the mine foremen and firebosses fully qualified in their particular kind of work.

For the last two weeks, Chief Henry has been holding mental examinations in various parts of the state, and those candidates who have passed these examinations are being sent to competent physicians near their homes for eyesight examination. To those who satisfactorily pass this additional test, certificates will be given. The results of the eyesight examinations are being forwarded to the mining department, and Chief Henry declares that there are only a few cases where the eyesight of the men has been found so defective as to warrant certificates being withheld.

It is explained, that in many cases the presence of gas in working places would be detected by its effect upon the flame of the safety lamp were it not that the mine foremen and firebosses are unable to see as well as they should.

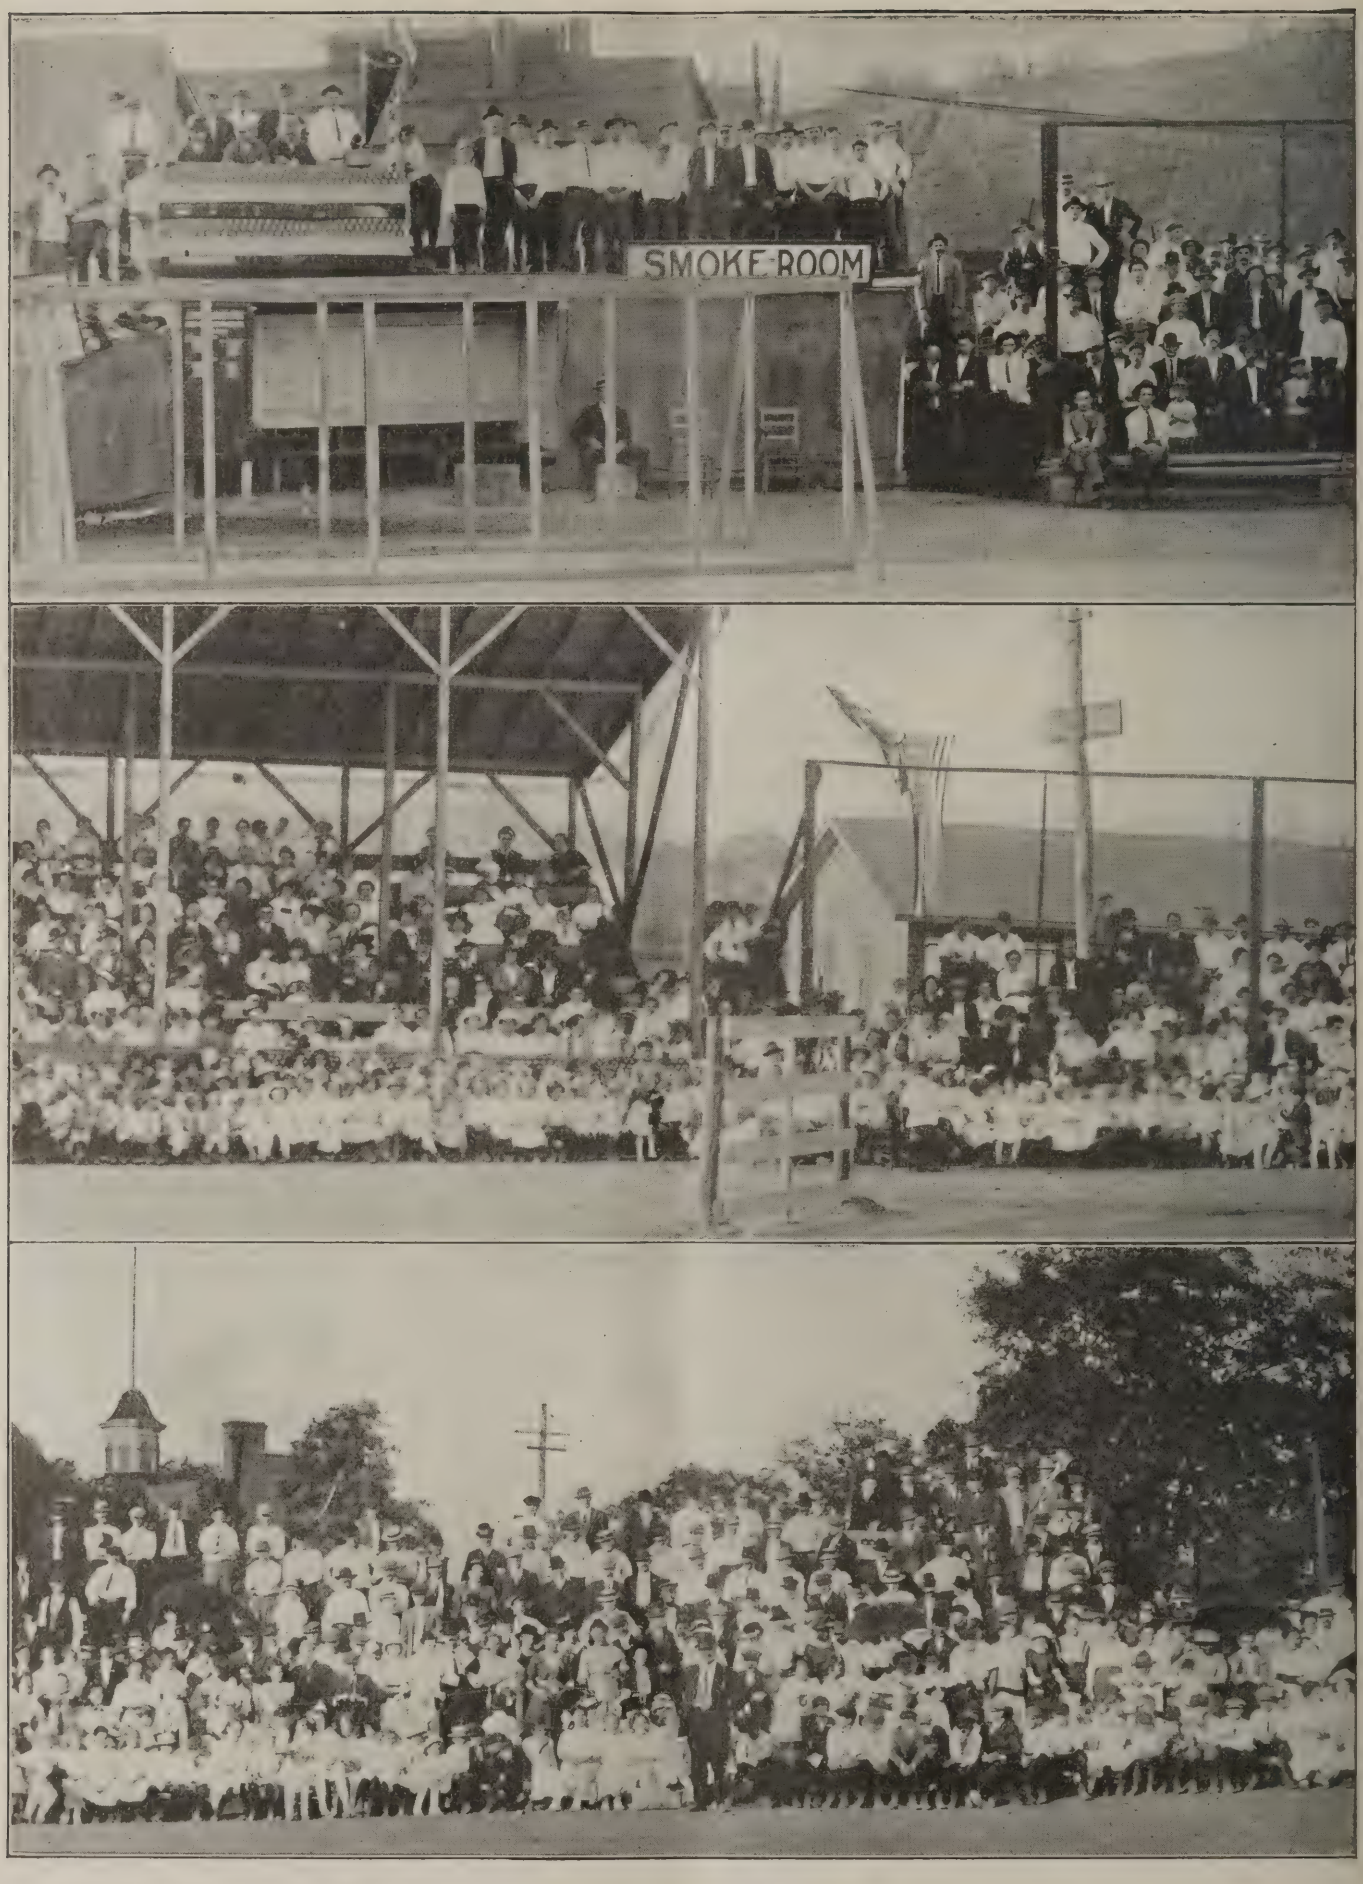
Ellsworth Community Meet

SYNOPSIS—This meet was remarkable for the large percentage of men in training, about one person in nine of the men in the mines and at the ovens showing an expert knowledge of first aid. The demonstration was held on home grounds so that all might attend. The children and the adolescent population took a part as important as that allotted to the adults.

The meeting at Ellsworth, about to be described, was known as the Third Annual Mine-Safety demonstration of the Ellsworth Collieries Co., but that corporation does not confine its interest to the men in its mines and at its ovens, but has an equal concern for them in their homes and a no less marked desire to make Ellsworth a desirable place for their families.

The visitor to our first-aid meets sees a mere sprinkling of women, no children and only the very best of the company's men. A visit to an Ellsworth meet is different. The whole community is in evidence. As can be seen in the first two sections of the panorama, the children and their teachers occupy the first seats and a careful review of the long lines of people will show a number of "citizens in the making."

Held at Home Where All Can Attend



Of course, this characteristic of the meet arises largely from the fact that it is held in the town of Ellsworth, where many of the miners and their families live, and not, as is usual, at a park several miles away. But a more important reason, and those who know Ellsworth and Cokeburg will be the first to declare it, is that the Ellsworth Collieries Co. has employed a sociological superintendent, E. E. Bach, who has kept the idea of the community needs clearly in mind.

The unfortunate part of the social work around mines has been that it has not included a sufficiently wide scope; the schools, the entertainments of the adults, the pleasures of the young boys and girls have been entirely overlooked, and at best safety, sanitation and village comeliness have covered the whole ground.

The reader will be interested to note in the panorama the commissary girls, the camp-fire girls, the boy scouts and the special stands for the children. Yet the long line of helmetmen back of the last mentioned squads shows that mine-rescue work has not been forgotten, even though the Ellsworth and Cokeburg mines have so far, we believe, never called on the services of their trained men.

The Emphasis Is Laid on the Schools

The meet was held on Tuesday, Sept. 22. A special car with several officials and guests arrived at 10:30 a.m. and immediately made an inspection of the schools, where the children sang their songs and performed their fire drill.

At the Ellsworth Meet the Children Take a Leading Part with Their Parents. The

Camp-Fire Girls and Local Bands Are Striking Community Features of the Celebration

THE CHILDREN AT THE FIRST-AID MEET AT ELLSWORTH, PENN., FORMED A LIVING FLAG AND A RED CROSS AND SARY ARE WORTH NOTING AS WELL AS THE

The building, containing 500 children, was emptied in 1¼ min. Luncheon was served in the clubroom for guests at 12 o'clock and at 1 p.m., with the arrival of the Cokeburg train, the celebration commenced.

The Ellsworth-Cokeburg band, with Americus Pardini as director, gave a concert, and then children lined up in procession behind the Ellsworth-Cokeburg boys' band. The members of this organization can be seen in the second section of the panorama, standing on a platform erected specially for them.

BOY SCOUTS AND CAMP-FIRE GIRLS

As will be seen, some of the children were grouped so as to form an American flag and others to represent the Red Cross. There were also maypole drill girls, tambourine girls and kindergarten athletes. The boy scouts, under Scout-master M. H. Moran, acted as messengers, and the camp-fire girls served lunch to the 900 school children and 200 first-aid men and other participants at the close of the exercises.

ELEVEN PER CENT. OF THE MEN ENROLLED

The Ellsworth Collieries Co., at Ellsworth and Cokeburg, mined 1,729,000 tons in 1912. It had 30 teams entered in the demonstration or one team for 57,000 tons annual capacity. To put the matter another way; there are about 1700 men in the mines of the company. Thus, there is one team to 57 men or one enrolled first-aid man to every 9.4 men. This is also a remarkable record and shows that first-aid has become popular among the miners, a large proportion of whom are men of foreign birth. These, too, are not of the most assimilable types, being largely Slavs and Russians. With the latter, who are unusually hard to approach, Mr. Bach is having much success.

Owing to lack of space, it has been necessary in the

PERFORMED MAYPOLE EXERCISES. THE SUBSTANTIAL BUILDINGS AND HOMES, THE BOY SCOUTS, THE COMMIS-LONG LINE OF HELMETMEN AND THE AMBULANCE

panorama to omit one of the largest groups of participants, the aim being to make the presentation representative rather than complete.

The three teams scoring 100 per cent. were as follows:

American team: Alex McBurnie, captain; Alex Lilly; John Williams; Walter Arnholt; John Rogers and Charles Welling. Italian team: Dominick Duluce, captain; Joe Rucello; Mike Curello; Joe Rosetta; Nick Ceci and Dan Lowby. Slovak team: Steve Petura, captain; Joe Litichy; Joe Sokol; Tom Kotula; Joe Peshik and Adam Ohutksey.

The judges of the work were Dr. W. T. Davis, of the American Red Cross, Washington, D. C., Doctors L. W. Hoon, R. Stewart and G. K. Hays, of Monongahela, and Dr. T. W. Hunter, of Charleroi. Owing to the length of the program only one mine-rescue event was demonstrated by the teams from Ellsworth Mines 1 and 2 and Cokeburg, respectively. The work was done in the imaginary mine shown to the left of the first part of the panorama. The judges in this exhibition were C. G. Brehm, of the Oliver & Snyder Steel Co. Coal Department, and W. W. Fleming, of the Republic Iron & Steel Co.

Six boys, between 10 and 11 years, gave a remarkably proficient exhibition of first-aid, after the adult teams completed their first-aid work.

The guests from out of town included E. A. S. Clarke, president of the Lackawanna Steel Co. and Ellsworth Collieries Co., New York City; C. H. McCullough, Jr., vice-president of the steel company and general manager of the coal company, Buffalo, N. Y.; G. W. Burleigh, a director in both corporations, New York City; W. A. James, chief engineer of both companies, and W. A. Luce, assistant general manager and director of the Ellsworth Collieries Co., Pittsburgh, Penn. W. R. Crane, dean of the mining department of Pennsylvania State College, was also present.

During the last 20 years, 177 persons have lost their lives through accidents caused by spontaneous combustion in coal mines in the United Kingdom.

Discussion By Readers

Mining Laws, Legislation and Mine Regulations

Letter No.2—I have always considered that it was an unjust act on the part of the framers of the Pennsylvania bituminous mining laws, to legalize the nonreturn of their examination papers to candidates trying for certificates of qualification as inspectors, foremen and firebosses. I have never been able to discover any good or even plausible reason why these papers should be retained and filed in the Department of Mines, at Harrisburg, as "state documents." If my idea of such documents is correct they are intended either for public investigation under the supervision of the department or to be used as references by the department.

In the first event, no one other than the applicants themselves would have sufficient interest in such papers to take the trouble and go to the expense of an examination; and, in respect to the latter, I cannot conceive in what way the papers would be of any material value to the department, for the purpose of reference. That there must be a reason it is fair to assume, but what that reason is must be purely a matter of conjecture. The most natural supposition for a candidate to make is that he is refused the return of his papers in order to hide any evidence of possible fraud or to avoid exposing any ignorance or error, on the part of the board in the correction of the papers.

While such a reason is, of course, within the range of possibility and may or may not be true, it is clear to any unprejudiced mind that the refusal to return the examination papers of a candidate, after the examination is completed and the marks determined, cannot but have a psychological effect on the candidate that is detrimental to either his mental or moral stamina. Such a refusal proclaims the superiority of the examining board in a manner that is neither pleasing nor helpful to the candidate and far from satisfactory in the event of his failure to pass the examination. In a word, this requirement of the law practically makes the examining board supreme, without affording the unfortunate candidate his unquestioned right of satisfaction.

It has often been remarked that "an examination is not a means of finding out what a man *does* know, so much as ascertaining some of the essential things he does *not* know." Now, it is the important things that we do *not* know that are of the greatest interest to us. Indeed, acquainting ourselves with the essential things of which we are ignorant is one of the chief elements of success.

No argument is required to prove the fact that every man is entitled to the benefit that may accrue from a knowledge of his mistakes. For this reason, to deprive a candidate of the opportunity of knowing and studying the exact points wherein he has failed in examination is undeniably an act of injustice to the candidate. On the ground of "equal rights to all men," guaranteed by our constitution, a law requiring such action on the part of any examining board should rightly be declared unconstitutional.

While referring to the examination of candidates for certificates of qualification to act as mine foremen, firebosses, etc., there is another question of equal importance to that I have just discussed; namely, the personnel of the examining board and the ability of its members to pass on the technical qualifications of candidates. Examining boards are quite generally composed of representatives of the state, the coal companies and the miners, respectively. Unfortunately, the manner in which the representatives of the last two classes named are appointed is no guarantee of their individual qualifications or ability to pass on the technical questions that must be asked in these examinations.

It is true that the representative of the coal companies is generally a superintendent who is, or should be, by virtue of his position, well versed in both the technical and practical principles of mining. However, I do not think that it is too broad an assertion to make to say that two-thirds of our mine superintendents are incapable of passing on technical questions relating to mining. This assertion by no means reflects on the practical capability of these men to act as mine superintendents. Neither do I mean to say that any man who accepts a position on an examining board, to act as representative for his company, necessarily belongs to this class. It may be stated with all fairness, however, that the capabilities of any member of an examining board should not be less than those required by law of the candidates whom they examine, in order that they may be able to pass with exactitude on the questions asked the candidates and the answers given in reply.

The same is true of the miners' representative on the examining board, who the law requires shall be "a man in actual practice," or actually engaged in the mining of coal. It is to this member of the board that many candidates in examination look for justice and, in order that he may faithfully acquit himself of the duties of his office and meet the expectations of candidates, he should be able to pass a similar examination himself. In other words, *he should himself hold a certificate of competency obtained by having successfully passed a previous examination.* Without such qualifications on the part of the representative of the miners, their interests, in this regard, are but indifferently safeguarded.

This aspect of the law I believe could be materially improved by permitting the miners to choose, as their representative, a man who is duly qualified to sit upon the board, without regard to the position he occupies in the industry. If they were granted this franchise, I am assured that they are so fully awake to the requirements that their choice would be a good one.

I regard this question of sufficient importance that it should demand the consideration of every man engaged in the mining industry, in whatever capacity he may serve.

Mining men should ask for the repeal of the statute to which I have referred and the substitution therefor of a mandatory law compelling the return of candidates' papers, with all errors properly marked and the correct answers given as determined by the official board.

I. C. PARFITT.

Jerome, Penn.

Fuel Economy in Coal Mining

Noting the numerous references, in COAL AGE, relating to the need of greater care in the purchase of coal for fuel purposes and the need of economizing on the use of fuel in other industries, it seems to me of growing importance to apply the same principle of economy in the use of fuel for the production of power, in coal mining.

A few years back, the fuel question, at coal mines, was not considered worthy of any consideration. The ease with which coal could be hoisted from the mine and dumped into the boiler-house chute made this item appear an inconsiderable expense from the coal operator's standpoint. It might be that from 15 to 20 boxes of coal would be dumped into the boiler chutes in a day, of which no account would be taken. In fact, frequently, the operator did not care what amount of coal was used for this purpose.

That condition has greatly changed, and today all uptodate operators and superintendents are making every effort to economize in the use of fuel at the mines, for power purposes. In this respect, I may be regarded as a crank; but coal has a value to me, without reference to the abundance of its supply at the mine. I consider coal is always worth its market value to the coal operator, as well as to the manager of other industries where coal must be purchased.

When inspecting a mine, I investigate the fuel question as carefully as any other matter. I want no leaky joints in steam lines or leaky valves, either in the boiler house or anywhere else about the plant. It is extremely important that blowoff valves should be tight or fuel will be wasted. Scaly boilers, dirty flues, as well as leaky joints and valves are robbers of fuel. A careless fireman can waste many times more fuel than could be paid for by his wages.

Once every year the engines and other machinery should be indicated by a competent engineer, who is capable to check up the system and ascertain the efficiency of the boiler plant, in respect to the consumption of fuel. By this means, he will be able to make many valuable suggestions, both in respect to the heating arrangements around the plant and the appliances for heating the feed water of the boilers. I consider the heating system should be in circuit and traps arranged to carry off the water of condensation, while the waste steam is conducted back to the heater.

Feed-water heaters should be kept clean and in good working order. Much economy is effected by heating the feed water to a constant temperature of 200 deg. F. or above.

In respect to the consumption of fuel, it is important to give close attention to the drainage system, both on the surface and in the mine. All surface waters should be prevented, as far as possible, from finding their way into the workings of the mine, which will greatly reduce the duty of the pumps. The drainage system underground should be as concentrated as possible, all the water, as far as practicable, being drained by ditches into the main sump. By thus reducing the amount of water to be pumped and concentrating the work, much economy can be effected in fuel consumption in mine drainage.

At all plants where coke is manufactured, the breeze or fine refuse of the coke should be carefully collected and burnt in the boilers, instead of being thrown on the waste dump. A car and a half of breeze is about equal to one car of good coal for fuel purposes. As the boiler plant is commonly located close to the ovens, the cost of collecting and transporting the breeze to the boilers should be practically *nil*.

In order to keep everyone alive to the importance of economizing fuel, at a coal mine, an exact record of every car of coal dumped should be kept on the weigh sheet, whether such car goes to the boilers or to the loading chutes. Every competent foreman should make it his business to know how much coal is consumed by the plant in his charge. Every tipple should have a separate chute for the coal for boilers.

A good plan is to have the boiler track of the same gage and connected with the mine track, so that mine cars can be run into the boiler house every night, for the purpose of loading the ashes, which in many cases can be used advantageously to ballast the tracks in the mine. An important point in the firing of boilers is to keep the ashpit clear, which saves the grate-bars. The ashes make a good track ballast, and the mules can do better work when the roadbed is thus kept in good condition.

Oliphant Furnace, Penn.

Proposed Method of Working to Reduce Expense of Upkeep

In connection with the discussion of various methods of working, the following proposed plan will be of interest in relation to reducing the expense of upkeep of the roads and air courses in a mine.

Since taking charge of the mine where I am at present employed, I find that, at the present rate of progress, it will take from six to seven years to drive and finish a single pair of butt-entries from the main entries to the next pair of face entries, a distance of 1200 ft. The reason for this great length of time is that too many butt-entries are being kept open and the work is scattered over too large an area. The maintenance of these entries requires a large amount of timber, besides entailing a considerable extra expense for retimbering roads and air courses and keeping up the tracks.

In addition to the extra cost of maintaining long roadways and air courses, there is a considerable increase in the expense of haulage. Because of the work being so scattered, drivers are compelled to haul long distances and much time is lost of necessity, which would not occur if the work were more concentrated. Another large loss results from the fact that when the mine closes down for the summer, as it frequently does, much of the pillar coal is crushed and cannot be recovered when work is again resumed in the fall.

To overcome these difficulties and losses, I propose to concentrate the work by driving two pairs of butt-entries, the entire distance of 1200 ft. between the main and face entries. When this has been done and the work

opens up in the fall rooms will be turned, starting from the inby end or close to the face entries. A sufficient number of rooms will be turned off both entries to give the daily output desired. At the present time, we are driving rooms a distance of 140 ft. with a width of 18 ft. Since the coal is 3 ft. 6 in. thick, I estimate that each room will yield about 300 tons of coal in the first working.

By driving two pairs of butt-entries and opening 24 rooms on each entry of each pair, making 96 rooms in all, I believe we can count on sufficient coal for an output of, say 1000 tons per day. By this arrangement, instead of the work being distributed through 13 pairs of entries, as formerly, it will be much more concentrated. Fewer drivers will be required to perform the same work, and it will be possible to maintain a much lesser length of roadways and air courses.

The coal, in this mine, is undermined by compressed-air punching machines, each machine-runner cutting the coal in six rooms. I estimate that the butt-entries can be driven the entire distance (1200 ft.) in six months or, say from July to February, inclusive. Then, if the rooms started from the inby end can be driven up in four months, this will leave two months for drawing back the pillars in these rooms before the close of the season.

My plan is to lay a 3-in. air line to the face of each pair of butt-entries, which will supply sufficient air to operate two machines on each entry, each of these machines cutting six rooms each shift, or 12 rooms per day. If this arrangement is successful, it will be possible to work out the 48 rooms on each pair of butt-entries, in 12 months.

I further plan to work out the remaining 16 rooms on each butt-entry and draw back the entry pillars and room-stumps the following winter. By this system, I expect to work out the entire area of coal in our tract in three years, with very little loss of coal and a greatly reduced expense for upkeep. The expense of maintaining the roadways, in the present system of working, is exceedingly heavy on the first 200 yd. of the butt-entries, owing to the fact that the rooms in this distance have been worked out and the pillars drawn, which throws a heavy weight on the entry pillars.

In the proposed new system, the first 450 ft. of the butt-entries will remain in solid coal until the 24 rooms inby from this point are worked out and finished. Besides the reduced cost of upkeep, the new system will afford better coal in pillarwork and secure greater safety to the miners.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Diameter of Water-End—The diameter of the piston or plunger of a direct, double-acting pump is calculated from the required actual capacity or discharge and an assumed efficiency of the water-end, for a given piston speed.

The **water-end efficiency** of a direct-acting piston or plunger pump will, of course, vary with the age, condition and workmanship of the pump and packings. The average efficiency in **mine work** is generally considered as not much exceeding 65 per cent. at the water-end; while that of a new pump or one in good condition and well packed, may be 85 per cent.

The diameter (dw), in inches, of the piston or plunger required to discharge a number of gallons (G) per minute, at a piston speed (S), in feet per minute, assuming a water-end efficiency (Ew), is calculated by the following:

Rule—Divide the required discharge of the pump expressed in gallons per minute, by the assumed water-end efficiency, and that quotient by the piston or plunger speed in feet per minute and multiply the square root of the last quotient by 4.95; the product obtained will be the required diameter of the piston or plunger, in inches.

Expressed as a formula, this rule is

$$d_w = 4.95\sqrt{\frac{G}{E_w S}}$$

Or, assuming, as is common, a water-end efficiency of 85 per cent., Ew = 0.85 and the formula becomes

$$d_w = 5.37\sqrt{\frac{G}{S}}$$

Example—Assuming an average water-end efficiency of, say 65 per cent., calculate the required diameter of the plunger of a pump capable of delivering 300 gal. per min., at a piston speed of 60 ft. per min.

Solution—The required diameter of the plunger, under the assumed conditions, would be

$$d_w = 4.95\sqrt{\frac{G}{E_w S}} = 4.95\sqrt{\frac{300}{0.65 \times 60}} = 13.7 \text{ in.}$$

Diameter of Steam-End—The diameter of the steam cylinder of a direct-acting pump is calculated from the total pressure on the water-end when the pump is in operation and the available steam-cylinder pressure. As previously shown (see Pressure Required in Pumping), the diameter ratio between the steam and water ends of a direct-acting pump is equal to the inverse ratio of the unit or gage pressures on these two ends, which, by transposition, gives the following formula:

$$d_s = d_w\sqrt{\frac{p_w}{p_s}}$$

In most cases, especially in the operation of large pumps, it is safer to make a suitable allowance for the loss due to friction in the pump, which may reduce the effective steam-cylinder pressure from 5 to 10 per cent.

The Coal Age Pocket Book

Length of Stroke—The size and capacity of pumps are commonly estimated for a given speed of the piston or plunger, expressed in feet per minute. The length of stroke is determined with respect to the diameter of the steam cylinder, and may vary from the length of such diameter to 1½ or 2 times that length. There results a loss of efficiency in the steam-end when the stroke of the pump exceeds twice the diameter of the steam cylinder.

Number of Strokes per Minute—The piston or plunger speed of a pump, expressed in feet per minute, divided by the length of stroke in feet, gives the number of strokes the pump makes each minute; according to the formula,

$$n = \frac{S}{l}$$

Discharge of a Pump—The discharge of a direct, double-acting pump is found by reversing the two formulas previously given for calculatig the diameter; thus, for any efficiency Ew.

$$G = 0.0408\, E_w S d^2$$

Or, for an assumed water-end efficiency of 85 per cent.,

$$G = 0.03468\, S d^2$$

Example—Find the discharge of a 6-in., double-acting pump, running at a speed of 100 ft. per min., assuming an efficiency of 75 per cent. If the length of stroke is 10 in., find the number of strokes per minute.

Solution—

Discharge, $G = 0.0408 \times 0.75 \times 100 \times 6^2 = 110.16$ *gal. per min.*

Number of strokes, $n = 100 \times 12 \div 10 = 120$ *strokes per min.*

Example—Calculate the required dimensions of a direct, double-acting pump capable of handling 9000 gal. of water per hour, under an effective head of 502 ft., when the available steam pressure at the pump is only 40 lb. gage, assuming a piston speed of 100 ft. per min.

Solution—The required capacity of this pump is 9000 ÷ 60 = 150 gal. per min.; then assuming an efficiency of, say only 75 per cent. to make suitable allowance for wear and depreciation in use, the required diameter of the water-end (piston or plunger) is

$$d_w = 4.95\sqrt{\frac{G}{E_w S}} = 4.95\sqrt{\frac{150}{0.75 \times 100}} = 7.0 \text{ in.}$$

The water-end pressure is

$$p_w = 0.434 \times 502 = 217.8 \text{ lb. per sq.in.}$$

Since the available steam-cylinder pressure is 40 lb. per sq.in., the required diameter of the steam-end or the steam cylinder is

$$d_s = d_w\sqrt{\frac{p_w}{p_s}} = 7\sqrt{\frac{217.8}{40}} = 16.33 \text{ in.}$$

In this case, it is proper to assume a stroke of, say 20 in., making the size of the steam cylinder 16x20 in., by slightly increasing the steam pressure above the estimated 40 lb. gage. The size of the pump is, therefore, 7x16x20 in.

Inquiries of General Interest

To Prevent the Freezing of Mine Shafts

We have been considerably annoyed in previous winters and the work of hoisting coal has been much delayed by the accumulation of ice in the hoisting shaft. With a view of avoiding this trouble we have had under consideration, recently, two methods.

By one of these methods, it is proposed to heat the intake air to such a temperature that the water draining down the shaft will not freeze in cold weather. The other proposed plan is to line the shaft by the "gun-crete" method, so as to render it waterproof. By this plan, the entire shaft would be lined with an inch of reinforced concrete, applied by means of the cement gun that is now so extensively used in all cement work, in mining and other industries.

In choosing between these two methods and deciding which is the best means to employ for the purpose of avoiding the trouble to which we have referred, we desire to gain what information we can from the experience of others along this line. I might add that we are inclined to consider the first method mentioned more favorably than the second, for the reason that the steam used for the heating of the intake air would accomplish, at the same time, the humidification of the mine air, which is so much to be desired during the colder months of the year. We shall be glad to have your views in reference to the matter and to hear from other readers of COAL AGE who have had experience similar to our own.

A MINE SUPERINTENDENT.

————, Ohio.

We heartily commend the choice of correspondent for the purpose in view, although it must be admited that there are certain disadvantages arising from the heating of the intake air passing down a hoisting shaft. These disadvantages, however, are slight in comparison with the advantages to be gained.

For the purpose of heating the intake air in the hoisting shaft of a large mine, we would suggest the installation of a system of steam pipes, say 1 to 1½ in. in diameter. The pipe line should be arranged to zigzag downward at the sides and on the faces of the shaft where the water is most troublesome. Each pipe line should connect with a pipe that will conduct the steam beyond the shaft bottom and permit it to discharge into the intake air current, at a point where the temperature of the air more nearly approaches that of the mine.

If the steam were allowed to discharge into the cold air at the shaft bottom, its condensation would cause a fog or mist that would impede the work of the cagers and trip-runners, but, discharging into the warmer air at a short distance inby from the bottom of the shaft, the moisture is quickly taken up by the warm dry air of the current and carried into the mine.

As is quite commonly recognized today, such a humidification of the air entering the mine prevents the absorption of moisture from the mine workings and the consequent drying of the dust throughout the mine by the air current. The adoption of this method of heating the intake air, therefore, accomplishes two valuable purposes. It not only prevents the freezing of the shaft but affords the desired humidification of the air current and greatly reduces the danger of explosion due to the accumulation of dry dust in the workings.

The disadvantages of this method, to which we referred previously, are chiefly two: (1) The men working on the shaft bottom, the cagers, trip-runners and oilers, are compelled to work in a somewhat warmer atmosphere, which enervates or weakens some men more than others; (2) the heating of the downcast air produces a certain air column in the downcast hoisting shaft that is opposed to the general circulation and, to this extent, imposes an added duty on the fan.

The waterproofing of the shaft, on the other hand, by the so called "gun-crete" method, besides lessening the work of pumping, provides a clean, dry lining for the shaft and decreases the friction of the air current, which may become quite appreciable in deep shafts of contracted area, in the ventilation of a large mine requiring a considerable air volume.

We shall be glad to have readers of COAL AGE *who have had experience in similar situations discuss this question from a practical standpoint, giving their ideas and conclusions.*

Equivalent-Orifice Formula

Kindly explain how the constant 0.0004 is derived in the formula for finding the equivalent orifice of an airway or mine. The formula to which I refer is

$$A = \frac{0.0004\ q}{\sqrt{w.g.}}$$

in which A is the area of the orifice (sq.ft.); q the quantity of air passing (cu.ft. per min.); and $w.g.$ the water-gage (in.).

A STUDENT.

Belleville, Ill.

The formula given by correspondent is derived from the well known formula for the theoretical velocity (v) in feet per second, due to a given head (h) in feet, $v = \sqrt{2\ gh}$, combining this with the ventilating formula $q = av$ and allowing for *vena contracta,* the coefficient being 0.62, and multiplying by 60 to reduce to minutes.

$$q = 60 \times 0.62\ A\ \sqrt{2 \times 32.16\ h} = 298.3\ A\ \sqrt{h}$$

But, taking the weight of 1 cu.ft. of air as 0.0766 lb., since the pressure per square foot is 5.2 $w.g.$, the head is 5.2 $w.g.$ ÷ 0.0766 = 67.88 $w.g.$, which substituted for h, in the last equation, gives

$$q = 298.3\ A\ \sqrt{67.88\ w.g.} = 2457\ A\ \sqrt{w.g.}$$

Hence, $$A = \frac{1}{2457}\ \frac{q}{\sqrt{w.g.}} = \frac{0.0004\ q}{\sqrt{w.g.}}$$

Examination Questions

Hoisting Engineers' Examination, Held at Springfield, Ill., Oct. 12, 1914

(*Selected Questions*)

Ques.—Find the approximate horsepower exerted by a pair of hoisting engines, cylinders 30 in. in diameter, steam pressure, 60 lb.

Ans.—Since the power exerted by an engine depends on its speed or the number of revolutions per minute and this is not stated, the question as it reads cannot be answered.

However, assuming that these engines have a piston speed of, say 600 ft. per min., and that the steam pressure given is the mean effective pressure in the cylinder, the horsepower developed is

$$H = \frac{2\ (0.7854 \times 30^2) \times 60 \times 600}{33{,}000} = 1542+\ hp.$$

Ques.—Find the useful horsepower during a hoist of two tons of coal up a shaft 1500 ft. deep, in 50 seconds.

Ans.—Assuming that the term "useful horsepower" refers to the power consumed in the hoisting of the *coal* only, disregarding the dead load of the rope and friction and supposing the car and cages to balance each other as they do in a double-compartment hoist, the horsepower in that case is

$$H = \frac{2 \times 2000 \times 1500}{\frac{5}{6} \times 33{,}000} = 218+\ hp.$$

Ques.—If the safety valve on a boiler is 4¾ in. in diameter and the lever is 38 in. long from the fulcrum to the center of the weight and 4½ in. to the center of the valve, the weight being 85 lb., what is the pressure of the steam exerted on the valve, in pounds per square inch?

Ans.—In answering this question, the weight of the lever, valve and valve-stem acting through their center of gravity must be ignored, since these are not given in the question.

The area of the valve is $0.7854 \times 4.75^2 = 17.72$ sq.in. Then, calling the required steam pressure, in pounds per square inch p, and equating the moment of the total pressure on the valve with the moment of the weight, we have

$$17.72\ p \times 4.5 = 85 \times 38$$

$$p = \frac{85 \times 38}{17.72 \times 4.5} = 40.5\ lb.\ per\ sq.in.$$

Ques.—The total pressure on the steam piston is 100 tons; if the diameter of this piston is 24 in., what is the pressure of steam per square inch?

Ans.—The area of the piston is $0.7854 \times 24^2 = 452.39$ sq.in. The pressure per square inch on the piston is, therefore, $100 \times 2000 \div 452.39 = 442+$ lb. per sq.in.

Ques.—What will be a safe working load for a steel hoisting rope ⅞ in. in diameter?

Ans.—The question should state whether an ordinary steel rope or an extra-strong steel rope is intended, as a 6-strand, 19-wire ordinary steel rope 1 in. in diameter has a breaking strain of 34 tons, while that of a similar extra-strong steel rope of the same diameter is 39 tons.

The formula for determining the strength of 6-strand 19-wire hoisting ropes is based on the breaking strains of the same class of rope 1 in. in diameter. Thus, using a factor of safety of 5, the safe working load for a 6-strand, 19-wire hoisting rope, of each class, is

Ordinary steel,

$$L = \tfrac{1}{5}\ (34\ d^2) = \tfrac{1}{5} \times 34\ (\tfrac{7}{8})^2 = 5.2\ tons.$$

Extra-strong steel,

$$L = \tfrac{1}{5}\ (39\ d^2) = \tfrac{1}{5} \times 39\ (\tfrac{7}{8})^2 = 6.0\ tons,\ nearly.$$

Ques.—What weight will a single engine of the following dimensions lift: Diameter of cylinder, 2 in.; length of stroke, 18 in.; geared at 4 to 1; diameter of drum, 6 ft.?

Ans.—The question omits to state the available steam pressure in the cylinder and, therefore, as the question reads, it cannot be answered.

However, assuming that the available steam pressure is, say 50 lb. per sq.in., the total cylinder pressure will be

$$P = 50\ (0.7854 \times 12^2) = 5655\ lb.,\ nearly.$$

Now, assuming that this total pressure is applied horizontally to the crankpin, which is one-half the length of stroke or 9 in., and calling the required weight to be lifted, W, the radius of the drum being $(6 \times 12) \div 2 = 36$ in., and equating the moment of the steam pressure multiplied by the ratio of gearing with the moment of the load, we have

$$5655 \times 9 \times 4 = 36\ L$$

$$L = \frac{5655 \times 9 \times 4}{36} = 5655\ lb.$$

Ques.—What are the four electrical units?

Ans.—The four common electrical units are the volt, ampere, ohm and watt.

Ques.—Define the four electrical units.

Ans.—The *volt* is the unit of electromotive force or the so called "pressure" of an electric current. It corresponds to the pressure producing the circulation of air in an airway or of water in a pipe.

The *ampere* is the unit that measures the "strength of the current" or the quantity of current flowing. This unit corresponds to the volume of air passing in an airway or the quantity of water flowing through a pipe.

The *ohm* is the unit of resistance. It is the resistance of a current of one ampere, flowing under a pressure of one volt.

The *watt* is the unit of electrical power. It is the power required to pass a current of one ampere, under a pressure of one volt. It corresponds to the work in foot-pounds per minute, in ventilation.

Ques.—How many gallons of water will a tank hold that is 9 ft. 11 in. high and 53 in. in diameter?

Ans.—The capacity of the tank is

$$\frac{119\ (0.7854 \times 53^2)}{231} = 1136+\ gal.$$

Coal and Coke News

Harrisburg, Penn.

An order was issued by the Inter-State Commerce Commission on Oct. 20, requiring several railroads in the bituminous region, namely the Pittsburgh & Lake Erie and the Baltimore & Ohio, to make through rates on coal from the Avella group of mines in Washington County, to points outside of Pennsylvania and these rates should not be more than 10c. per ton higher than the through rates from mines on the West Side Belt R.R. The new rates must go into effect on the first of next year and be in force for two years.

The decision is the outcome of a complaint filed by the Pittsburgh & Southwestern Coal Co., the Pryor Coal Co., the Waverly Coal Co., and the Avella Coal Co. against the Wabash-Pittsburgh Terminal, the West Side Belt Line, the Pittsburgh & Lake Erie, the Baltimore & Ohio and other roads, declaring that the rates on coal from their mines are unreasonable and unlawfully discriminatory.

No joint rates are maintained from the Avella group of mines, and the local rate of 30c. per ton is charged by the Wabash-Pittsburgh Terminal for hauling coal to Pittsburgh Junction, while joint rates are in effect from mines on the West Side Belt Line. The complainants say they are entitled to the same consideration.

The commission on the above date heard argument and reserved its decision at a meeting in the Federal Building, Philadelphia, on the complaint of the Mitchell Coal & Coke Co. against the Pennsylvania R.R. to recover damages for alleged illegal rebating.

The case was originally filed in the District Court and resulted in a verdict of $40,000 for the coal and coke company. Upon appeal to the Supreme Court the latter tribunal reversed this finding on the ground that the complaint should have been made to the commission, and, in the event of a favorable finding, suit should have been brought in court.

The industrial railroad cases involving the claims for restoration of allowances to the "Short Lines" by trunk lines will be argued on Nov. 19. The final testimony will be taken Nov. 9 in two cases postponed from this week. Fifteen railroads are involved.

PENNSYLVANIA

Anthracite

Jeddo—The G. B. Markle Coal Co., in whose mines the man was hurt, is financing the return to his parents in Italy, of 24-year-old Cosemo Scalpi, whose back was broken last March and who can never walk again. The company will send along a man to nurse the patient on his 4500 mile journey.

Parsons—Fire of unknown origin, on Oct. 22, broke out in the washery operated by Samuel Chase, of Wilkes-Barre. The frame structure was outside of the city limits, but to protect property on the lower side of the creek and in the city, several streams were turned on the blaze by the city firemen. The headway gained by the flames before an alarm was sent in made it impossible to save the washery, however, and it was destroyed.

Harrisburg—An informal report recently issued by the Department of Mines says that the state inspectors, operators, and miners are all working toward the end of safety, there having been a decided decrease in the number of fatalities during the three months ending Sept. 30, 1914, compared with the corresponding quarter of 1913. The comparisons of these fatalities are as follows:

Anthracite, 1914—killed, 137. Bituminous, 1914—killed, 102.
Anthracite, 1913—killed, 156. Bituminous, 1913—killed, 154.
Decrease, 19, or 12 per cent. Decrease, 52, or 34 per cent.

Statistics of non-fatal accidents have not been completed, but it is believed they will make as favorable a showing as the fatal accidents.

Wilkes-Barre—The threatened strike at the Stanton Colliery at Wilkes-Barre was averted recently by the patchers returning to work pending an investigation of their grievance that too much work is being placed upon them.

It is estimated that there are about 300 breakers in the anthracite coal region, costing on an average $200,000 each, some of the larger and more elaborate buildings running as high as $300,000 to $500,000. It is alleged that if the preparation of anthracite for market after it is mined were conducted as a separate industry, it would require a capitalization of at least $100,000,000.

Bituminous

Connellsville—The Connellsville coke production and output recently established a new low record, and is still going down. This record was 237,000 tons, or a drop of 8000 tons from the previous week. With the blowing out of 1200 ovens by the H. C. Frick Coke Co., a still further decrease in production was effected. It is believed by some that the output will run as low as 225,000 tons by the close of October.

Johnstown—Alleging that hurts he received in the mines of the Citizens Coal Co., on Oct. 8, 1914, permanently disabled him and prevented him both from playing baseball and earning a living at his occupation of coal mining, John Russel has filed a suit, asking $10,000 damages.

Brownsville—The Lilley Coal Co., with one of the largest and best equipped plants in Fayette County, has shut down its operation indefinitely. The company owns about 700 acres of coal land. It has a new plant, and if running at full capacity would employ 400 men. The plant has only been operating two days a week for the past two months. On Oct. 15, it is stated, 85 men were laid off and notice was given later that the plant would shut down indefinitely on account of lack of orders.

Big Bend—Coal operators in this vicinity report that many new orders have been received lately from Eastern coal dealers, who say they are storing immense quantities of fuel on the Atlantic seaboard. It is said the orders are in sufficient volume to keep the mines in operation until well into the summer.

Greensburg—The appraisement filed in the United States district court of the assets and properties of the Pittsburgh-Westmoreland Coal Co., by Julian Kennedy and R. C. Crawford, the appraisers appointed by the court, is $13,676,115. The total net obligations of the company are about $6,800,000. The company went into the hands of receivers July 29 last on account of the maturity of a $900,000 two-year note issue which matured Aug. 1 and which it was unable to take care of on account of the sudden breaking out of the European war. The net operating earnings of the company for the last fiscal year prior to the receivership was $899,465. It is understood that the interest coupons will be paid when due.

WEST VIRGINIA

Vivian—The tipple of the King Coal & Coke Co., located on Laurel Creek, was recently damaged considerably by fire. The origin of the fire is not known. The flames were discovered about 9:30 o'clock in the evening, and were not under control until about 4:30 a.m. The damage is estimated at approximately $20,000, which is said to be covered by insurance.

Moundsville—The Ben Franklin Coal Co. of West Virginia has discontinued the use of open lights at its Panama mine in the southern part of Moundsville, and has installed electric safety lamps, the latter being now in use. The Hirsch electric safety lamp, which has been approved by the U. S. Bureau of Mines, is employed. It is believed that this is one of the biggest steps for the safety of employees and property which has been taken by any West Virginia coal company.

TENNESSEE

Jellico—Demonstration teams representing 18 mining companies of Kentucky and Tennessee have signified their intention of competing for the Mine Foremen's Association's prizes to be offered at the field day to be held here shortly.

KENTUCKY

Barboursville—Miners have returned to work in the Tye Fork district on a compromise basis after a strike which had tied up operations for some time. It is stated that changes in the wage scale after the companies had installed electrical apparatus were not satisfactory to the miners. Both sides made concessions, it is understood, but details are lacking.

Louisville—The second operation of the Harlan Coal Mining Co., the Snead & Meguire enterprise, was opened at Kayu in Harlan County on Oct. 24. This is on the opposite side of the valley from the Coxton operation of the company and though a separate tipple, screening plant, etc., are required, the same loading facilities will be employed. The Harlan company is operating regularly in spite of the condition of the market.

Central City—The agreement under which the local mine of the Central Coal & Iron Co. has resumed operations provides that arbitration of differences between the company and the miners shall be disposed of by the National Executive Board of the United Mine Workers. The difference between the miners and the company was on the appointment of D. Stewart Miller, commissioner of the Operators' Association, as arbitrator for the company. Many improvements, including a new tipple and engine chutes and betterments inside the mine have been completed at a cost of $50,000.

Jenkins—Six out of twelve of the mines of the Consolidation Coal Co. and the Elk Horn Mining Corp. in the Jenkins-McRoberts-Fleming-Haymond-Hemphill field have closed down owing, it is said, to conditions brought about by the European war and the stagnation of markets throughout the country. Several hundred men are out of employment as a result of the closing of the mines.

OHIO

Pomeroy—In an effort to arrive at a correct interpretation of certain clauses of the agreement entered into last May, a series of conferences will be held at Pomeroy between the United Mine Workers and representatives of the Jackson Coal & Mining Co., the Newton Coal Co., and the Hutchinson Coal Co., operating in what is known as the Pomeroy Bend. There has been a misunderstanding between the coal company and its employees as to the meaning of Sections 1 and 19 of the agreement, which pertain to the suspension of work.

Cleveland—The No. 8 operators learned on Oct. 26 that the United States supreme court has refused them an injunction against the Ohio Industrial Commission to prevent the commission from enforcing the Ohio screened coal law. It also has denied the plea of the commission, which was to throw the case out of court as frivolous. The court held the screened coal law to be of such vital importance that the case should be heard immediately and set the full hearing for Nov. 30. This means that the highest court will probably render an opinion on this measure by Jan. 1, 1915. Sitting as a court, District Judges Fater and Killits and Circuit Judge Warrington held the screened coal law constitutional early in the summer.

Glouster—A meeting of the miners employed by the Sunday Creek Co., and the Pittsburgh Coal Co. will be held at Glouster at 1 p.m., Oct. 31, for the purpose of trying to get all of the operators to comply with the mine-run law. A different method is pursued at various mines which is said to be unsatisfactory to the miners.

New Philadelphia—Another effort is on foot for the organization of a miners union among employees of the small retail mines in the district surrounding New Philadelphia. A meeting was held recently, called by William F. Lincks, president of Sub-district No. 3. Several previous attempts to organize the retail mines have failed.

Columbus—There is considerable speculation in coal circles in Ohio over the coming changes in the organization of the Sunday Creek Co. According to the latest ruling of the courts, Nov. 4 is the time fixed for the separation of the ownership of the company from the Hocking Valley, the Lake Shore and the Chesapeake & Ohio railroads. So far no announcement has been made locally. It is pointed out that the reorganization of the company at this time is a most difficult problem and it is believed an extension of the time may be granted by the courts.

INDIANA

Terre Haute—The delegates from this city to the American Mining Congress at Phoenix, Ariz., Dec. 7, are J. C. Kolsem, W. E. Van Winkle and Frank Richards.

The Pittsburgh Mining Co. has brought suit against the Big Four Ry. Co. for $3000 damages, alleging that a train wrecked a coal tipple at the mine near Sanford.

ILLINOIS

Farmington—The old Maplewood mine, or Black Hawk No. 1, will be again placed in operation in about six weeks, so it is alleged. This mine has been idle for the past five years, nothing being done in the way of upkeep or repairs during that time. It has taken the pumps almost a year of steady pumping to empty the pit so that men could move about therein.

Princeton—The property of the Marquette Third Vein Coal Mining Co. will be sold at sheriff's sale at Princeton on Monday, Nov. 2. This sale will be made to satisfy a judgment of Patrick Carney. Carney is now dead, but the money is due his estate. The mine is said to be worth approximately $100,000.

NORTH DAKOTA

Ryder—It is said that the reservation coal lands are to be thrown open for entry in all probability by next fall, not sooner than September of 1915. They have yet to be appraised, and the appraisers have not been named. The regulations pertaining to the opening rest entirely with the Secretary of the Interior, so that no one can bespeak authoritatively how these lands are to be opened. It is thought, however, that because of the small number of these claims, less than a thousand, they will be thrown open to general settlement.

COLORADO

Denver—Contending that mine guards are being sworn into the Colorado militia during the reorganization, John R. Lawson, an officer of the Colorado district of the United Mine Workers, recently presented a protest to Chairman Foster of the House Mine Committee against the withdrawal of the Federal troops from the strike district.

WASHINGTON

Seattle—Speedy settlement of the strike that has been on in the Carbonado coal mines for nearly a month is promised as a result of a protracted peace conference that has just come to a close in this city. Officers and members of the Washington Coal Operators' Association representing the Carbon Hill Coal Co., owner of the mines, and officers of District No. 10, United Mine Workers of America representing the strikers, were the conferees. The grievances responsible for the strike were satisfactorily adjusted and an agreement under which the men will return to work unpenalized was reached.

FOREIGN NEWS

St. John, N. B.—The coal output in the Minto coal region is not equal to the demand, and it will be necessary to greatly increase operations if the demand is to be met. At present, the daily output is about 300 tons. This will be brought up to 400 tons. It is said that Sir Thomas Tait, who is at the head of the Minto Coal Co., has been looking into the question of establishing a distillation or byproduct plant at the mines.

RECENT COAL AND COKE PATENTS

Smoke Jack. W. Reenstrom, Chicago, Ill., 1,108,234, Aug. 25, 1914. Filed May 7, 1914. Serial No. 836,943.

Grate Bar—J. H. Dietz, Cleveland, Ohio. 1,111,059. Sept. 22, 1914. Filed Apr. 18, 1914. Serial No. 832,771.

Mine Car Wheel—A. B. Day, Knoxville, Tenn. 1,109,906, Sept. 8, 1914. Filed Jan. 28, 1914. Serial No. 730,480.

Miners' Auger. J. Underaton, Hocking, Iowa, 1.104,231. July 21, 1914. Filed May 21, 1913. Serial No. 769,097.

Mechanical Stoker—A. G. Elvin, Somerville, N. J. 1,111,531, Sept. 22, 1914. Filed Feb. 24, 1913. Serial No. 750,124.

Boiler Tube Cleaner. F. Herle, Chicago, Ill., 1,104,262. July 21, 1914. Filed Dec. 10, 1913. Serial No. 805,700.

Steam Generator—A. A. Cary, New York, N. Y. 1,109,041, Sept. 1, 1914. Filed Oct. 26, 1911. Serial No. 656,798.

Mining Machine Chuck—F. Nugent, Mace, Idaho. 1,109,865, Sept. 8, 1914. Filed Sept. 23, 1913. Serial No. 791,381.

Gas Producer—T. B. Benner, Cortland, N. Y. 1,110,372, Sept. 15, 1914. Filed Mar. 21, 1914. Serial No. 826,369.

Spark Extinguisher—E. Thompson, Radnor, W. Va. 1,109,486, Sept. 1, 1914. Filed Aug. 16, 1913. Serial No. 785,181.

Fire Box for Boilers—J. M. McClellon, Everett, Mass. 1,111,266, Sept. 22, 1914. Filed Oct. 1, 1909. Serial No. 520,556.

Underfeed Furnace. R. S. Riley, Providence, R. I., 1,103,625, July 14, 1914. Filed Oct. 20, 1911. Serial No. 655,821.

Water-Cooled Fire Bar. R. Grabowsky, Hanover, Germany. 1,107,291. Aug. 18, 1914. Filed Sept. 4, 1912. Serial No. 718,457.

Suction Gas Producer. M. F. Derrick, Montreal, Canada, 1,107,917, Aug. 18, 1914. Filed June 12, 1913. Serial No. 773,309.

Inclined Grate for Furnaces—G. H. Thacher, Jr., Albany, N. Y. 1,109,266, Sept. 1, 1914. Filed Oct. 22, 1912. Serial No. 727,148.

Mine Drilling and Channeling Machine. L. J. Daft, Seattle, Wash., 1,108,342, Aug. 25, 1914. Filed June 23, 1913. Serial No. 775,270.

Water Tube Boiler—R. Delauney, Belleville, St. Denis, France. 1,109,627, Sept. 1, 1914. Filed Dec. 11, 1913. Serial No. 806,044.

Automatic Stoker for Locomotives—P. M. Thayer, Plymouth, Ind. 1,109,802, Sept. 8, 1914. Filed Mar. 6, 1913. Serial No. 752,313.

Coal Conveyor. J. Dodds and W. Brown, Cambuslang, Scotland, 1,104,481. July 21, 1914. Filed May 31, 1910. Serial No. 564,191.

Grate Bar. B. C. Stewart, assignor to Murphy Iron Works, Detroit, Mich. 1,107,860, Aug. 18, 1914. Filed Jan. 16, 1914. Serial No. 812,563.

Mining Machine. H. A. Kuhn and W. W. Macfarren, Pittsburgh, Penn., 1,107,239, Aug. 11, 1914. Filed Nov. 30, 1908. Serial No. 465,299.

Automatic Stoker. E. A. Jones, Scranton, and J. E. Jones, Throop, Penn., 1,107,217, Aug. 11, 1914. Filed Apr. 4, 1913. Serial No. 758,914.

Adjustable Heat and Fuel Economizer. M. M. Gillam, Flushing, N. Y., 1,107,605, Aug. 18, 1914. Filed Feb. 20, 1914. Serial No. 819,912.

Locomotive Fire Box Construction—L. G. Parish, New York, N. Y. 1,110,815, Sept. 15, 1914. Filed June 15, 1914. Serial No. 845,079.

Spark Arrester and Smoke Treating Device—H. A. Weber, Hartford, Conn. 1,109,884, Sept. 8, 1914. Filed Oct. 15, 1912. Serial No. 725,860.

Mine Ventilating Apparatus. W. Clifford, assignor to Ellicott Co., Pittsburgh, Penn., 1,107,264, Aug. 18, 1914. Filed Jan. 4, 1912. Serial No. 669,329.

Cutter Head—L. F. Hess, assignor to Hess Dustless Mining Machine Co., Ansted, W. Va. 1,109,988, Sept. 8, 1914. Filed Nov. 9, 1912. Serial No. 730,480.

Pyriphoric-Ignition Miner's Safety Lamp—F. Fattinger, Treibach, Austria-Hungary. 1,109,055, Sept. 1, 1914. Filed Dec. 16, 1911. Serial No. 666,144.

Boiler with Fire Tube Superheater. S. Hoffman, assignor to Locomotive Superheater Co., Wilmington, Del., 1,104,756. July 21, 1914. Filed Jan. 12, 1912. Serial No. 670,734.

Refractory Arch for Locomotive Boiler Furnaces—C. B. Moore, assignor to American Arch Co., New York, N. Y. 1,109,692, Sept. 8, 1914. Filed Nov. 17, 1908. Serial No. 463,070.

Bottom Construction for Furnaces. H. H. Blake, assignor to Blake Crusher and Pulverizer Co., Pittsburgh, Penn., 1,104,402. July 21, 1914. Filed June 30, 1911. Serial No. 636,294.

Process for Regulating the Temperature of Combustion—J. M. Rusby and J. H. Taussig, assignors to United Gas Improvement Co., Philadelphia, Penn. 1,110,991, Sept. 15, 1914. Filed Dev. 27, 1909. Serial No. 535,178.

PERSONALS

Fred Vinton has resigned his position as mine foreman for the Penn-Mary Coal Co. by which he has been employed for the past eight years, and has accepted a position as superintendent for the Greenwich Coal & Coke Co., at Saxton, Penn.

J. C. Arnold, general sales manager of the Interstate Coal & Mining Co., is pushing his sales campaign on the strength of the use of steam shovels in mining, which it is claimed produces a finer and cleaner coal than the ordinary system.

Col. W. H. Thomas and Jairus Collins of Bramwell, W. Va., together with N. D. Maher, vice-president of the Norfolk & Western R.R., are making arrangements for placing a creditable display of coal and coke from the Pocahontas coal fields at the Panama Exposition in San Francisco next year.

Benjamin S. Daddow, of Ashland, Penn., who has been employed as chief clerk of the Mahanoy and Shamokin Division of the Lehigh Valley Coal Co., has been promoted to the position of chief clerk to Mining Superintendent Thomas Thomas, of the same company, with headquarters at the general office in Wilkes-Barre.

Miss Margaret Jordan has accepted a position as domestic science instructress, directress and helper, for all families of the employees of the Leckie Coal Co., the Panther Coal Co., and the West Virginia Pocahontas Coal Co. Miss Jordan is a graduate of Columbia University, and her new duties will be to visit the various operations at regular intervals, instructing the housewives in domestic economy, sanitation, teaching the children healthful recreation, and in every way assist in uplifting the communities in which her work lies.

OBITUARY

Andrew A. Bruch, manager of sales for the S. Flory Mfg. Co. of Bangor, Penn., who has been with the company since its inception, died on Oct. 20.

Michael H. Healey, aged 45, a member of the Executive Board of District No. 1, United Mine Workers of America, and one of the best known union men in the anthracite region, died on Oct. 20, at his home, 431 Fourteenth St., Scranton, Penn., of kidney trouble.

Andrew Roy, the first mine inspector in Ohio, died at his late home at Wellston, Ohio, recently, from old age. He was 80 years old and a well known character in the mining industry of the state. The deceased was born in Scotland. He served in the Union army during the Civil War. After the war he was a candidate for secretary of state of Ohio but was defeated. He was appointed on a commission to investigate the condition of mining in Ohio and his report led to the establishment of the mine inspectors' department. He was appointed the first chief inspector on Apr. 6, 1874 which office he held for four years. On Feb. 12, 1880, he was re-appointed chief inspector by Governor Charles Foster and served for another four years.

CONSTRUCTION NEWS

Holsopple, Penn.—The Victor Coal Mining Co. of Holsopple will shortly put into commission new equipment to operate its mine electrically.

Middlesboro, Ky.—It is announced that the Low Ash Mining Co. is to install electrically operated cutting and haulage machinery in its mines near here.

New Orleans, La.—The Illinois Central R.R. Co. recently awarded to the Roberts & Schaefer Co., of Chicago, a contract for a large barge loading plant to be built immediately at Harahan Incline, New Orleans.

Charleston, W. Va.—The Boone County Coal Corporation will shortly develop coal mines on Beach Creek, a tributary of Little Coal River. This firm will also build a tipple and establish a town, constructing two miles of railroad.

Toledo, Ohio—New coal docks, modern car dumping and coal hoisting machinery, and additional yards, all to cost more than half a million dollars, are to be added to the terminal facilities of the Cincinnati, Hamilton & Dayton R.R. in Toledo, within the next few months. The improvements have just been authorized, and preliminary surveys, plans and specifications are being worked out by the company's engineers.

Chicago, Ill.—The Roberts & Schaefer Co., of Chicago, has just concluded a contract with the Louisville & Nashville Ry. Co., for the equipment of a 1000-ton reinforced-concrete Holmen type locomotive coaling plant with weighing facilities, for installation at the new Radnor Terminal at Nashville, Tenn.

A contract was also concluded with the Louisville, Henderson & St. Louis Ry. Co. for the building of a similar tipple of 200 tons capacity, with proper weighing facilities at Henderson, Ky.

Charleston, W. Va.—A railroad will be built through the densely wooded portion of Nicholas County for the development of the natural resources in coal and lumber there found. The Cherry River Southern R.R. Co. has completed the permanent survey for the route of the proposed line, and will, it is expected, let the contract for the construction of the road at the earliest possible moment. This road will be about 35 miles long, and will extend from Curtin in Nicholas County, to Bay's Ferry, where the counties of Nicholas, Green-

brier and Fayette converge. About 100,000 acres of valuable coal and timber land will be tapped by this road.

Huntington, W. Va.—What is believed to be the first step in a movement to utilize and turn to commercial advantage the water power afforded in the valley of the upper Guyandotte River is seen in the incorporation of the Logan Light & Power Co. of Logan, with an authorized capital stock of $1,500,000. The incorporators of this firm are George W. Stevens, Jr., E. S. Aleshire, and R. P. Aleshire, of Huntington, Curtis McComas, of Barbourville, and W. C. Lawrence, of Logan. The intention is to erect a power house at Logan, and from that center distribute commercial current to the various mining operations in Logan County and throughout the Guyandotte Valley generally.

NEW INCORPORATIONS

Terre Haute, Ind.—The Fairmount Coal Co. has been dissolved.

Jersey City, N. J.—The Mexican Coal & Coke Co. of Jersey City has decreased its capital stock as a New Jersey corporation from $5,000,000 to $50,000.

Elberfeld, Ind.—The Elberfeld Coöperative Coal Co. has been organized with a capital stock of $2000, for the purpose of mining and dealing in coal. The incorporators are C. A. Wiggs, William Rostron, and B. Fulling.

Tacoma, Wash.—The Scranton Coal Mining Co. has been organized in Tacoma with a capital of $300,000. The incorporators are Ernest Hutchins, A. L. Hutchins, B. W. Watkins, and F. M. Lane; Eugene Carr is attorney.

Listonburg, Penn.—The Somerset Quemahoning Smokeless Coal Co. has been organized with a capital of $10,000. The incorporators are J. H. Saulsbery, Eleanor M. Saulsbery, of Punxsutawney, John T. Harrington and Marion Harrington, of Horatio.

INDUSTRIAL NEWS

Birmingham, Ala.—The Tennessee Coal & Iron Co.'s rail mill and open hearth department at Birmingham, which was closed Oct. 1, resumed operations on full time Oct. 22.

Pittsburgh, Penn.—Shipments of coal and coke over the Pennsylvania Lines east of Pittsburgh and Erie for September, show a total of 6,024,214 tons, or a decrease of 295,168 tons.

Athens, Ohio—Negotiations have been completed for a loan of $100,000 by which the line of the Hocking-Sunday Creek Traction Co. will be extended to Athens. The loan was made by Close Bros., of Chicago.

Bluefield, W. Va.—During the month of September, the Norfolk & Western R.R. hauled 2,509,916 tons of fuel from the mines along its right-of-way. This was divided as follows: Pocahontas region, 1,390,531 tons; Tug River, 295,332; Thacker, 295,776; Kenova, 110,158; Clinch Valley, 158,393, and other Norfolk & Western territory, 4781 tons, the balance being received from other railroads.

Fayetteville, W. Va.—For the month of September, the Chesapeake & Ohio R.R hauled 2,082,675 tons of coal from the Kanawha, New River, Guyan, and Kentucky districts. The Kanawha district furnished 709,535 tons, New River, 587,455 tons, Guyan, 555,445, and Kentucky, 230,200 tons. The Guyan district lacked only 32,000 tons of equaling the New River output hauled by the Chesapeake & Ohio.

Scranton, Penn.—It is reported that the city of Scranton pays more for its domestic fuel than is charged at tidewater, in spite of the fact that freight charges are added to the fuel shipped to these points. It is said that Scranton pays $4 per ton net, without the cost of handling, while Paterson, N. J., for instance, gets the same grade of coal for $3.35. It is alleged that complaint will be made to the State Utilities Commission.

Washington, D. C.—Freight rates on bituminous coal from mines in Washington County, Penn., to destinations on the Pittsburgh & Lake Erie and Baltimore & Ohio railroads in other states, were recently held by the Interstate Commerce Commission to be unreasonable and discriminatory to the extent that they exceeded by 10c. a ton rates for similarly located mines for the same destinations. This decision affects many roads and a considerable traffic.

Clarksburg, W. Va.—Announcement was recently made that the Hygrade Coal Co. had leased its Page mine at McWhorter to J. S. Klinefalter & Co. These holdings consist of 150 acres of Pittsburgh coal, all of which is leased to the new corporation. The Page mine is modernly equipped, having been in full operation for some years, but it is stated that the lessees will continue to operate the mine on full time, and will probably make considerable improvement in the equipment.

New York, N. Y.—The local unions will petition President Wilson to effect a speedy settlement in the Colorado coal strike situation. Ernest Bohm, secretary of the Central Federated Union, recently received a telegram from a committee of the Trinidad coal strikers, asking the New York unions to petition the President to take speedy action in forcing the coal operators to comply with the requirements laid down as the basis of settlement of the Colorado coal strike.

Washington, D. C.—Reductions in the rate on coal from mines in Oklahoma and western Arkansas to Weatherford, Tex., were recently ordered by the Interstate Commerce Commission, in the case of the Weatherford Chamber of Commerce and others against the Missouri, Kansas & Texas and other railroads. The roads were directed to reduce from $2.50 to $2.25 per ton, the rate on lump coal, and from $1.70 to $1.65 per ton the rate on slack. These reduced rates are to take effect Dec. 1.

Huntington, W. Va.—The Chesapeake & Ohio Ry., including the C. & O. of Indiana, during last year used 41,000 carloads or 2,000,000 tons of fuel, for which $2,220,000 was paid. By adding to this $813,000 which it cost to transport this coal to the various points on the road, and $85,000 which was spent by the company to put it on the tenders of locomotives, it will be seen that $3,098,000, or $1.55 per ton was spent by this railroad for fuel. This is equal to 8½ per cent. of the gross earnings of the road during this period.

Washington, D. C.—The Supreme Court recently agreed to review a decision by Federal Judge Dayton of West Virginia, since reversed by the Federal District Court of Appeals, holding that the United Mine Workers of America is a monopoly in restraint of trade. This decision was made in the case of the Hitchman Coal & Coke Co., which brought anti-trust proceedings against John Mitchell, T. L. Lewis, and William B. Wilson, as officers of the miners' union, and against the union itself. The company alleged that the organization was destroying its business.

Washington, D. C.—The case of the United States against the Lehigh Valley R.R. Co., the Lehigh Valley Coal Co., and the Lehigh Valley Coal Sales Co. has been set for argument Nov. 11, before Judge Hough in the Southern District Federal Court of New York. The Government brief which was recently filed contends that the Lehigh Valley R.R. Co., through its subsidiaries, has monopolized the production, transportation, and sale, of anthracite coal from mines along its lines, and asks the Court to compel the railroad company to dispose of the stocks of its subsidiaries to persons who are neither its stockholders nor agents.

Frankfort, Ky.—The Circuit Court of this (Franklin) County has upheld in toto the Workmen's Compensation act which was questioned in a test case given its preliminary hearing here recently. Judge Stout upheld the contentions of the State Board of Arbitration in every detail and granted the mandatory injunction which was asked by the Board against the printing concern which declined to comply with the provisions of law. The case went at once to the Court of Appeals and its hearing in that body will be expedited. In this connection it may be noted that the Board has extended the time for the employers to report the means they are going to use to comply with the act, from the first of November to the first of December. The coal operators of the state, who have favored the act all along, are well pleased with the turn affairs have taken.

Connellsville, Penn.—A suit of much interest to coke men of the Connellsville region was completed recently in the Superior Court of Massachusetts when J. K. Dimmick & Co., a former coke brokerage concern with offices in Uniontown and Philadelphia, was given the decision in a breach of contract action. The suit was brought against the Dimmick firm by the Federal Coal & Coke Co., whose offices are in Boston, and whose plant is at Fairmont. The concern sued to recover $20,000. Breach of contract was alleged, it having been declared that the Dimmick firm contracted for 24,000 tons of coke, and refused to take the remainder after 500 tons had been shipped. A defense that the coke was of an inferior quality is said to have been made by the Dimmick concern, and a cross suit was brought to recover $1200 or 5c. per ton commission on the deal. The court awarded the suit to the Dimmick company, giving it $1200 with interest.

Coal Trade Reviews

General Review

Cold snap starts the retail anthracite trade moving, but the mines continue short of orders. Bituminous outlook pessimistic. Cancellations the rule and mines are reducing working schedules.

The recent cold snap has had a stimulating effect upon the retail anthracite trade, but with all dealers generally well stocked, it will have to continue for some time before the beneficial effect will be felt at the mines. Many of the large companies are already receiving cancellations, and a few have been forced to reduce their working schedules. The Upper Lake ports are reported as choked up with coal, though shipments are still substantially less than last season. The large amount of individual coal going to Tidewater is also indicative of the adverse situation. On the other hand, there is a notably healthy undercurrent through the trade, particularly as compared with average conditions in other industries.

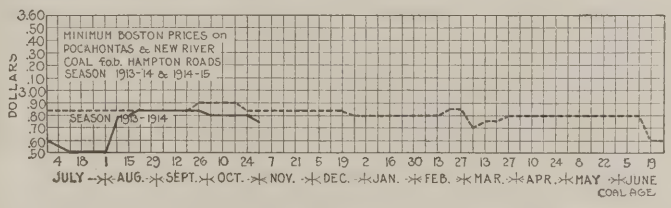
Bituminous operators are distinctly pessimistic. In spite of the rigid curtailment, cancellations of orders are constantly threatening to develop heavy accumulations, and agencies are occasionally forced to make liberal concessions. Unsold portions of consignments to consuming centers are exceedingly difficult to move, and with heavy stocks in all directions, it is difficult to see where there can be any betterment. The improvement in some phases of the financial situation is creating renewed hopes in certain quarters.

Further curtailment in both general manufacturing and the iron and steel industries has created an additional heaviness in the Pittsburgh district. The customary fall advance in the circular is not being discussed, while the Lake shipping, which has been a disappointment throughout the season, has slowed up still further. Instead of an increased consumption, as is usually the case at this period, it seems to be falling off. Consumers are well stocked, but the mines are still urging coal forward, and some is occasionally noted on demurrage.

Ohio prices have softened under the influence of the continued weakness in domestic grades, the dull steam business and the falling off in Lake tonnage. Production has slowed down materially, and even in the event of cold weather it will be some time before the effects are reflected back to the mines. Some hopes of a final rush in the Lake trade are still entertained, reports from the Upper Lake ports indicating that considerable coal is moving to the interior.

The Middle Western operators have succeeded in relieving some of the pressure on slack coal by diverting a portion of the demand to straight mine-run. Prices on slack recently touched the lowest point in the history of the trade, but they are substantially better now. The general market continues heavy. There seems to be practically no demand whatever, and the past week has witnessed still further declines.

ATLANTIC SEABOARD



BOSTON

Weakness in Hampton Roads coals likely to be more pronounced. Inland demand now as slack as Tidewater. Pennsylvania grades also somewhat off in price. Anthracite only in light demand and independent offerings again in evidence.

Bituminous—The week has developed some soft spots in the Pocahontas and New River market; several of the agencies have quietly been offering coal at a liberal concession from the $2.85 price. This condition is not widespread as yet, but it is certainly significant. Unless present indications fail, there will be a general slump in Hampton Roads coals by the early part of November. The usual effort is being made to cover up the f.o.b. basis of such sales as are effected, and so far the low-priced offerings are confined to alongside business at points like Boston, Providence and Portland. Only a rigid curtailment can correct the present state of the market. The extremely mild weather has not only reduced coal consumption, but transportation has been moving on record time, and practically every point is surfeited with supplies.

For inland delivery, there is practically no inquiry. At Mystic Wharf, Boston, the season price of $3.78 on cars is still quoted, but it is doubtful if a price 50c. less would be attractive enough today to make a sale of any considerable tonnage. At Providence, $3.40 on cars has been named, a figure that would analyze back to $2.62 f.o.b. Hampton Roads, based on the lowest marine freight. Unsold balances continue to keep the market weak, and with the heavy stocks everywhere, it is difficult to see how there can be any improvement for weeks to come.

The Pennsylvania grades are also showing the effect of the dull market. Most of these coals, however, are sent to the loading ports only on firm orders, and there is nothing like the proportion of distress coal at New York and Philadelphia that prevails at the Virginia terminals. At the same time, prices have had to be modified in many instances to secure any orders at all.

There are no new developments on Georges Creek. The shippers are caught up on their contracts and new business on this coal is as much out of the question as on any of the other standard grades.

Anthracite—The retail dealers complain of exceptionally light business. There has been no weather to burn coal, and stocks continue at the maximum in most cases. Shipments have fallen off very noticeably and loading dispatch at New York has correspondingly improved. One of the signs of a dull market is the offering of various independent coals at Boston and points East at prices a few cents under the company circular. The difficulty with independent shippers, as with others, is that they cannot furnish the proportion of stove coal required, and egg and chestnut are a drug on the market.

Bituminous prices at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*.....	$0.85@1.45	$1.20@1.55	$1.67@1.77	
Philadelphia*.....	2.10@2.70	2.45@2.80	2.92@3.02	
New York*.....	2.40@3.10	2.75@3.10	3.22@3.32	
Baltimore*.....	.....	.....	2.85@2.95	
Hampton Roads*.	.....	.....	.....	$2.75@2 8
Boston†.....	.....	.....	.....	3.50@3 78
Providence†.....	.....	.....	.....	3.40@3 7

* F.o.b. †On cars.

NEW YORK

Working schedules in the bituminous field are much reduced. Outlook pessimistic. Anthracite operators curtailing production though the recent cold snap has improved conditions.

Bituminous—The market outlook continues distinctly pessimistic. A particularly adverse development of the week was a well defined rumor of a substantial cut in the circular on New River coal. The working schedules in the mining regions have contracted still further; it is unofficially stated that the Berwind-White interests have reduced to a two- or three-day basis per week, the two-day schedule probably predominating. Many of their miners are seeking employment in other fields, and in fact this is becoming so general throughout all the mining regions that the situation is rapidly becoming distressing.

But even in the face of all these adverse conditions features of a constructive nature are not entirely absent. The rapid decline in the rate of exchange down to a more normal basis, together with other favorable developments, such as the more hopeful outlook in cotton, are expected to have a steadying effect. There is no absolute pressure to sell at Tidewater, accumulations being relatively restricted and no demurrage coal reported. The demand from tramp steamers is holding up in a most satisfactory manner.

Prices are irregular and are showing weakness, though the market is still quotable on the former basis which we continue as follows: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—A sharp cold snap during the current week had a much needed stimulating effect upon the markets which were showing a decided tendency toward heaviness. Some of the large companies, as, for instance, the Reading, had already been forced to curtail operations, while practically all were receiving cancellations. The line trade all over the country has shown a distinct falling off, while the amount of individual coal coming to Tidewater is sufficient indication of the slowing up at interior points. It is generally agreed that the local dealers are all well stocked up, and it will probably take a long spell of cold weather before the trade will get back to a satisfactory basis. On the other hand, however, the situation is not by any means as bad as might be expected, considering conditions in general.

Egg coal is still in excess supply in all directions. Stove coal is becoming more plentiful all the time, straight cargoes being readily obtainable. Nut is only fair, and pea coal about the same. Steam sizes are heavy and difficult to move.

The New York hard-coal market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.65@5.10	$5.05	$4.60@5.05
Egg	5.35	5.00@5.35	5.30	4.95@5.30
Stove	5.35	5.35	5.30	5.30
Chestnut	5.60	5.50@5.60	5.55	5.45@5.55
Pea	3.55	3.45@3.55	3.50	3.40@3.50
Buckwheat	2.80	2.50@2.80	2.50@2.75	2.25@2.75
Rice	2.30	2.05@2.30	2.00@2.25	1.60@2.25
Barley	1.80	1.70@1.80	1.75	1.50@1.75

PHILADELPHIA

Cooler weather creates some improvement in anthracite, but operations are curtailed. Small sizes still in surplus. Demand for domestic is absorbing current output.

Anthracite—The past week was more seasonable, but did not have the snap that indicates the trade has reached the point where uninterrupted operation of the mines may be expected. Mitchell Day was celebrated by a complete cessation of mining, and it is understod that several of the large companies were idle for an additional day or two. It is the heaviness in the small sizes that is interfering with a larger production of the domestic grades. The market appears to absorb the current output of broken, egg, stove and nut, but even the inducement of substantial concessions on the steam sizes finds little response from the trade. Everyone is complaining of the unsatisfactory conditions, and the consensus of opinion seems to be that nothing but good coal-burning weather, and plenty of it, will add backbone to the trade.

Prices at Tidewater rule about as follows:

	Circular	Individual
Broken	$4.75	$4.50 @ 4.60
Egg	5.00	5.00
Stove	5.00	5.00
Chestnut	5.25	4.90 @ 5.10

Bituminous—There is practically no change in the bituminous situation. If anything, the past week has been less fruitful in the way of new business and requisitions for tonnage on contracts. Industrial curtailment has caused quite a number of cancellations, or postponed deliveries, and it is quite apparent that manufacturers are not laying in any more supplies than will be sufficient for their immediate needs. The market is such that no stated price can be used as a basis for coal from any particular district. Coal on demurrage is likely to be disposed of at figures which will hardly net the freight, and it is understood there is quite an accumulation at Tidewater points, some of which is aproaching the danger line. On all sides comes the same story, and it is difficult to find an operator with a cheerful outlook for the future.

BALTIMORE

All branches of the coal business unsatisfactory. Extremely low prices for soft coals. Anthracite demand poor. No great industrial resumption now expected.

There is little of a satisfactory nature in the present coal situation here and the same condition seems to exist everywhere else. The operating interests of this section are facing a number of problems. Even at reduced time and with many mines closed entirely, a surplus is constantly threatened through cancellations from consumers who ordinarily take a large amount of fuel at this season.

In West Virginia, good fuels, such as three-quarter gas and first grade steam coals, were offering to the trade at anywhere from 80 to 90c. Slack was selling around 40c. Western Maryland steam coals sold ariously to the trade at the mines at from 75 to 85c. Pennsylvania low-grade fuels were offering anywhere from 85c. to $1, with better grades at $1.05 to $1.15, and best coals of the state around $1.35. But it was hard to sell even at such sacrifice figures, in many cases considerably below actual production expense.

The entire situation seems to be due to the poor industrial call. The trade has now resigned itself to the situation and does not look for an early resumption of activity.

Anthracite conditions are none of the best. With no real cool weather, there is a flat period in the trade, now that summer deliveries have been closed out for some time.

The export trade continues to hold up fairly well. A number of Mexican charters were noted among the recent announcements.

HAMPTON ROADS

Some improvement in foreign movement. Prices stationary, with slightly above normal quantity of coal on hand.

Although shipments from Hampton Roads to foreign ports have not been exceptionally heavy, at the same time there has been a decided improvement over last week's movement. Some large cargoes have gone to New England ports and the government has taken in the neighborhood of 15,000 to 16,000 tons into colliers. The largest percentage of coal moving has been Pocahontas and New River mine-run, although there have been several cargoes of high volatile and nut and slack shipped.

The accumulation of coal in the railroad yards is still above normal, with fair shipments en route from the mines. Quite a large tonnage is due at the various piers, and with the vessels now in port the accumulation will be considerably reduced. Quotations are about the same as they have been during the last few weeks. Owing to the warm weather, the domestic demand is light and dealers are complaining of poor sales.

Of the foreign steamers tied up in Hampton Roads at the outbreak of the war, all, with the exception of two, have cleared and left for various loading ports. During the week the Virginian Ry., at Sewalls Point, did excellent work in the bunkering of the "Anglo Saxon" and "Anglo Columbian," approximately 2500 tons of bunkers being put aboard the latter steamer in the short time of seven working hours.

Of 13 steamers reported to have been sunk by the German cruiser "Karlsruhe," over half of them have been either loaded or bunkered at some time at one of the Hampton Roads ports.

The following cargoes have cleared from Norfolk and Newport News, between Oct. 16 and 23, inclusive:

Norfolk				Newport News			
Date	Vessel	Tons	Destination	Date	Vessel	Tons	Destination
16	Frankrig	2253	Barbadoes	16	Auchendale	6218	Havana
17	Trodenskjold	5560	Canal Zone	17	Ella	2047	Santiago
19	Berwindvale	7938	Havana	17	Ekaterini	5432	Brindisi
21	Santa Isabel	3006	Havana	17	Leonatus	3131	Port au Spain
22	Noordijk	4467	Bahia	17	Josef Fredrik	2964	Havana
23	Homewood	2335	Santa Fe (AR)	17	Amista	6044	Montevideo
23	Chimu	2676	Chilian Ports	20	Gemma	4875	Brindisi
23	Tasmania	5268	Spezia	23	Westerdijk	4332	Montevideo

COAL CHARTERS

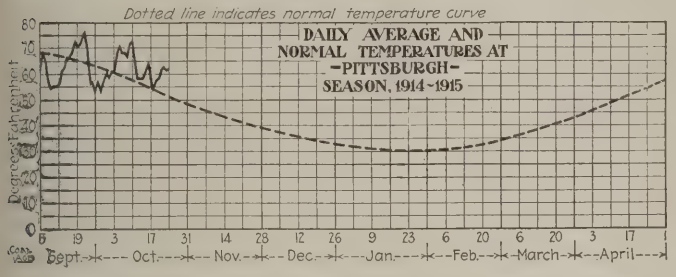
Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Karen	Norwegian	Baltimore	Colon	1072	
Rio Blanco	British	Philadelphia	Rio Janeiro	2580	
Haakon VII	Norwegian	Baltimore	Tampico	1379	
Biemiller		Philadelphia	Porto Rico	858	
Alicia B. Crosby		Philadelphia	Portland	1016	
Winnegance		Philadelphia	Lubec	251	
J. Howell Leeds		Philadelphia	Gloucester	393	
Margaret		Philadelphia	Porto Rico	1236	
John A. Hooper		Baltimore	San Francisco	1321	
Sophie H.	Dutch	Virginia	Rio Janeiro	1864	

Note—Steamers are indicated by **bold face** type, all others being schooners.

LAKE MARKETS

LAKE TRADE



No season in Lake trade has ended as dismally as the present one. Ordinarily there are very fine finishes in the trade owing to the desire of shippers to have their commodities moved before navigation becomes impossible. Nothing of the sort, however, characterizes the present season. Shippers some time ago began to send their own vessels to dock owing to their inability to provide them with cargoes. —"The Marine Review."

PITTSBURGH

Lake shipments still lighter and will soon end for the season. Line demand slightly less. Prices irregular and practically unchanged, except for rather less irregularity in slack.

Lake shipments have decreased further and the movement will soon be over. The demand from the Northwest has

been an almost continuous disappointment throughout the season, and the last hopes of an improvement have, of course, disappeared. Manufacturing demand has shown a slight decreasing tendency in the past week or two, as the iron and steel mills are operating at still lower rates, one estimate having it that last week the steel mills as a whole operated at only 45% of capacity. Domestic trade shows a slight improvement, but retail dealers are still ordering in as small quantities as possible.

Prices are as low and irregular as ever, even slack showing no decided strengthening in keeping with the decreased output of screened coal and the fact that Lake shipments of ¾-in. coal will be entirely finished in a very few weeks. Slack is quotable this week at about 50c. as minimum, against 40@50c. last week. Best grades of gas coal, in prompt lots, command in the neighborhood of $1.15, but there are occasional lots offered down to about a dollar. Nothing definite can be learned as to new circular prices, which, according to custom, should shortly be announced. The old circular, still nominally or officially the market, is: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

BUFFALO

Still much complaint of unseasonable weather, and anthracite trade is sure to be affected soon. Bituminous accumulating on track everywhere. Grave outlook when the Lake trade is shut off.

Bituminous—There is not much chance of improvement in any branch of the coal trade so long as the present weather continues. There is as much coal in consumers' hands as they want to carry and the mines are still urging it forward, often paying demurrage on it, when they ought to be realizing all the profit they can. The jobbers say that if there is demurrage to pay, the mines will have it to settle. Reports come from the mines that they are able to run only three or four days a week at the most, and quite often less than that. This is the time of the year when the consumption of bituminous ought to increase steadily, but it appears to be falling off instead. Complaints of poor trade multiply. Iron furnaces continue to shut down and mines run more slowly. Canada is buying so little that some shippers say there is hardly an excuse for covering it, except to keep acquainted with their old customers. Quotations continue unchanged, though all prices are weak, slack especially so, on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack. Allegheny Valley coal is about 25c. below Pittsburgh, except slack, which is about on a par with it.

Anthracite—The demand is fair, but in no way as rushing as it sometimes is. It is not believed that there is any disposition to cut down the amount required, so the quietness is acceptable to the wholesalers, though the local dealers are complaining about it some.

Shipments by Lake are fairly good, though not what they were last fall. Shipping agents say that they are sure of coal enough at Upper Lake ports, and there is no need of haste. It is reported that sales at Upper Lake ports are not active, and more will be necessary if further shipments are to be made from here, as storage room is practically all taken up. The amount shipped for the week, according to custom house figures, is 139,000 tons, which is a fair fall average.

Rail line shipments of anthracite are improving and should continue to do so for some time.

TORONTO, CAN.

Market well supplied and business quiet. Prices steady.

Owing to the continuance of mild weather, the coal trade remains unusually quiet for the season. The market is well supplied and large consignments are being received by dealers in anticipation of the close of navigation. There is no change in prices, quotations being well maintained as follows: Retail —Anthracite, egg, stove and nut, $7.75; grate, $7.50; pea, $6.50. Bituminous, steam, $5.25; screenings, $4.35; domestic lump, $6; cannel, $7.50. Wholesale, f.o.b. cars, three-quarter lump, $3.78; screenings, $2.64.

TOLEDO

Situation continues unchanged and generally heavy. Closing of domestic mines creates a shortage of small sizes.

Conditions have changed but little, domestic demand still being light, while steam coal is moving slowly as compared with other years. Owing to the fact that many Hocking domestic mines are closed down altogether, nut, pea and slack are showing more strength. Lake business is unchanged. The T. & O. C., C. H. & D. and Hocking docks are all moving some coal, and the C. H. & D. is making a better showing than it did a year ago.

Railroad movement continues light and there is no congestion noted here. The uplake coal handled thus far this season by the C. H. & D. here amounted to 1,000,000 tons, and the company officials are predicting that the season's tonnage will reach 2,350,000 tons.

COLUMBUS

Curtailed production due to falling off in domestic demand. Steam business slow and Lake trade is not so active. Prices have weakened.

The feature of the coal trade in Ohio is the continued weakness in domestic grades, which has curtailed production. This, coupled with the dull steam business and a falling off in Lake tonnage, has had a bad effect on the trade generally. Prices have softened materially and the tone of the market is not as good as formerly. These conditions are believed to be only temporary, however, and a turn for the better is expected as soon as lower temperatures prevail.

Dealers' stocks are sufficient for present needs, and they are only buying a small amount. Cancellations have been frequent. Buying is now being done for delivery in the first half of November. There is no likelihood of an advance soon and $1.75 coal is now out of the question before the first of the year. Retailers say there is still a fairly good demand for the fancy grades, such as Pocahontas and West Virginia splints. Hocking lump is also moving fairly well.

Little change is reported in the steam trade. Manufacturing is still quiet, and there has been practically no increase in fuel requisitions. Buying in the open market is still the rule among certain factories. Railroads are only taking a fair tonnage, and the prospects for the future are not considered bright.

The Lake trade shows a slight falling off, due to congestion at some of the upper Lake docks, but this condition is being relieved and a fairly good movement is expected right up to the closing of navigation. Lake prices have not changed materially and shipments to the interior are heavier. Production has been slackened during the week and the Hocking Valley is now producing only about 45% of the average. The same percentage prevails in Crookville, Jackson and Cambridge districts. In the Pomeroy Bend district, the output is estimated at about 70 to 75% of normal.

Anthracite is in fairly good demand among the trade and prices are as high as formerly.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Re-screened lump	$1.60	$1.70	.....
Inch and a quarter	1.50	1.50	$1.40
Three-quarter inch	1.40	1.40	1.35
Nut	1.15	1.30	1.15
Mine-run	1.10	1.15	1.10
Nut, pea and slack	0.50	0.55	0.50
Coarse slack	0.40	0.45	0.40

CLEVELAND

Sharp fall in temperature has stimulated the retail trade. Prices are generally stiffer and there is a better tone to the market.

Colder weather that has forced heating plants to fire up, brought a liberal lot of orders to the retail dealers Monday. This was the first real fall business of the season and it has had a most beneficial effect since the local trade depends upon one- and two-ton lots for more than half of its business. The increased reail trade did not affect the wholesale market and will not before the latter part of the week, but the weather had a bracing effect upon spot car business. Coarse coals moved readily and fine coal was in brisk demand. This brought a stiffening in prices and some slight advances in certain lines.

Youghiogheny slack was sold at $1.70 with Panhandle at $1.60 to $1.65. Fairmount slack, which has been very low for several weeks, was up to $1.65 and operators were not cutting the price for orders for shipment. Hocking and Goshen slacks are not being offered, as the lighter production of larger sizes has so reduced the output of these grades that there is only sufficient for contract requirements. No. 8 from West Virginia has been sold largely on consignment the last few weeks, but it brought quoted prices in sympathy with other coals. For the first time this fall the

market looks as if it would continue to hold above the rock bottom level at which it has been so frequently during the last few months.

The Lake trade is rapidly drawing to a close. Only such cargoes as are needed to round out contracts are being shipped. It does not seem likely that any considerable amount of coal will be moved during the rest of the season and practically no coal will go up the Lakes after Nov. 15.

Prices for current shipment are as follows:

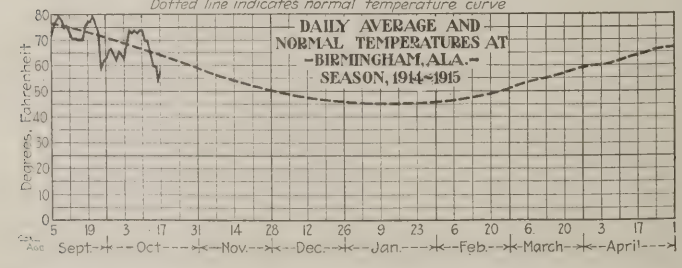
	Pocahontas	Youghiogheny	Bergholz	Fairmount	W. Va. No. 8
Lump	$3.75	.....	.....	.....	.....
Lump, 6 in.	.....	.....	$2.45	.....	.....
Egg	3.75	.....	.....	.....	.....
Egg, 6 in.	.....	.....	2.10	.....	.....
Lump, 1¼ in.	.....	$2.40	2.25	.....	.....
Lump, ¾ in.	.....	2.30	2.10	$2.05	$2.05
Mine run	2.75	2.25	1.95	1.90	1.95
Slack	2.40	1.65@1.70	1.65	1.65	1.65

CINCINNATI

No change noted and the demand continues light. Colder weather will make some improvement. Transportation and labor conditions are excellent.

The continued mild fall weather and the lack of any improvement in the industrial demand has resulted in about as dull a market as possible. The hoped-for improvement among manufacturers has not yet taken place, although there are encouraging signs that it may develop in the near future. So far, however, the better feeling has not made itself evident in an increased demand for fuel, which must evidently await a decided increase in the extent of operations.

The domestic market, as far as the storage demand is concerned, is generally understood to be about filled, but there is undoubtedly a large volume of business to be handled in one-ton orders when the first cold snap comes. It is not likely, however, that even colder weather will help much for some time, as the retail trade is well stocked.



SOUTHERN

LOUISVILLE

Market generally demoralized. Still large excess of slack. Mining slowing down.

Generally speaking, the Kentucky coal market is demoralized by the weather and the curtailment in industrial operations. The extent to which it has been affected is shown by the fact that many of the mines which produce the fancy and the advertised brands of domestic coal are now selling these for steam use. In addition to this, some operators are dumping their nut and slack on the ground in order to dispose of it. Such mines have large contracts to fill in domestic coals and have to get it out, but they have been unable to dispose of their steam grades. The railroads are profiting to a considerable extent, having much steam coal turned over to them for the demurrage and freight charges.

Mines are slowing down on production and this is tending to strengthen the domestic market, in which prices are more or less steady. It is not common, however, for operators to get business at prices which are at all reasonable, while almost anything that looks like real money for steam coals gets the order.

COKE

CONNELLSVILLE

Small furnace coke contract closed at $1.75, the highest regular asking price. Market quiet. Production and shipments further decreased.

A contract for a relatively small monthly tonnage of furnace coke, to run to the end of the year, has been closed with an eastern Pennsylvania consumer at $1.75, ovens, practically the highest price now seriously quoted. There are negotiations for one or two lots for November shipment only, on which $1.75 or less will be done, as there are sellers of some brands for early delivery at as low as $1.65. Prompt coke shows scarcely any activity, and there are offerings at $1.60, but these cover only occasional lots, not regular supplies. Foundry coke is easier as to prompt lots, there being fairly good brands available at $2.15, while indifferent grades could be had at $2, or possibly a shade less. We quote: Prompt furnace, $1.60; contract furnace, $1.65@1.75; prompt foundry, $2.15@2.50; contract foundry, $2.35@2.50, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Oct. 17 at 237,729 tons, a decrease of 8381 tons, and shipments at 236,109 tons, a decrease of 8484 tons.

BUFFALO

The oven output still shows a falling off. Prices at rock bottom, with little prospect of any improvement.

There is no upturn yet to the coke market. Coal dealers are discouraged and are giving coke a wide berth. So many furnaces are idle that the prices are controlled by the consumers, which means that they are at the bottom. All reports from the oven districts agree that the output is not increasing, and in many cases it is falling off. Prices remain on the basis of $4.25 for best 72-hr. Connellsville foundry, with $3.30 for stock coke.

MIDDLE WESTERN

INDIANAPOLIS

A better price for screenings. Operators selling mine-run in place of steam lump.

The only feature in the Indiana coal situation that is changed is a better price for screenings. The minimum price now seems to be 40c., as against 30c. the last several weeks. Operators are not sure about the influences that have brought this about, but they feel that they themselves have been a factor. They managed to induce some railroads and other large buyers to switch from lump to mine-run, and they are apparently satisfied with the change. This, together with a less pressing demand for domestic lump, has reduced the accumulation of slack, with the result that there is less now on the open market, and buyers have had to bid higher for it. It had sold down to 25c., the lowest in the history of the Indiana field. A year ago screenings were selling at 75c. and 80c. Operators are still of the opinion that the Keokuk dam has something to do with the generally lessened demand for coal. The consumption cut off by the great water power has to be sought elsewhere and competition is sharpened. Mining and retail prices are generally unchanged and mines are on half time. Summer weather still prevails.

Retail prices are as follows:

Anthracite, chestnut	$8.25	Raymond, lump	$4.50
Anthracite, stove and egg	8.00	Winifred, lump	4.50
Anthracite, grate	7.75	Hocking Valley, lump	4.50
Pocahontas, forked lump	6.00	Luhrig lump	4.50
Pocahontas, shoveled lump	5.50	Luhrig washed egg	4.75
Pocahontas, mine run	4.50	Cannel	6.00
Pocahontas, nut and slack	3.75	Linton No. 4 lump	3.50
Blossburg	5.50	Linton No. 4 egg	3.50
Jackson (Ohio)	5.25	Sullivan No. 6	3.50
Kanawha, lump	4.50	Indiana washed egg	3.50
Kanawha, egg and nut	4.25	Brazil block	4.50
Pittsgurg, lump	4.50	Connelsville coke	6.00

ST. LOUIS

A declining market. Mild weather and practically no demand. Outlook generally discouraging.

There has been a continually declining market during the past week, both as to prices and demand. An unusually mild month thus far has upset all the expectations of the coal trade, and everything seems to have gone wrong. There is practically no demand in the city for coal in a domestic way, and steam business is off about 50 per cent. In some respects, this is due to a general business depression, and also to the mild weather. It is customary, at this season, to ship a large tonnage to the South for cotton gins, etc., but the movement this year is slow.

The situation is particularly bad in the Standard districts, where screenings have been selling for as low as 10c. and lump for $1. The only relief is cold weather and plenty of it, and even this may not bring the market into the condition it ought to be at this period of the year.

Anthracite still continues in fairly good demand, with nothing moving in the way of smokeless.

The prevailing circular is:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump		....	$1.30	$1.05@1.15	$1.15@1.20
3-in. lump		....	1.40		
6-in. lump	$1.50@1.85	....	1.50	1.25@1.35	1.30@1.35
Lump and egg	1.85@2.15	$2.25			1.35
No. 1 nut	1.25@1.40	....		0.75@0.80	
Screenings	0.25@0.40	....	0.80@0.85	0 10@0.20	0.20
Mine-run	1.05@1.10	....		0.75@0.80	
No. 1 washed nut	1.50@1.60	2.25	1.50	....	
No. 2 washed nut	1.20@1.30	....	1.35	....	
No. 3 washed nut	1.05@1.10	....		....	
No. 4 washed nut	1.00@1.05	....		....	
No. 5 washed nut	0.15@0.25	....		....	

KANSAS CITY

Coal has been moving slowly, both for domestic and steam plant use. Winter season is late.

The seasonal movement of coal in Kansas City continues to be postponed, due to the delayed winter. Before the middle of October last year, there had been two weeks of really cold weather, but this year there has not been even a frost. Domestic prices are generally unchanged, as are steam grades also, and unless sufficiently prolonged cold weather comes soon, there will be a break in the market for slack. There are no large stocks of coal on hand with either dealers or consumers. Illinois sales have fallen off markedly from the previous week, and there is considerable coal now threatened with demurrage.

Coal Contracts Pending

Contract No. 2—Norfolk, Va.—The United States Government is in the market for 200 tons of bituminous coal for use in waterway improvement work. Bids opened Oct. 12 were as follows: Pocahontas Fuel Co. (14,850 B.t.u.), $2.63. Castner Curren & Bullitt, (14,600 B.t.u.), loading at city pier: Lump, $3.545; mine-run, $2.545; for loading at Lamberts Point: Lump, $3.545; mine-run, $2.59. New River Coal Co. (14,800 B.t.u.), $2.55. Smokeless Fuel Co. (14,800 B.t.u.), $2.53. C. G. Blake Co. (14,850 B.t.u.), $2.55. Nottingham & Wrenn Co. (14,800 B.t.u.), $2.58. Chesapeake & Ohio Coal & Coke Co. (14,850 B.t.u.), $2.59 trimmed and $2.57 not trimmed. Johns Bros. (14,800 B.t.u.), $2.53. All communications should be addressed to E. Eveleth Winslow, Lieutenant Colonel of Engineers, United States Engineer Office, Norfolk, Virginia.

Contract No. 4—Boston, Mass.—Rhode Island Co. is in the market for 90,000 to 100,000 tons of Pocahontas, New River, Georges Creek, or Somerset run-of-mine. Shipments are to be made in about monthly proportions for a year, and the point of delivery is Providence, R. I. All communications should be addressed to E. H. Raquet, Engineer of Tests, South Station, Boston, Massachusetts.

Contract No. 6—New York—The Connecticut Co. is in the market for 22,000 tons of a good grade, low volatile, low ash, low sulphur bituminous coal for 10 months, Nov. 1, 1914 to Sept. 1, 1915. Shipments are to be as required f.o.b. boats, to be placed by the company at New York loading ports. Bids should be submitted to J. H. Sanford, Purchasing Agent, New Haven, Connecticut.

Contract No. 7—Zylonite, Mass.—The Berkshire Street Railway Co. is in the market for 21,000 tons of a good grade, low volatile, low ash, low sulphur bituminous coal for 10 months, Nov. 1, 1914 to Sept. 1, 1915. Shipments are to be as required and price to be made f.o.b. cars at mines for Tunnel Power plant at Zylonite, Mass., B. & A. R.R. Bids should be submitted to J. H. Sanford, Purchasing Agent, New Haven, Conn.

CONTRACTS LET

Contract No. 5—Boston, Mass.—The New York, New Haven & Hartford R.R. closed a fuel contract this week of about 350,000 tons for delivery at Boston and at Providence with the New England Coal & Coke Co., it is understood, on Davis Coal & Coke Co.'s Elk Garden coal.

FOREIGN

Guayaquil, Ecuador, South America — La Compania de Alumdrado (Lighting Company) is in the market for 3500 tons of gas coal. Prospective bidders should state the specific gravity, weight per cubic foot, and space occupied by one ton of gas coal. Give approximate analysis including moisture, fixed carbon, sulphur and ash, and a commercial analysis showing the gas per ton of coal, gas per cubic foot of coal, illuminating power of the gas in standard sperm candles, value of one cubic foot in grains of sperm, sperm value per ton of coal, coke per ton of coal (good quality), coke per cent. of coal, ash in coke, sulphur eliminated with the volatile products, sulphur in the coke, tar per ton of coal. Quotations should be c.i.f. Guayaquil. Address The Manager, Compania de Alumdrado, Guayaquil, Ecuador, South America.

South America—An American consular officer in that country has transmitted detailed information relative to tenders which will be received, until Nov. 1, for the supply of coal for government steamer service. American coal dealers who are interested should apply to the Bureau of Foreign and Domestic Commerce, mentioning item No. 14,016 for the reserved information.

South America—Supplementing a previous notice, the Bureau of Foreign and Domestic Commerce at Washington states that details regarding a certain inquiry from South America have been forwarded to the department, and that complete information, including blank forms on which to submit bids for supplying coal under the conditions specified can be had on application. All inquiries should mention item No. 14,048, and be addressed to the Bureau of Foreign and Domestic Commerce, at Washington, D. C.

Santiago, Chile, S. A.—Bids are wanted on 300,000 tons of coal a year during the next three years, according to press reports. The coal is to be used on the Chilean Railway. All communications should be addressed to the Department of Materials, Santiago, Chile, S. A.

Latin America — An American minister in Latin America has transmitted, by telegram, information relative to the coal market in his district. Full particulars may be had on application to the Bureau of Foreign and Domestic Commerce and its branch offices, referring to item No. 14,133.

PRODUCTION AND TRANSPORTATION STATISTICS

NORFOLK & WESTERN RY.

The following is a statement of coal handled by the N. & W. Ry. during September and the past four months of the current year in short tons:

	June	July	August	September
Pocahontas Field	1,245,440	1,314,478	1,277,621	1,390,531
Tug River District	244,342	263,240	293,179	295,332
Thacker District	261,248	288,643	286,572	295,776
Kenova District	97,352	100,600	105,724	110,158
Clinch Valley District	156,028	140,751	134,408	158,393
Other N. & W., Territory	2,337	2,735	4,211	4,781
Total N. & W. Fields	2,006,747	2,110,447	2,101,715	2,254,971
Williamson & Pond Creek R.R.	76,822	90,819	91,813	85,053
All other railroads	232,387	301,796	257,280	169,892
Grand total	2,315,956	2,503,062	2,450,808	2,509,916

Distributions of shipments for August and September compare as follows:

	August			September		
	Shipped	Tipple	Total	Shipped	Tipple	Total
Pocahontas	1,208,245	14,573	1,222,818	1,225,197	16,952	1,242,149
Tug River	289,223	3,956	293,179	292,570	2,762	295,332
Thacker	232,234	9,377	241,611	246,980	9,057	256,037
Kenova	94,494	11,230	105,724	99,941	10,217	110,158
Total	1,824,196	39,136	1,863,332	1,864,688	38,988	1,903,676

Shipments of coke, entirely from the Pocahontas field, amounted to 58,266 tons in August as compared with 18,734 tons in September.

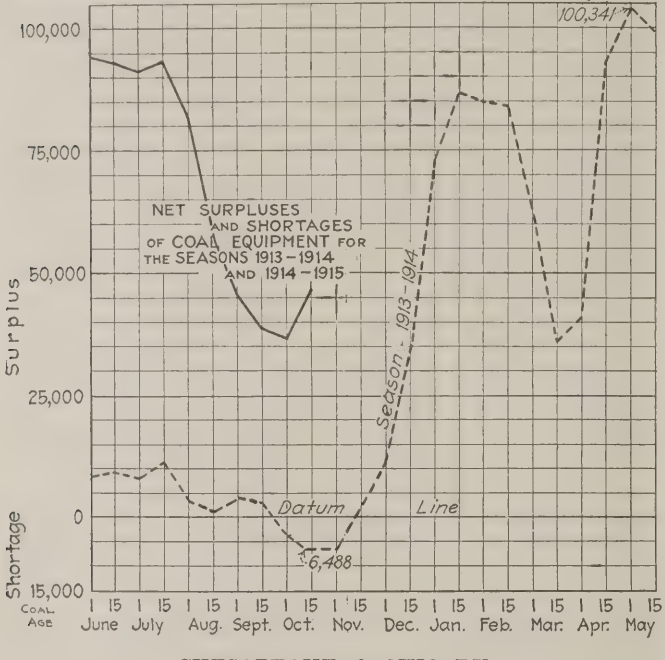
Destination of shipments over this road for September and the first nine months of this year and last year were as follows in short tons:

	September		Nine Months	
Coal	1913	1914	1913	1914
Tidewater, foreign	107,814	331,205	1,236,387	1,587,552
Tidewater, coastwise	295,402	347,571	2,892,968	2,917,784
Domestic	1,911,662	1,828,140	14,323,918	15,474,771
Coke				
Tidewater, foreign		142	27,199	339
Domestic	137,204	58,970	1,204,236	807,104
Total	2,452,082	2,569,028	19,684,708	20,787,550

PENNSYLVANIA R.R.

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for September and nine months of 1913 and 1914, in short tons:

	September		Nine Months	
	1914	1913	1914	1913
Anthracite	996,528	813,394	8,149,935	7,665,020
Bituminous	4,291,425	4,378,037	36,112,774	37,774,323
Coke	736,261	1,127,951	7,603,937	10,859,413
Total	6,024,214	6,319,382	51,866,646	56,298,756



THE CAR SITUATION

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended Oct. 15, as follows:

	Surplus	Shortage	Net*
New England Lines	492	0	**492**
N. Y.; New Jersey, Del.; Maryland; Eastern Penn.	5,249	20	**5,229**
Ohio; Indiana; Michigan; Western Pennsylvania	20,826	0	**20,826**
West Virginia, Virginia, North & South Carolina	5,819	185	**5,634**
Kentucky, Tenn.; Miss.; Alabama, Georgia, Florida	4,206	0	**4,206**
Iowa, Illinois, Wis., Minn.; North & South Dakota	5,717	0	**5,717**
Montana, Wyoming, Nebraska	584	10	**574**

Total	2,106,083	100	1,667,167	100	3,907,312	100	3,059,441	100
Coke	21,181		26,723		46,214		56,668	

BALTIMORE & OHIO

The following is a statement of coal and coke tonnage moved over this system and affiliated lines during July, August and September of this year and last year:

	July		August		September	
	1914	1913	1914	1913	1914	1913
Coal	2,594,407	2,938,723	2,769,453	3,295,123	2,878,963	3,001,733
Coke	255,650	391,485	242,283	391,999	237,661	387,704
Total	2,850,057	2,330,208	3,011,736	3,687,122	3,116,624	3,389,437

FOREIGN MARKETS

ENGLAND

Business slow and unsatisfactory. War Department taking all the Admiralty coals. The problem of the unemployed.

The London coal market is still moving very slowly. House coals are accumulating, and manufacturing qualities are not selling so freely. Slacks and small nuts have been over-plentiful, and prices are considerably weaker.

The present position of the coal trade is far from satisfactory. The indecisive period of the war is being prolonged beyond expectations, with the result that buyers hesitate to speculate. Shipowners are reluctant to send vessels to the mine-strewn area of the North Sea, and this has created a dearth of tonnage, and in addition to this, freight rates have kept on a high level. The Yorkshire markets are on the quiet side, and in the west a dislocation of traffic adds to the difficulties. The Cardiff position is best described as marking time. The Admiralty continue to take the whole of best Admiralty coals. Trade in Scotland is fair.

An Amsterdam telegram states that it is reported from Essen that negotiations concerning the renewal of the coal combination have come to a complete standstill. The period within which unaffiliated companies might join expired on Oct. 1, but the term has been extended.

The South Wales Miners' Federation express dissatisfaction with the results of the Parliamentary Committee's request for a special congress on the inadequate provision for the families of soldiers and sailors and the need for a state scheme dealing with unemployment. They have decided, failing assent of these bodies, to call on the Miners' Federation Council to summon a national conference of unions.—"The Colliery Guardian."

Oct. 16—Admiralty List coals are in good demand and prices are firmer. Dry coals also meet with a ready sale, but Monmouthshire descriptions are in good supply and values are unimproved. Cardiff small steams still offer cheaply. Quotations are approximately as follows:

Best Welsh steam	$5.04@5.28	Best Monmouthshires	$4.02@4.08
Best seconds	4.56@4.80	Seconds	3.84@3.96
Seconds	4.32@4.44	Best Cardiff small	1.92@1.98
Best dry coals	4.80@5.04	Seconds	1.32@1.56

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, exclusive of wharfage and for cash payment.

Freights—Chartering is a little busier, there being a better demand for tonnage. Rates are approximately as follows:

Gibraltar	$1.68	Venice, Ancona	$2.88	Singapore	$2.64
Malta	1.68	Alexandria	1.92	Las Palmas	1.68
Marseilles	1.76	Port Said	1.86	St. Vincent	1.80
Algiers	1.56	Aden	2.40	Rio Janeiro	2.88
Genoa, Savona	1.92	Colombo	2.46	Monte Video	2.52
Naples	1.92	Sabang	2.46	Buenos Ayres	2.76

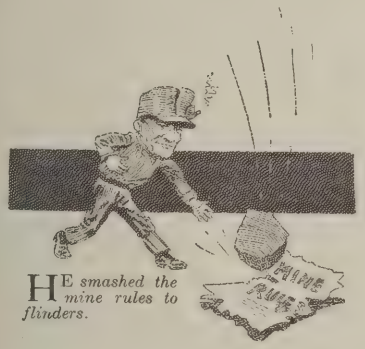
GERMANY

Shortage of miners and production heavily curtailed. Car supply also restricted and irregular. Requirements are still being met, however, and the market is relatively easy.

Reports from the Rhenish-Westphalian coal market show great improvement. It is only a few weeks since the pits not belonging to the syndicate stated that the mining output had sunk to a little more than one-half normal owing to the reduction of about 65% in the operating force. In addition, the irregular, insufficient and, at times, altogether failing transportation service, made frequent holidays necessary. While on the one hand, coal users were clamoring for delivery, the demand for coke had ceased and large stocks were accumulating, even with the greatly diminished production.

Within the last few days conditions have shown a great change for the better. A large demand has appeared since the opening of railway service. Shipments are being made even to the Lower Rhine by rail. All the lump coal continues to be taken for the navy, exclusively so that the demand for this size has been diverted to other grades. The demand for small sizes is very urgent, and the mines are so fully provided with orders that it is impossible to satisfy them, even approximately.

The railways are well supplied and, in some instances, cancellations have been received from this quarter. Gas coals are scarce and it is hard to fill orders promptly. A fair demand for coke has sprung up, and important orders are confidently looked for from the Luxembourg blast furnaces, now that the railway service is about to be resumed in that section. The call for briquettes has slackened. Car conditions leave much to be desired, still only about 50% requirements be alloted. The embargo on exports of coal, coke and briquettes is now restricted to marine sizes. Rhine shipments by boat are subject to indefinite and prolonged delays at loading and discharging points.



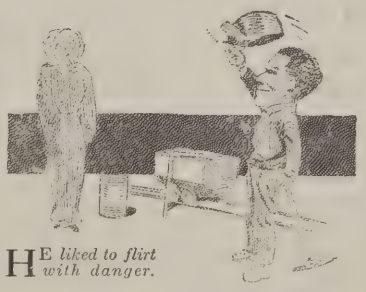
The Coal Syndicate and the Dealers Association claim they are filling all existing contracts without any change in prices but they demand more on new orders or increased quantities. On the other hand, it is said that deliveries on contracts are slow.—Translated from the "Frankfurter Zeitung."

COAL AGE

Vol. 6 NEW YORK, NOVEMBER 7, 1914 No. 19

THE DARE-DEVIL

Written expressly for COAL AGE
By MICHAEL BERNARD



HE *smashed the mine rules to flinders.*

HE regarded with flagrant and mighty contempt
All the rules for his better protection,
And he smashed them to flinders whenever he dreamt
That his acts were not under inspection;
For he felt that a babyish care was displayed
In the way that the laws had been modeled,
And because he had long passed the infantile grade
He despised being pampered and coddled.

He was callous to pain and impassive to hurt,
While to fear he was absolute stranger,
And it added a zest to his labor to flirt
With the witching allurement of danger.
So he pulled out his pipe and he filled up the bowl
For a smoke, when the hankering seized him,
And he rammed down a charge in the depths of a hole
With the end of a drill if it pleased him.

He became very skillful in bouncing a trip,
For it saved him the trouble of tramping;
Setting safety aside, he continued to slip
Coal-dust into the holes he was tamping;
He persisted in keeping and carrying caps
Loosely thrown in the box with his powder;
And the fact that he missed any ugly mishaps
Made his dare-devil spirit grow prouder.

He had bragged to his fellows, again and again,
That his luckiness never forsook him,
But he trifled with fate once too often, and then
The expected result overtook him;
For he lifted a stretcher to hook up a mule
With whose temper he wasn't acquainted
And the angels foregathered to welcome the fool
To the blissful abode of the sainted.

HE *liked to flirt with danger.*

Where Coöperation Is Most Essential

THE THREE WATCHWORDS OF PROGRESSIVE MINING ARE: *Safety First, First Aid and Co-operation. When we consider these slogans in their relative importance, we are reminded of the three Christian virtues, Faith, Hope and Charity, and in like manner we are moved to the conclusion that the greatest of these is co-operation.*

o o o

The great importance of co-operation in first aid and safety first movements is quite apparent—forming as it does the very foundation of these life-preserving methods

We are being constantly reminded, also, how essential to a successful outcome is co-operation between mine superintendent, foreman, fireboss, and even to the man at the face.

This is all very good and true, but such an excellent rule as this should readily work up as well as down, and why shouldn't it be equally as important that the heartiest co-operation exist between the operating and sales departments of our large mining operations?

There is scarcely a mine superintendent today, but who could make some interesting remarks concerning the inconveniences frequently inflicted upon him through lack of harmony between the men "higher up." Furthermore, by reason of the subordinacy of his position to each of these men, he is obliged to change carefully worked out plans of procedure to suit the foibles of one or the other.

An incident of this nature occurred recently in a Southern coal and coke operation, which threatened to disrupt what was apparently a well-organized force of employees.

The sales manager upon receiving several complaints as to the quality of coke being furnished a contract customer, attempted to adjust matters by securing a number of samples of the coke in question; these he sent to the superintendent in charge of coke operations, with a request for an investigation and report.

The superintendent, in turn, submitted the samples to the chemist who informed him that he was under strict orders from the head of the operating department to do no work for the sales departent without written orders from him.

When this information was reported to the sales manager, he became indignant over the curtailment of his authority in this direction and, rather than suffer the humiliation of asking for a permit to have the investigation made, came back with renewed vigor on the defenceless and ever-ready-to-please superintendent, demanding that the quality of the coke be improved.

The superintendent, in an effort to remedy the trouble without the aid of his chemist, used only certain coals for this coke and by so doing, threw completely out of balance the adopted system for charging the ovens, decreasing the yield, increasing the cost and placing himself in general disfavor with the operating manager.

After much parleying the old system was reinstated, the superintendent sternly disciplined and the contract eventually lost.

This may appear to be an extreme case, but it proves that the little green-eyed devils of jealousy and envy are not confined entirely to the underground workings of a coal mine, and that it is just as essential that they be abolished from the general office as from the plant itself, if complete success is to be attained.

One company of the Middle West overcame this difficulty by making the head of their sales department assistant to the head of the operating department. In this way they each realized how dependent the success of their respective departments was one upon the other. Each sought the other's counsel in all new enterprises and crises, and the harmonious effect was felt throughout the whole system.

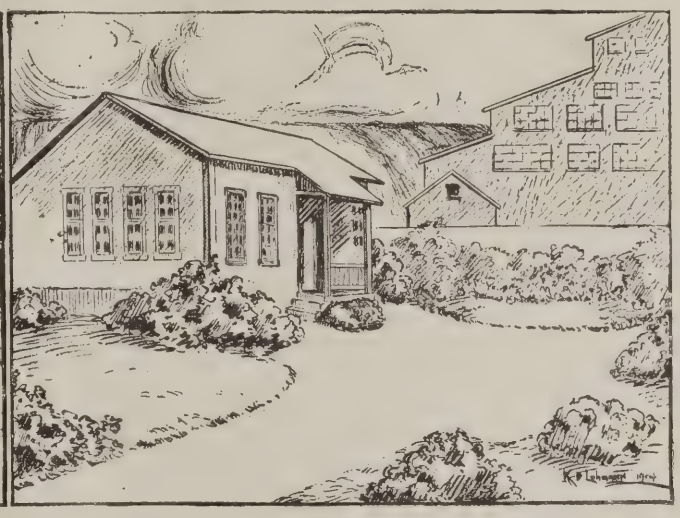
Let the "get together" spirit prevail from the president's office down to the humblest trapper boy—then watch results.

Improving Colliery Surroundings in Anthracite Region

By Karl B. Lohmann*

SYNOPSIS—There is no good reason why colliery plants should be blots on the surrounding landscape. By the aid of cleaning, painting, placement of paths, and the planting of shrubs and flowers, much can be done to reclaim the appearance of mining communities.

It was not very many years ago when the mountains of the anthracite coal region were clothed in virgin timber and the streams that flowed along their valleys were clear and unpolluted. Our ancestors fished, hunted and lived amidst that undefiled natural scenery. Within the past half century, however, the aspect of the country has changed considerably. Villages, towns, cities have sprung up, and in them or near them the tremendous coal breakers tower in the air, looking out over sulphurous streams and desecrated landscape.



The damage brought about by the introduction of the coal breaker and its workings into the anthracite region is obvious, and the owners cannot help but feel their duty toward the community in the way of some reparation through reclaiming in part, at any rate, the surrounding landscape. This may do at least in the immediate vicinity of the mines.

Voluminous coal dust in connection with mine operation has been of great detriment to the communities, but lately the installment of dust-prevention systems has been a first step in the right direction toward the improvement of breaker surroundings. But in general the colliery yard remains sunbaked, bleak and unsightly.

The question comes up, therefore, how the hard-coal companies may restore unto the landscape and unto their own grounds, beauty and pleasantness of appearance, such as is now being accomplished in other manufacturing industries throughout the country.

Before Improving

After Improving

The Susquehanna River is an example of this condition. As a result of the sulphur issuing from the mines, 50 miles of the most beautiful portion of this river has been bereft for the most part of its game fish. The once charming Lackawanna is another example, and now passes through the city of Scranton as a malodorous stream, and positive menace to the citizens of that municipality.

Not only has the sulphur been destructive, but deposits of coal in the river bottom have helped greatly to cause annual floods at Wilkes-Barre, Penn., that have wrought and still bring with them great destruction of property.

Blots on the Landscape

The landscape also has suffered. Cave-ins have become so common that one scarcely ever hears them talked of anymore. Here and there over the landscape one sees the bleak mountains of culm, which not only offend the eye, but are charged with great carbonic heat that renders it doubly uncomfortable for people in hot weather who live near them. Furthermore, they are easily windswept, at which times they cloud the air with coal dust.

"Ridding-Up" and Painting

In the first place, there must be a general "ridding-up" of the grounds. Débris and all unnecessary refuse naturally must be removed and all of the surroundings of the buildings cleaned and put in order. After that is done, the buildings ought to be whitewashed where practicable, or given some neutral tone of coloring. The former seems most desirable around the mines, even though it would soon fall into disrepute perhaps among highly artistic circles. Whitewash seems to please the eye of the miner, either because it signifies cleanliness, or else beauty of contrast in its whiteness as opposed to the darkness amidst which he labors.

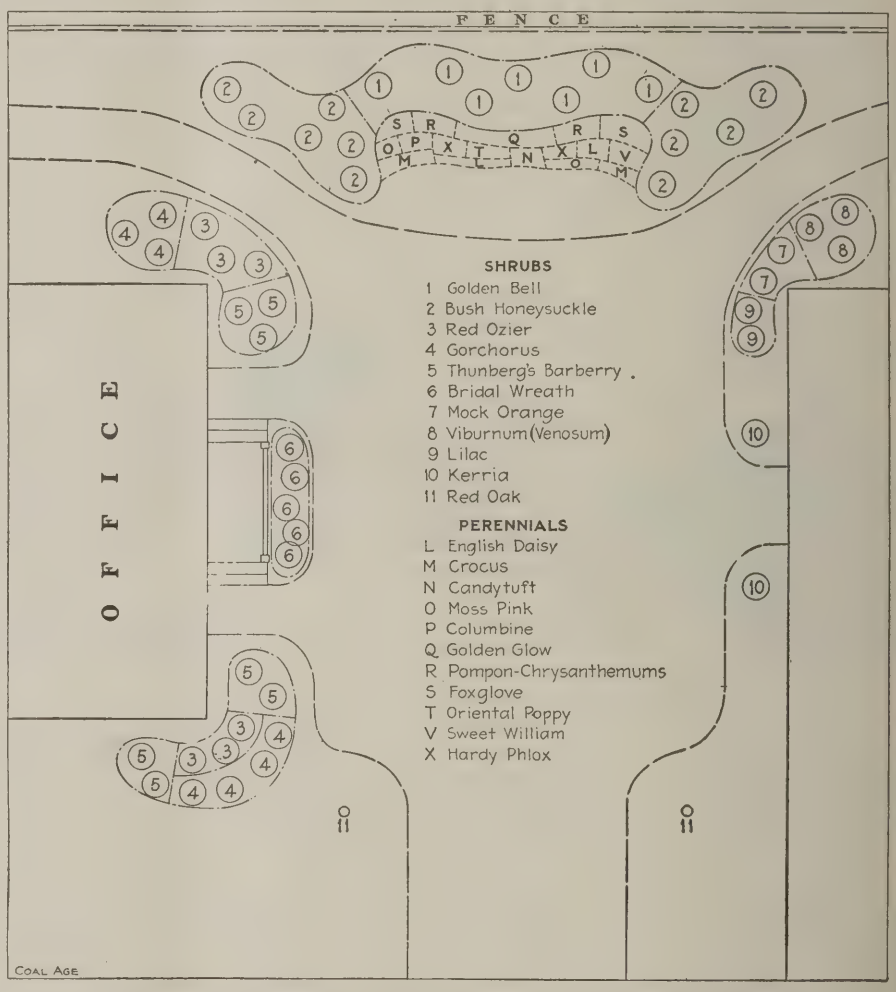
Roads and Paths

After cleaning and painting up, the next step on the breaker grounds is the placement of paths and roads. This is important and is a provision which a large number of companies have unfortunately failed to consider. At first thought it is easy to understand just why they

*Landscape architect, Wilkes-Barre, Penn.

have not. To see hundreds of different men crossing as many different imaginary paths it would seem impossible to provide for them definite ways of travel. But it is not impossible in the least. There are a few commonly traversed areas when one comes right down to the study of it, and if pathways were provided for these, they would contribute not only to the appearance of the colliery yard, the appearance of systematic orderliness, but also to the convenience, comfort and safety of the men.

As an example of the safety provision of paths, one might note the efforts that have been made at the Mineral Springs colliery, of the Lehigh Valley Coal Co., near Parsons, Penn. At that colliery the Lehigh Valley has expended a large amount of money to construct a wall and a path down over an incline just for the purpose of directing the stream of employees across one track instead of several, as before. A great deal could be accomplished in this problem of intelligent path and road construction with colliery yards.



Vegetation Possibilities

One of the most vital things to be done in the surroundings of the mines, the highest and the most important step of all from an æsthetic point at least, is the bringing in of vegetation. This is an undertaking which is now being attempted successfully. Here and there at various collieries, it is true, little patches of lawn and pathetic clumps of flowers have been tried with fear and trembling as if doubting the propriety of the undertaking. The Prospect and the Mineral Springs collieries, belonging to the Lehigh Valley Coal Co., have made the most extensive attempt of any, however, and in their efforts may settle for other collieries the appropriateness of landscape improvement.

"If placed in colliery yards, has the vegetation any chance of growing?" is a natural question that comes to most minds. I have seen little beds of flowers persisting even in the clouds of some of the dustiest breakers. With the new systems of dust prevention, therefore, there is no question whatsoever of the possibility for growing things. It will mean, of course, in many instances the using of a few loads of loam, to be mixed on the grounds with mine manure, all at little expense. It will mean but very little maintenance after once started if proper advice is followed in the choice of plants in general. And it will mean a world of difference in the appearance of all surroundings.

"Why will it mean just this?" someone has asked, and we answer by saying, that to bring vegetation into the colliery yard is to relate the yard to the surrounding landscape, from which it has been so long divorced. That may sound technical and difficult, but it signifies no more than the actual truth.

Furthermore, will not someone wonder if the flowers, shrubs, grass, etc., would be trampled down by the men? At the Prospect Colliery already mentioned, I found that there never had been the slightest trouble of this kind. Instead of trampling down the flowers, the employees have taken a tender pride in them. During idle moments of the day, when the miners were waiting between shifts, they often took care of the flowers and some of them have even brought plants from their own gardens. Also, the men are known to come before the hour of work just to be near these little grass plots and flowers, which form for them a pleasant rendezvous.

General Scheme for Beautifying Colliery Grounds

Planting Shrubs

When bringing in vegetation for planting, the first thing to do is to select the area where it is to be placed. It may be that shrubs will be wanted along the paths, perhaps a couple of trees here or one or two there. It may be that shrubs ought to be placed near the outlying structures. The arrangements of the breaker grounds are such that nature rather than geometrical forms ought to be followed where practical in the working out of the scheme. Let the shrubs hide the foundations of the outside property buildings, let them inclose areas of grass, bound paths, mark entrance-ways, and offer themselves purely for individual or collective beauty.

Granted that areas for vegetation have been chosen, the first step is to prepare the ground of those areas preparatory to the planting. If the soil is of a clay nature, then plowing, harrowing and manuring are necessary. If

the soil is made up of culm principally, then new soil will have to be used. The depth of ground thus needed will vary. For ordinary grass suitable around breaker grounds, not much depth of loam will be necessary, but for the areas where shrubs and flowers are to be placed, at least eighteen inches of good soil should be put in.

The Choice of Plants

After the soil has been put into condition, it is ready for the plants, most of which may be introduced either in the fall or in the spring of the year with equal success. Now, the question comes up about just what sort of vegetation should be used. In one or two of the breakers they have attempted to grow annuals of brightly shining colors. Somehow they seem pleasantly appropriate for the miner who emerges from the darkness. Yet why this kind of plant should always be grown to the entire exclusion of perennials and shrubs in breaker yards is simply a matter of habit and lack of knowledge in the use and possibilities of other materials.

In the first place, annuals, beautiful though they may be, require reseeding every year and their lease on life is comparatively short. Shrubs, for example, have body to them and display their beauties not only in the summer season, but in the winter as well, and present charm of color and of branching habit. Yet shrubs would not be a substitute altogether for annuals by any means. They have their own functions to perform.

Perennials, however, are flowers that offer untold beauties and advantages for use in breaker yards. They do not require reseeding every season like the annuals that are in such general use, but rather they continue to grow annually more and more beautiful and they are in bloom from early spring until late fall if intelligently chosen.

The Planting of Culm Piles

There is one part of the colliery property where vegetation should find valuable use and that is upon culm piles. Except where they are to be removed immediately there is no good reason why they should not be covered with vines and all sorts of plants, and, in some instances, good grass, as in the case of the Mineral Springs Colliery heretofore mentioned.

With little trouble and expense, a thin layer of loam is raked into the side of the culm bank. It is surprising what a small amount of soil is necessary for all kinds of plants to take root immediately. But in addition to the used loam, "pockets," or wooden boxes are filled with good earth and then planted with a few hundred Virginia creepers, black alders, etc., or almost anything else growing nearby in the wild. Moreover, if trees as well as shrubs be planted informally about the base of the culm pile, a magical change will be wrought in every desert mountain of black refuse that is so treated.

Conclusion

Therefore, it seems that by the aid of cleaning, painting, placement of paths and roads, and the planting of trees, shrubs and flowers, much can and has been done to reclaim the appearance of the mines and surroundings with a minimum amount of cost, while incidentally restoring values of abutting property and helping in the uplift of the men.

Here and there at different mines one will discover a mere piece of grass or bunch of flowers carefully nurtured by a circle of miners. Who will fail to answer the call for more grass and more flowers? Who will deny for his community and for his men the best possible surroundings?

The day has arrived when the larger coal companies especially are exerting every effort for the betterment of colliery surroundings, from an ethical as well as practical standpoint. Their action in such direction is noteworthy, and the time is ripe when their broadening operations for improvement will include the feature of practical and æsthetical landscape architecture.

Coroner's Inquest at Mulga Explosion

The report of the coroner's jury regarding the Mulga mine explosion is dated from Birmingham, Ala., Oct. 12, 1914, and is as follows:

Inquest over the remains of Ed King, C. R. Combell, John Zalemski, Bob Dupion, Joe Malcoskie, Wilet Pilcoskie, John Krativick, white; Scott Garret, Warren Whatis, Hamp Swanson, Cory Howard, W. M. Long, Joe Bragdon, Bert Webster, Tom Mitchell and Sam Chatman, colored.

Caused by an Open Door

We, the jury duly impaneled by the coroner of Jefferson County, on the 12th day of October, 1914, to inquire into the cause of death of the above mentioned, who were killed at the Mulga mines, Mulga, Ala., on Oct. 5, 1914, having diligently investigated said cause, and having taken all the testimony obtainable, agree that the deceased came to their deaths by an explosion of gas at Mulga mines, Oct. 5, 1914, which occurred because the trap door in the eighth right heading was broken down and was not replaced for a period of approximately one hour. The air was short-circuited, causing an accumulation of gas in the eighth and ninth right headings and rooms. There were men working in these places with naked lights, and the accumulated gas coming in contact with the flame caused an explosion, which resulted in the death of the aforesaid parties.

Employees Broke Down Door

We find that the trap-door was knocked down by a carload of ties attached to an empty trip in charge of Ed Lee, colored, motorman, and Jackson Rodgers, colored, trip rider. This motorman, Lee, and trip rider, Rodgers, were not the motorman and rider who went into the eighth right heading regularly, but were only placing the carload of ties, which were for use in that entry. The trapper boy at the door on that heading wanted to open it, but the trip rider, Rodgers, told him he was not going through, so the boy need not bother to open the door. But Rodgers must have miscalculated the distance, as we find that the car of ties crashed into the door and broke it down, frame and all, thereby short-circuiting the air and depriving the said eighth and ninth headings of the necessary amount of ventilation to remove the gas which was being produced in said workings.

Company Censured for Failing to Act

Therefore, we, as jurors, consider that as the ventilation of said eighth and ninth headings was cut off and impaired, we condemn the action of the company officials for not taking proper precautionary measures to safeguard the lives of the workmen in said eighth and ninth headings by calling them out from the danger zone in said headings until such time as the circulation of the air was restored and was again such as to make it safe for the men to continue working in said eighth and ninth headings.

Therefore, in view of the foregoing verdict, we, as jurors, recommend that in all mines generating gas, overcasts be put in as soon as practicable, on all headings, and the use of trap-doors be discontinued as far as possible. We also recommend that when the air is short-circuited or the ventilation of any mines impaired so that there is danger to human life, the management call the men in said mines to a place of safety.

We also recommend that in all mines generating gas, the fire boss examine the working places so frequently that no more than three hours may elapse between the times when the place is examined and when the working man goes to work.

JOHN GUTHRIE, M. J. SHENLIN, WILLIAM MUIR, SAM BRODIE, JOE HOSKINS, JAMES LIDDELL. C. L. SPAIN, Coroner of Jefferson County.

Coal Prospecting

By J. F. K. Brown*

SYNOPSIS—The opening of coal measures in a new country or one remote from railroad connections is accomplished only under difficulties. Although the first expense of the project may appear high, it is money well spent to provide abundant supplies of all kinds at the start, so that the work or any part of it may not be "hung up" for lack of some necessary fitting or appliance insignificant in itself.

Herein is discussed only that part of prospecting which deals with the assembling of the plant and accessories necessary to commence operations. What is written and described is out of some years' experience in this class of work, in many out-of-the-way situations.

There are companies who take their prospecting seriously and go into details thoroughly. There are others who have the habit of ordering their men to carry out work miles from any operating base, with second-hand equipment. There are still others who only calculate the cost of the main pieces of equipment needed, forgetting that the sundry items in many cases come to at least half the amount paid for hoist, boiler, compressor, etc., if not to more.

This shows that there are several points which it is important to keep in mind, when such work is being considered. They are mainly never to use for prospecting any second-hand equipment. This should be kept in mind as more particularly referring to pumps. Secondly, insist that the list of material made out by you as necessary, be shipped exactly as you have ordered it, before you leave for the scene of operations. If the concern cannot afford to purchase what is required, or the ordering is hung up by an ignorant office staff, anxious to justify its existence by reducing expenses, then it were better that the work had never started.

The conditions to which the details entered into hereafter apply are considered somewhat exceptional for coal work, but any figures given must be taken as covering only this particular locality, since probably no two prospects are ever sufficiently alike to allow of exact comparisons.

It is, therefore, understood that all the prices given, hereafter, with the exception of figures on timber, that being native grown, are f.o.b. point of purchase. This will enable many young engineers to have a commencing point in their own calculations, and give some idea of the class and amount of material needed, and the expense thereof. The list is fairly complete, but estimated cost can be varied according as to whether bedrock prices, or hardware merchants' figures must be paid.

The area in question was held under an unlimited option, on which, however, a monthly rental of a fairly heavy character was payable, so time meant money. The mineral to be opened was coal, of a thickness at the outcrop of 10 ft., but dipping at an angle at the surface of at least 60 deg. A shaft was sunk on the coal, to be afterward used as a ventilation opening, which shaft was made almost the full height of the seam and of a width of 10 ft., coal being left on the foot wall. The water encountered averaged 100 gal. per minute, but in the spring and fall went as high as 150 gal.

The situation of the proposed mine was 10 long miles from the nearest railway station, with a heavy climb for at least seven miles over woods roads, which in the wet periods were impassable for a heavily loaded wagon. From the station the nearest foundry and machine shop was 10 hours' travel distant. In winter, communication was many times interrupted because of snow storms, up to ten days at a time.

Operations were commenced in the midst of thick timber of small second growth, and at the end of a hot summer. Good timber for mining or building work had to be hauled a distance of from two to five miles. Cordwood was cut on the ground, but coal was used as soon as the surface sinking was completed. The cordwood, cut and delivered at the boilers, cost $3 per cord.

Wages were paid at the following rates per day:

Wages:			
General laborer	$1.50	Machinist	$2.20
Blacksmith	2.50	Firemen	1.75
Carpenter	2.50	Sinkers	2.50
Chief mechanic	3.20	Machine men	3.00
Chief sinker	4.00		

A sinking contractor wanted $12 per foot for the shaft, 8x10 ft.; manway, 3x8 ft.; ladders and landings

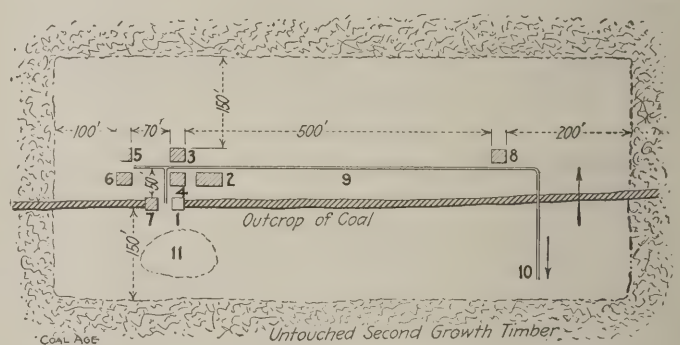


Fig. 1. Plan of Operation and Buildings

1. Shaft. 2. Compressor house. 3. Boiler house. 4. Hoist. 5. Forge. 6. Store. 7. Store (oil). 8. Magazine. 9. Fire lines. 10. Final outlet of pumped water. 11. Dump.

every 30 ft., timbering complete, he to pay timbermen and blacksmith, the company to provide all tools, timber, drills, power and explosives, and other material. The offer was refused, and the work carried out by day labor.

The prices paid for timber were as follows:

Boards	$13 to $14 per M. ft.
Heavy timber	12 to 14 per M. ft.
Shingles	1.75 per 1000
Hauling charges:	
Single buggy and driver	$3.50 per day
Double buggy	4.00 per day
Double team hauling supplies	4.00 per day
Double team with two men	6.00 per day

The weight that could be hauled depended on the shape of the material, and the condition of the roads. There was one period when equipment and fittings were scattered along the roadside for several weeks, jettisoned, owing to a storm. The usual load would approximate 1200 lb. One of the boilers was hauled 16 miles in the dead of winter, having been consigned to the wrong station. It weighed three tons, and the time spent on the road was five

*Sydney, Nova Scotia, Can.

days, during which, progress the first day, was five miles, the second day, one mile, and the third day, one-quarter mile. On this last day 8 horses, half a dozen men, and a block and tackle were required. The cost of this particular item, including the men's meals and board on the road, was $96, which worked out at $2 per ton-mile.

A Careful Plan Was Made

As the work was expected to last some time, the ground was laid out to a plan shown in Fig. 1. The surface sloped from the buildings to the shaft. For a distance of roughly 150 to 200 ft. in all directions, the ground was cleared of all trees and shrubs, and a fire-fighting system laid out, operated from the pump. Two-inch pipes were used and nozzles provided near the blacksmith shop and boiler house, the roofs of which blazed up later on, on a number of occasions.

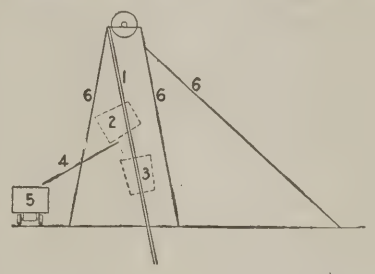

Fig. 2. Diagram of Headframe

1. Guides. 2. Bucket. 3. Bucket. 4. Chute. 5. Car. 6. Headframe timbers.

The buildings were erected at various times, and under all conditions of weather. A number were only finished by degrees, owing to the pressure of other work. Particulars were as follows:

Building	Size	Total Cost	Cost per Sq.Ft.
Compressor	24x17 ft.	$186.95	46c.
Hoist	16x12 ft.	128.12	67c.
Boiler	18x12 ft.	86.40	40c.
Forge	16x12 ft.	79.34	41c.
Store	10x 9 ft.	64.95	72c.

Owing to the dip of the seam being in toward the hill and under the buildings, the headframe was specially designed and placed to allow of hoisting from a slope the grade of which might change. A type of headframe which has been used successfully in the Cobalt district, was decided on, and is shown in Fig. 2.

A special kibble was also designed. The main object to be attained was automatic dumping in a simple fashion from a bucket which, at the same time, could be wound safely from either a vertical or inclined shaft. In the sketch, Fig. 3, the method of doing this is indicated. In hoisting the bucket slides on round timber guides of suitable length, but on coming near the landing place these guides cease, their place being taken by the outside runners, on which the horns of the bucket rest. On these runners, made of hardwood faced with iron strips, the horns move upward until they drop into the notch provided for them. Hoisting then ceases, the hoistman slacks out some rope, when the tub, lying at an angle of 60 deg., and suspended on the horns, which are well below the gravity point of the full bucket, turns sharply over and spills the contents into a chute. When empty the bucket is raised above the swing pieces fastened as shown to the side runners, and on lowering, the horns engage these side pieces, and turning them over, they form a bridge across the notch, over which the bucket slides down the runners and onto the regular guides. The swing pieces are pulled back into position by a wire spring.

This system operated quite satisfactorily, on almost all occasions, but once in a while the coal and dirt would jam in the mouth of the bucket, mainly through insufficient difference having been allowed in the width between the diameter at the bottom of the bucket, and the diameter at the mouth. On dark nights also, or when the wind was driving the steam around the buildings, it was difficult to see distinctly, and sometimes impossible to tell the exact position of the bucket, or when it was properly emptied.

In order to avoid this, the iron strips on the face of the runners were severed in two places with a saw cut, just above the tippling notch, and above the top of the swing pieces. These, as well as an iron rod at the collar of the shaft, were connected to a battery and bell of the single-stroke type. Further, a balance weight was used in the chute, onto which the bucket discharged.

When full, the bucket in turning over was heavy enough to press this down, but when empty, the balance weight forced it up. This was indicated by means of a slide in the engine room. Thus the engineer was made independent of any outside help in telling not only the position of the bucket, but also whether properly emptied or not.

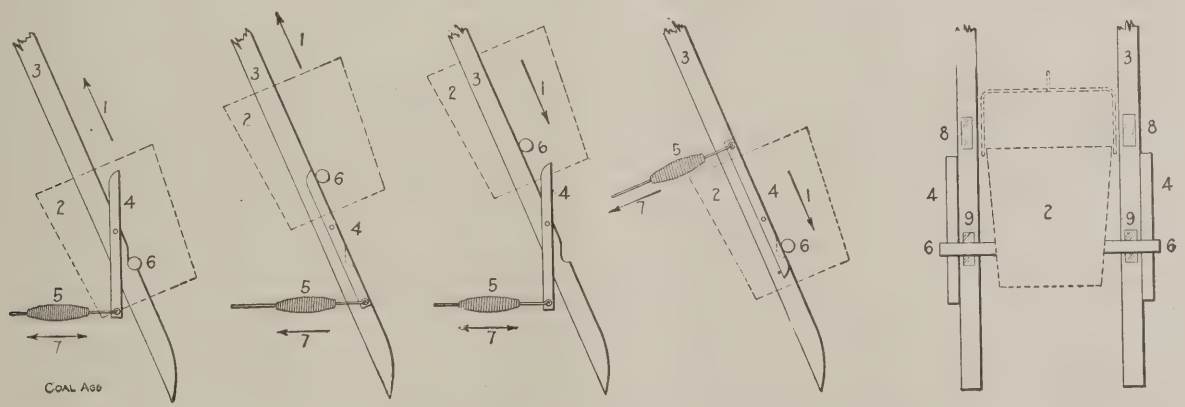

Fig. 3. The Use of Trigger and Covering Piece

1. Arrows indicating direction of bucket travel. 2. Bucket. 3. Trigger. 4. Covering piece. 5. Spring attached to covering piece. 6. Horn of bucket. 7. Arrow indicating direction of tension. 8, 8. Plates connected by wire, which become electrically connected when horns of bucket pass over them, and so indicate position in engine room. 9, 9. Ditto, for position of bucket in turning notch.

The cost of the headframe, including timber, hauling, erection and pulley, amounted to $230.19, distributed as follows:

Material	$82.69
Haulage of material	15.00
Labor	132.50
Total	$230.19

Two Dump Cars Were Built

Two dump cars were built by the carpenter on the ground out of the remains of two originally sent out with the rest of the equipment. The original cars were so heavy and clumsy that a horse was needed to pull them, and furthermore, they were only box cars without any arrangement for dumping. On their arrival they were promptly burnt and out of the wreckage two small, self-dumping, full-circle cars were evolved that proved successful and easy to operate. They cost, including material and labor, a sum of $43 each. This is, of course, more than they would have come to, had the proper car been sent up as ordered.

The plant consisted of two boilers, a hoist, an air compressor, two sinking buckets, two dump cars, one drill with column, two hammer drills and a sinking pump. The remainder of the material possibly comes under the head of supplies.

The boilers were two in number, described in the specifications as follows:

Two steam boilers of the inclined type, with water front, 40 hp., 44 in. diameter, 16 ft. long over all, with suitable dome 22 in. diameter, 27 in. high, firebox 6 ft. long, ⅜ in. thick, shell $\frac{5}{16}$ in., and heads ⅜ in., fitted with 61 tubes 2½ in. diameter, 8 ft. long, No. 12 gage thick, and having the following fittings and fixtures of first-class quality: One 2-in. "Crosby" screwed safety valve, one 2½-in. nipple, one 2½-in. stop valve, one 2½-in. nipple, one "C" "Penberthy" injector 1 in., one check valve 1 in. properly piped and fitted, one blow-down valve 1½ in., with nipples and elbow, one water column fitted and attached to boiler having steam gage, try cocks and drain cocks, tube cleaner and whistle with pipe and valve, wrought-steel front having water space and fitted with steel fire and ash doors, cast-iron grates, bearers, steel smoke box ⅛ in. thick, with lined smoke doors, neck for funnel, and hand cleaning doors with fixtures.

One smoke funnel, 20 in. diameter, 30 ft. long, No. 14 gage thick, with bands on top, guy bands and 150 ft. of guy wire.

Each boiler is to be mounted on suitable axles with iron wheels, having flat iron spokes and broad tires, and is to be provided with a pole and fixtures.

Each boiler is to be carefully built by experienced workmen, for a safe working pressure of 125 lb. per sq.in., and tested with cold-water pressure to 200 lb.

Each boiler to be furnished complete with water gage, water-gage cocks, steam cocks, gage, safety valve, blow-off cock, injector, fire-bars, and stack and tools. The price paid complete at the purchase point to be $725 each, or $1450 for the two boilers.

Boilers for plants in out of the way situations, should be tested before leaving the works, and where two boilers are employed they should be of exactly the same size and capacity, and each powerful enough to give almost the full amount of steam needed. "Plenty of steam power, and to spare" is a good maxim. There is always some little thing that takes more steam than was calculated on, or the water supply goes bad, and pumping from some source a considerable distance away has to be resorted to.

The mine hoist was built for operation by compressed air or steam. It had double cylinders 6½x9 in., also triple drums arranged in tandem, each 16 in. by 20 in. between flanges. Each drum was provided with a band-brake, friction gear and reversing-link motion all operated by levers in a quadrant at rear of frame between the cylinders. The capacity was 4000 lb., hoisted by each drum on a single line at 120 r.p.m. The floor space was 92x46 in., weight 4900 lb.

The price was $610; extra for third drum, $110, making total cost $720.

It is always advisable to have a three-drum hoist. This is contrary to the usual practice, but an extra drum is a very handy rig. One drum is in use hoisting, from the second hangs the pump, and a spare third is extremely useful for holding heavy timbers in position, hauling heavy material on the surface, or holding an extra bucket with tools, drills, etc., in the shaft, when ready to fire.

If at all possible, it is advisable to secure an upright compressor in two small units, not only for the sake of the less weight, but also for the size of the buildings and foundations needed. In the case under consideration however, a Canadian Rand compressor was installed, straight-line, 10-in. high- and 15-in., low-pressure steam cylinders, 10-in. air cylinders, stroke 15½ in., air-pipe 2½ in. to 3-in. main. The steam pipes were, admission 2½ in., exhaust 5 in., steam pressure carried was 40 lb. Ten gallons of cooling water were required per minute. This machine was stated to be of 200 cu.ft. per min. capacity at 100 r.p.m. For transportation, the machine came in six large pieces, the weight of the heaviest being two tons. The price was $3102.

Three Drills Were Employed

A Canadian Rand drill 2½ in. and two "B. A. 26" butterfly flap-valve hammer drills were utilized. These have been priced as follows:

Drill, $250; hammer drills, $105 each, or $210 for the two, making a total of $460.

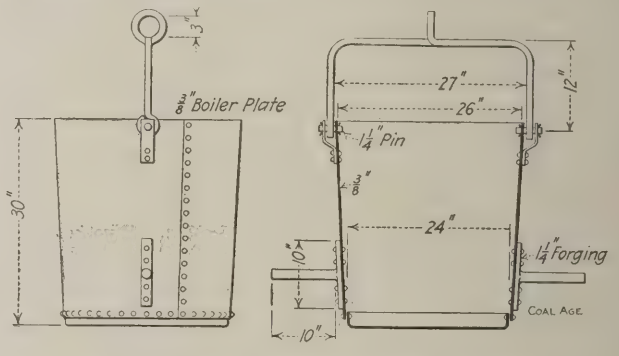

Fig. 4. Details of Sinking Bucket

The principal precaution to be taken with such drills, and especially the hammer drills, is to keep moisture out of the air pipes in winter time. This freezes in the exhaust opening of the drills, the passages of which are not very large. Further the "B. A. 26" are hand-rotated machines, and for the type of sinking being described not well suited. The steels stick in the holes when withdrawing, and the whole operation is slow. A drill, machine rotated, capable of withdrawing its own steel, is much to be preferred.

One oil cup at the shaft collar forms a simple way of oiling any machinery operated by compressed air, but too much oil is just as bad as water. Usually this excess of oil is found coming over from the compressor. Frequently the backwoods engineer believes in oil (castor included) as a sure cure for all engine troubles.

An extra long column for the percussive drill is useful as a spare, especially when sinking a wide shaft. It is well to insist on having the steels intended for the drills, ordered from the makers, and not provided from a store by obstinate storekeepers, with the final necessity of having to have them attended to, or altered by a local blacksmith. It is advisable also to have valves at the top and bottom of the air columns, and in positions which are handy to get at. If there are three air branches at the

bottom, one to each of the drills, valves will be required on each.

At the top of the air main erect some simple form of oil and water separator, such as is shown in Fig. 6, and leave a space around it in which a fire can be built for heating purposes in winter. This is crude work, but it is just as well to be prepared for all sorts of "artful dodges" when in the woods prospecting.

The Proper Type of Pump Is Important

The best type of pump for this work is probably a Cameron sinker, on account of both its simplicity and compactness. In this case, however, a Bawden sinker, size 7, was used and proved satisfactory. It is simpler than the Cameron in having no tappets internally, or outside valve-levers, and is positive in action. On the other hand, it is bulkier, and occupies more space in the shaft where space is a consideration: This pump was 10x5x7 in. and had a capacity of 100 gal. per min., weighed 2285 lb. and cost $250.

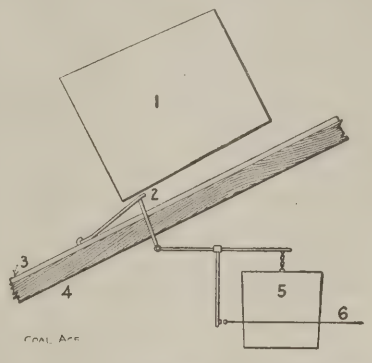

Fig. 5. Diagram of Arrangements to Indicate Full or Empty Bucket

1. Bucket falling over. 2. Projecting catch. 3. Sheet cover on chute. 4. Wooden floor of chute. 5. Counterweight to balance empty bucket. 6. Wire to hoist room.

When working with a sinking pump which is taxed to near its limit, a good plan is to arrange a small track in an inclined shaft, or guides in a vertical shaft, on which the pump can run easily, and hang it to the second hoisting rope. Double the hoisting rope over a "gin" to get the requisite lifting power if this is necessary. As a rule, a pump of this size can be operated readily either by steam or air, though some are better one way than the other.

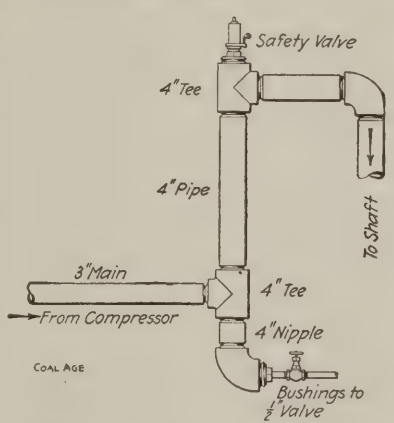

Fig. 6. The Oil Trap Employed

If there is air to spare, it is advisable to use it, as in a shaft, work about a pump thus operated is much to be preferred. Standing on the hot steam chest with rubber boots, fighting with refractory connections is temper-trying work. The remarks made about air freezing in the drills are applicable to the pump. If the freezing is bad, a little paraffin oil in the feed cups works wonders. This should not be overdone.

Babbitt-Covered Plungers Are Advantageous

In sinking in a coal seam, where the water is usually acid, the pump plunger should be built with a babbitt cover, as this is the best material to withstand bad water. Use hose connections, at least as long as a full pipe length on the discharge inlet, and if steam is used on the exhaust pipes, between the mains and the pump. Have valves at the ends of each of these pipe lines on the pump. Use unions which do not need gaskets, on all the connections which require changing frequently, and place these unions on the pipe, so that the ring catches from the top onto the part below.

It is easier to hold the end of a piece of pipe up and screw the ring over it downwards, than it is to raise the pipe, and attempt to screw upwards from the bottom position. Black oil should be used on all pipe connections, it is just as good as red lead or pipe-joint compound, and enables one to uncouple any pipe without trouble, which is especially handy in shaft work. In addition, on steam and exhaust, a drip arrangement should be provided at the pump. Nothing is more annoying than to have to stand on a hot pump and blow the accumulated condensed steam out of these two pipes, and besides there is always the possibility of the hose giving way, due to water pressure.

The use of hose allows the prompt insertion of another length of pipe, which is very useful where water is rising fast and further it gives the hoist man some little latitude as to his exact stopping point in lowering the pump, which it may be, owing to the position of the toothed grip on the side of the drum, is a bit above or below the exact position desired. It is well to leave the pump hanging on the rope attached to second drum. By this means, the pump may be lowered or raised in a minimum of time, and the water may be followed down, foot by foot, without stopping the working of the pump throughout the full length of the hose used.

Supplies have simply been tabulated at the actual prices, that is, catalog prices, less trade discounts:

PUMP FITTINGS

48 ft. water hose, 2 in., at 40c. per ft.	$19.20	
48 ft. steam hose, 1 in., at 43c. per ft.	20.64	
48 ft. exhaust hose, 1½ in., at 52c. per ft.	24.96	
12 ft. suction hose, 2½ in., at $1.75 per ft.	21.00	
1 foot valve, 2½ in.	6.00	
1 strainer, 2½-in. pipe	9.00	
1 valve, 2 in.	2.65	
1 valve, 1½ in.	1.75	
1 valve, 1 in.	.90	
		$106.10

AIR-DRILL FITTINGS

2 lengths 20 ft. of 1-in. air hose, at 50c per ft.	$20.00	
2 lengths 20 ft. of 2-in. air hose, at $1.03 per ft.	41.20	
6 1-in. steels, 12 in. 6 1-in. steels, 18 in. 6 1-in. steels, 24 in. 6 1-in. steels, 30 in. 6 1-in. steels, 36 in. 6 1-in. steels, 42 in. 6 1-in. steels, 48 in.	257¼ lb., at 8¼c. per lb.	21.10
6 ⅞-in. steels, 12 in. 6 ⅞-in. steels, 18 in. 6 ⅞-in. steels, 24 in. 6 ⅞-in. steels, 30 in. 6 ⅞-in. steels, 36 in. 6 ⅞-in. steels, 42 in.	40½ lb., at 8c. per lb.	3.24
1 key and wrench	2.00	
		$87.84

HOISTING REQUIREMENTS

1 pulley, 3 ft. 6 in., cast with blocks for ¾-in. rope	$30.00	
1 coil ¾-in. wire rope, 300 ft., at 15c. per ft.	45.00	
1 coil ¾-in. wire rope, 300 ft., at 15c. per ft.	45.00	
1 set blocks, single $2.00 And double with hooks for block and tackle 4.00		6.00
100 ft. of 1 in. dia. manila rope, at 20c. per lb.	8.00	
2 cast-iron 12-in. pulleys for ¾-in. rope groove, at $10	20.00	
2 self-dumping buckets, at $23	46.00	
2 thimbles for ¾-in. rope, at 14c.	.28	
12 rope clamps, at 40c.	4.80	
1 "gin" block	10.00	
		$215.08

BOILER AND BOILER HOUSE

1 scraper for 4-ft. grate	$5.00	
1 poker	1.50	
2 extra injectors, No. C.C. (Pen.), at $20 each	40.00	
3 doz. gage glasses, 18 in. long, ⅝ in. dia., at 81c. per doz.	2.43	
1 spare pop safety valve, 2 in.	15.00	
		$63.93

EXPLOSIVES

2000 lb. 40 per cent. dynamite, at $13.20 per 100 lb.	$264.00	
1000 No. 8 electric detonators, at $4.08 per 100	40.80	
6000 ft. safety fuse, at $5 per 1000 ft.	30.00	
1000 No. 6 detonators, at $1 per 100	10.00	
1 battery, No. 2	13.50	
1 thaw-pan	7.00	
		$365.30

BLACKSMITH FITTINGS

1 portable forge, "Buffalo" type	$37.00	
1 anvil, 200 lb., at 9c. per lb.	18.00	
1 set tools for anvil: Cross, dolly, sow top, bottom spreaders, top and bottom swages, 1 in. and ⅞ in.	3.00	
1 pair tongs, straight tip, 16 in., at $6 per doz.	.50	
1 pair tongs, curved tip, 16 in., at $8.50 per doz.	.70	
1 pair tongs, pick up, 16 in., at $6 per doz.	.50	
2 striking hammers, ½ lb. and 1 lb., at $12 per doz.	2.00	
2 hand hammers, ½ lb. and 1 lb., at $12 per doz.	2.00	
1 6-in. jaw vise	22.00	
1 pipe vise	14.00	
		$99.70

GENERAL TOOLS

2 sets stocks and dies for pipe ¼ in. up to 4 in.	1 at $28.00 1 at 45.00

1 doz. 3½-in., at 20c. each	2.40	
	$21.00	

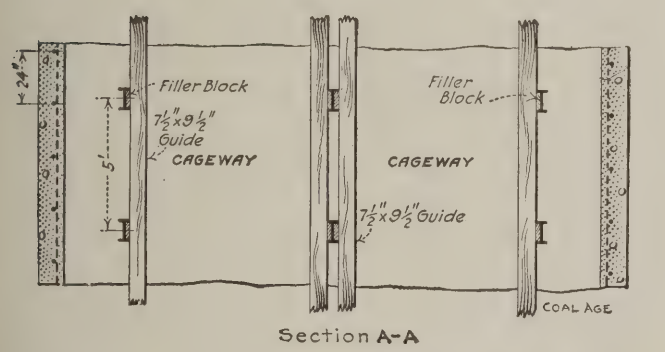
Nipples:	Close		Long	
6, ¼-in., at 2c.	$0.12	and 3c. each		$0.18
6, ¾-in., at 3c.	.18	and 3c. each		.18
6, ⅜-in., at 2c.	.12	and 3c. each		.18
6, ½-in., at 2c.	.12	and 3c. each		.18
1 doz. 1-in., at 4c.	.48	and 5c. each		.60
1 doz. 1¼-in., at 5c.	.60	and 6c. each		.72
2 doz. 1½-in., at 6c.	1.44	and 8c. each		1.92
2 doz. 2-in., at 8c.	1.92	and 11c. each		2.64
1 doz. 2½-in., at 16c.	1.92	and 24c. each		2.88
½ doz. 3-in., at 19c.	1.14	and 29c. each		1.75
¼ doz. 4-in., at 34c.	1.02	and 48c. each		1.44
	$9.06			$12.67
				9.06
				$21.73

Rails, 2000 ft., 30 lb. to the yard, at $2 per 100 lb.	$400.00
Fishplates, 500 lb., at $2.40 per 100 lb.	12.00
Rail spikes, 2000 lb., at $2.90 per 100 lb.	58.00
3 kegs of 6-in. spikes, at $2.60 per 100 lb.	7.80
3 kegs of 4-in. spikes, at $2.75 per 100 lb.	8.25
5 kegs of 2-in. nails, at $2.90 per 100 lb.	14.50
Track bolts, 300 lb., at $5.25 per 100 lb.	15.75
	$516.30
Total general supplies	$3048.64

The above list may be long and cost much to provide, yet it is to be remembered, that it is much easier and more economical to have all that is likely to be required at hand, than to have to send to some far-off town for some material or article with the consequent loss of time, and money entailed in holding up the whole or any part of the work.

Finally, the total expenditure has been tabulated as follows, from which it appears that the price of the sundry articles comes to at least half the amount spent on what may be termed the plant proper:

	Boiler	Hoist	Compressor	Head-frame	Pump	Drills	Stores	Total
Material	$63.93	.....	.....	$215.08	$106.10	$87.84	$3680.40	$4,153.35
Equipment	1450.00	$720.00	$3102.00	230.19	250.00	460.00	.....	6,212,19
	$1513.93	$720.00	$3102.00	$445.27	$356.10	$547.84	$3680.40	$10,365.54



Concrete-Lined Shafts at the Bunsenville Mine

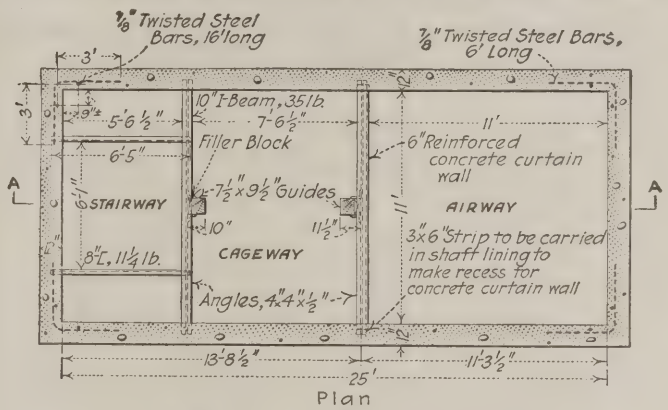
By A. F. Allard*

SYNOPSIS—The machinery and other temporary equipment necessary for the sinking and concreting of two fireproof shafts are enumerated, together with the method of work employed during construction, and the progress made in sinking and placing the concrete shaft walls.

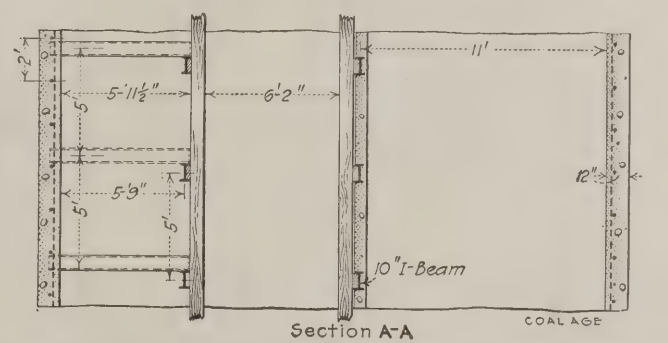
The Bunsen Coal Co., of Danville, Ill., has recently completed the construction of two fireproof concrete-lined shafts at its new Bunsenville mine, situated in Vermilion

FIGS. 1 AND 2. PLAN AND SECTION OF MAIN SHAFT

County, Ill., about three miles northwest of Georgetown. Both the main and auxiliary shafts are of rectangular design, and were sunk at a distance of 500 ft. apart. The entire work was carried on with the coal company's forces.



The method adopted in sinking, timbering and lining the shafts with concrete has been entirely successful. The sinking of both shafts to the bottom of the sumps was completed before any of the concrete lining was placed. The shafts were erected in connection with a new coal-mining plant, designed for the development of the unworked territory belonging to the Westville district. An area of 3000 acres of coal has been allotted to this mine, which when in full operation will supply an output of 4000 tons daily.



*Chief engineer, Bunsen Coal Co., Danville, Ill.

Description of Shafts

Ground was broken for the main hoisting and auxiliary shafts on May 6, 1914. The main shaft is of rectangular design (see Fig. 1), measuring 20 ft. 2 in. by 11 ft. in the clear between concrete walls; it has a depth of 204 ft. from top of coping to the bottom of the No. 6 or Grape Creek coal seam, and is provided with a sump 21 ft. deep below the coal. This shaft is divided into four compartments, containing two cageways and one pipeway at either end. The clear opening area of 222 sq.ft. comprises 172 sq.ft. for the two cageways and 50 sq.ft. for the two pipeways.

From the top of the coping to a point in the solid rock,

FIGS. 3 AND 4. PLAN AND SECTION OF AUXILIARY OR AIR SHAFT

a distance of 89 ft., the concrete lining is 18 in. thick. From this point to the bottom of shaft the concrete walls have a thickness of 12 in. The walls in both shafts are of plain concrete except the corners, which are reinforced vertically, each with two lines of 7/8 in. by 16 ft. twisted steel bars, back of which are placed 7/8-in. by 6-ft. bars laid horizontally and spaced every 2 ft. for the entire depth of the shaft. No water rings are constructed in either shaft.

The top coping at each shaft has a thickness of 4 ft. at the surface, a width of 6 ft. at the base, and extends to a depth of 8 ft., forming a solid foundation for the support of the structural-steel headframe. The feature of a wide coping provides ample room inside of the coping fence to do repair work on the cages, etc.

The buntons supporting the cage guides in each shaft are all 10-in. I-beams weighing 35 lb. per ft.; they

extend into the concrete sidewalls 6 in., and are spaced 5 ft. center to center for the full depth of the shaft. The guides are all 7½x9½-in. by 30-ft. surfaced yellow pine, fastened at each bunton connection with two 1-in. bolts. White oak filler blocks are inserted between the web of I-beam and back of the guide giving a solid bearing.

Fig. 2 shows a section of the main shaft and the location of the buntons.

The auxiliary shaft is designed for combination hoist and ventilation. The hoist is for the purpose of handling material and the raising and lowering of men. The shaft is of rectangular design (see Fig. 3), measuring 25x11 ft. in the clear between concrete walls, and has a depth of 203 ft. from top of coping to the bottom of coal. The sump has a depth of 12 ft. below the coal. This shaft is divided into three compartments, containing one cageway of same size as the main shaft, one airway and a stairway. The clear opening area of 275 sq.ft. is divided into 86 sq.ft. for the cageway, 121 sq.ft. for an airway and 68 sq.ft. for the stairway. From the top of coping to a point in the solid rock, a distance of 75 ft., the concrete lining is 18 in. thick; from this point to the bottom the walls are 12 in. thick. Fig. 4 shows a section of this shaft, the location of the concrete curtain wall in the airway and the I-beam buntons.

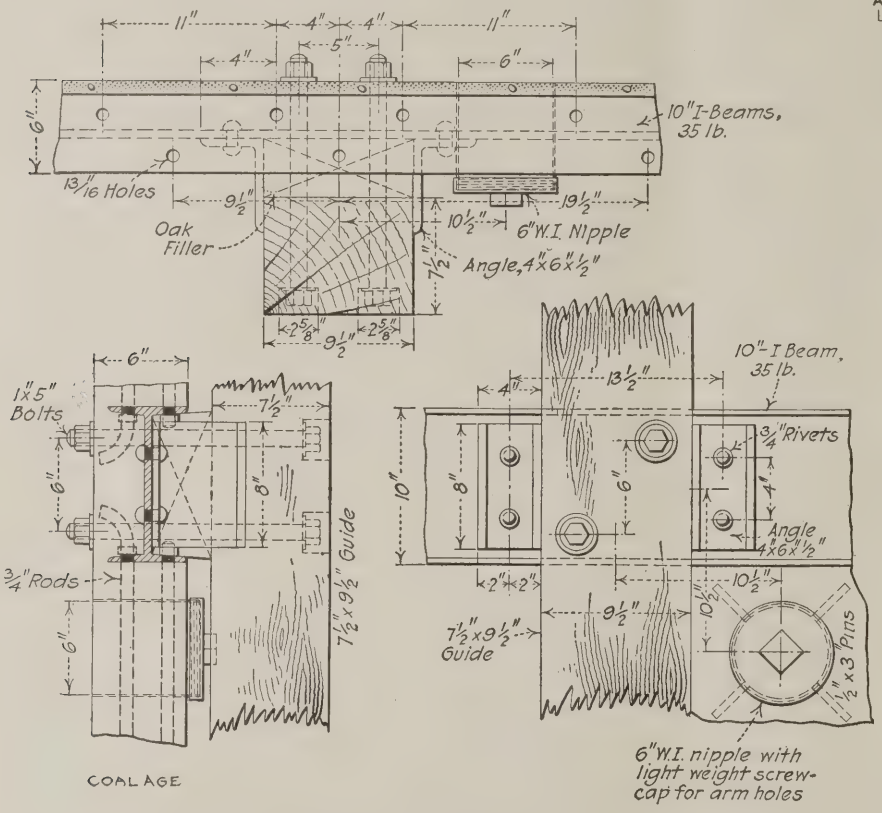


Fig. 5. Detail of Guide Connections to Buntons

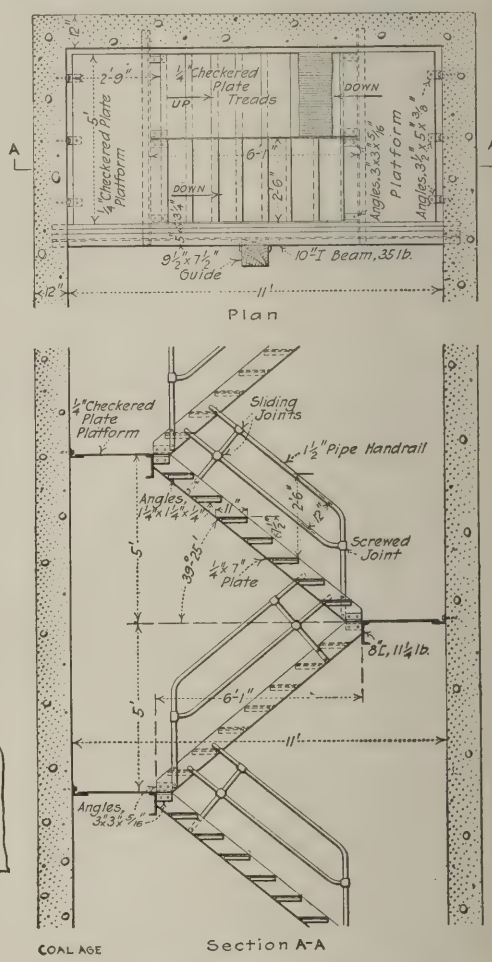

Fig. 6. Plan and Section of Stairway

A Concrete Curtain Wall Is Provided

The reinforced-concrete curtain wall separating the airway from the cage compartment was poured 7 in. thick and extends from top to bottom of the shaft. The reinforcement consists of plain ¾-in. rods placed 9 in. center to center, staggered along the full flange length of the I-beam buntons. These rods are connected to the top and bottom flanges of the I-beams by means of nuts on the threaded ends. At the side of the guide and below each bunton, 6-in. heavy wrought-iron nipples are placed, provided with a plug screw cap for the purpose of arm holes to reach the nuts of the guide bolts at the back of the curtain wall. A space of 1½ in. was left between the back of the guide and the face of the curtain wall to prevent transfer of vibration from the guide to the curtain wall.

Fig. 5 is a detail of the guide connection to the bunton along the curtain wall, and also shows the location of the arm holes. The addition of 4x6-in. angles at the sides of the guide to prevent vibration was omitted.

The steel stairways are of zigzag pattern, and, together with the landings, occupy a space longitudinally in the shaft for a width of 5 ft. 6½ in. Each flight rises on a 39° 25′ angle from the horizontal, and is 8 ft. long. The separate flights, including the landings, are supported on 8-in. channels weighing 11¼ lb. per foot, placed crosswise in the shaft, which in turn are supported at one end on the 10-in. I-beam buntons, while the other end is secured in the concrete end wall and has a bearing of 6 in. The channels are placed 2 ft. 5½ in. from the side walls, and are spaced vertically 5 ft. apart center to center, alternating for each flight.

The stair stringers are ¼x7 in. deep. The treads are ¼x11 in. by 2 ft. 6 in., with checkered surfaces, and are supported on 1½x1½x¼-in. angles riveted to the stringers. The rise between treads is 7½ in. The landing plates are ¼ in. by 2 ft. 9 in. by 5 ft., and are also checkered on the surface. Three lugs of 3½x5x⅜-in.

angle iron are riveted to the landing plate and fastened to the concrete wall by means of 5/8x5-in. expansion bolts well drawn up. The hand railings are made up of two lines of 1½-in. pipe; the uprights are bolted to the stair stringers and connected to each line of railing. The total weight per vertical foot of stairway and landings, not including the channel supports, is 100 lb. The stairway is easy for the men to walk on and is of economical design, as may be seen in Fig. 6, which shows the plan and part elevation.

Wooden Forms Were Employed

The forms used for the concrete lining walls in each shaft were of the company's design, made and put together at the shaft site. A description of those used for the main shaft only will be given. The sides and ends were composed of 1½x10-in. tongued-and-grooved yellow

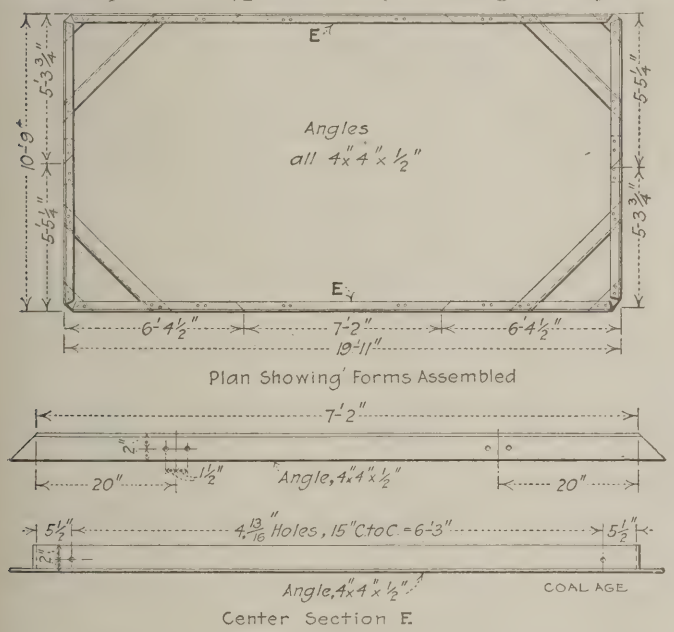

Fig. 7. Steel Frame Used for Stiffening Forms in Main Shaft

pine boards, surfaced on both sides, and cut into lengths making the section 2½ ft. high. Nailing strips 1½x12 in. extended around the top and 1½x4 in. placed at the bottom formed cleats for the several units and held the matched boards securely in place. The top piece extended a distance of 1 in. above the top of the form on the inside for the reception of the next form section.

For stiffening the forms and supporting the concrete until it should set, a steel frame consisting of 4x4x½-in. angles was placed midway of each section and attached to the form boards by means of ¾-in. bolts spaced 13 in. center to center around the entire section. The steel framework was stiffened at the corners with 4x4x½-in. angle bracing; while ⅜-in. splice and gusset plates were used for bolting together the several units composing the frame.

To insure easy removal of the forms and to increase the thickness of the walls, the corner pieces were cut on a 45° angle with a 5-in. bevel face. The vertical edges of each unit, including the forms and angle frames, were also cut on a 45° bevel, while 6x10-in. pockets were made in the top of every other form for the reception of the 10-in. I-beam buntons which are placed vertically 5 ft. center to center. The completed 2½-ft. section, including the steel frame, weighed 2080 lb., and the heaviest unit 400 lb.

Fig. 7 shows the design of the steel frame used for the forms at the main shaft, and Fig. 8 that of the forms for the ventilating shaft. The latter provides for the construction of a reinforced-concrete curtain wall for separating the cageway from the air compartment.

A new feature in the construction of a sump was inaugurated at the bottom of the main shaft. The lining walls and the floor are of concrete 12 in. thick, with a sump well 4 ft. wide, extending the full width of the shaft, placed at the low end to catch all seepage water. This provides ample room for a pump suction line. The sump is of sufficient depth below the cage landing to permit a standard mine car to be run under either of the cage landings. They may here be loaded by gravity with the coal droppings from the dump or mine cars, accumulating in the storage hoppers placed under each landing.

A heavy steel sliding gate is placed at the bottom of each hopper which is operated by means of a hand chain and wheel placed at the side of the sump. When the mine car is filled it may be conveyed by motor through a concrete-lined tunnel which leads from the end of the sump up a sharp incline to the haulage road.

A reinforced-concrete floor extends over the sump to support the cage landers and for additional strength to

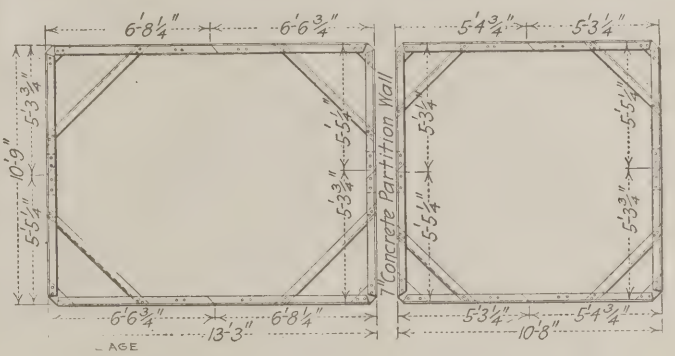

Fig. 8. Steel Frame Used in Forms for Auxiliary Shaft

absorb the shock of the cages striking the bottom landers. Heavy 24-in. I-beams are placed in the concrete floor and extend across the sump and are anchored into the lining walls.

Fig. 9 shows two vertical cross-sections of the sump. This design and the method of handling the waste eliminates the continual labor necessary to clean out by hand a deep sump, which not only is a source of annoyance to the pit boss, but a large expense annually to the coal company.

Arches Are Placed in the Shaft Approaches

The approaches leading to the main shaft bottom from both the loaded and empty sides are of concrete. These are of 18-ft. 2-in. span, having a minimum thickness of 24 in. for the sidewalls and crowns. Each arch extends 12 ft. from the face to the shaft lining. An arch of 8-ft. span having a minimum thickness of 18 in. and extending a distance of 12 ft. from face of the shaft lining will be later erected. This arch will connect with a cross-entry and manway around the shaft bottom. An archway of 4-ft. span will be placed in the sidewalls for entrance to the run-around.

At the intersection of all arches with the shaft lining

wall, steel bars were placed for reinforcement. The centering for the large arches was built of 2-in. plank spaced 17 in. center to center, covered with 1x4-in. boards laid close together. Concreting of all the large arches was brought up at one time coincident with the shaft lining walls. Fig. 10 shows the plan and sections of the arches and the method of placing the reinforcement.

In the ventilating shaft the concrete arch approach leading to the shaft bottom from the caging side is of 10 ft. 4 in. span. The arch leading away from the air compartment is of 17 ft. 6 in. span. Both arches have a minimum thickness of 18 in. for the sidewalls and crowns and extend a distance of 12 ft. from the face of the shaft lining. Fig. 11 shows the arch plan and a section through the airway arch.

Temporary Plant

The plant used for the sinking and construction of the shafts consisted of three 50-hp. Pennsylvania economic boilers, return-tubular type, and one 40-hp. unit of

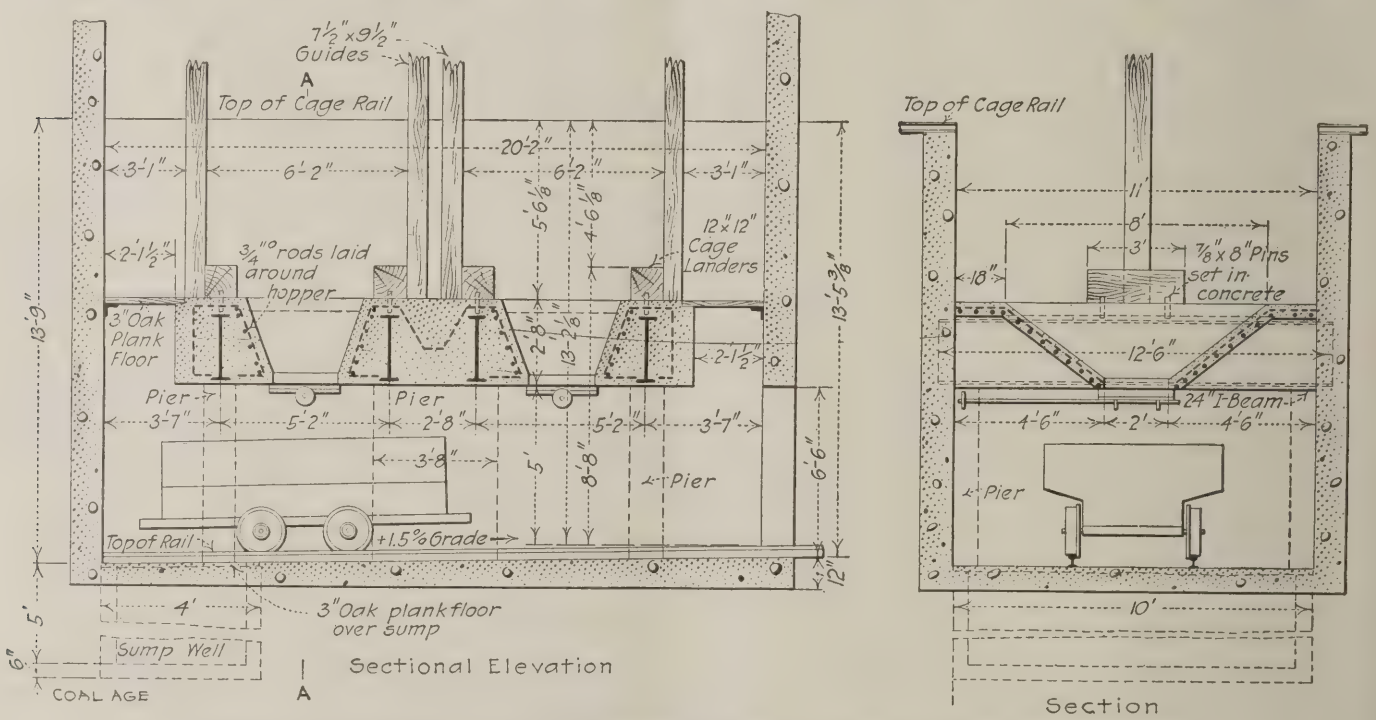

Fig. 9. Longitudinal and Transverse Sections of Sump under Main Shaft

same variety. The boilers were all placed together and located at a point midway between the two shafts. The feed water was supplied by one 6-in. duplex feed pump. All water for boiler purposes was secured from the supply at the Kelly No. 2 mine and conveyed to the plant site through an 8-in. and 6-in. water line. One 10-kw. 110-volt generator was used for lighting purposes. One duplex 8x13-in. geared hoisting engine with single drum, 48 in. in diameter, was placed at the main shaft and one duplex 6¼x10-in. double drum hoisting engine was used at the auxiliary shaft. Both hoisting engines were of friction type with link reversing motion, capable of hoisting at a speed of 400 ft. per minute under a load of 4000 lb. Nonrotating hoisting ropes ¾ in. in diameter were used at each shaft.

The muck and concrete were all handled from the same rope. One 10-hp. portable cubical concrete mixer with 5x7-in. vertical steam engine attached, having a capacity of 11 cu.ft. was placed at the top of each shaft. For handling muck, steel shaft-sinking turnover dump buckets, 36 in. in diameter and 36 in. deep, were used. These were replaced later with 3x3x3-ft. wooden boxes, made of 2-in. pine boards bound together with steel straps and provided with an end gate for dumping.

For taking care of the shaft water, two No. 9 Cameron regular pattern horizontal piston pumps were provided. These, however, were found unnecessary, as the water encountered at no time exceeded 5 gal. per minute. One 7½x5x10-in. piston pump was used at intervals for removing the water at each shaft.

For temporary ventilation required in driving the bottom landings, there will be placed at the main shaft one 2-ft. double-inlet fan, with a capacity of 15,000 cu.ft. per minute, driven by a 7x7-in. vertical engine. At the air shaft the fan will be a 3-ft. double-inlet machine with a capacity of 25,000 cu.ft. per minute, driven by an 8x8-in. vertical engine.

Revolving dump cars of 2 cu.yd. capacity for 36-in. gage track were used for the removing and distributing of the muck taken from the shafts. The concrete for the lining was conveyed from the surface to the point of application in a specially made steel dumping bucket 30 in. in diameter and 50 in. deep, with a capacity of 11 cu.ft., equipped with a steel chute and swinging door for the release of the concrete to the pouring chute. One of these buckets was used at each shaft. Fig. 12 shows the design of bucket used for this work.

Temporary Headframes

The temporary headframes were of wood construction. The one used at the auxiliary shaft occupied a space for the tower of 11x18 ft., and was 41 ft. high. Each of the tower posts and batter legs was built up of two pieces of 6x12-in. yellow pine spliced and bolted together. The tower was supported on mud sills, this foundation being 48 ft. long and divided into three panels, each braced with

4x12-in. diagonals held together at the panel points with 1-in. tie rods.

The dumping floor was placed 14 ft. above the surface, and directly over the hoisting chamber a pair of self-closing doors were placed for protection to the men in the shaft when the muck bucket was dumped. These doors were built of double 2-in. plank well cleated and each leaf secured to the platform with a pair of heavy strap hinges. The doors occupied a space of 6 ft. 8 in. by 9 ft., and were automatically raised and lowered by means of a counterweight extension which was operated by the topman.

Sinking work at each shaft was started with the aid of a wooden shoe, made of 8x12-in. timbers and having a cutting edge on a 45° angle for penetration through the surface soil. The latter was composed of black loam and a wet sand and clay mixture. The shoe timbers were mortised half and half at the corners and stiffened with 6x12-in. cross-pieces dividing the shaft into three chambers. The shoes were forced down by hand with 10-ton screw jacks and landed in each shaft at a depth of 12 ft. below the surface.

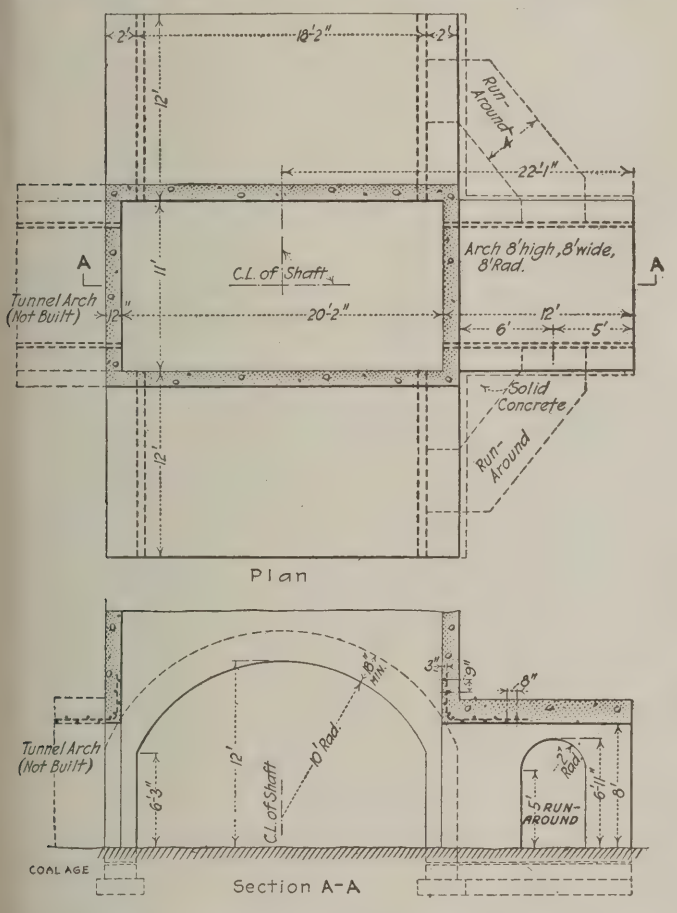

Fig. 10. Plan and Section of Main Shaft Bottom Approach Arches

The top timber set or mud sill anchors at the shaft ends were 8x10 in., and extended back a distance of 25 ft. from the curbing, bolted at intervals into concrete abutments for supporting the total weight of the curbing timbers until rock was reached, a distance of 55 ft. from the surface.

At the auxiliary shaft, in addition to the timber mud sills, a heavy 24-in. I-beam with hog chains attached secured the curbing at each end until solid rock was reached. The timbers were all placed skin to skin and for a distance of 60 ft. below the surface were in one stick for the sides and ends; from this point to the bottom, they were in short lengths, 10 ft. to 16 ft. long, composed of 8x10-in., 6x12-in., 4x12-in. and 2x12-in. sizes. The heavier pieces used were required in the softer strata penetrated. Eight by ten-inch temporary buntons spaced 2 ft. 6 in. apart vertically divided each shaft into three chambers.

Drilling was started when rock was reached. The first set of hitch timbers was placed in the main shaft, a distance of 55 ft., and in the auxiliary shaft 58 ft. below the surface. From these points to the shaft bottom the hitch timbers averaged 16 ft. apart. For shooting sumps and ends in each shaft an average number of 20 holes drilled 6 ft. deep were placed. Forty per cent. "Forcite" gelatin was used for the sinking of both shafts. Sinking and timbering was carried on continuously in three 8-hr. shifts and necessitated the employment of 8 men at the main shaft and 10 men at the air shaft.

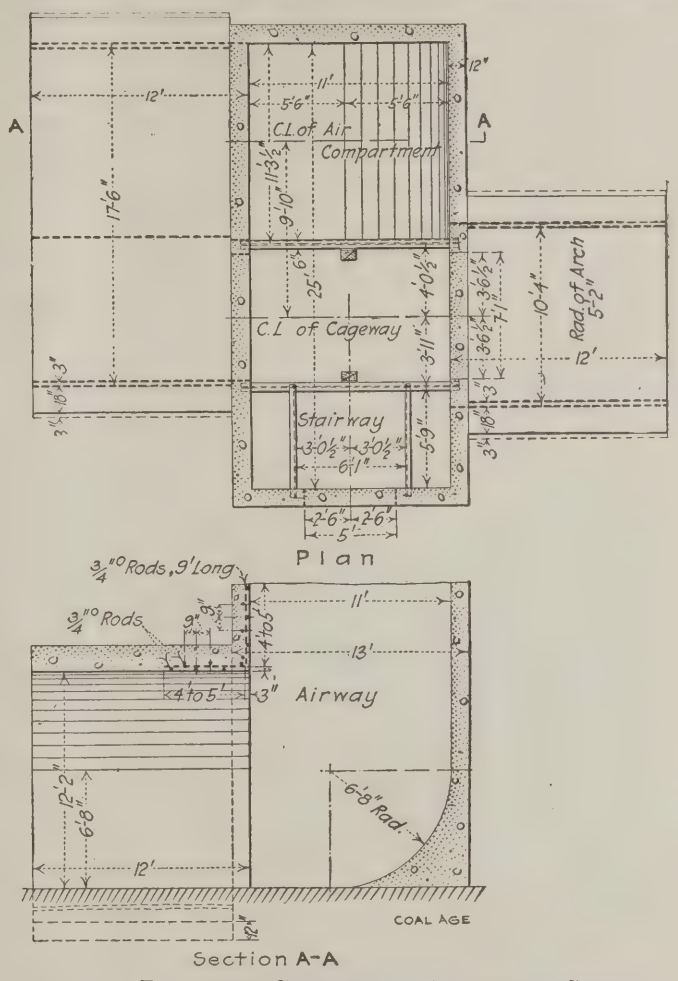

Fig. 11. Plan and Section of Auxiliary Shaft Bottom

The water met with in both shafts was handled by steam jets up to a depth of 60 ft. A 3-ft. 9-in. square box made of 2-in. plank answered for a suction well and was sunk in advance in the middle chamber to keep the water away from the muckers until solid rock was reached.

Method of Placing Concrete Shaft Lining

The method of concreting was carried on in the same manner at each shaft. No concrete was poured until the

bottom of the sump in each shaft was reached. The sump walls, first section of the bottom arches and the shaft lining up to the top of the arch crowns were all poured together. The forms for this portion of the work were erected at one time; 1½x10-in. surfaced boards were used for the lining.

The arch centers were cut from 1½ x10-in. boards spaced 17 in. center to center and covered with 1x4-in. strips for a smooth concrete face. From the top of the arches to the top of coping, special forms previously made in sections 2½ ft. high were used; 50 vertical feet of forms were on hand and used for each shaft, necessitating four changes during the entire process of concreting.

Concrete was placed after every 5 ft. of forms were in position. It was delivered to the scaffold platform and conveyed into the sidewalls from a frame box chute 6 in. deep and 12 in. wide, the mouth of which was, however, 24 in. wide. Chutes of sufficient length reached the side and end walls.

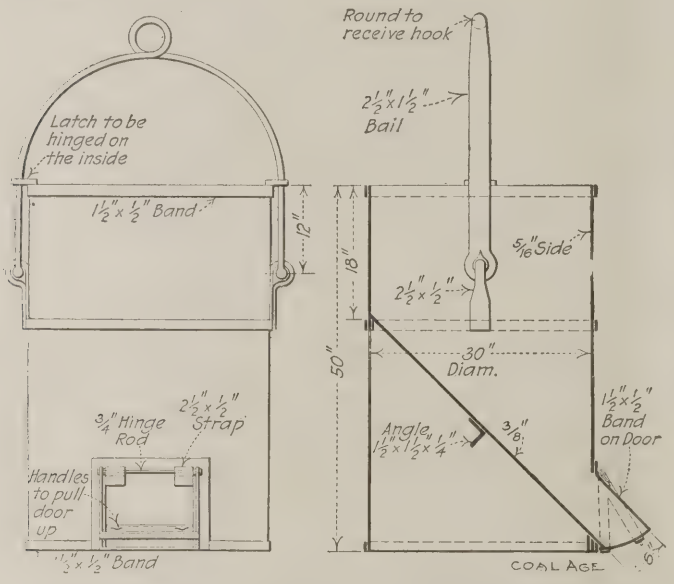

Fig. 12. Special Bucket Employed for Lowering Concrete into the Shafts

At the auxiliary shaft it was necessary to use a floating double-deck scaffold for the placing and removal of the forms in the airway. This scaffold was handled by a rope on the second drum of the hoist engine. No forms were removed from the work under a period of 48 hours. The 8x10-in. buntons supporting the curbing were removed as the concrete lining advanced; these were replaced after each form was in position with 4x6-in. temporary supports for the forms until the concrete had set.

Both lines of 4x6-in. temporary buntons were supported on 1½x4x10-in. blocks attached to 1½x10-in. vertical wall plates cut in 5-ft. lengths. These plates extended back of the forms. Four 1½x2½x10-in. blocks attached to the back of the wall plates cleared the steel angles on the forms and made a substantial support.

Quantities and Materials Used in Permanent Work

In the main shaft the concrete yardage per vertical foot for 12-in. lining walls was 2.5 cu.yd. and 3.8 cu.yd. for walls having a thickness of 18 in. In the auxiliary shaft the 12-in. walls averaged 2.8 cu.yd. per vertical foot and the 18-in. walls 4.3 cu.yd. All of the concrete work was composed of one part cement and five parts of clean Wabash River gravel. Cement for the entire work was the "Universal Brand," manufactured by the Universal Portland Cement Co. All structural steel and reinforcement was furnished by the Illinois Steel Co.

Progress of work at main shaft was as follows: Excavation started May 6, 1914. The bottom of the sump reached July 20, 1914. The total distance sunk was 225 ft. below the top of coping. The sinking operation, including the placing of the timber curbing, occupied a period of 10.7 weeks, which was an average of 21 ft. per week and 84 ft. per month. The greatest progress made in any one week was 27 ft.

Concreting started Aug. 7, 1914, and the top coping was reached Sept. 8, 1914. The concreting included the placing of 15 ft. of 8-ft. span arch for the sump tunnel and 30 ft. of 18-ft. 2-in. span arch for the bottom cage landing approaches from the empty and loaded sides. The entire work done in connection with the concreting of the shaft lining walls occupied a period of 4½ weeks, which was an average of 50 ft. per week.

Excavation started at the auxiliary shaft on May 6, 1914, and the bottom of the sump was reached July 20, 1914. The total distance sunk was 216 ft. below the top of the coping. The sinking operation, including the placing of timber curbing, occupied a period of 10.7 weeks, which was an average of 21.2 ft. per week and 84.8 ft. per month. The greatest progress made in any one week was 31 ft.

Concreting started Aug. 7, 1914, and the top of the coping was reached Sept. 30, 1914. This process included the placing of 15 ft. of a 10-ft. 4-in. span arch at the bottom cage landing and 15 ft. of a 17-ft. 6-in. span arch leading from the bottom of the air compartment. The total work done in connection with concreting the shaft lining and the pouring of the concrete curtain wall occupied a period of 6.7 weeks, which was an average of 32.4 ft. per week and 129.6 ft. per month.

Coming Meetings

The annual meeting of the American Society of Mechanical Engineers will be held in New York City, Dec. 1, 2, 3 and 4, 1914. Calvin W. Rice, secretary, New York City.

The seventeenth annual session of the American Mining Congress will be held at Phoenix, Ariz., Dec. 7, 8, 9, 10 and 11, 1914. J. F. Callbreath, secretary, Denver, Colo.

The winter meeting of the Coal Mining Institute of America will be held Dec. 8 and 9, 1914, at the Fort Pitt Hotel, Pittsburgh, Penn. Charles L. Fay, secretary-treasurer, Wilkes-Barre, Penn.

The American Institute of Mining Engineers will hold its annual meeting in New York City, beginning Feb. 16, 1915. Papers to be presented at this meeting should be in the hands of the secretary of the Institute not later than Nov. 23, 1914, and as much before that date as possible. If a manuscript is received after Nov. 23, the editorial staff will lend its best efforts to having it prepared in time for the meeting, but cannot give assurance that it will be ready in time. Bradley Stoughton, secretary, New York City.

The Kentucky Mining Institute's winter meeting will be held Dec. 4 and 5, 1914, at the Seelback Hotel, Louisville, Ky. On Friday afternoon, at 1:30, there will be an address of welcome by the mayor of Louisville, Honorable John Buschmeyer. This will be followed by presentation of papers. At 7 p.m. there will be a banquet in the Red Room of the hotel, in conjunction with vaudeville. On Saturday at 10 a.m. papers will be presented, and in the afternoon at 1:30 a trip will be made to the Speed Cement Works. In the evening at 8 o'clock a visit to Macauley's Theater where Miss Billy Burke will appear, will terminate the meeting. H. LaViers, Paintsville, Ky., president; Ivan P. Tashof, Lexington, Ky., secretary-treasurer.

Mine Explosion at Royalton, Ill.

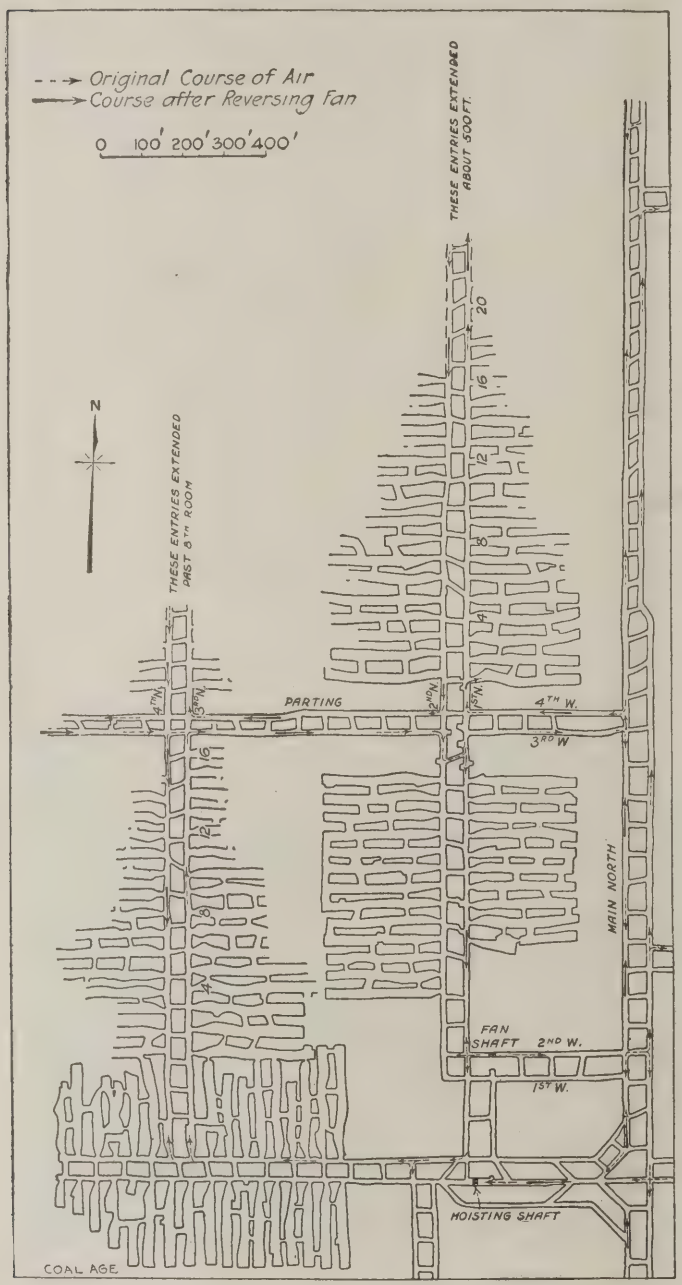
Special Correspondence

SYNOPSIS—A gaseous mine, operated with open lights, exploded on Oct. 22, and as a result 51 men were killed. The authorities immediately reversed the fan, and it is believed their promptitude in pursuing this drastic measure saved many lives and jeopardized the chances of escape of few, if any. A shortage of safety lamps retarded the recovery of the mine.

The most disastrous explosion that ever occurred in the coal fields of southern Illinois happened at the North mine of the Franklin Coal & Coke Co., Royalton, Ill., at 7:25 Tuesday morning, Oct. 29. Fifty-one men lost their lives either through the direct force of the explosion or through inhaling the afterdamp which was formed thereby.

Surface Works at Royalton Mine Soon after Explosion Occurred

Royalton is a town entirely occupied by miners in the southern end of Franklin County, near the Williamson County line, and has a population of about 2000 people. There are two mines in the town, both operated by the Franklin Coal & Coke Co., of which J. L. Mitchell, of St. Louis, is president. The seam worked in these mines is No. 6 of the Illinois correlation, and is about 10 ft. thick. Of this, about 2½ to 3 ft. is left up as top coal, the entries and rooms being opened up to a height of about 7 ft., and the top coal drawn from the rooms after they have been driven up their full distance.



A Gaseous Mine but Well Ventilated

The mining is all done by machines, and the haulage is by mule and electric motor. The mines in this field are regarded as gaseous, the Franklin and Williamson County fields having the most gas of any in the state. The ventilation system at the mine was good, and at no time was it thought necessary to put the mine on safety lamps. The fan is of the Sirocco type, 20 ft. in diameter, and 5 ft. wide, housed in a brick, steel and concrete house. It is guaranteed to deliver 200,000 cu.ft. of air per minute when running at a speed not exceeding 225 r.p.m. The mine has an average output of 3000 tons per day.

The top coal left up as a roof forms an exceptionally strong covering, and no entry timbers are used in the mine. The seam is clean, and there is but little refuse in the gob.

The mine is worked on a panel system, and has four main entries, going respectively to the north, east, south and west. Nearly all the men who worked upon the first three entries mentioned and had arrived at their working places, were not only uninjured, but for some time were unaware that an explosion had occurred.

The explosion happened while the men were still being lowered into the mine, to start the day shift. At the time there were 350 men underground, and about 40 waiting their turn at the head of the shaft. Many of the men inside had not left the shaft bottom when the explosion occurred. There was but a single blast, and from all signs it was evidently caused by gas being ignited.

NORTHWESTERN SECTION OF ROYALTON COLLIERY

There had been no shooting done, so presumably the gas was set on fire by a naked light.

COURSE OF THE EXPLOSION

The explosion evidently occurred in the third or fourth north off the fourth west entry, a distance of about 3000 ft. from the hoisting shaft. At the fourth west, the force of the explosion seemed to split, part going out of the fourth west and part going down the entries to the south. About 400 ft. outbye the fourth north is a parting, on which stood a trip of loaded cars. These were piled together by the force of the explosion, and evidently blocked it from going further in that direction. This blockage forced out the stoppings between the third and fourth west, and probably saved the part of the mine to the east.

The explosive force going down the south entries passed through the rooms on each side of these headings, went through the old workings and out to the hoisting shaft. On the east side of that shaft were two lines of loaded cars, extending for a distance of approximately 200 ft. These stopped the explosive force from going any further in that direction.

NO EVIDENCE OF VIOLENCE AT SURFACE

Neither the shaft, cages nor fan were injured by the explosion, and the only indication on the surface was the blowing of the circuit-breaker in the engine room. James Brown, the manager of the mine, was on the surface at the time, and he immediately ordered the reversal of the air current, the hoisting shaft then becoming the downcast and the fan shaft the upcast. This reversal of the air may have caused the deaths of five or six men in the northwest entries, yet it undoubtedly saved the lives of those on the main north entry and those near the shaft bottom who were not killed by the force of the explosion. The map indicates the direction of the air current as it normally went, and also the direction after the reversal of the fan.

Men who were on the surface when the explosion occurred immediately went below in an effort to rescue their fellow workers, and succeeded in getting out several who were in the neighborhood of the shaft, and on the main north. They also recovered several dead bodies. The stoppings along the main north were substantially built of brick, and were not seriously damaged, so the rescuing forces were able to advance to the point where the third west turns off the main north.

SEVERAL RESCUE PARTIES AT THE SCENE

Calls were sent at once to the Illinois Mine Rescue Station at Benton, to the State Mining Board at Springfield, and to neighboring mines for assistance. On account of the isolated position of Royalton, most of the rescue men were obliged to secure automobiles and make the run of from 12 to 50 miles over the rough country roads. The first crew of helmet men came from the Benton Station, arriving at the mine soon after ten o'clock.

Because of the ruling recently adopted by the Illinois Mine Rescue Commission, authorizing the organization of a corps of five men at each station, these men to be in continual training and to be ready to respond to any call, there were in the Benton crew eight trained men ready for work as soon as they reached the mine.

Following them came a crew of six men from the mines of the Madison Coal Corporation, at Dewmaine, and two helmetmen from the operations of the Saline County Coal Co., at Harrisburg. During the day trained men from all over the southern end of the state appeared at the mine and volunteered for work, and about midnight a crew of helmetmen from Eldorado arrived, having covered the 50 miles in an automobile. This crew appeared just in time to relieve the men who had been working all day.

That men could be so quickly gathered together is a triumph for the management of the Illinois Mine Rescue Commission, and it is to be hoped that other mining states will follow the lead of Illinois in establishing

such mine-rescue stations at suitable central points.

Most of the afternoon was expended in exploration work and in the reëstablishing of the ventilating current. By erecting a brattice about 200 ft. east of the hoisting shaft, and a stopping west of the shaft, most of the air was carried up the main north in the direction indicated by the double-pointed arrows, and thrown into the fourth west by means of a stopping on the main north. Investigation by the helmetmen proved that there was no fire anywhere, and also demonstrated that all the men inside the second north were killed immediately.

One Man Found Alive

The rescue party worked its way up through the rooms on the first north, through the inside crosscut and down the second north. On entering Room 25 on the latter entry, a man was found sitting down, with his carbide lamp burning. He was conscious, but was evidently partially overcome by the gases resulting from the explosion. The feed pipe from one of the apparatus was unscrewed and placed in his mouth, and he revived in a short time and was taken out.

This was the only man found alive, or with any signs of life, beside those rescued immediately after the explosion. That the trip of loaded cars on the parting between the second and third north stopped the force of the explosion from spreading through the mine was evidenced by the fact that the door in the slant crosscut between the first and second north, the fourth from the west entry, was uninjured. Two men found near this door were evidently overcome by the afterdamp, but all the men found from this point in showed unmistakable evidence of having been killed by the direct force of the explosion.

By eight o'clock Tuesday night, fifteen bodies had been taken from the affected area and deposited in places of safety near the bottom. They were not brought up at once, because every effort was being put forth in hunting for possible living men. The entire area affected by the explosion was not explored until nearly six o'clock Wednesday morning, but the work of bringing up the bodies was commenced before midnight, and by morning 47 bodies had been recovered.

This number included all the bodies which were in sight. The possibility of finding more was acknowledged, but the only way in which more could be found was by a thorough cleaning up of the débris. During the next day, four additional bodies were discovered, bringing the total up to 51 killed.

Crowd at Shaft Awaiting Outcome of Rescue Work

Much Assistance Offered

During the night, frequent calls were made for volunteers to assist in building brattice and cleaning up the track, and marked eagerness to help was shown by the mining men gathered around the head of the shaft. Telephone and telegraph calls were received from many points during the day, offering assistance, and the federal mine-rescue car from Vincennes was started on the way. This went as far as DuQuoin, but was stopped there when the

Showing Royalton Headframe, Tipple and Power House

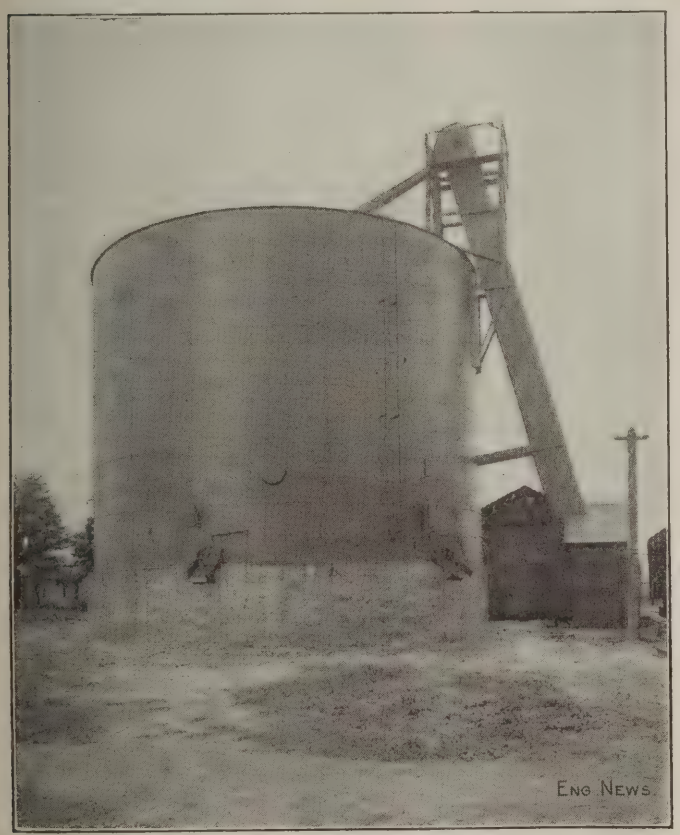
officials in charge were informed that there was plenty of assistance available.

A great handicap in pushing forward the recovery work was the shortage of safety lamps. Several lamps were supplied by the Chicago & Carterville Coal Co., by the Orient mine, and by the Illinois Miners' and Mechanics' Institutes.

Following the rescue work, an extended examination of the mine was made by state and federal officials, among whom were J. W. Paul and H. I. Smith, of the U. S. Bu-

Another View of Royalton Plant after the Accident

reau of Mines, John Bohlander, president of the Illinois Mining Board; Oscar Cartlidge, manager of the Illinois Mine-Rescue Station Commission, who was present during the entire recovery work; State Mine Inspectors Morgan, Reed and McClintock, the first two of whom were present during the work; and County Inspector Laughlin, who assisted in the recovery work. It is too early to give a report of the findings of this body.



Verdict of Coroner's Jury

The verdict of the coroner's jury was simply "Death by an explosion." No blame was placed on any one for the disaster. The dead were buried in a tract of land donated for the purpose by the Franklin Coal & Coke Co.

The colored rescuemen of the Madison Coal Corporation did excellent work. An illustration in our issue of Oct. 25, 1913, Vol. IV, p. 621, shows this team. Three men shown on the page preceding also did excellent work.

Steel Tank for Coal Storage

The proprietor of a retail coal yard in North East, Penn., stores his stock, except the large lump varieties of coal, in a circular steel bin, fashioned somewhat after the manner of a circular grain bin. The dimensions of

Steel Tank for Coal Storage

the bin are, height and diameter, each about 40 ft. It rests on a brick foundation about 6 ft. high.

The coal which is to be unloaded into the bin is allowed to run from hopper-bottom cars into a pit under the center of the track. A bucket conveyor, inclosed in a chute and propelled by an electric motor, carries it to the top of the bin, where it may be diverted into any one of six compartments.

Note—From "Engineering News."

When delivery is to be made to a retail customer, the driver backs his truck under the gate of the proper compartment. The coal runs from the bin through a screen chute, so that it is cleaned while being loaded.

This method of handling coal is found to be economical and satisfactory for several reasons. The expense for labor is small and the proprietor is independent of that uncertain class of help upon which in ordinary times he must depend. Orders can be gotten out very rapidly when the first cold snap comes and a great many householders suddenly remember that they forgot to order coal. No insurance is carried on the bin shown in the view. The builder is the VonWald Engineering Co., of Buffalo, N. Y.

Recent Legal Decisions

State's Right to Tax Corporate Assets—The Tennessee Coal, Iron and R.R. Co. was organized in Tennessee, but it has general offices in Alabama, which state has by special law granted it all the powers of a domestic corporation. Held that moneys and credits payable at the Alabama offices are subject to taxation in that state. (Alabama Supreme Court, State vs. Tennessee Coal, Iron & R.R. Co., 66 Southeastern Reporter 178.)

Excessive Recovery for Injury to Miner—$3400 was excessive recovery for injury to a mining employee for injury to his leg which did not prove to be serious, where he was able to resume work at higher wages than he had obtained before the accident, and did not incur any expense on account of the accident in excess of $400. (Keller vs. Chicago, Wilmington & Vermillion Coal Co., 184 Illinois Appellate Court Reports 248.)

Proximate Cause of Accidents—In an action for death of a mine trapper and switchman who was killed by being run over by a motor car and a train of coal cars, plaintiff was not entitled to recover on the ground that the operator had failed to comply with the safety requirements of the state mining laws, without showing that such failure was the direct cause of the accident. (Wyzard vs. Vivian Collieries Co., 184 Illinois Appellate Court Reports 199.)

Safety of Mine Doorways—Duty to Contractor's Employees—When operations in a mine are conducted by an independent contractor, and the owner of the mine undertakes to furnish means of ingress and egress for use by employees of the contractor, the owner is required to use the same degree of care to keep such means in reasonably safe condition for their safety, as is required concerning the owner's own employees. So, in such a case, the owner is liable for injury to an employee of the contractor, whose head came in contact with a low frame of a door in the mine, while he was being carried from his work in cars provided by the mine-owner, if, on account of the presence of smoke and steam in the mine, the danger was not obvious. (Pennsylvania Supreme Court, Podona vs. Lehigh Valley Coal Co., 91 Atlantic Reporter, 920.)

Interesting Articles Next Week

The next issue of Coal Age will contain a number of articles that should prove interesting to all coal-mining people. Among other things will be a description of "A Modern Method of Mine Development," illustrated with a detailed working plan. This scheme can be modified to fit most any case of a panel system of mining. The principal object of the method is maximum percentage recovery. Another article will deal with the use of "Ball Bearings on Mine Locomotives" while a third description will cover "The Pittsburgh Coal Field in Western Penn." Other special articles planned for this same issue are, "A Modern English Mine-Rescue Station," "Coal Waste in Mining Plants" and "A Testing Appliance for Coal Washeries." The information contained in any one of these articles may save you a lot of money.

Extracts from a Superintendent's Diary

This morning about nine o'clock, Joe Kosko, who tends the feeder between the run-of-mine chute and the shaking screen at No. 4 tipple suddenly jumped down from his platform and ran back and forth under the tipple yelling at the top of his voice in a most excited manner, "villain! villain! villain!"

Everybody, within hearing and seeing distance, naturally dropped the work in hand and made a bee line for Joe, and they found that he really had justification for all of the excitement he was creating.

Lying there on Joe's platform, in full view of the gathering crowd, were ten sticks of dynamite, which Joe had caught just in time to prevent being fed into the crusher.

After the initial excitement had subsided, the crowd began to offer suggestions as to the motive for the dastardly attempt at assassination, and the possible ways of discovering the offender. Had the camp been agitated by a strike or threatened strike, such a plot could have been explained easily, but we were all at peace.

But on one thing all were agreed and that was that the coward must be discovered, even if it took an army of detectives to accomplish the task, and after the villain was captured he ought to be blown up.

By this time word had traveled out through the camp and a great crowd was beginning to collect about the shaking screen and the crusher.

Joe suddenly found himself very much in the limelight and he was compelled to explain over and over again his part in frustrating the villain.

Of course, each time Joe had to add a little to keep up his own interest in the telling and finally he added as a concluding remark, "He try killy Joe, Joe he shooty that bad mans when he get a hold him."

About a half hour after Joe had astonished the tipple crew, a short insignificant looking Slav, named Mike Petrosky, came up out of the manway and made straight for the dump at the end of the tipple.

He seemed to know exactly what he expected to find, but apparently did not find it on the tipple floor and so went to the edge of the platform and looked down at Joe's platform directly underneath.

This time he had better luck. As soon as he saw the ten sticks of dynamite, he immediately started down the steps making straight for them.

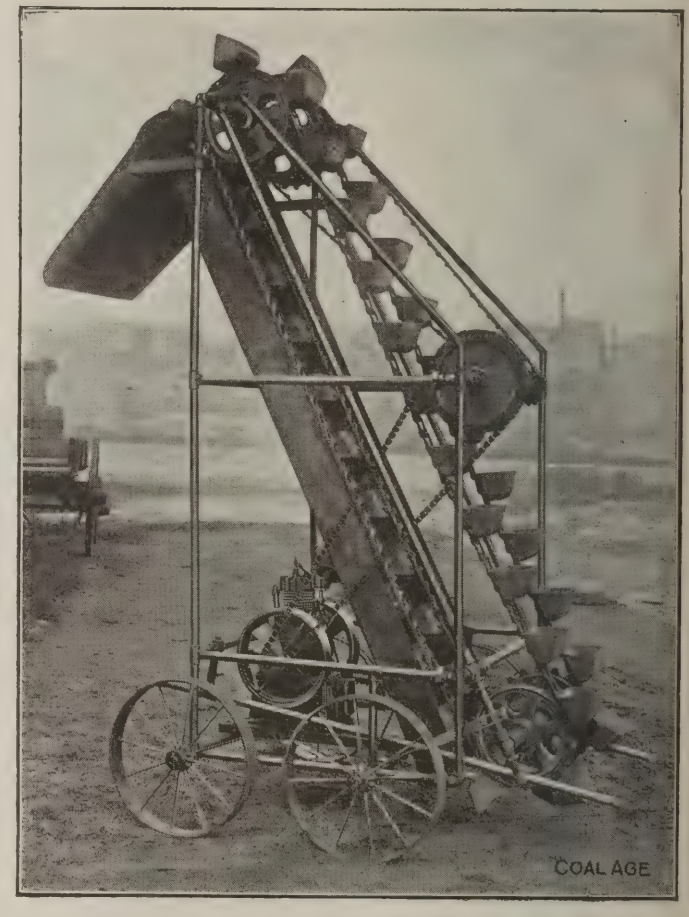
Joe was just saying for the twentieth time, "Joe he shooty that bad mans."

"Those mine," interrupted Mike, pointing to the dynamite.

Quickly a crowd closed in around Mike, Joe and the dynamite.

"Kill him" shouted someone.

But Joe saved the day.



It all shot through his head like a flash. Mike had probably left the dynamite in an empty car in his room over night and in the morning had loaded coal over it without thinking. Now he had come up to claim it, entirely unconscious of the excitement he had stirred up.

And so instead of shooting Mike, Joe found himself trying to protect him until the crowd could be made to understand.

The threatened tragedy ended as comedy.

The Jersey Wagon Loader

In the Jersey loader, there have been developed a few features of great importance to a machine of this character, viz., low first cost and the maximum of convenience in handling. The manufacturers make the claim that where the machine replaces hand labor, it will effect a saving sufficient to pay for itself in 60 to 90 days. This particular apparatus is also designed so that it can be easily handled and moved from point to point in the coal yard by one man—an important consideration in such a machine.

VIEW OF THE JERSEY LOADER

The extreme height of the loader is 10 ft. over all and the weight is 1000 lb. It may be operated by either a 1-hp. gasoline engine or motor, and when working with the former motive power, the manufacturers claim that the actual cost of operation is only 4c. per hour. The machine, under normal conditions, is capable of handling one ton of coal per minute.

The chute which conveys the coal to the point of destination is provided with a removable plate, under which plate there is a screen designed to render it possible to remove all dust while the wagon is being loaded. The chute is also provided with a detachable dust retainer. All the drive parts are ball-bearing. The entire apparatus is so designed that a moderate pressure on the handles serves to bring it in balance on the two wheels, after which it is easily moved about by one man. The handles when not in use, are pushed back out of the way, as shown in the illustration.

The machine is manufactured by the Jersey Wagon Loader Co., 95 Liberty St., New York.

Editorials

The Acetylene Lamp

Only a few years ago the fact that the pouring of water on carbide compounds would generate a flame of unusual brilliancy became known. Now there are few mines not generating firedamp, where the acetylene lamp is not in use. It has the advantage over the oil lamp that it is cleaner, gives more light and is cheaper to operate.

There is a further advantage, extremely important where the danger from fire is imminent. This is that there is no wick to the lamp which, when thrown on one side ablaze, may set timbers or coal on fire. It is also possible to keep a light in a draft in which an oil lamp would go out and with the self-lighters now provided, the lamp can be far more readily ignited in a moderate wind than an oil torch. All of which excellent points have made the acetylene lamp popular.

At our request, George B. Pryde, general superintendent of the Union Pacific Coal Co., has furnished us the following facts as to the cost of burning acetylene and oil lamps. No attempt has been made to compare the candle-power-hours. Such a comparison would be far more favorable to the acetylene lamp than is even that here given. The period on which the estimates are based is a day of 8 hours.

COST OF ACETYLENE AND OIL LIGHTING

Name of Mine	Carbide Lamp	Lard-Oil Lamp
Reliance	$0.015	$0.048
Rock Springs	0.055	0.075
Cumberland	0.035	0.045
Superior	0.034	0.075
Hanna	0.034	0.070
Average	0.0346	0.0626

The estimates are based on a charge of 8⅓c. per lb. for carbide and 65c. to 75c. per gal. for lard oil.

We Are Each But a Part of the Community

Adam Smith, in the introduction to his great work, "Wealth of Nations," calls attention to the fact that because every man in a nation is employed in useful labor does not necessarily indicate that such a nation is prospering nor that its laborers are above being classed as "miserably poor."

To illustrate, he compares the savage tribes of hunters and fishers where every individual must provide for his family, but who are often reduced to starvation as against the ordinary workman in a thriving country where large numbers of people do not labor at all, and yet influence the produce of the whole labor of society to such an extent that the humblest workman may obtain more, as his share, than does the most prosperous member of the savage tribe.

This does not prove that the monopolist, with no love of the common herd in his makeup, who is always trying to boost food prices because he thinks he can get away with it, is a necessary evil any more than it suggests that the I. W. W. radical who is "agin" everyone with a standing on the tax list has any influence on the sum total of human happiness. It ought to suggest, however, without any great stretch of the imagination that the terrible "Coal Baron" who has invested his entire fortune in the coal industry is vitally connected with any future prospects of the workers in his camp even though he does not (literally) earn his bread by the sweat of his brow.

It seems strange that in the bituminous-coal industry where the percentage of profit on capital invested is probably smaller than in any other large industry, the demands of the workers during the past few years have been the most unreasonable. If the leaders of mine labor were of the same opinion about the profits on coal mining as the average city dweller, there might be some justification for their actions, but it is hard to believe that such is the case. There are no secrets about coal-mine cost sheets, and any inhabitant of a mining village who can't figure costs within a few cents must be musty on the multiplication table.

An Adam Smith writing today would not be compelled to fall back on the almost extinct savage tribes to illustrate the futility of all men working; he could illustrate his point quite as satisfactorily with late history of the doings of the unions at Butte, where the mine owner recently was in danger of being entirely eliminated from power and consideration. Certain officials of the miners' organization threatened to kill any labor leader who suggested that the mine owners should be consulted.

Eventually those miners out there who manage to escape bombs and bullets will decide that they are only part of the community.

Colorado, a Land of Promise

The conditions in Colorado are extremely promising. To those who would work and those who won't, the prospects are alike inviting, especially to the latter or to some at least of these. We think most of our readers belong to the former class, so we will show them what opportunities Colorado offers to the worker before we expatiate on its advantage to those who do not desire to toil.

The average daily earnings of the miners of the Victor-American Fuel Co. were, between June 30, 1912, and 1913, $4.69. The average time worked was 234½ days and the average yearly earnings $1100.75. The Colorado Fuel & Iron Co.'s average day wage for the same time was $4.02, the time worked 248½ days and the yearly income $999.36. The Rocky Mountain Fuel Co. paid an average day wage of $4.36, an average annual wage of $1007.01, the men working 231 days.

As the earnings of an average American family (of which two members are employed) are less than eight hundred dollars a year and the Bureau of Census has shown that anthracite miners average about $532 per year and bituminous miners $516, conditions are not unfavorable for workingmen in Colorado. Some, of course, make much more money than others. Thus, four brothers of Italian origin each made $1850 in one year digging coal in Colorado mines. The miners, as an average, received from the Colorado Fuel & Iron Co., 80.9 per cent. of their

earnings in cash, 11.73 per cent. being deducted for purchases at the company stores, 2.25 per cent. for rent and 5.12 per cent. for coal, board, powder and smithing.

But when we compare these figures with some others, we ask our readers not to be indignant, for they are far lower than have been paid by the United Mine Workers to their deserving official heads in Colorado, according to a little booklet, "Facts Concerning the Struggle in Colorado for Industrial Freedom." Frank J. Hayes was paid $4052.92 for nine weeks' salary and $1667.20 for expenses during the same period. Thus, he was recompensed at the rate of $90 per day, or $32,000 a year. John McLennan received $2683.55 and for expenses $1469.55, or $66 in all per day. John R. Lawson received as his nine weeks' salary $1773.40, or $28 per day. Mother Jones, whose sources of income have been a matter of much inquiry, was paid $2668.62, or $42 per day as salary.

We do not know what were the deductions made in these accounts, how much went to buy arms and ammunition, tents and automobiles and all the grim equipment of war. But the pay is princely and clearly establishes Colorado as a land of promise and makes the earnings of the men who work for the corporations look meager beside the pickings to be obtained from serving the union.

However, the rank and file of the men in Colorado receiving pay from the United Mine Workers of America drew only $3 per week and to them that state must have appeared like Nish or Mitrovitza.

Some Damages

Did you hear about Thomas Smith down in Arkansas who sued the Central Coal & Coke Co., for $220,000 damages for injury done him in a mine cave-in? Well, it's a fact, and here is the itemized bill that was filed:

Twenty-five thousand dollars for physical and mental suffering; $25,000 for medical attention and other expenditures; $5000 for loss of earnings to date of trial; $75,000 loss of future earning power; $25,000 loss of pleasures as a husband; $10,000 loss of happiness in additional children; $25,000 for humilating physical condition; $10,000 for fear of impending death; $10,000 loss by means of hunger, want and constant mortification; $10,000 fear of deprivations after trial; $220,000 total claims in suit.

Mr. Smith was employed as a fireboss, and alleges that a foreman of the C. C. & C. Co. sent him in to extinguish a fire that broke out in one of the entries. He attempted to do so, taking a hose with him. While playing a stream of water on the fire, the roof fell, crushing and disabling him. The plaintiff further alleges that it was not his duty to put out fires, as he was employed to inspect for gas.

Mr. Smith probably won't get anything like the absurd amount to which he lays claim, but the mere fact that such claims can be filed for judgment should prove a warning to our coal companies. The time has arrived when accidents simply must be avoided or the ghost of bankruptcy will loom large on the coal operator's horizon.

Workmen's Insurance in Germany

In view of the great interest in the United States concerning workmen's insurance, the results of similar efforts in Germany are illuminating. The Germans passed their first bill for sickness insurance in 1883, and since that time, numerous other acts dealing with the same problem have been added, until in 1911, the basic statutes were extended to widows and orphan's insurance.

From 1885 to 1912, the following amounts were expended in Germany: Care of the sick, $1,404,200,000; accident insurance, $760,800,000; invalid and death insurance, $1,123,200,000. This makes the total insurance payments, $3,288,200,000.

It is evident from the foregoing that when applied to the entire industry of a great nation, accepted forms of workmen's insurance are no light burden on invested capital. Doubly is this true of the coal-mining business where the hazards are so exceptional.

Indemnity and liability insurance are desirable things, and we trust that some fair and equitable form of protection for our miners may be worked out. Coal mining, however, is one form of industry where great judgment must be exercised in solving the problem, for serious accidents happen in our best regulated mines, and only an unusually strong corporation could ever survive the expense it would have to shoulder if some laws now contemplated were to be passed in an unaltered form.

The Matter of Collections

In these days of world war, with the resulting uncertainty and apprehension, many coal corporations of excellent reputation are facing financial problems of great importance to their very existence. Nothing bears more heavily on all industry than a tendency to defer payment of debts. If *A* doesn't pay *B*, then the latter can't pay *C*, and so the thing extends until the wheels somewhere must stop.

It is an elementary rule of busines that profit is made in proportion to the turnover; consequently collections must be made promptly if we expect efficiency and economy in our mining operations. About the only man who will resent your asking for payment of an account past due, is the fellow who proposes to do some financing at your expense.

Prompt payment of accounts is the best kind of insurance, for creditors will extend a helping hand in case of unavoidable emergency to the man who has zealously guarded his reputation when skies were blue.

A company that goes after collections diligently is always the kind of corporation that also looks after each and every operating detail. Careful management, good accounting and prompt collections are invariably found associated with a sound business.

Reinforced-Concrete Construction

In a paper before the Association of Engineers, in London, Henry Adams discussed the risk of spontaneous combustion where a large quantity of coal is stored, and referred to the use of reinforced concrete for the construction of coal bins. He said that structures of creosoted timber may last for 50 years, with increasing expenditure for repairs after the first 15 or 20 years; but in 50 years a reinforced-concrete structure may be in better condition than in the year it was built. It is probable that in the future this will be the only method of construction adopted for the purpose. It seems impossible to conceive of any better material; it has every advantage and no drawback. The strength and toughness of buildings in reinforced concrete increase with age.

Discussion By Readers

The Eskmeals Test of the Verner Counter-Current Theory

Letter No. 11—In response to a personal letter written by a prominent engineer who has been deeply interested in the discussion of the counter-current theory assisting the propagation of a dust explosion in a coal mine, as advanced by John Verner, former state mine inspector in Iowa, Dr. R. V. Wheeler, of the Experimental Station at Eskmeals, writes an interesting letter.

As the letter throws much light on the bearing of the Eskmeals experiment in this discussion, I have obtained permission to present it to the readers of COAL AGE, who have been greatly interested in the question of the *air factor* in a coal-dust explosion.

Doctor Wheeler writes as follows:

"If, as I assume, the article to which you refer is the one written by Mr. Dean, for COAL AGE, describing his visit to Eskmeals, I would say that Mr. Dean asked my permission to publish the results of the experiment that he persuaded me to carry out, and I readily gave my consent. I thought, however, that I made it clear that the experiment did not appeal to me as a test of Mr. Verner's theory *in toto*.

"The experiment made at Mr. Dean's request is described in the *Colliery Guardian*, of Sept. 25, as follows:

> The experiment at Eskmeals was carried out in the small gallery, 3 ft. 3 in. in diameter. A mixed dust was used, containing 70 per cent. coal dust and 30 per cent. incombustible dust (fuller's earth). This was done to slow down the explosion and allow more time for observing the air actions at the mouth of the gallery. Across the mouth of the tube, a board 6 in. square was supported by four coil springs, and from the board a rod 6 ft. long projected out into the open. There was a white mark on the rod, which passed through a stationary upright painted black. The rod moved back and forth as the air movements forced the board outward or inward. Half a pound per linear foot of mixed dust was strewn along the gallery to within 20 ft. of the mouth, and 1½ lb. of black powder, stemmed with 8 in. of dry clay, was fired from the cannon placed 50 ft. from the closed end of the gallery.
>
> A whistle was blown immediately before the shot was fired, and the first action observed was a cloud of dust blown out of the mouth of the gallery. This was caused by what might be called the concussion wave from the cannon; there was no flame in this dust cloud. Then immediately there was an air inrush, then an outrush with little dust, then another inrush, then an outrush with flames, which appeared first at the top of the mouth of the tube. The final movement was an air inrush. The second air inrush was very strong, accompanied by a loud sucking or whistling noise as the air rushed into the tube.

"As regards the observations made on that occasion, they are quite in conformity with what I have frequently observed during similar experiments both in the 3-ft. 3-in. and the 7-ft. 6-in. galleries. For such experiments, *the galleries are closed at one end and open at the other*, and ignition is effected by the firing of a cannon placed 50 ft. from the closed end, pointing toward the open end. The alternate inrush of air and outburst of smoke and dust before the flame reaches the open end are most noticeable when slowly moving inflammations are obtained, such as one gets by using a mixture of 60 per cent. coal and 40 per cent. incombustible dust. I have counted as many as seven outbursts before the appearance of flame at the open end when using such a mixture strewn throughout the 7-ft. 6-in. gallery (800 ft. long).

"The first air movement is the concussion wave from the cannon (which travels with the speed of sound in air at the temperature of the gallery). There is then a pause of maybe a second or two before a rushing noise is heard, and flame can be seen (through small holes in the side of the gallery) traveling with alternate spurts and halts along the gallery. When the flame reaches within 150 or 200 ft. of the open end of the gallery these 'spurts' and 'halts' are manifested by corresponding outbursts of smoke and inrushes of air at the open end. There is an interval sometimes of several seconds between successive spurts of the flame. At length, with one last spurt, the flame issues into the open air, there then follows a rapid inrush of air, which is sufficiently powerful to draw shingle and stones from 20 or 30 ft. in front of the gallery into the gallery.

"The reason for these phenomena is, I think, clear. As I explained to Mr. Dean, the cooling of the products of combustion behind the flame creates a partial vacuum—you must remember that the rear of the gallery is closed; *no such phenomena occur when the gallery is so arranged that air can enter freely behind the flame.*"

AN INTERESTED READER.

Philadelphia, Penn.

Letter No. 12—In the issue of COAL AGE, Oct. 17, p. 623, a certain "Mining Engineer" criticizes the previous article of Samuel Dean, COAL AGE, Aug. 22, p. 294, describing the Eskmeals experiment, which was made by special request and by the courtesy of Doctor Wheeler, at that time in charge of the Experimental Station. Mr. Dean had asked that the experiment be made to prove or disprove the Verner theory of the "counter-current" as assisting the propagation of a coal-dust explosion.

While the criticisms, for the most part, condemn without disproving the statements of Mr. Dean, there are some points worthy of reply. Under the heading "Proving the Inrush Theory," it is stated that Mr. Dean's argument "does not appear at all convincing," because the pressure curve given by Mr. Dean "is meaningless, as it does not show the atmospheric line and give the relative pressures and time intervals, ... starting from the instant when the shot was fired." Objection is also taken to the failure to "separate the effects of the igniting shot and of the explosion proper."

I would ask, What would have been gained had Mr. Dean given this additional information and showed the "atmospheric line" on his diagram and also the "time intervals," starting from the firing of the shot. Would this information have made any clearer the unquestionable fact shown by the experiment that there were *two* inrushes of air before the flame appeared at the mouth of the gallery, and demonstrated the fact shown by the

diagram that *the second inrush of air was much greater than the first.* These were the facts Mr. Dean desired to prove or disprove.

I would ask, again, What would be gained by a more marked "separation" of the effects of the igniting shot and the subsequent dust explosion. These differ only in magnitude, the inrush of air in each case being proportional to the energies of the explosions of the *shot* and of the *dust,* respectively. This difference was clearly shown in the Eskmeals experiment. The first inrush of air was small in comparison with the second inrush due to the explosion of the dust.

In speaking of the wave set up by "any violent vibration," it would seem that the writer held the opinion that the first two inrushes of air, at Eskmeals, were caused, or could have been caused, by the vibratory effect of the *shot.* He gives the following illustration:

> One may, with a paddle, give a violent impulse to water in one end of a water trough, and there will be a return wave of almost the same size, followed by waves to and fro, until friction on the sides has absorbed the energy originally imparted.

This illustration, showing as it does a steadily diminishing vibratory effect, fails to support the contention that the vibration shown by Mr. Dean's diagram resulted from the *shot,* as there was not only an *increasing pressure,* but the second inrush of air into the mine instead of being less was *much greater than the first.*

While the statement that "the use of springs to suspend and hold the board in the middle does not commend itself as being good for scientific observation" may be true, this device furnished the desired visible proof of the *inrush of air* that formed the counter-current. Mr. Dean obtained, besides this *visible* evidence, *audible* proof of the same, as the noise of the air rushing into the gallery was plainly heard by the observers stationed 100 ft. away from the opening.

In this connection, I recall the remarkable experiences of Mr. McAllister, described in COAL AGE, Vol. 2, p. 881, which incidentally furnishes excellent proof of the inrush of the air into a mine, following an explosion. Referring to an explosion that occurred in a newly opened shaft mine, Mr. McAllister states that many of the workmen had left their coats hanging on the shaft timbers, and these were first drawn into the shaft (apparently by the first inrush of air preceding the general explosion of the mine) and almost instantly blown back and left hanging in the sheaves, while timbers and rock were thrown at least 300 ft. into the air by the final blast.

It would appear that to question, as "Mining Engineer" does, the statements of men who have survived an explosion and reported that they had felt the force of an inrush of air while the explosion was still in progress, would seem to serve no good purpose. Such evidence is rarely available and to say of these men that their state of "mental agitation" would render their assertions somewhat doubtful, appears as an attempt to detract from the value of actual evidence bearing on this question.

While admitting that an inrush of air following an explosion is possible, objection is made to this inrush taking place "along the bottom, in the face of an advancing explosion of coal dust," claiming that it is "completely in violation of the fundamental laws of physics." I would ask, What laws of physics are violated? Just here, it might be well to investigate what are the laws governing the compression of one gaseous body at a low temperature, by another gaseous body at a high temperature, under such conditions as exist in the mine. Until this has been made clear, the charge of "violation of the fundamental laws of physics" cannot be sustained.

In concluding his article, "Mining Engineer" asks:

> If, for the moment, we assume there is a "counter-current," where does it lead us? What does it mean? Does it bring us any nearer to the prevention of explosions? It has been hinted that it suggested the cutting off of the supply of air in the mine, and this method has been practiced by shutting down the fan at shotfiring time in some Western states, including Mr. Verner's state, Iowa, and notably in Kansas and Oklahoma, which states are reported to have more explosions from shotfiring than occur in any two other coal-mining states in the country of many times their output. One mine is said to have had three in a single year, and another operation two in one month.
>
> Is that what the theory leads to? If it does not, it should be made clear that it only deals with the internal mechanism of an explosion, is of theoretical interest only, and has no relation to the prevention of such unfortunate occurrences as otherwise the general mining public, which has neither the time nor the means of studying the matter, is liable to be seriously misled.

This is certainly a remarkable statement, coming from a mining engineer, as it indicates a doubt in his mind as to the practical bearing or influence of such an inrush of air to develop a destructive explosion, from an otherwise local occurrence. If there is the danger that the acceptance of the theory of a counter-current, in connection with dust explosions, would lead to mischievous conclusions and practices, it is the more necessary to *disprove* the theory by a thorough investigation of the facts claimed, which has been my desire.

I have faith to believe, however, that eventually the theory of the counter-current will win out and be shown to have a practical value, in respect to the *prevention* of explosions. The theory makes possible the rational explanation of the process by which the explosive combustion of dust is effected in mine workings, and explains, in a most reasonable manner, the propagation of such an explosion throughout the mine.

The study of this theory, in my opinion, will lead to the best means of preventing such explosions. *It may even be hoped that such a study will reveal the manner in which the counter-current itself may be used to arrest the progress of a dust explosion already under way, and thus furnish the desired solution of the dust-explosion problem.*

JOHN VERNER.

Chariton, Iowa.

Letter No. 13—In reading the article by "Mining Engineer," COAL AGE, Oct. 17, p. 623, relating to the Verner theory of the counter-current in respect to mine explosions of coal dust, it does not seem to me that the article, in its entirety, does justice to the theory.

The writer of the article, referring to the description of the Eskmeals explosion test given by Mr. Dean, COAL AGE, Aug. 22, p. 294, states that he does not find, either in that article or in the five reports issued by the British Commission "any avowed support of the theory." If I rightly understand Mr. Verner's view and claims, his proposition is primarily a theory formulated to explain *the cumulative action of a coal-dust explosion,* which, I am pleased to find, throws much light on the fact of such an explosion proving more intense and extensive than an explosion of firedamp in a mine.

It will be remembered by readers of COAL AGE that some time ago, in an excellent article entitled "The Air

Factor in Mine Explosions," Coal Age, Vol. 5, p. 604, Mr. Verner offered some practical suggestions, in regard to the experimental investigation of this theory by the Federal Bureau of Mines. As far as anyone knows, these suggestions were not accepted by the Bureau, nor has any investigation been conducted along the lines indicated in detail by Mr. Verner at that time.

However, in response to the request of Samuel Dean of Delagua, Colorado, who recently visited the Eskmeals Experimental Station, the British Station undertook a simple experiment to prove or disprove the existence of such a counter-current in a dust explosion, with a view to showing the alternate outrush and inrush of air into the experimental gallery following the explosion of the igniting shot, and the later general explosive combustion of the coal dust thereby thrown into suspension in the air. While it is not claimed by anyone that this test was complete or conclusive, it was generally understood to point to the ultimate confirmation of the theory propounded by Mr. Verner.

In his article discussing the Verner theory, "Mining Engineer" regards the suggestion "that there is an inrush of air along the bottom, in the face of an advancing explosion of coal dust, . . . incomprehensible, as it seems to be completely in violation of the fundamental laws of physics." He continues, "How can there be coexistent, a great pressure of expanding gases and in the same area of combustion, a depression or void?"

One would infer from this statement that the writer makes two assumptions: 1. That the counter-current is a continuous progressive factor. 2. That the expanding force of the resulting explosive combustion of the dust is constantly and equally distributed over the entire area of opening through which the explosive wave advances. The fact is seemingly overlooked that the internal propelling force in any explosion decreases constantly as expansion takes place, while the opposing force of resistance due to the compression of the air and gases propelled through the airway increases. Now, if it can be proved that the propelling force is constant and equally distributed over the area, it must be admitted that the weaker resisting forces will be overcome and there can then be no counter-current; but, on the other hand, if one or both of the opposing forces are *not* thus equally distributed over the area, *it is possible for a weaker force to advance in opposition to the stronger expansive forces of the explosion, which fact forms the basis of the counter-current theory.*

In the diagram I submitted as a graphic illustration of the Verner theory, Coal Age, Vol. 5, p. 1059, I tried to show what "Mining Engineer" styles "the chief difficulty apparent in all of the discussions by Verner and Dean." This difficulty, he states, is that "they do not separate the effects of the igniting shot and of the explosion proper." I explained clearly, Vol. 5, p. 1059, that the effect of the exploding shot was to cause a momentary vacuous condition close to the face of the heading where the shot was fired, which was due to the air at this point being swept away by the explosive blast.

Referring to this claim, Messrs. Ashworth, Vol. 6, p. 398, McCune, p. 603, and "Mining Engineer," p. 624, refuse to accept as true the momentary existence of a vacuous condition surrounding the shot, at the face of the heading. Mr. Ashworth admits that a depression might exist "if such a shot were to be fired at a gate-end, on a longwall face." Mr. McCune, assuming that an explosion of powder or coal dust causes an equal pressure in every direction concludes "it is hard to understand" how I would explain the existence of a partial vacuum at the face of the coal surrounding the shot." In reply, allow me to say, it is well understood that if the initial point of the explosion is surrounded by an open space the explosive force will be projected radially in every direction from that initial point. This, however, is not the case in the blast projected from the mouth of a cannon or shot fired at the head of an entry; but the lines of force are projected into the entry, as I have shown in the diagram, except as these lines are deflected by the bounding walls of the heading.

In refuting the claim of a "partial vacuum" at the face of the heading where the shot is fired, "Mining Engineer" cites two instances, which he considers prove a vacuous condition impossible. The first is the Altofts experiment No. 116, in which the flame and gases passed back in the opposite direction to that in which the cannon was pointed "due to the pressure created by the shot in the explosion." The second reference is to an explosion test, made at the U. S. experimental mine, when the cannon was placed outside of a plank stopping in which a hole had been cut to admit the mouth of the cannon. This stopping was at the entrance and the cannon pointed into the mine. When the charge was fired no explosion occurred, but the stopping was blown outward by the force of the shot reacting against it. In my opinion, these instances each show the reactionary effect claimed in the theory of the counter-current. They do not disprove the momentary existence of a vacuous condition immediately surrounding and out of range of the projected blast.

I. C. Parfitt.

Jerome, Penn.

The Foreigner in Mining

Letter No. 8—I want to add a word by way of emphasizing some of the statements made in the many interesting letters that have discussed this important question. I was particularly interested in two of these letters; namely, Letter No. 3, written by Mr. Parfitt, Coal Age, Sept. 12, p. 440; and Letter No. 5, written by Mr. Dixon, Oct. 3, p. 561.

I could not help, like Mr. Dixon, contrasting the tone of Mr. Parfitt's letter with that of Letter No. 4, written by Mr. Hogarth, which appeared on the same page. As Mr. Hogarth states, the larger proportion of this foreign element "are illiterate and come from the lowest classes in their respective countries where they never had a chance." When they first reach this country it must be acknowledged they are very ignorant and, as a result, I am afraid they are often imposed upon and their personal liberties and rights taken from them.

However, it is my observation that these people learn very fast, and I want to say that we could not at the present time get along without them, as Mr. Dixon has already indicated. The man that labors under the belief that they are not progressive is much mistaken, as when given half a chance they invariably make good citizens.

I will admit that, before the different companies started to educate this class of mine workers and to better their living conditions, they did appear to make little improvement; but I will say, with Mr. Hogarth, they greatly

appreciate what is being done for them, as is shown by the way in which they adapt themselves to their changed conditions. This fact is very evident from the general appearance of their yards and houses, which are commonly neat and well kept.

A visit to any first-class mine today reveals the fact that its labor is very largely made up of the foreign element. This is true not only of the mining end, but many of the bosses belong to this class. In my tours of inspection, I have frequently asked mine foremen why they employed Slavs or other foreigners as drivers in the mine. The reply is invariably that "they haul more coal than the boys in this country." This is not to say that Americans *cannot* haul the same coal, but they *do* not.

The spirit of coöperation is often stronger among the foreign element than among the English-speaking miners. It is coming to be the custom now among the foreigners to ask their foremen for days off when they wish to be away. They did not use to do this, which fact also shows a decided improvement as a result of their education.

Another evidence of their advancement is the objection often heard made by them, in respect to occupying any kind of a house that it is proposed to rent them. As a rule, they desire a good house, and many of them will not consent to keep boarders. Where boarders are taken, the number accommodated is much less than formerly. It used to be that from 12 to 16 boarders were crowded into a small house of four or five rooms, but this is not common now. When asked by the superintendent to keep boarders, the reply has been made, "Why do you not keep them yourself; you have a large house." This spirit, Mr. Parfitt would style, "a dominant characteristic" and smart. I also term it "smart," but in a different sense, it being, in my opinion, the result of education.

With Mr. Dixon, I regard the foreigners as the best *machine-runners* and the best loaders, and believe that it is only a question of time when these same foreigners will fill many of the official positions in our mines. For this we can blame no one but ourselves; I want to say again that the time given to the training of these people is not lost, but well spent.

In closing I want to endorse what Mr. Dixon has said that "The foreigner coming to this country judges of its laws and customs by the treatment he receives." The attempts made during the past eight or ten years to educate and better the condition of the foreigner have resulted in making them better men and their children are often hard to distinguish from our own American boys and girls, not only in dress but in manners.

PENNSYLVANIA ENGINEER.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

GEOMETRY

The principles of geometry form the basis of all measurements, whether of **length, surface,** or **volume.**

Elements—Four elements may be considered as determining **location, distance** and **superficial** or **solid** measurement; they are as follows:

1. A **point** is that which has position only, in space.
2. A **line** is that which has length only.
3. A **surface** is an element of two dimensions.
4. A **solid** is an element of three dimensions.

Postulates—A postulate is a proposition that is so evident that it is accepted as true and needing no proof; as for example,

1. If a **point** moves in space it generates a line. If the movement is in one direction only the line is a **straight line.** If the direction is constantly changing the line is a **curved line.** If the direction changes frequently, at intervals, the line is a **broken line.**

2. If a **line** moves in any direction except that of its length it generates a surface. If the movement is in one direction only a **plane surface** or a **plane** is generated. If the direction is constantly changing a **curved** or **warped surface** is generated.

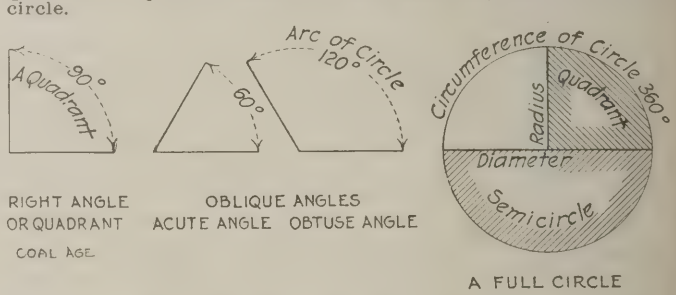
3. If a **plane surface** of given dimensions moves in any direction except in its own plane it generates a **solid.**

Angles—Angles, in geometry, are classified as plane or solid.

A **plane angle** is formed when two straight lines, having different directions, meet at a common point. The two lines lie, therefore, in the same plane, which is the **plane of the angle.** The **angle** formed is the portion of the plane included between the two lines, or the difference in direction of the lines. The point at which the two lines meet or intersect is the **vertex** of the angle.

A **solid angle** is the space included between two or more intersecting planes. When two planes intersect in a common line, forming a "wedge," the space included between them is the **angle of the wedge.** Three intersecting planes always have one common point, which is the **vertex** of the solid angle bounded by these planes. When more than three planes intersect in a common point that point is the **vertex** of the solid angle thus formed.

Plane and solid angles may be **rectilineal** when bounded by straight lines or planes; **curvilinear** when bounded by curved lines or surfaces; and **mixed** when bounded by both of these.



A **right angle** is one formed by the intersection of two straight lines that are perpendicular to each other. When the two intersecting lines are inclined to each other the angle formed is an **oblique angle.**

An **acute angle** is an oblique angle that is less than a right angle.

An **obtuse angle** is an oblique angle that is greater than a right angle.

The Coal Age Pocket Book

Measurement of Angles—Angles are measured by circular units called **degrees, minutes** and **seconds,** which will be better understood in the study of the circle. The accompanying figure shows the right angle, acute angle, obtuse angle and the circle. The circle is divided to show both the **quadrant** or quarter circle and the **semicircle,** which is a half-circle.

It is evident that there are four right angles or quadrants in a full circle; and since there are 360 deg. in the circumference of a circle, there are 360 ÷ 4 = 90 deg. in the arc of a quadrant; or a right angle is 90 deg.

An acute angle is therefore always less and an obtuse angle greater than 90 deg. An angle is thus measured by the **arc** that it subtends, and this arc is expressed in degrees, minutes and seconds.

In practical work it is often convenient to subtract the angle from 90 deg. or from 180 deg. and employ this difference instead of using the given angle. This gives rise to two terms; namely,

1. The **complement** of an angle is 90 deg. minus that angle. Thus, the complement of 60 deg. is 90 — 60 = 30 deg.; and 30 deg. and 60 deg. are therefore said to be "complementary" to each other.

2. The **supplement** of an angle is 180 deg. minus that angle. Thus, the supplement of 145 deg. is 180 — 145 = 35 deg.; and 35 deg. and 145 deg. are therefore "supplementary" angles, in relation to each other.

Geometrical Figures—The figures employed in plane geometry are represented as bounded by straight or curved lines. The bounding line or lines taken together are called the **perimeter** of the figure and the space inclosed is its **area.** The figures of plane geometry are of two general classes.

1. The figures bounded by straight lines are mostly named from the number of their sides. They are the **triangle, quadrilateral, pentagon, hexagon, octagon,** etc., having 3, 4, 5, 6 and 8 sides, respectively.

2. The common figures bounded by curved lines are the **circle** and **ellipse.**

Inquiries of General Interest

Dulong's Formula for Calculating Heat Value of Coal

Will you kindly give what is known as Dulong's coal formula and show its application and practical use for determining the heat value of different coals. Are the results obtained in the use of the formula reliable? And is it much used in practice?

INQUIRER.

Linton, Ind.

In reply to this question, an engineer of standing writes as follows:

"In actual practice, the Dulong formula seems to be almost relegated to the past. Personally, I have never had any use for it outside of college; probably because I have not made an ultimate analysis of coal since leaving college. As is well known, most tables giving the analyses of coals give, besides, their calorific values. For this reason, mining engineers seldom have need to calculate the heating value of a coal from its ultimate analysis, preferring to take the value as given in the table. The formula, however, is of interest for the purpose of checking the heat values given in a table; or for calculating this value, in case the analysis only is given.

What is commonly known as the Dulong formula is the following:

$$h = 146\,C + 620\left(H - \frac{O}{8}\right)$$

In this formula, h equals the heat value, in B.t.u. per pound of coal; C equals percentage of carbon; H, percentage of hydrogen; and O, the percentage of oxygen, as given by the ultimate analysis of the coal. In the formula these percentages are not expressed decimally. When great accuracy is required, it is common to add to the heat value obtained by this formula, 40 B.t.u., for each per cent. of sulphur in the coal, although this is not a part of the original Dulong formula. The results as thus calculated, in the accompanying table, include this addition for the sulphur.

As a matter of curiosity, and believing that it might interest some readers of COAL AGE to compare the heat values given in the table with the values calculated from Dulong's formula, I have selected from Bulletin No. 22, U. S. Bureau of Mines, five samples of coal obtained from mines at long distances apart, each having an approximate calorific value of 10,000 B.t.u. per lb., according to the tables. The samples selected come from Arkansas, Iowa, Kentucky, Missouri and Wyoming. In the table, both the proximate and the ultimate analyses of these coals are given.

It will be noticed that the several analyses show a considerable difference in the percentages of fixed carbon in the different coals, varying from a minimum of 33.76 per cent. to a maximum of 55.22 per cent. The percentages of ash in the different coals also vary considerably; from a minimum of 10.05 per cent. to a maximum of 24.81 per cent. These coals will not only vary in chemical composition, but their outward appearance will be generally quite dissimilar.

Comparing the values calculated by the use of the formula, with the experimental values determined by the Bureau of Mines, it is seen that the former agree fairly well with the latter, the calculated results being sometimes a little high and sometimes a little low as compared with the values determined by experiment.

TABLE SHOWING PROXIMATE AND ULTIMATE ANALYSES OF COALS AND THEIR EXPERIMENTAL AND CALCULATED HEAT VALUES

	Proximate Analysis					Ultimate Analysis					
	Moisture	Volatile	Fixed Carbon	Ash	Sulphur	Hydrogen	Carbon	Nitrogen	Oxygen	B.T.U.	Dulong's Formula
Arkansas....	5.26	14.71	55.22	24.81	1.00	3.91	59.87	1.23	9.18	10,451	10,502

New York City.

Weight of Boiler

What is the weight of a boiler, 6 ft. in diameter, 16 ft. long, with sixty-six 4-in. flues? The steel is ¼ in. thick in the shell and ends and ⅛ in. in the flues.

X.

Peoria, Ill.

The circumference of the boiler shell is $3.1416 \times 6 = 18.85$ ft. Multiplying this circumference by the length of the boiler and the thickness of the shell expressed in feet, which is $^1/_{48}$ ft., the amount of steel in the shell is $18.85 \times 16 \times {}^1/_{48} = 6.28$ cu.ft.

The area of the two ends of the boilers is $2\ (0.7854 \times 6^2) = 56.55$ sq.ft. From this area must be subtracted the area cut out for the sixty-six 4-in. flues, in both ends of the boiler. This area is $2 \times 66 \times 0.7854\ (⅓)^2 = 11.52$ sq.ft. The net area of the two ends is, then, $56.55 - 11.52$ = say 45 sq.ft. Multiplying this by the thickness of the plate, $^1/_{48}$ ft., gives for the amount of steel in the two ends, $45 \times {}^1/_{48} = 0.93$ cu.ft.

The superficial surface of a 4-in. flue, 16 ft. long, is $3.1416 \times ⅓ \times 16 = 16.755$ sq.ft. The amount of steel in 66 of these flues, the metal being ⅛ in. or $^1/_{96}$ ft. in thickness, is $66 \times 16.755 \times {}^1/_{96} = 11.52$ cu.ft.

The total amount of steel in the shell, boiler ends and flues is, then, $6.28 + 0.93 + 11.52 = 18.73$ cu.ft. Then, taking the weight of wrought iron as 485 lb. per cu.ft., the total weight is $18.73 \times 485 \div 2000 = 4.54$ tons.

Examination Questions

Mine Examiners' Examination Held at Springfield, Ill., Oct. 12, 1914

(*Questions Answered by Request*)

Ques.—In longwall workings where there is firedamp, how would you arrange to ventilate the job; and what would you do with abandoned roadways?

Ans.—If the gas is given off in about the same quantity around the entire circle of longwall face, the air current should be split at or near the shaft bottom, into as many separate currents as is practicable; and each of these should be conducted directly to the face. At the face, each air split is again divided into two currents, one passing to the right and the other to the left along the face, till each meets a similar current returning from another section. These two return currents are then conducted through a roadway to the main-return air course.

Where this system is employed the entire longwall face should be divided into four or eight sections, according to the quantity of gas generated in the mine and the length of the face open. The main air current must be of sufficient volume to ventilate each section with a velocity sufficient to sweep away the gases that accumulate.

With *four* ventilating sections, there should be two main intake roads and two main return airways leading to and from the face, respectively. The intake air should be split at the head of the intake roadways and the four currents thus formed should unite and return by the two main return airways to the bottom of the upcast shaft, as just described.

When the face is divided into *eight* sections, there should be four main intake roads to conduct the air currents to the face where each current is divided, as before; and these, again uniting, should return by four separate airways to the bottom of the upcast shaft.

In longwall work, all abandoned roadways should be either filled solid with refuse or ventilated by a sufficient scale of air to keep them clear of gas.

Ques.—Describe the operation of clearing gas out of a working place, and state the precautions necessary to be taken while so doing.

Ans.—The exact method of proceeding can only be determined when the character of the working place is known or specified. However, where the quantity of gas is considerable, all workmen should be withdrawn from the return side before any attempt is made to dislodge the gas; and every approach to the return airways of that section should be safeguarded to prevent anyone from entering the return current unwarned. The work of removing the gas should be conducted from the intake end and the air conducted forward by a brattice, if necessary, to cause it to sweep away the gas that has accumulated. The brattice should be extended gradually as the work proceeds, ample time being allowed for the air to dilute and sweep away the gas. Only safety lamps should be used and these must be carefully watched and guarded from the effects of a possible fall of roof.

Ques.—In an airway passing 20,000 cu.ft. of air per min., the anemometer indicates a velocity of 500 ft. per min., what is the sectional area of the airway?

Ans.—Assuming that the anemometer records the average velocity of the air current, the sectional area of the airway is

$$a = \frac{q}{v} = \frac{20{,}000}{500} = 40 \text{ sq.ft.}$$

Ques.—(a) In a mine ventilated by several splits of air, how would you ascertain if any split was passing more than its share of the air? (b) If you found one split passing more than its share, how would you remedy the defect?

Ans.—(a) The quantity of air that will be required in each split will depend on the number of men employed and the conditions peculiar to that split. A split generating gas may require double the quantity of air in another split where no gas is generated, although the same number of men may be employed in each split. The size of the workings, condition of the stoppings, rise or dip of the roadways, etc., will also modify the quantity of air required. These conditions must determine the proper proportion of air for each split.

(b) Where more air is required in any one split than what is passing in the same, it will be necessary to regulate the air by building regulators in those splits taking more than their proper proportion. By thus obstructing the flow of air in those airways requiring a less quantity, the desired distribution of the air is obtained.

Ques.—With what object have safety lamps been provided with a bonnet or shield?

Ans.—The purpose of the *bonnet* on a safety lamp is to protect the gauze chimney from strong air currents and thus provide greater security in the upper portion of the lamp. A *shield* is often provided on a Davy lamp for the same purpose; namely, to protect the flame of the lamp from a strong air current or a sudden blast of air and prevent, if possible, the flame of the lamp being blown through the gauze.

Ques.—How would you find the area of a circular airway?

Ans.—Multiply the square of the diameter of the airway in feet, by 0.7854; the product obtained will be the sectional area of the airway, in square feet.

Ques.—A current of 3000 cu.ft. of air (and gas) is at the most explosive point; how much fresh air must be added to prevent a cap?

Ans.—Assuming that the given volume contains 9.46 per cent. of gas, the volume of gas in this current is $3000 \times 0.0946 = 283.8$ cu.ft. per min. Now, assuming that a gas cap cannot be detected ordinarily when the gas does not exceed 2 per cent., and taking this volume of gas, therefore, as 2 per cent. of the entire current after the addition of fresh air, the volume of the increased current will be $283.8 \div 0.02 = 14{,}190$ cu.ft. per min. The volume of air that must be added to produce this condition is then $14{,}190 - 3000 = 11{,}190$ cu.ft. per min.

Coal and Coke News

Harrisburg, Penn.

The free schools for miners are now open throughout the anthracite region, of Pennsylvania, and according to the State Department of Public Instruction the indications are that the enrollment, when compiled will show an increase over last year. More mine workers are taking advantage of the courses of instructions which won them nearly a score of mine foremen's certificates and almost a hundred assistant mine foremen's certificates from the state last year as well as many hundreds of promotions from the companies.

The full list of schools, which opened on dates ranging from the middle of October to the present includes those at Nanticoke, Glen Lyon, Wanamie, Alden, Mt. Carmel, West Coal, East Coal, Brady, Sagon, Kulpmont, Exchange, Shickshinny, Nesquehoning, Wiconisco, Lykens, Shamokin, Ellsworth, Centralia, Lost Creek, Mahoney City, Shenandoah, Minersville and Pottsville.

No action has been taken as yet as to repeating last years' appropriation of $140,000 for free vocational schools, part of which was devoted to the re-imbursing of two-thirds of the expenses of such of these schools as qualified for state aid, as the Legislature does not convene until January, but there have been no changes in the provisions of the act of May 1, 1913, under which the appropriation was made.

In the meanwhile the operators are guaranteeing the schools' expenses as heretofore, and helping them in many ways. The widespread interest among the mine workers in these ladders to promotion is evidenced also by the increase in the membership of the institutes new and old which are adjuncts of the schools.

PENNSYLVANIA

Anthracite

Lattimer—No coal was mined or prepared for market in the anthracite coalfield on Oct. 29, the 200,000 or more employees of the various collieries remaining idle to celebrate Mitchell Day. Only such mine employees as firemen, engineers, and pump runners remained on duty, the balance of the wage earners holding parades and mass meetings in commemoration of the victory won in 1900. The men throughout the Hazleton district did not parade but gathered at Lattimer, where they were addressed by local and visiting speakers.

Hazleton—It is said that the greatest tonnage ever produced by any individual hard-coal operator in the history of anthracite was that secured by the G. B. Markle Co., of Jeddo, for the fiscal year ending Oct. 31. Up to that date, this firm had sent somewhat over 1,500,000 tons of fuel to market.

Harrisburg—The Dauphin County Court recently granted a preliminary injunction restraining Chief of Mines, James E. Roderick and the miners' examining board in Schuylkill and Dauphin Counties from conducting examinations. This action was taken because a suit is pending to determine what constitutes practical experience as a miner.

Towanda — Development work on the property of the Loyalsock Coal Mining Co. which has been going on for about two years indicates that the firm will soon be producing coal in paying quantities. A drift has been driven into the mountain 225 ft., and the present working face shows a seam of coal 5 ft. 11 in. thick, free from slate and sulphur. A breaker has been erected equipped with modern machinery, which has a capacity of 400 tons per day.

Avoca—Three men were buried up to their shoulders in an avalanche of culm, large quantities of which were afire while the remainder was heated to burning point on Oct. 28, at the Old Forge Colliery of the Pennsylvania Coal Co. One of the men died and the other two are in a serious condition. They were engaged in removing a part of the bank so that the culm could be conveyed to a washery in a conveyor line. While they were shoveling a part of the bank which had not caught on fire they disturbed the entire side and the burning coal in tons came sliding upon them.

Bituminous

Connellsville—The Connellsville coke trade is still moving downward with no assurance that bottom is in sight. Shipments now aggregate about 214,000 tons weekly, and 2000 additional ovens were recently put out of blast by the furnace interests.

Chicora—The tipple and stables of the Morris Coal Co. near Claytonia were recently destroyed by fire. Quick work on the part of the employees saved the horses and mules from burning. The damage is estimated at $14,000 partially covered by insurance.

Heilwood—The following officials and employees of the Berwind-White Coal Co. have resigned: H. P. Doular, superintendent; Harry Kallaway, assistant superintendent; Drs. Henry and Gourley; mine foremen and assistants, Charles Gonoe, S. Fink, Fred Fenton, Thomas Hogarth and John Shay; master mechanic, William Davis; chief and assistant electricians, Jay Flemming and Ernest Pelkington; mining engineer, Archie Donaldson and others.

Monongahela—One man was burned to death and two others overcome by flames and afterdamp in the Pattison mine of the United Coal Co., opposite Clairton on the Monongahela River recently when they became hemmed in by a fire in the mine. The men from the United States Bureau of Mines Station at Pittsburgh were summoned but the miners were imprisoned for about six hours.

WEST VIRGINIA

Herberton—The Willis Branch Coal Co., recently organized by T. K. Laing, has taken over the coal holdings of the former Herberton Collieries Co., and is preparing to open new operations, abandoning those started by the old company. The vein which will be operated is the same as that being worked by the Long Branch Coal Co.

Charleston—That the State of West Virginia can annually furnish 100,000,000 tons of coal from the 1000 mines now in operation together with the output of about 100 more that are ready to begin work when there is a demand for the product is the opinion of Earle A. Henry, chief of the State Department of Mines. Mr. Henry further believes that the production of the state will be greatly increased within the next year, and is generally optimistic concerning the coal mining industry in spite of the general falling off of orders in all states during the past month or more.

Bluefield—Several thousand feet of moving picture film portraying the Pocahontas coalfield operations in their various and interesting forms, showing the various operations through which the coal passes from the working face of the mine to the railroad car and thence to the loading piers at Newport News, will be a part of the moving picture film of West Virginia to be projected in the state building during the Panama Pacific International Exposition. A large portion of this picture film has already been taken, while the balance will be made in the near future.

ALABAMA

Coleanor—In a local gas explosion of the Coleanor mine, Bibb County, between 6.30 and 7 o'clock, Oct. 31, three men lost their lives, and four more were injured. The explosion occurred just as the men had entered the mine, about 125 having gone in. The mine is operated by the Blocton-Cahaba Coal Co., and little damage was done.

KENTUCKY

Mater—The Elkhorn Coal Co. is increasing its output, as are also the other small operating companies in the eastern Kentucky field. At the same time, some of the mines of the Consolidation Coal Co. and The Elk Horn Fuel Co. in the Jenkins-McRoberts-Burdine-Fleming field have closed down. The coal business, however, holds up pretty well. European war conditions are given as the cause for the dullness.

Somerset—Coal men and property owners in this part of Kentucky are much interested in the reported consummation of a deal by which Eastern capitalists, not named, are said to have taken over 100,000 acres of coal land lying in Pulaski, Rockcastle and Laurel counties and to be preparing to open up an office in Mt. Vernon. This transaction would mean another railroad for Pulaski county and it is asserted that part of the development projects of the purchasers is a railroad which will tap their holdings. It is reported that the survey is to be made at once. Hundreds of acres in the counties named are rich in coal which cannot be reached until railroads are built.

Louisville—Preparations are being made for the annual meeting here on Dec. 4 and 5 of the Kentucky Mine Institute. Prof. Ivan P. Tashop, of the Kentucky State University and secretary of the institute, is at work on the program which has been announced in a tentative form. The institute will convene on Friday afternoon, hear the address of welcome and several technical papers. At night there will be a banquet. More papers will be presented on Saturday morning. That afternoon the Speed cement mills will be visited and at night a theater party is in order. All the sessions of the institute will be at the Seelbach Hotel. A large attendance is looked for.

OHIO

Bellaire — A deal was recently closed by the Lynskey, Lynskey & Lynskey Real Estate Agency, whereby the Mattuci Coal Co. became the owner of the mine and equipment belonging to James Weeks. This property consists of 17 acres of coal, a tipple, and other equipment. This mine is a strictly retail proposition, no coal being shipped at present.

Columbus—According to the officers of the Lorain Coal and Dock Co., of Columbus, the company is not yet ready to make a statement concerning the rumor that one of the mines in the Belmont County field will be dismantled and the equipment moved to the Hocking Valley.

The Supreme Court of the United States has set the time for hearing arguments on the case of the Rail & River Coal Co. against the Ohio Industrial Commission involving the constitutionality of the Ohio anti-screen law for Nov. 30. Assistant Attorney General Laylin recently filed a motion in the supreme court asking for a dismissal or advancement of the case on the docket. The court accordingly advanced it. At first Chief Justice White announced a dismissal but immediately withdrew the dismissal and set it for argument.

Coshocton—John A. McGiffen, a small operator near Coshocton, Ohio, recently advertised for miners preparatory to resuming operations and a large number applied for positions. The mines throughout the Coshocton district have been idle since Apr. 1. It is said a few more of the smaller mines will resume work but the larger operators have not yet signed up.

The recently enacted anti-screen law in Ohio is the basis for an injunction suit filed by Jones Eschliman against the J. H. Somers Coal Co., of Coshocton. Eschliman leased a tract of 200 acres of coal lands to the defendant company on a percentage basis, receiving 12 cents for each ton that went over a 1¼-in. screen. Since the new law was enacted a 2-in. screen has been installed and the owner asks for an injunction restraining the company from using the latter screen.

INDIANA

Sullivan—A suit is being tried here in which a township school board is suing the Vanadalia Coal Co. for $5000 damages for undermining the foundations of a school house. It is furthermore alleged that the coal company had not bought the mining rights under the land owned by the school board.

ILLINOIS

Hallidayboro — The Hallidayboro mine, which has been taken over by Connellsville, Penn., parties, is expected to be put in operation about the 15th of November. S. J. Harry, of Connellsville, will be general manager, and the mine superintendent will be E. M. Miller, recently with the Four States Coal Co. and the Jones interests in West Virginia.

Farmington—The Alden Coal Co. is planning to begin the use of coal mining machines in its new mine No. 8, in the near future. These machines have never been tried before in this immediate vicinity; but it is believed that even in the smaller vein existing here in comparison with the southern Illinois measures where the machines are extensively employed, a considerable saving can be made.

Chicago—David Rosenheim, a Chicago merchant, has joined with the Rev. Hiram Vrooman in bringing forward a plan of industrial coöperation. The intention is to conduct coöperative enterprises on several thousand acres of land already secured. This includes some coal mining property. The establishment of various industries, and possibly the building of a new city are contemplated.

OKLAHOMA

Muskogee—Six hundred miners of the Oklahoma Coal Co., at Henrietta, went on strike recently because the company refused to discharge a foreman whom the men had asked dismissed.

COLORADO

Denver—No date has yet been fixed for the withdrawal of Federal troops from the Colorado coal district, although it is rumored in some quarters that this withdrawal will take place on or about Nov. 15. It is authoritatively stated that although he has received many requests that the mines of Colorado be closed, the President has no present intention of closing the mines of the state.

Protector for the Heads of Boiler Flues. J. E. Landon, Phila., Penn. 1,112,373. Sept. 29, 1914. Filed May 28, 1913. Serial No. 770,385.

Coal Washing Apparatus. E. G. Burks and N. Haynes, Birmingham, Ala. 1,112,976. Oct. 6, 1914. Filed Oct. 15, 1913. Serial No. 795,302.

Mining Machine. F. L. Sessions, assignor to Jeffrey Mfg. Co., Columbus, Ohio. 1,112,332. Sept. 29, 1914. Filed Mar. 23, 1910. Serial No. 551,068.

Gas Producer. J. H. Hirt, assignor to Allis-Chalmers Mfg. Co., Milwaukee, Wis. 1,114,355. Oct. 20, 1914. Filed Nov. 30, 1908. Serial No. 465,424.

Means for Crushing Coal and Similar Substances. R. W. Lyle, South River, N. J. 1,113,229. Oct. 13, 1914. Filed Dec. 27, 1911. Serial No. 668,051.

Stoker for Furnaces and Boilers of the Underfeed Type. J. McCullough, Glasgow, Scotland. 1,113,569. Oct. 13, 1914. Filed Oct. 12, 1912. Serial No. 725,510.

Locomotive Boiler Furnace. C. B. Moore, assignor to American Arch Co., New York, N. Y. 1,115,230. Oct. 27, 1914. Filed Dec. 18, 1911. Serial No. 666,338.

Gas Producer. E. W. Jeffries and G. H. Islen, assignors tc Morgan Construction Co., Worcester, Mass. 1,112,702. Oct. 6, 1914. Filed Aug. 23, 1909. Serial No. 514,146.

Mechanical Stoker. H. Iserman, assignor to Multiple Grate Bar Endless Chain Stoker Co., a corporation of New York. 1,114,142. Oct. 20, 1914. Filed Sept. 11, 1911. Serial No. 648,747.

PERSONALS

J. F. Callbreath, secretary of the American Mining Congress has gone to Battle Creek, Mich., where he is going to take a few days rest.

A. D. Macfarlane, chief engineer for the receiver of the LaFollette Coal, Iron & Ry. Co. at LaFollette, Tenn., has been made also assistant manager of operation.

J. J. Wolfarsparger until recently superintendent of the Moffat Coal Co. near Oak Creek, Colo., has been appointed superintendent of the Yampa Valley Coal Co., at Oak Creek.

Carl Scholz, of Chicago, president of the American Mining Congress, is arranging to get up a party to attend the Congress during the week of Dec. 7, going to Phœnix, Ariz., in a private car over the Rock Island Lines.

C. J. Norwood, dean of the College of Mines and Metallurgy of the Kentucky State University, has just returned to Lexington from conducting a mining institute at Stone, near the West Virginia line. This was part of the extension and educational work of the college.

C. H. Nesbitt, chief mine inspector of Alabama, is in receipt of a letter from the Society of the Mining Association of the Ruhr District, Germany, dated Oct. 3, which indicates that the mines are working full time in Germany, despite the war. The letter was writen from Essen, near the upper part of the German Rhine.

Fearing that the European war may create a shortage of Christmas toys, Mrs. E. B. Coxe, of Drifton, Penn., whose Christmas benefactions have made her beloved by youngsters for the last 35 years, has already started a census of the 3500 children on the Coxe coal lands in order that proper purchases of presents may be made for the coming Christmas.

Capt. R. S. Oakes, well known river man, who has been with the Monongahela River Consolidated Coal & Coke Co. since the organization of that firm, has severed his connections to accept a position with the West Virginia Pittsburgh Coal Co. The new position makes Capt. Oakes the master of transportation on the Ohio river for the above company. His work will be directed locally from the West Virginia Pittsburgh Coal Co.'s Mine No. 3, formerly known as the Gilchrist mine.

W. S. Thomas, general manager, of the Maderia Hill Coal Mining Co.; John Price, general superintendent, and William Rowland, inside superintendent, had a narrow escape from suffocation at Stanton Colliery, Oct. 30. A shot fired in an old working broke through a pillar. The officials believed that water was rushing through the opening, and went there to investigate. Instead of water the workings were fast filling with white damp, brought down by the fall of rock and coal, and the three men were overcome. They fell in the gangway and would have suffocated in a short time. Workmen attracted to the scene, found the victims and carried them out of the deadly fumes at the risk of their own lives. It took the first-aid corps and two physicians more than three hours to restore the three officials to consciousness.

OBITUARY

Hiram Cobb, chief engineer of the Southern Coal, Coke & Mining Co., and in chargé of its several mines, was killed on Oct. 28, while making an inspection of the Little Oak Mine, belonging to that company, near Belleville, Illinois.

Mr. Cobb was well known throughout southern Illinois as a leading mining engineer. He was 35 years old, and single, and was a resident of Voellinger Place, Belleville.

Alexander Y. Hanna, who was for many years interested in coal operation throughout Pennsylvania, having been connected with several mining companies, died recently in Philadelphia. Mr. Hanna was 51 years of age, being a native of the City of Philadelphia. While engaged actively as a coal operator, he lived in different towns throughout the state, but for the past ten years has made his nome in the city of his birth.

CONSTRUCTION NEWS

Bakerton, Penn.—The Sterling Coal Co. is installing a 10-ton locomotive at the No. 6 mine located at this place.

Rockwood, Penn.—The State Line Coal Co. of this place has recently completed the construction of a new plant at South Rockwood.

Woodward, Ala.—The creosoting plant of the Woodward Iron Co. now under construction, is making good progress and will soon be ready for operation.

Portsmouth, Ohio—Work on the bridge across the Ohio River at Sciotoville has been started. The work is under the direction of the Chesapeake and Ohio Northern R.R. Co. which will build a line connecting Columbus and Portsmouth.

Charleston, W. Va.—A contract has been let by the Big Bend Coal Co., for the construction of 2½ miles of railroad near Matewan in McDowell County. Ryan & Co., of Lexington, Ky., was awarded the railroad construction contract.

Winchester, Ky.—Officials of the Louisville & Nashville R.R. have announced that the Winchester-Irvine extension of the road will probably be in operation by Jan. 1. The bridge over Red River, the most difficult piece of work remaining, is practically completed, and rails are being laid over it. This will be a heavy coal carrying line.

Pittsburgh, Penn.—The Youghiogheny Coal Co. is taking estimates for remodeling its building at 1000 Second Ave. The specifications call for removing the roof, the front wall and the east end wall of the present blacksmith shop, the tearing down of the first 80 ft. of the frame stable, and the construction of a brick shop building complete.

Salt Lake City, Utah—One of the largest pieces of railroad construction work under way in Utah this year will be completed in a few days, and will be put into immediate operation. This road, the Utah Railroad, extends from Panther Junction, 1½ miles east of Castlegate, to Mohrland, Black Hawk and Hiawatha, and was built to serve the coal mines in that district. When completed, it will represent an expenditure of more than $3,000,000. The road will be operated by the Denver & Rio Grande Co. The length of this road in the mining district is about 21 miles, but owing to the roughness of the country unusual difficulties were encountered in the construction of the line, which accounts for the heavy cost per mile.

Williamson, W. Va.—E. L. Bailey, general manager of the Williamson Coal Co., and others expect to develop an extensive tract of valuable coal land located across the state border at Sharondale, in Pike County, Ky. A contract for the construction of a tipple and several houses has already been awarded, and work has begun. This operation will be located on the Pond Creek branch of the Norfolk & Western Ry., and will mine the Burnwell coal measure.

Two large coal operations are being developed on Blackberry Creek, the work on the tipple and houses having already been commenced, and it is expected that by the time the railroad contractors complete their work for the extension of the railway, coal will be available for market from these mines.

The Stone Mountain Coal Corporation of Matewan has made an expenditure of $20,000 on its mine with a view to increasing the output. It is also stated that the United States Coal & Oil Co. will enlarge its tonnage by opening up and developing new mines on Pond Creek.

NEW INCORPORATIONS

Henryetta, Okla.—The Fursman Coal Co. has been incorporated here by W. H. Fursman and others. The capital stock is $5000.

Huntington, Ark.—The Phœnix Mining Co. has been incorporated here, by L. E. Lake, E. G. Lake, A. W. Jasper and C. A. Beggs; capital, $10,000.

Albright, W. Va.—The Realty Coal Land Co. was recently organized with an authorized capital of $75,000. The incorporators are A. R. Malcom, James Grant, James A. Campbell, A. W. M. Cecil, and J. E. Swaim.

West Union, W. Va.—The Jackson Coal Co., owned and controlled by West Virginia men, which recently purchased an estate of 6000 acres of coal land in Illinois has increased its capitalization from $5000 to $750,000.

Rich Hill, Mo.—The Ideal Coal and Mining Co. has filed articles of incorporation, capitalized at $4000, and with the purpose of developing coal fields near Home. Stockholders are Rev. John A. Davis, Dr. A. L. Billings, B. F. Billings, Elmer Whited.

Mount Sterling, Ky.—The Rush Branch Cannel Coal Co. has been organized by Lewis Apperson, J. W. Clay, M. C. Clay, John A. Judy, and R. H. Wynn, of Mount Sterling, R. G. Judy and Frank Allen, of Bath County, and W. S. Taylor, of Winchester. This firm owns a large tract of coal land in Morgan County, and will develop mines on the same at once.

INDUSTRIAL NEWS

Petersburg, Ind.—J. Mackey, owner of the Hartwell mines at Petersburg, Ind., has sold the property to the Mackey Coal Co. for $75,000.

Washington, D. C.—The Supreme Court recently affirmed the decision of the Ohio Supreme Court holding the so-called mine run clause of the coal screen law to be constitutional.

Columbus, Ohio—The State Public Utilities Commission of Ohio has approved the application of the Hocking Valley Ry. Co. to issue $4,000,000 six per cent. one-year notes to be sold at 97¾.

Birmingham, Ala.—Members of the Chamber of Commerce of the United States were the guests of the City of Birmingham recently. The party reached Birmingham at 9 o'clock in the morning, where a special train was waiting which took them for a trip through the coal mining region of the district, as well as to the steel plants, furnaces, etc.

Portland, Ore.—The steam schooner "Rochelle" which was bringing a cargo of about 600 tons of coal from the Puget Sound country to this port last week drifted ashore because a light was out of commission at the entrance to the Columbia River and will be a total loss. This was the "Rochelle's" first voyage in the coal trade between Puget Sound and Portland.

Birmingham, Ala.—One of the most important conventions recently held in this country has just adjourned. The American Iron & Steel Institute, consisting of the foremost steel, iron and coal men in the country, has been in session in Birmingham throughout an entire week, more than 350 persons attending. They visited many of the largest mines in the district, and at one of them had an old time Southern barbecue.

Knoxville, Tenn.—The case of the Electric Corporation versus the LaFollete Coal, Iron & Ry. Co. was continued until the December term of the United States District Court, by Judge Sanford, in a preliminary hearing recently. A decree was, however, handed down ordering the preferred claims of three physicians against the defendant company and allowing the creditors until Dec. 1, in which to file claims not already filed.

Birmingham, Ala.—William A. Veditz, commercial attache of the United States at Paris, and Edwin Thompson, commercial attache of the United States at Berlin, conferred during the past week with the Birmingham Chamber of Commerce relative to exporting Alabama coal to Spain. Spain has been getting her fuel from Belgium, and must turn elsewhere, and it was for this purpose that the meeting was held. Nothing definite has yet been given out as to the results.

Columbus, Ohio—Because of complaints against the rules and regulations governing drilling for oil and gas on coal lands, the Ohio Industrial Commission has named a special committee to investigate and report changes. The special commission consists of D. A. Bartlett, Marietta; J. M. Gerard, Columbus; Lemuel G. Neeley, St. Marys; Harry E. Cameron, Cambridge; William Maloney, Bellaire; Prof. J. A. Bownocker, Ohio State University, and J. M. Roan, chief mine inspector.

Knoxville, Tenn.—Failure of the Tennessee Timber, Coal & Iron Co., of Harriman, Tenn., to meet a note for $40,000 has led to foreclosure proceedings in the Federal Court here. Judge Sanborn appointed Frank H. Enwright, of Harriman, trustee for the company, as receiver. The petition was filed for Allen Forbes, Ashton L. Carr and Charles F. Allen, of Boston, trustees under the mortgage. The property, which includes 18,000 acres of coal and timber land in Morgan County has been advertised for sale.

Philadelphia, Penn.—On Oct. 27, two mortgages aggregating nearly $11,000,000 were satisfied in the courts of Luzerne County, and occasioned some comment because of their size and age. They were both by the Lehigh Coal & Navigation Co., to the Fidelity Insurance, Trust and Safe Co. One was dated Apr. 1, 1864, and was for $5,786,182.92, the other was Nov. 27, 1867, and was for $5,000,000. Both were covered with war stamps of the Civil War period. The first carried $5000 worth of stamps and the other $1000 worth, the mortgages cover land in five counties.

Pittsburgh, Penn.—A strong rumor persists in Pittsburgh that J. V. Thompson, of Uniontown, has exchanged large tracts of his holdings in coal lands for Phipps property in Pittsburgh, the total value on both sides of the deal being said to amount to something like $15,000,00. The Phipps properties reported to have been traded are the Fulton Building, the Bessemer Building, the store building at Penn Ave. and Cecil Way, the Power Building on Duquesne Way, and the warehouses on Penn Ave. between Ninth St. and Garrison Alley. It is reported that the papers in this deal have already been signed.

Columbus, Ohio—F. C. Albrecht, the chief inspector of the Ohio Department of Weights and Measures has made the announcement that he will soon start a state-wide campaign to compel retail coal dealers to give full weights. The campaign will be carried on in a number of the cities of the state, the dates to be kept secret. It is planned to coöperate with the police departments in the various cities. At Springfield last week the police called at all of the retail yards and inspected weights with the result that six arrests were made from the 19 retail yards. It is said by the state sealer that many dealers are giving but 1750 lb. for a supposed ton, but this is generally denied.

St. Louis, Mo.—Application for an increase of 10c. per ton on coal shipments over the Santa Fé and all roads operating south of St. Louis to all points in Southwest territory was recently filed with the Interstate Commerce Commission. The application is one of many that will be filed by Western railroads on various commodities. It is understood this increase on coal is to become effective Dec. 1. The proposed increases of approximately 16 per cent. in rail and lake rates on knit goods from New York and other points and trunk line territory to Chicago, St. Louis and Minneapolis were recently granted by the Commission to the New York Central Lines, and a number of other railroads, together with some other important decisions concerning railroads lying immediately south of the Great Lakes.

Cincinnati, Ohio—The third foreclosure suit which has been filed against the Cincinnati, Hamilton & Dayton R.R. Co. within the past few months was brought in the United States district court here on, Oct. 28, by the Central Trust Co. of New York and Augustus L. Mason, as trustee, against the company named, with several others, and Judson Harmon and Rufus B. Smith, receivers of the railroad company. The bill alleges default in the payment of interest to the amount of $79,050, on bonds for $3,162,000 issued by the Indiana, Decatur & Western Ry., which was absorbed by the Cincinnati, Indianapolis & Western Ry. and that road in turn by the Cincinnati, Hamilton & Dayton. The court is asked to appoint receivers, but the present receivers will probably be retained, as a matter of course.

Coal Trade Reviews

General Review

Anthracite production heavy last month but market is still dragging. Spot demand for bituminous has entirely disappeared and heavy concessions are the rule. Lake trade still further curtailed but Middle Western situation improved.

As a result of the continued mild weather, anthracite consumers are becoming indifferent about accumulating further stocks, and the companies are pushing hard for business. The short cold snap of last week stimulated buying for the moment, but all sizes are now in free supply, and orders generally scarce. Evidence of the poor business in the Northwest is seen in the light Lake shipments, which are fully 25% behind last season. In spite of the slowing up toward the close of last month, the production was unexpectedly large but a continuance of the mild weather will undoubtedly result in a heavy decline in shipments, operation having been somewhat curtailed through the current week.

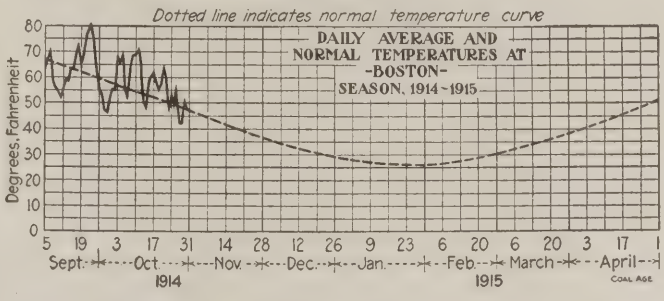
Circular prices on the Hampton Roads coals in the coastwise trade are purely nominal, all spot business being subject to such active competition that heavy concessions are now the rule. Some coal loaded on contract is being refused and is exceedingly difficult to move. The local spot demand has practically disappeared, and there is absolutely no life to the contract market. There has also been a gradual but well defined slowing up in the export business.

Further curtailment in the steel industry is noted in the Pittsburgh district, while some of the mines shipping the Lake markets are already beginning to close down and the end of the current month will see many of these idle. One compensating feature of the light Lake trade, however, is that the tonnage has been gradually tapering off for several months so that the trade will not be subjected to the customary shock of an abrupt cessation of shipments. The short cold snap of last week caused a run of domestic orders, but it was not of sufficient duration to affect the general situation, and had also been discounted to a certain extent. The general heaviness in all lines of industry, particularly iron and steel, together with the further restriction in the Lake trade, due to the congestion at the Upper Lake ports, are the predominating features in the current market. The real test of the trade will occur in about two weeks when the Lake shipping closes down entirely.

The Southern market has touched the lowest point for several years, both as regards prices and demand, but the operators have adopted rigid curtailment policies and have the situation well in hand. The Middle Western trade through October was a big disappointment, the tonnage showing a heavy decline particularly at some points such as Chicago, where it is estimated at 60% normal. However, close observers see indications of a change for the better in the very near future. Many furnaces have now started up for the winter's run and there have been some heavy orders for war supplies placed in the Middle West, which will stimulate manufacturing.

ATLANTIC SEABOARD

BOSTON



No longer any pretence of quoting $2.85 for Pocahontas and New River. No demand, spot or contract, and outlook decidedly poor. Large purchase of Dominion coal for the local market. Distress offerings of Pennsylvania steam grades. Water freights at low level and anthracite dull.

Bituminous—Apparently none of the Hampton Roads shippers is now adhering to the $2.85 f.o.b. price and if there were any spot market worth mentioning there would be a scramble to see who could sell at the lowest figure. As it is the low prices made lately have only shown that buyers are utterly unresponsive. The amount of spot business is practically nil and when coal now standing at the piers is absorbed it is probable, with so rigid a curtailment in force, that the volume at the Virginia ports will be the smallest at any time this year. There is no life to the demand for contract fuel either and it is generally felt that there will be no stir in the steam coal trade until settled cold weather.

Low quotations have been made generally, as low even as $2.50 f.o.b. Hampton Roads, in the effort to place distress coal. Some low delivered prices have also been named but so far the only apparent result has been to induce two or three corporations recently in the market, to postpone purchases.

Prices at Providence and Boston for delivery to interior points are merely nominal at the season figures; there is no inquiry and shippers with unsold cargoes on their hands have a hard row to hoe.

The steam varieties from the Pennsylvania districts are developing weak spots here and there. Consignees disappointed in the failure of contractors to accept coal put on the rails for them, find it extremely hard to dispose of accumulations. There have been several such instances the past week and cuts of 15@25c. have not been sufficient to induce buying. The last shipments are being put under way now for points up the Maine rivers and soon there will not be even that small demand to help out the market. All-rail the situation is about as stagnant as at tidewater.

Water Freights are the lowest in several months. Charters on fair sized vessels can be closed easily at 60@65c., and one or two have been made at 55c., Hampton Roads to Boston. Two more steam colliers have been tied up pending improved conditions.

Georges Creek at Baltimore and Philadelphia is also in too plentiful supply but the shippers apparently realize nothing can be gained by forcing and no concessions are heard.

Anthracite—Light business continues and room for new stocks is being made only very slowly. All the companies are now in position to make prompt deliveries and from one or two sources there is complaint over the dearth of orders. Shipments to Maine ports are well in advance of the average and there are only scattering cargoes to go forward in November.

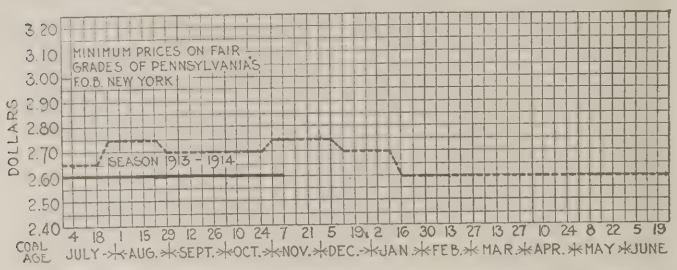
NEW YORK



Pennsylvania R.R. declares an embargo against South Amboy. Some low prices noted on bituminous. Anthracite trade generally soft, but irregular, and with an excellent undertone.

Bituminous—The Pennsylvania R.R. last week placed an embargo on all shipments to South Amboy. It was reported that there were somewhat over 5000 loaded cars en route from the mines to this port. This reflects the present condition of the bituminous market in New York.

The call for bunker coal has not been so heavy during the past week, and the demand from industrial consumers has showed a tendency to decrease. It would seem, however, in spite of the apparent surplus running to this market, that the majority of the coal has a destination, as there is not much tendency toward moving the tonnage at really low prices. There have been one or two lots offered at South Amboy during the past week at low figures, one quotation being down to $2 on board.

This embargo by the Pennsylvania R.R. is the first for some time, which indicates reluctance on the part of the

operator to consign coal to this market when not sold, and shows that there is a more conservative trend; costly experience has proved the futility of attempting to push tonnage on a market that will not absorb it. While there is no basis on which to warrant expectations of greatly improved conditions, the movement of an accumulation at Tidewater is usually followed by a temporary reaction, which should have a good influence. The winter season also invariably calls for increased consumption, so that it is reasonable to hope for somewhat improved conditions in the bituminous trade during the next month. The market is now quotable as follows: West Virginia steam, $2.50@2.60; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The past week finds a rather peculiar condition in the anthracite trade. One of the large companies has been forced to suspend operations for a week on account of the overstocked conditions, while another of the other representative companies worked continuously, even operating on election day.

There is no doubt that the more seasonable weather has in many respects stimulated the trade and prevented a more or less serious condition. The orders in hand up to this time have not been in great volume, but the appearance of cold weather, with the reports of snow and winter conditions in more northern territories, has increased the demand perceptibly.

The situation on stove sizes has become considerably easier, although it is still in the heaviest demand. Egg has improved considerably and chestnut is moving in good shape. Conditions in the steam sizes have improved a trifle in the past week, but they are still long. Stocks with the producing companies are quite heavy generally, but with anything like reasonable weather conditions, these should be reduced and the current workings of all the collieries taken care of.

The New York hard-coal market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.65@5.10	$5.05	$4.60@5.05
Egg	5.35	5.10@5.35	5.30	4.90@5.30
Stove	5.35	5.35	5 30	5.30
Chestnut	5.60	5.50@5.60	5.55	5.30@5.55
Pea	3.55	3 45@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.25@2.75
Rice	2.30	2.10@2.30	2.00@2.25	1.60@2.25
Barley	1.80	1.70@1.80	1.75	1.40@1.75

BALTIMORE

Anthracite the strongest feature of a listless market. Soft coals fail to improve. Export tonnage has gradually dropped off.

Frost, ice and general wintry weather proved a boon to the hard-coal trade last week and considerable orders were reported. Many of these are from customers who are usually stocked at this time, and the promise for a fairly early fall business seems excellent. Collections are said to be easier.

Not much is to be said in favor of the soft-coal trade. Prices continue poor and demand has almost disappeared. Small orders are developing here and there, but for the most part at unsatisfactory prices and there is not much in the trade for the operator. Pennsylvania coals sell variously at from 90c@$1 for less desirable grades, to $1.15@1.40 for best qualities. West Virginia three-quarter and steam coals, and western Maryland steam fuels are selling at from 80 to 90 cents.

Export tonnage is not so large as in September. There has been a gradual but certain lessening of the movement although there is still about 2500 to 3000 tons per day being shipped.

PHILADELPHIA

Unseasonable weather conditions still discourage anthracite trade. Consumers well stocked and improvement dependent on colder weather. Bituminous market continues to lag, with no pressure for supplies.

Anthracite—The past week has seen a retrograde movement as far as the anthracite trade is concerned. The more seasonable weather of the week previous, has been followed by almost summer temperatures, and as a result, the expected depletion of supplies did not materialize to the extent expected. Consumers seem loath to take on any additional stocks until conditions warrant it, and the dealers are playing close in the matter of buying and seem to be covered in all the sizes that are likely to be called for. Notwithstanding the depression, there is considerable coal moving. The companies are pushing hard for business, but apparently without much effect. Most of the mines were closed on Tuesday, Election Day, and some for additional periods, the average working time being four days weekly.

Prices are being fairly well maintained, except on chestnut and the small sizes. The former can be purchased at anywhere from 25 to 50c. off the present circular, and pea has moved back again, to the old basis of $2.25, or even less. Egg and stove seem to be moving off, at circular prices in most cases with none going into stock.

In the face of the exceedingly low prices prevailing for bituminous, there seems to be a disposition on the part of many of the industrial establishments to substitute this fuel, either wholly or in part, for the more expensive anthracite steam sizes. It is understood that many requisitions have been curtailed, and it is this condition which is undoubtedly causing the surplus of the small sizes in the market.

Prices at Tidewater rule about as follows:

	Circular	Individual
Broken	$4.75	$4.75
Egg	5.00	5.00
Stove	5.00	5.10
Chestnut	5.25	4.90 @ 5.10

Bituminous—No new conditions have been developed in the soft-coal trade during the past week. Adverse comments are the rule rather than the exception, and there does not seem to be any indication of improvement in the near future.

HAMPTON ROADS

Fair shipments both foreign and coastwise. No change in prices. Some little demand for high volatile.

Shipments from Tidewater during the week have been fair. Export cargoes have moved to Rio de Janeiro, Genoa and Para, with one large cargo for Manila. Coastwise shipments have been made to Boston, Providence, Portland, Everett, Bangor and one or two other New England ports. As information is no longer given out at the Custom House as to destination of foreign vessels it is almost an impossibility to obtain these data. It is understood that information as to clearances will be withheld for thirty days, which should give steamers ample time to reach their destination before the general public learns where they cleared for.

Coal remaining in the railroad yards is still above normal with a fair quantity moving to the Seaboard. A large fleet of vessels is expected during the first few days of November which should reduce the accumulation down to perhaps a little below the normal supply. Prices on all grades are unchanged although it is expected that the retail circular prices on domestic coals will be advanced shortly.

It is believed that the total dumpings for the month of October will be somewhat above those for the same period last year. It is already clear that the Chesapeake & Ohio will be considerably ahead of their last year's figures, although it is not believed their dumpings will be as heavy as they were for the month of September.

COAL CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Edgar H. Vance		Philadelphia or Baltimore	San Francisco	1523	
Chas. H. Klinck	British	Philadelphia	Biddeford	444	$0.95
		Baltimore or Virginia	Philippine Islands	6500	7.50
Phineas W. Sprague		Newport News	Jucaro	709	
Frederic A. Duggan		Philadelphia	Cay Francis	981	
Blanche H. King		Philadelphia	Porto Rico	1021	
Emily I. White		Philadelphia	Saco	296	1.00
Edgar W. Murdock		Baltimore	Two ports Porto Rico	1215	
William Booth		Philadelphia	Calais	435	

Note—Steamers are indicated by **bold face** type, all others being schooners.

OCEAN FREIGHTS

A steamer was chartered last week to take about 6500 tons from Baltimore to the Philippine Islands, at $7.50 per ton; the last charter for similar business effected in June was at $3.41. Freight market conditions are practically the same as covered by our last report, with Trans-Atlantic freight rates advancing more rapidly than to other destinations.

We quote coal freights by steamer from New York as follows:

To	Rate	To	Rate	To	Rate
Havana	$1.60@1.75	Kingston	$2.00@2.25†	Tampico	$1.85@2.00
Cardenas or Sagua	2.15@2.25	Curacao	1.75@1.85	Rio	3.96@4.20

W. W. Battie & Co.'s Coal Trade Freight Report.

LAKE MARKETS

PITTSBURGH

Only about a fortnight of light shipments left to the Lake trade, but prices being already liquidated and no shock to the market is anticipated. Mining operation at about 50% of capacity, and prices irregular, $1.15 for mine-run being usually shaded.

Scarcely a fortnight of Lake shipments is now left the coal trade, and even the present movement is at a light rate. A few mines have already closed and by the end of the month there will probably be a large number idle. There is one favorable factor in the situation; Lake shipments have been tapering off for weeks and the market will not suffer the shock it usually experiences at the close of a good season, when the demand stops suddenly instead of gradually.

The market has been weak and irregular right along, prices being dictated not by demand, but by the cost of production, and no serious decline in prices, from the present low level, can be expected. Mining operations in the Pittsburgh district this week are at an average not much above 50% of capacity. Manufacturing demand has experienced some further decrease. The steel industry, for instance, is hardly operating at more than 40% of capacity, against about 45% a week ago and somewhat above 50% at the beginning of October. Retail demand on the other hand has increased moderately, with fairly cool weather.

Prices are very irregular, mine-run being sold more often at under $1.15 than at that figure, while slack has been firming up considerably, sales being made in the past week at 60c. or better. Nothing is heard yet as to new circular prices. Last season's prices were: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

BUFFALO

Mines working on minimum schedules but production is still excessive. No price improvement until coal on track is much reduced. Anthracite Lake shipments 25% behind last year's record.

Bituminous—It is generally reported that there is not quite as much bituminous on track as a week ago, but it is still above normal. There is too much being produced in spite of the continued complaint that the mines are running about as slow as they ever have done. There are also certain outside operators who are using this market as an overflow, offering their coal at what would be the cost of production to most mines. There is too much coal on track generally for prices to improve.

It is reported that slack is doing a little better as is to be expected at this time of the year. There is now very little slack made in connection with the Lake trade and there will soon be less. On the other hand there will soon be more of the sizes to sell and if the consumption does not improve, the surplus will be quite as large as ever. As a rule the increased consumption has been sufficient to take care of the entire late-fall surplus, but there is some doubt of this now.

Bituminous prices show no change. Quotations remain on the basis of $2.80 for best Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine run and $2.15 for slack. Allegheny Valley prices rule 25c. lower for sizes. There is an increased demand for smokeless for general city use, to help comply with smoke ordinances, but prices are about the same as for other bituminous grades.

Anthracite—The end of the month found local dealers rather slow in ordering supplies, but the touch of colder weather early in the week brought in more business than formerly. The weather has been much against the coal trade and the difficulty is not over yet. There is still a shortage of stove and chestnut and a surplus of egg, which much embarasses the shippers, who are often obliged to insist on a certain amount of egg with orders for other sizes. Independent anthracite is moving freely, most shippers finding that they can get supplies much more readily than formerly. It sells at circular prices yet, which is evidence that there is a good general supply.

Lake shipments of anthracite continue active, the amount for the week being 122,400 tons and for the month of October, 538,250 tons as against 564,160 tons for the same month last season, a falling off of less than 26,000 tons. The shipments for the season to November are 3,695,131 tons, against 4,495,096 tons to the same date last year. Some of the companies are preparing to continue on into November without much abatement.

COLUMBUS

Colder weather has stimulated the domestic trade but not sufficient to make much of an impression. Steam business still quiet and some dullness is reported in Lake trade.

The weather conditions in Ohio improved somewhat last week and there was a better run of domestic orders, but the lower temperatures were of short duration. However, a better tone was given to the market and more optimism is apparent in coal circles generally. Steam business is still dull and there is also a falling off in Lake tonnage.

Congestion on the docks of the Upper Lake ports has become more acute and this is affecting the Lake tonnage, especially at docks where the interior movement has not gained much headway. But it is expected that conditions will improve before the close of navigation and a larger Lake movement will take place.

Domestic trade, which was temporarily stimulated by the colder weather is again quiet. Prices are generally well maintained in retail lines as few of the dealers are inclined to make concessions. Dealers' stocks are still large and buying is on a small scale. Preference is still shown for the better grades such as West Virginia splints and Pocahontas.

Steam business is the dullest in months. Manufacturing is quiet because of the European war and there is little hope for immediate improvement. Contracts are being renewed at about the same figures which prevailed the previous season. Buying on the open market is one of the striking features of the steam trade.

Production continues sharply curtailed. In the Hocking Valley the output is estimated at about 60% of the average and Crooksville, Cambridge and Massillon the same. In Jackson less than 50% of the normal tonnage is produced. In the Pomeroy Bend field the output is estimated at 75% of usual.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Re-screened lump	$1.60	$1.70	...
Inch and a quarter	1.50	1.50	$1.40
Three-quarter inch	1.40	1.40	1.35
Nut	1.15	1.30	1.15
Mine-run	1.10	1.15	1.10
Nut, pea and slack	0.35	0.40	0.35
Coarse slack	0.25	0.30	0.25

TOLEDO

Domestic trade is slightly stiffer but steam coals are causing a great deal of anxiety. Lake movement sluggish.

Prices remain unchanged in Toledo but domestic business has picked up considerably since the cold weather began. Steam coal is causing the greatest worry as there is much difficulty in moving this grade and there is considerable on demurrage. Domestic coal is in much better shape, there being none on track in this vicinity. The Lake movement is rather sluggish but still keeping up.

No. 8 operators have practically decided that their mines will not be opened this fall even if the difficulties with the miners are adjusted, as there is no market for the coal. Local dealers generally are optimistic. Domestic is selling closer to the list and fine coal is showing some signs of increased strength.

CLEVELAND

Some new steam orders coming in and the trade is steady. Closing of Lake shipping will severely test the market.

Despite only moderately cool weather, the coal market has held all that it gained a week ago. Fine coal is selling at about the same figures that it did a week ago, but a noticeable improvement has taken place in contract business. A number of companies that have been out of the market for several weeks have placed orders for from two to five cars a day for delivery over this week. Some of these orders began to arrive the middle of last week, and it was feared that they would be only temporary, but they are proving more substantial and some other orders have been booked for delivery over the current month.

The demand is principally for nut and slack, with a few scattered orders for mine-run and the three-quarter sizes. The domestic market is somewhat firmer, the retail trade taking a little coal to replenish stocks drawn upon last week. One weak spot in the market is consignment coal of the larger sizes.

The real test of the market will come in about two weeks. The Lake shipments will then be over to all intents and the all-rail trade will have to support the business. Already the mines are reducing production, and in some instances are offering fine coal only so fast as orders are received for three-quarter. This is the case in the Goshen, Cambridge and Hocking fields. There are more properties working in Bergholz territory and Massillon. Pocahontas is stronger, but the improvement is purely in the firmness with which operators are holding to current quotations.

Anthracite is being received as fast as needed, and the demand is somewhat improved, as with other domestic coals.

Quotations for shipment are as follows:

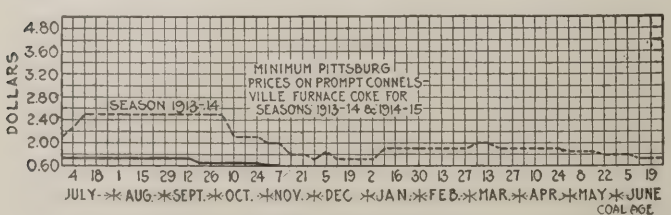
	Pocahontas	Youghiogheny	Bergholz	Fairmount	W. Va. No. 8
Lump	$3.75	.....	.....	.....	.....
Lump, 6 in.	.....	.....	$2.45	.....	.....
Egg	3.75	.....	.....	.....	.....
Egg, 6 in.	.....	.....	2.10	.....	.....
Lump, 1½ in.	.....	$2.40	2.25	.....	.....
Lump, ¾ in.	.....	2.30	2.10	$1.95@2.00	$1.95@2.00
Mine run	2.75	2.25	1.95	1.85@1.90	1.90
Slack	2.40	1.65@1.70	1.65	1.65	1.65

CINCINNATI

Cold snap stimulates the domestic market, but the increase was not especially heavy. Continued weakness of the steam market hampers the trade considerably.

The first half of last week saw the coldest weather of the season, the temperature going below freezing several nights in succession. Domestic consumers, as expected, started a rush to the dealers for belated supplies, and this created a flurry which was reflected to some extent among the operators. However, this buying movement had been anticipated and already discounted to a certain extent so the effect at the mines was not such as to afford any considerable relief. The chief difficulty still lies in the extreme dullness of the steam market. Iron and steel and allied trades, continue very inactive and other industries also have little to do.

Operators are finding themselves shut off from deliveries on contract, and the spot demand being quite negligible, there is practically no place to put steam coal. The Lake demand, has practically ended, after a fairly good movement; this has made the situation worse both by diverting the coal which formerly moved in that trade, and by rendering the transportation facilities, which have been good all season, still better.



COKE

CONNELLSVILLE

Negotiations for early delivery dropped, but some inquiry appearing for next year. Prices steady. Shipments 60% of the best average rate of the year.

Negotiations that were on for November furnace coke in one or two instances have been suspended, it being found the coke will not be needed. Some inquiry has developed, however, for next year, one consumer inquiring as to a six-month contract and another as to a contract for the whole year. Except for odd lots of prompt coke sometimes sacrificed, the prompt furnace coke market is quite steady at a minimum of $1.60, but foundry coke shows somewhat more irregularity. On the whole, transactions are extremely light, but prices are relatively well maintained, and we quote: Prompt furnace, $1.60; contract furnace, $1.75; prompt foundry, $2.15@2.50; contract foundry, $2.35@2.50, for best grades, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Oct. 23 at 229,519 tons, a decrease of 8210 tons, and shipments at 214,132 tons, a decrease of 21,977 tons. The shipments were at about 60% of the best average rate reached this year, from the middle of February to the middle of April.

BUFFALO

No increase of activity and tonnage is very light.

The state of the coke trade is unchanged. The movement continues light and prices do not improve. There is some promise of more strength to the iron trade, but it will have to occur before coke will move normally. This territory has quite a good many idle furnaces, none of which promises to start up right away. Prices rule on the basis of $4.25 for best Connellsville foundry and $3.30 for stock coke.

CLEVELAND

The coke trade is very light and prices are still on the low plane they have been on for several weeks. Byproduct coke is being sold at $4.10, delivered here, although some are talking 5c. higher.

BIRMINGHAM

No business whatever is being done in furnace coke, and foundry coke is moving in small lots, with no indications of early improvement.

CHICAGO

Coke is quoted at: Byproduct, $4.75@4.95; Connellsville, $4.55@4.90; Wise County 72-hr. (select), $4.55; gas coke, $4.25; furnace coke, $4.50@4.65.

SOUTHERN

BIRMINGHAM

Both steam and lump coal quiet, though lump shows some slight improvement.

The poor demand for steam coal continues, but there is little excess on the market, due to the fact that the operators are mining only the tonnage for which they have orders. Lump coal shows some improvement on account of the recent cold weather, and shipments for last month will be slightly larger than for September.

The majority of the mines are running only three and four days a week, and the indications are that this will be the rule during November, for even should the cold weather create a demand for lump coal, the steam grades would be hard to dispose of under present conditions. Blacksmith coal is in a satisfactory condition.

LOUISVILLE

Market has touched the lowest point for several years. Cool weather creates some stir in domestic lines but does not relieve the pressure.

Steam coals are probably lower than ever before in this part of the country. The domestic coals are active and the retail trade is exceedingly brisk, due to the belated arrival of some cool weather. The retailers are contending with the usual rush brought on by the first cold snap.

Inquiries as to coal for export have developed little if anything as yet and there has been little change in industrial conditions. Most of the mines are working, but few of them are on full time. Here and there an effective selling organization is keeping certain mines normally busy for the season, but such mines are the exception. Prices are hardly quotable. Some of the eastern Kentucky coals are selling at from $1.40 to $1.60 for block coal, f.o.b. mines.

MIDDLE WESTERN

CHICAGO

Short cold snap increases demand for domestic coals. Not much improvement in the call for steam fuels. Anthracite trade quiet. Market for screenings slightly improved. October tonnage only about 60% normal.

The demand for domestic sizes from the Indiana and Illinois mines has been a little better as a result of colder weather in the early part of the week. The last few days, however, have again been warm and sunny.

Screenings are somewhat stronger owing to the curtailed production of lump coal but will no doubt again be weaker when the demand for lump increases.

There seems to be a slight improvement in the steam trade. Some close observers believe this is due to better running time on the part of manufacturers of clothing, leather, motor trucks, automobiles, and other commodities for which the European warring powers have placed heavy orders in this city.

The market is now a weather proposition pure and simple. The cold weather of few days ago stimulated the demand for all sizes. It is well established that dealers in the country have not stocked anything like the usual amount of coal. The

dealers in the Central West now show a disposition to confine sales to a cash basis and their customers will not buy under this condition until they are obliged to do so by the cold weather. Householders generally have not put in supplies.

West Virginia coals are listless, and splint, smithing and the gas fuels show no improvement. Kentucky grades are being offered freely at prices ranging from 25 to 35c. below usual market quotations with few sales.

A slight increase has been noticed in the demand for anthracite during the last three days, but the effects of the continued warm weather have not yet been overcome. Some dealers in Chicago, Indiana and Illinois have received more anthracite than in former years, in anticipation of being able to dispose of it at advantageous prices later. So far weather conditions have not afforded them much encouragement.

There is an abundance of splint coal on the docks which is awaiting cold weather for a sale.

There was a better tone in the market for Franklin County coals, due to the influence of the cold wave in the early part of the week, but the effect was mostly sentimental. Indiana operators are endeavoring to market their coals at home instead of shipping them to Chicago to be sacrificed at the prices prevailing here.

October shows a considerable falling off in the tonnage as compared with previous years, being considered only about 60% normal.

Prevailing prices are as follows:

	Franklin Co.	Springfield	Carterville	Sullivan	Clinton[1]
Lump	$1.75	$1.75	$1.75	.....	$1.75
4-in. lump	.....	.....	.....	$1.60@1.75	.....
Steam lump	.....	.....	.....	.....	1.20
2½-in. lump	.....	.....	.....	1.50	.....
1¼-in. lump	.....	.....	.....	1.35	.....
Mine-run	.....	.....	.....	.....	1.10
Egg	1.75	.....	.....	.....	.....
6x3-in. egg	.....	1.50	1.75	.....	.....
No. 1 washed egg	.....	.....	1.75		
No. 2 washed egg	.....	.....	1.75		
Nut	.....	1.40	.....	.....	.....
No. 1 nut	1.75	.....	.....	.....	.....
Screenings	0.50@0.75	0.50@0.75	.....	0.40@0.75	0.35@0.60

[1] These prices are for Nos. 3 and 5 coal; No. 4 coal averages 10c. higher.

Hocking Valley 1¼-in. lump, $1.40@1.50; mine-run, $1.25.

New River & Pocahontas lump and egg, $2.25; mine-run, $1.35.

Somerset Smokeless lump and egg, $2@2.25; mine-run, $1.25@1.40.

INDIANAPOLIS

Screenings have made a further improvement. October trade not up to average, but operators look forward to better results in November. Railroad buying slightly improved.

The feature in the Indiana coal industry is the betterment in the market for slack. For several weeks, this grade was selling largely at 30c. but it is now commanding 50c., with some companies getting 60c. Operators believe the advance must now continue until the price gets up to normal, around 80c. The change was mainly forced by the operators themselves; they reached a point where they had to either advance other grades or bring slack up to a fair value and they concentrated their efforts on the latter.

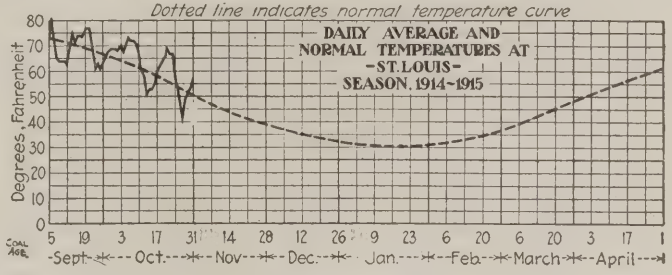
A few frosty nights have made themselves felt in the trade and there has been general lighting of furnaces for the winter run. The mines are making slightly better time. October was not up to its average and the trade is looking for the deficiency to be made up this month, which is one of the best of the year, as a rule. October was so unusually mild that householders could not be induced to stock heavily and a cold November will cause a rush at the yards.

The railroad purchases are a little better, as considerable grain has been moving. Retail prices are unchanged.

ST. LOUIS

October has been a big disappointment to the trade but there are now indications of a slight improvement.

October was such a disappointment that the trade now hardly expects to have any more good business this season. The market continued weakening throughout the month, though at the beginning there was a tendency to pick up some.



The demand is slightly better and the most noticeable thing is the fact that steam coals are in better call and the price is improving. This of course pertains only to the high grade field where conditions are somewhat peculiar.

The washed market is picking up some, and in a general way conditions have improved with the first few days in November. In the Standard district it is the same old story of selling coal for less than the cost of production. Little encouragement is held out for a betterment in the immediate future although the demand will continue to grow for domestic grades.

Anthracite is slowing up, and limited quantities of smokeless are on hand at East St. Louis under demurrage.

The prevailing circular is:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	....	$1.30	$1.05@1.15	$1.15@1.20
3-in. lump	.....	....	1.40	.....	.....
6-in. lump	$1.40@1.60	....	1.50	1.30@1.40	1.30@1.35
Lump and egg	1.85@2.15	$2.25	.....	.....	1.35
No. 1 nut	1.30@1.45	....	.....	0.75@0.80	.....
Screenings	0.25@0.40	....	0.80@0.85	0.15@0.25	0.20

No. 5 washed nut	0.20@0.25	....	.....	....	.....

KANSAS CITY

An attempt to advance prices is expected early in November. Business has been slow.

The coal trade has been unusually quiet this fall. The first really cold weather occurred last week, and the dealers had a taste of actual business. Dealers generally say that an effort will be made to raise prices early in the month, but there are many who believe that quotations will not actually go up until cold weather sets in.

At present coal is reported a drug on the market; wholesalers have cars on demurrage, and all retailers are overstocked. Small-town dealers in Missouri and Kansas have heavy supplies. The market for slack is heavy, selling as low as $1.15 at the mines, and $1.85 wholesale at Kansas City. Illinois coal has gone all to pieces, selling through the West at $1.50 plus freight.

SAN FRANCISCO

Prices fair and the market is moderately active.

The local coal market is quite active, and dealers are taking on heavy stocks in anticipation of a good season. The summer was cool, resulting in a good trade and a maintenance of fair prices. Bituminous coals are selling to the dealers at from $7.50 to $8 per ton. Due to the opening of the Panama Canal, blacksmith and Pennsylvania coals coming into this market have shown a reduction of $3 per ton in price.

Coal Contracts Pending

Contract No. 2—Norfolk, Va.—The United States Government is in the market for 200 tons of bituminous coal for use in waterway improvement work. Bids opened Oct. 12 were as follows: Pocahontas Fuel Co. (14,850 B.t.u.), $2.63. Castner Curran & Bullitt (14,600 B.t.u.), loading at city pier: Lump, $3.545; mine-run, $2.545; for loading at Lamberts Point: Lump, $3.545; mine-run, $2.59. New River Coal Co. (14,800 B.t.u.), $2.55. Smokeless Fuel Co. (14,800 B.t.u.), $2.53. C. G. Blake Co. (14,850 B.t.u.), $2.55. Nottingham & Wrenn Co. (14,800 B.t.u.), $2.58. Chesapeake & Ohio Coal & Coke Co. (14,850 B.t.u.), $2.59 trimmed and $2.57 not trimmed. Johns Bros. (14,800 B.t.u.), $2.53. All communications should be addressed to E. Eveleth Winslow, Lieutenant Colonel of Engineers, U. S. Engineer Office, Norfolk, Virginia.

Contract No. 4—Boston, Mass.—Rhode Island Co. is in the market for 90,000 to 100,000 tons of Pocahontas, New River, Georges Creek, or Somerset run-of-mine. Shipments are to be made in about monthly proportions for a year, and the point of delivery is Providence, R. I. All communications should be addressed to E. H. Raquet, Engineer of Tests, South Station, Boston, Massachusetts.

Contract No. 6—New York—The Connecticut Co. is in the market for 22,000 tons of a good grade, low volatile, low ash, low sulphur bituminous coal for 10 months, Nov. 1, 1914 to Sept. 1, 1915. Shipments are to be as required f.o.b. boats, to be placed by the company at New York loading ports. Bids should be submitted to J. H. Sanford, Purchasing Agent, New Haven, Connecticut.

Contract No. 7—Zylonite, Mass.—The Berkshire Street Railway Co. is in the market for 21,000 tons of a good grade, low volatile, low ash, low sulphur bituminous coal for 10 months, Nov. 1, 1914 to Sept. 1, 1915. Shipments are to be as required and price to be made f.o.b. cars at mines for Tunnel Power plant at Zylonite, Mass., B. & A. R.R. Bids should be submitted to J. H. Sanford, Purchasing Agent, New Haven, Connecticut.

Contract No. 8—Portland, Ore.—Proposals for furnishing and delivering about 5000 tons of bituminous coal for use on the Dalles-Celilo Canal construction work will be received at the U. S. Engineers' Office, Portland, Ore., until 11 a.m., Nov. 27, and then publicly opened. All communications should be addressed to Major of Engineers, Jay J. Morrow, U. S. Engineers' Office, Portland, Oregon.

CONTRACTS LET

Contract No. 5—Boston, Mass.—The New York, New Haven & Hartford R.R. has closed a contract for about 350,000 tons. Half of the order was placed for Cape Breton Island coal and the remainder for West Virginia locomotive fuel.

FOREIGN

Guayaquil, Ecuador, South America—La Compania de Alumdrado (Lighting Company) is in the market for 3500 tons of gas coal. Prospective bidders should state the specific gravity, weight per cubic foot, and space occupied by one ton of gas coal. Give approximate analysis including moisture, fixed carbon, sulphur and ash, and a commercial analysis showing the gas per ton of coal, gas per cubic foot of coal, illuminating power of the gas in standard sperm candles, value of one cubic foot in grains of sperm, sperm value per ton of coal, coke per ton of coal (good quality), coke per cent. of coal, ash in coke, sulphur eliminated with the volatile products, sulphur in the coke, tar per ton of coal. Quotations should be c.i.f. Guayaquil. Address The Manager, Compania de Alumdrado, Guayaquil, Ecuador, South America.

South America—An American consular officer in that country has transmitted detailed information relative to tenders which will be received, until Nov. 1, for the supply of coal for government steamer service. American coal dealers who are interested should apply to the Bureau of Foreign and Domestic Commerce, mentioning item No. 14,016 for the reserved information.

South America—Supplementing a previous notice, the Bureau of Foreign and Domestic Commerce at Washington states that details regarding a certain inquiry from South America have been forwarded to the department, and that complete information, including blank forms on which to submit bids for supplying coal under the conditions specified can be had on application. All inquiries should mention item No. 14,048, and be addressed to the Bureau of Foreign and Domestic Commerce, at Washington, D. C.

Santiago, Chile, S. A.—Bids are wanted on 300,000 tons of coal a year during the next three years, according to press reports. The coal is to be used on the Chilean Railway. All communications should be addressed to the Department of Materials, Santiago, Chile, S. A.

Latin America—An American minister in Latin America has transmitted, by telegram, information relative to the coal market in his district. Full particulars may be had on application to the Bureau of Foreign and Domestic Commerce and its branch offices, referring to item No. 14,133.

COAL FREIGHT DECISIONS

Investigation and Suspension Docket No. 344—Coal rates from Oak Hills, Colo.

Proposed joint rates of the Denver & Salt Lake R.R. Co. and Chicago, Rock Island & Pacific Ry. Co., for the transportation of bituminous coal from Oak Hills, Colo., to destinations.

I. C. C. No. 6317—Pittsburgh & Southwestern Coal Co. vs. Wabash-Pittsburgh Terminal Ry. Co.

Combination carload rates on bituminous coal from points on the Wabash-Pittsburgh Terminal Ry. in Pennsylvania to destinations in other states on and reached via the Pittsburgh & Lake Erie R.R. and the Baltimore & Ohio R.R. found to be unreasonable and unduly prejudiced to complainants to the extent that they exceed by more than 10c. per ton joint carload rates on bituminous coal for hauls to same destinations from mines on the West Side Belt. Defendants required to establish joint rates from points on the Wabash-Pittsburgh Terminal Ry. which shall not exceed by more than 10c. per ton the rates to same destinations from points on the West Side Belt R.R.

I. C. C. No. 5604—Weatherford Chamber of Commerce vs. Missouri, Kansas & Texas Ry.

Existing carload rates of $2.50 per ton on lump coal and $1.70 per ton on slack coal from mines in Oklanoma and western Arkansas to Weatherford, Tex., held unjust and discriminatory, and rates not to exceed $2.25 per ton on lump and $1.65 on slack coal established.

FOREIGN MARKETS

GREAT BRITAIN

Market fairly active. Shortage of vessel tonnage causes heavy accumulation of export coal. War relief measures.

The London coal market is fairly brisk, especially for the better qualities of household fuel. The colder weather has stimulated the demand, but the enormous arrivals of Yorkshire and Lancashire coal (usually absorbed in the export trade) have kept prices low.

Scarcity of tonnage, due to the unwillingness of shipowners to risk their ships in the mined area of the North Sea, continues to act as a deterrent to trade, though, perhaps, to a lesser degree than last week. Financial difficulties are gradually being overcome, and war risk rates have eased slightly in consequence of increasing confidence in our overseas trade.

Coal exports have been prohibited by the Australian Commonwealth.

The Miners' Federation of Great Britain have postponed their annual conference owing to the war, but there is to be a conference to elect officials and discuss necessary details on Oct. 27 in London.

A circular has been issued by the Government Committee on the Prevention and Relief of Distress, drawing the attention of the local representative committees acting for the City of London and the Metropolitan area, to the offer made by Sir Arthur Markham and certain coal merchants to deliver coal to the needy at stipulated maximum prices.—"The Colliery Guardian."

GERMANY

Supplies less plentiful. Byproduct plants working full in order to provide benzol. Mines operating at a loss.

It is becoming more and more evident, with the approach of winter, that the German householder will have a hard time in securing his coal. The car shortage has improved until the transportation facilities have reached about 66% normal and the Syndicate deliveries are now 50% normal for coal and 25% for coke, but there are no indications that these figures will be bettered. All the lump and steam sizes are taken at once for the navy and the railways and the industries engaged in producing war materials.

Deliveries drag in gas-making coals, in spite of the pressing demand, as the pits cannot increase their production because of the shortage of miners. The operators are also forced to coke more coal than the demand justifies in order to furnish benzol, a byproduct of great military importance just now. At the request of the Coal Syndicate, the minister of commerce has issued a circular to all the chambers of commerce in the empire, strongly recommending the increased use of coke for domestic purposes, and the minister of railways has contracted for 100,000 tons of coke at a reduction of 85c. per ton. Although the coke prices have not been advanced, it is thought that they are still too high and that a material reduction should be made to ease the situation.

In spite of higher coal prices, the operators will be more than satisfied if they are able to meet the greatly increased expense account with nothing more serious than a loss of profits. Undoubtedly, many will have to work at a serious loss.—Translated from the "Frankfurter Zeitung."

GREECE

During the year 1912 there were imported into Greece 482,768 short tons of coal, of which Great Britain supplied 354,996 tons, Germany 115,035, the rest coming from Turkey, Belgium, and the Netherlands. The total imports for 1911 were 639,822 short tons. The estimated figures for 1913 show a rapid recovery from last year, the imports into the port of Piraeus for the 12 months being 665,000 tons, including steam and gas coal, patent fuel, etc. Of this amount Germany sent about 100,000 tons, the remainder coming from England. Of the above amount perhaps 450,000 tons were taken out of the country as bunker coal. Coaling stations in the Islands of Zea and Syra received 140,000 tons, most of which was later supplied to ships calling for coal. "Daily Consular and Trade Reports."

COAL AGE

Vol. 6 NEW YORK, NOVEMBER 14, 1914 No. 20

TO FORMULATE and transmit instructions is but 25 per cent. of the whole job. The big undertaking is to get things done according to schedule.

Every business carries a certain dead-load in the form of salaries paid men who do nothing more than follow up affairs to see that employees obey orders. The comptroller, auditor and treasurer must be alert to see that those who are intrusted with the company cash handle it safely. No set of rules can do this; only eternal vigilance counts. In the case of a coal mine, the operating head must make his workings safe and keep them so. This also requires ceaseless vigilance.

> What can I do to save some of the time and money I am spending in following up instructions to see that they are carried out and that the mine is run as I have directed?

The above thought is most persistent in the minds of coal mining executives.

If the letter files of thousands of coal-mine executives could be exhibited, they would be found full of excuses to the "big boss" for failure to carry out his instructions.

It's an old story to most mining men that a large percentage of accidents are preventable. It is equally true that much time is consumed in writing letters, making visits and following up things generally. This is the kind of executive work that hundreds and thousands of men, in all kinds of business, are doing every day. There is much of it that should be eliminated.

Most executives themselves are entirely responsible for the condition that requires an expenditure of 75 per cent. of their time in getting things done.

Do a little introspective work and be honest with yourself. Probably you will find you have never been willing to trust any man under you to do a job all by himself, but persisted in showing him every detail all the way through. You killed initiative, stifled enthusiasm and injured self-confidence on the part of your subordinate. He has learned to wait for you to come along before even starting a job, because he has been taught to feel he can't start the work in the right way.

Don't be an executive of this kind; give your men a chance. Restore their confidence, and they will do wonders for you. While they're accomplishing the work in hand, your time will be free to plan bigger and better things.

Mine officials reading this don't need to be told that it is difficult to acquire foremen and department heads who quickly and satisfactorily carry out instructions. The remedy is a simple one—get men who will. It won't be necessary to make more than one or two changes before the others wake up.

There are two things particularly that coal mine officials cannot afford to do:

1. Acquire knowledge of how to operate a plant successfully by experience alone. The tuition of experience is far too dear and the dividends are rarely paid out of earnings.

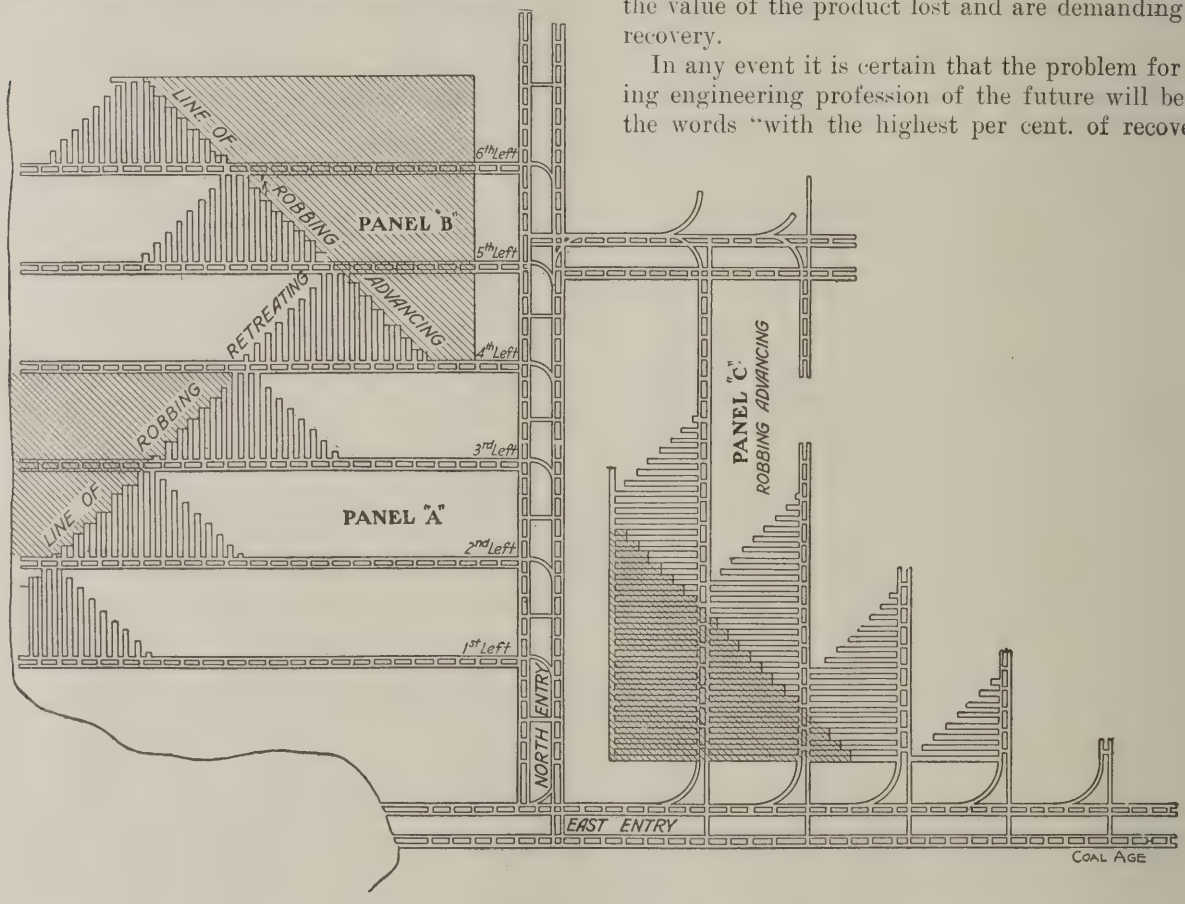
2. They cannot afford to keep on giving 75 per cent. of their time to an undertaking in order to get it done. This plan won't insure dividends of the right sort either.

A Modern Method of Mine Development

By Ernest L. Bailey*

SYNOPSIS—Description of a proved plan that may be modified to fit most any case of a panel system of mining. The principal object of the method outlined is the attainment of a maximum percentage recovery.

The question of prime importance to the intending coal-mine operator is "Will it pay?"



Of the many elements to be considered before a conclusion is reached the three most important are, quality of product, cost of extraction and ultimate recovery.

While the quality of product is largely dependent upon nature and the various processes of cleaning and preparation, the amount and quality of lump produced are, nevertheless, vitally affected by the plan of mining.

No mine should be opened without a carefully projected plan of development. Conditions may arise which will render it inexpedient to rigidly follow this plan, but if due care is exercised in obtaining the engineering data, and the proper knowledge and forethought are brought to play in the formulation of the plan, the general ideas, except in isolated cases, may be carried to completion.

It will hardly be questioned that in most of the coal fields of the United States, too little attention has been paid in the past to ultimate recovery, but with the aroused interest in conservation it seems not improbable that legislation looking to the adoption of a minimum allowable recovery will be enacted in the not far distant future. But should this not occur, the owners are awakening to the value of the product lost and are demanding a higher recovery.

In any event it is certain that the problem for the mining engineering profession of the future will be to write the words "with the highest per cent. of recovery" into the time-honored slogan of "maximum output at minimum cost."

Suggested Plan of Mine Development

Probably the most important factor entering into the cost of production and percentage of total recovery is the human factor. It is doubtful if in any other field of industry an investment will yield a profit or a loss more directly in proportion to the ability—or lack of ability—of the man in charge.

Method of Mining Affects Cost

Aside from the human factor the greatest influence on cost and recovery is exerted by the plan of mining.

It is in the hope of aiding to a solution of this problem or at least in stimulating an interest, that the model plan shown here is submitted.

This plan presupposes machine mining and electric haulage, also that entry work, where required, will be double shifted.

The Underground Layout

The rooms are 400 ft. long and are spaced at 50-ft. centers. They are driven 24 ft. wide leaving a 26-ft.

*Mining engineer, Crumpler, W. Va.

pillar. These rooms are designed for a single track and are limited to 24 ft. in width in the belief, based on personal observation, that this is the maximum width that affords economical shoveling.

Not more than three rooms on any one entry should be driven to completion in advance of the robbing and the line of the faces of the rooms should make an angle with the entry of approximately 40 degrees.

The width of rooms and of pillars is equalized with a 2-ft. margin in favor of the pillars to counterbalance their more rapid recovery. The pillars are mined by machines and drawn by the pocket and stump method. All cross-entries are driven 12 ft. wide on 36-ft. centers, leaving a 24-ft. chain pillar which allows crosscuts to be made without laying a special turnout in the track.

Main entries are driven in pairs on same centers as cross-entries with a 100-ft. chain pillar between each pair. The crosscuts in the main chain pillar are spaced at from 200 to 400 ft. at the discretion of the engineer. This method has the dual object of facilitating ventilation and reducing the cost of stoppings as the stoppings in the short cuts are of a temporary nature and may be of canvas or boards while only the main crosscuts require permanent stoppings.

The robbing of panel *A* is not to start until the robbing of panel *B* has been completed, and room development is to be retarded except an occasional two rooms on Third Left as is required for haulage purposes. The mine should be divided into sections of robbing which would limit the maximum break line to not more than 2000 ft. in length.

Careful Supervision Is Necessary

For the successful execution of this plan strict supervision and careful engineering are absolutely essential. The rooms, as well as entries, should be driven on sights set by the engineer and extended at intervals not exceeding 200 feet.

Each section of robbing and rooms should be placed in charge of a competent section foreman whose duty it is to see that the line of the room faces, as well as the breakline of the pillars, is kept at the desired angle with the entry. This is not difficult with machine mining as it is only necessary to see that each working place receives the same number of cuts. This plan as outlined has the disadvantage of a somewhat more expensive haulage than the ordinary panel method.

Advantages of the System

The advantages claimed for it are as follows: (1) Higher per cent. of recovery and better quality of product due to the fact that no portion of the developed work stands but a short time before pillars are drawn. Roof settlement to an effective extent does not occur on the pillars beyond the line of break, thus allowing a cleaner extraction and yielding a greater amount of lump; (2) reduced cost of production due to the high degree of concentration of the working places; (3) the largest output in the shortest time consistent with safety and mining economies.

The most distressing feature of a model plan is that it will rarely fit any particular instance. It is my opinion, however, that modifications of the above plan may be used in the development of any mine that permits of the panel system.

In the special case for which it was designed, the east entries dip about 1½ per cent. and will eventually have natural drainage.

It might not be amiss to state that experience has gradually forced me to believe that the general horror of dip workings—with an ultimate natural drainage—while probably justifiable enough in the days of the hand pump and water car, is something of a bogey in the days of the electric pump.

Mining Fatalities in West Virginia during September

The list of fatalities in the coal mines of West Virginia during the month of September has just been issued by Earl A. Henry, chief of the department of mines, and shows that thirty miners lost their lives in the state that month, a decrease of two from the records of the previous month.

The list also shows that falls of coal and slate were responsible for sixteen of the deaths, while nine were attributable to mine cars, three to motors, one to electrocution, and one to a railroad car at the tipple.

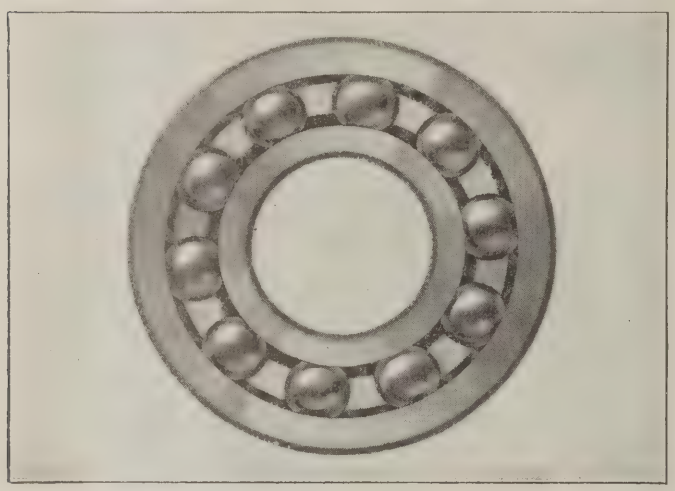
A British View of Our Export Trade

There can be no doubt that the temporary dislocation of our own foreign business as a result of the war appeared likely to offer our trans-Atlantic competitors opportunities, but they have so far not materialized. Some additional orders for markets in which, as a rule, British coal reigns supreme, have no doubt been taken. Substantial contracts have been booked for Italy, it is reported, and an attempt has been made to invade the Mediterranean generally, while renewed attention is also being bestowed upon South America.

American efforts to sell coal to Europe have never met with much success as yet owing to the heavy ocean freight rate, due partly to unalterable geographical reasons and partly to the difficulty of securing a return cargo. This latter difficulty has been overcome in some cases, but not with sufficient regularity to encourage a permanent trade of any great importance. It must be acknowledged that the export of coal from the United States to Europe rose from 255,000 tons in 1911 to 476,000 tons in 1913; but the strike here in 1912 probably had much to do with the increase, and now, of course, abnormal circumstances are again operating in favor of the Americans. It seems very doubtful whether much of this business will remain when normal conditions are restored, for the reasons to which we have referred already, and even if the total tonnage for 1913 were doubled this year, it would yet remain insignificant compared with our own Continental coal trade.

More success perhaps may attend American efforts to capture the South American markets. So far as the Pacific Coast is concerned, of course, the opening of the Panama Canal has put American exporters in a more advantageous position. It has also to be remembered that so far as Chile is concerned, the nitrate trade with Germany is at an end, and the consequent decrease in the available quantity of return cargo is likely to check our coal trade with the republic, which in 1913 amounted to nearly 600,000 tons.

The Canal, however, will afford the Americans no assistance in the Atlantic states, with which our largest trade is done. It was thought in the United States that our coal shipping trade would be so paralyzed by the war that we should have to virtually abandon the markets in question. Our American friends soon saw they had made a mistake; but it is probable that in view of the handicap imposed upon us by the war they may be able to do more business with the southern republics, and to retain some of it. D. A. Thomas is reported to have said before the war that he feared the United States more than Germany as a competitor of the United Kingdom in the foreign coal trade. Germany is out of the question during the war, while we are hampered to some extent, although not for long we hope, and no doubt the Americans will make the most of the opportunity.—"Iron and Coal Trades Review" (London, England).



Ball Bearings on Mine Locomotives

By Frederic H. Poor*

SYNOPSIS—The chief reasons for the adoption of ball bearings, particularly on mine locomotives, are here set forth. Contrary to a more or less popular conception, ball bearings require lubrication.

At a time when many types of coal-mining equipment, particularly locomotives, are being fitted with ball bearings, it might be well to inquire exactly what are the causes for this departure from the well known and thoroughly tested type of bearing lined with babbitt or bronze.

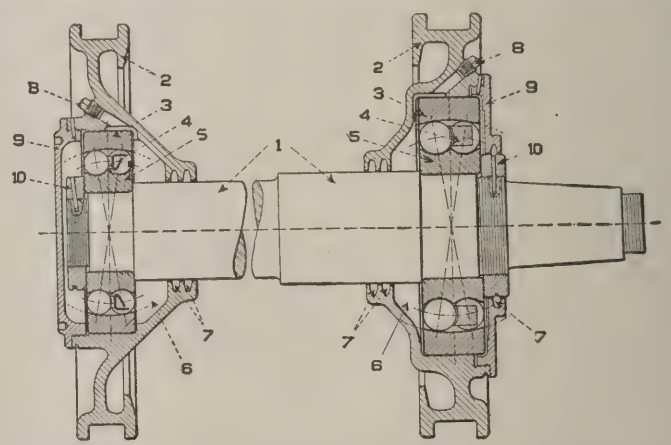
At first sight it might appear strange that the subject of motor commutation should have any influence upon

A Heavy-Duty Bearing Used on Mine-Locomotive Motors

the type of bearing employed. Good commutation is, however, directly dependent upon the accuracy and fineness of setting of motor bearings, regardless of their type. To secure the best results motor armatures must revolve smoothly and concentrically with the pole faces. Furthermore, particularly in coal mining, the revolving parts must be kept free from oil which tends to accumulate dust, thus forming a carbonizing compound which endangers the commutation and is extremely liable to cause "flash overs."

In this respect, the compact bearing heads employed in ball-bearing units and the effectual sealing of the lubricant chambers have proved of inestimable value. Protected from the lubricant, the commutators retain their finish and the brushes are kept free from accumulations of a conducting dust or smut on the lead edges.

Another factor which strongly affects commutation is the maintenance of the air gap. Plain bearings are subjected to a continuous rubbing action which causes wear on the bearing surfaces, frequently allowing the shaft to settle out of the true center of the magnetic field, thus necessitating frequent gaging of the air gap and inspection and possible replacement or renewal of the bearing linings.



On ball-bearing machines this wear is practically eliminated. Hardened-steel balls roll on hardened races. Rolling is thus substituted for rubbing, and practically continuous accuracy secured. Self-alignment in ball bearings allows them to accept the sudden impulses of load without binding, and insures the best possible load distribution with a minimum pressure per ball.

As an illustration of the results secured with ball bearings, in September, 1914, an inspection of a ball bearing removed from the pinion end of a mining locomotive was made after two years of continual service. During this time the locomotive had traveled approximately 60,000 miles. The bearing showed no appreciable wear, and was immediately returned to service.

Instead of repeated attention to bearings as is required in plain-bearing machines, a weekly filling of the grease cups and an occasional inspection insures long life and the elimination of bearing troubles where ball bearings are employed.

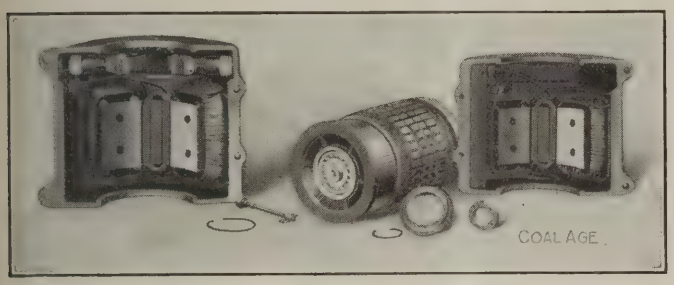
Ball Bearings Must Be Lubricated

The reasons for lubricating ball bearings are two: First, to preserve the highly finished surface of the balls and races from the destructive action of moisture, air and mine gases. Second, to reduce the small amount of friction which exists in such a bearing. In addition to performing these main functions, the grease in the lubricant chamber and sealing grooves helps to protect the bearings against the intrusion of foreign matter from without.

Sectional Drawing of Motor Heads Employing S. K. F. Ball Bearings

1. Armature shaft
2. Motor bearing head
3. Outer bearing race
4. Balls and retainer
5. Inner bearing race
6. Lubricant chamber
7. Grooves to seal lubricant chamber
8. Grease feed pipe
9. Outside housing cap
10. Lock nut to hold inner race on shaft

While it is true that the coefficient of friction for ball bearings is extremely small (approximating 0.0012), this consideration should not lead to the belief that such bearings may be successfully operated dry. Ball bearings *must* be lubricated, and a high grade of grease should be employed and care taken to see that it is chemically neutral in order to avoid possible corrosion of the balls and races by either acid or alkaline compounds contained in the grease.



*S. K. F. Ball Bearing Co., New York.

A ball bearing and its mounting are extremely compact and free from rotating oil rings, wicks or waste packing chambers.

Due to their comparative freedom from wear, ball bearings prevent motor armatures from rubbing on the pole pieces. The maintenance of centers insures greater life to the gears, since the latter are held continuously in proper mesh and a higher gear efficiency obtained.

The proper mounting of these bearings requires a tight fit for the inner ball race on the shaft in order that the two may revolve as an integral unit. The outer ball race, on the other hand, should have a "piston" fit in the casing. Such a fit allows the outer race to slowly creep around, thus gradually distributing the bearing load over the complete ball path of the outer race.

The casing containing the bearing should provide a liberal lubricant chamber, which by an extremely simple construction may be sealed against the leakage of the

View of Disassembled Mine-Locomotive Motor

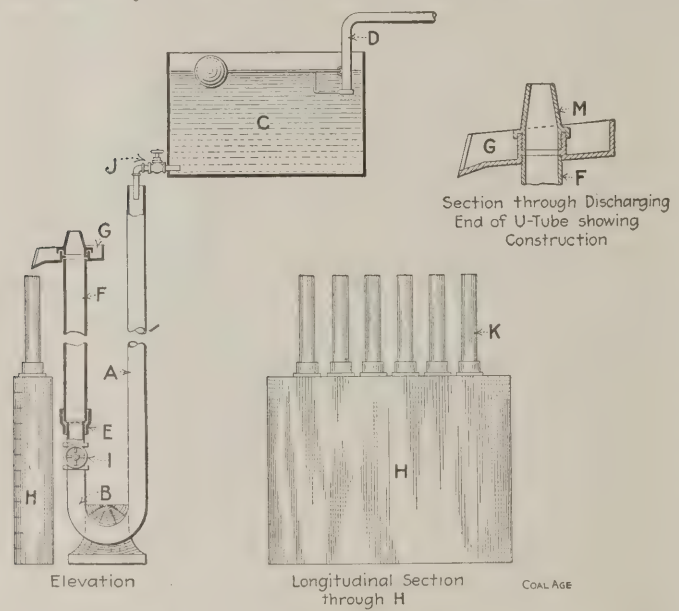
lubricant from within, or the intrusion of water, grit, or other abrasive substances from without.

The advantages of the ball bearing as applied to mine-locomotive motors may be summed up as follows: Freedom from repairs, a material reduction in the amount of lubricant required, long intervals between inspections, good commutation, and decreased wear on the gearing. What is probably more important so far as coal mining is concerned, the locomotives are more dependable and are more nearly constantly in commission instead of being in the repair shop.

Don'ts for Safety Inspectors

1. Don't forget that you are under the direction of the mine foreman.
2. Don't fail to make a daily report, showing what places you have inspected and what has been done in the interest of the safety of the employees.
3. Don't fail to examine and test with a bar the roof, ribs and face of each working place, and also test for gas every time you enter same.
4. Don't forget in your travels to note every condition that may lead to an accident, and report to foreman, noting on your report when such conditions are remedied.
5. Don't fail to examine timbering, and if dangerous, instruct miners to set timber without delay; see that orders are complied with and report same to mine foreman or assistant mine foreman immediately.
6. Don't fail to examine roof and timbers along main haulage roads and travelingways, and report at once any retimbering necessary to be done.
7. Don't fail to examine all safety devices, such as trip alarms, safety blocks at the top of shafts, slopes, planes, etc., reporting to the mine foreman or assistant mine foreman immediately any needed repairs.
8. Don't fail to caution all miners to be careful while trimming down the face after firing a blast.
9. Don't fail to report all abandoned workings and entrances to all dangerous places that should be fenced off, and the sign, "Danger, Keep Out," placed thereon in a conspicuous place.
10. Don't fail to report any person or persons who neglect to notify men in the immediate vicinity when they are about to fire a blast.
11. Don't fail to impress on the miners the importance of sounding the roof and testing for gas in the morning before commencing work, and before and after firing each blast during the day.
12. Don't fail to report to foreman any miners who fire two holes at the same time.
13. Don't allow any person to carry dynamite and caps at the same time, except when taking same into face to be used, and report any violation to the foreman.
14. Don't fail to stop any persons from leaving fuse, caps and exploders in the same box with dynamite, and report any violation.
15. Don't fail to stop any employee from making holes in dynamite with a file or cut spike, in order to insert cap, and report any violation.
16. Don't fail to caution miners who cap fuses with their teeth, and report violations to foreman. A crimping tool should be used.
17. Don't fail to warn the miners that using dynamite and black powder in the same hole is prohibited.
18. Don't permit miners to leave keg of powder on road or alongside of same. Insist that they replace it in box kept for that purpose, and report any violation to foreman.
19. Don't allow tamping to be done with iron or steel bar or needle. If men are not using wooden bars, report at once to foreman.
20. Don't permit miners to leave the wires attached to electric battery. They should be disconnected after the shot is fired. Report violations.
21. Don't fail to report all miners who use a blasting barrel instead of a fuse. They insert a cap in the barrel and explode the same with a squib. This is a dangerous practice.
22. Don't fail to warn miners that they must not leave safety lamps at their tool box. They should have them at their working face.
23. Don't permit any persons when placing relief timber to remove the old sets before placing the new, and be sure they lag, also sprag, where necessary.
24. Don't permit persons to leave lumber, boards or timbers with projecting nails lying loose in any place. Such nails must be removed or bent down close.
25. Don't fail to report all slopes and planes that do not have safety holes.
26. Don't fail to report all door frames and other structures that are erected too close to rail.
27. Don't fail to report all unguarded trolley wires that men are compelled to pass under.
28. Don't fail to report all frogs and switches that are not properly blocked.
29. Don't fail to have the passageways kept clear of obstructions.
30. Don't fail to caution brakemen or others not to stand between the rails and attempt to board locomotive or cars while same are in motion.
31. Don't allow any person to ride on cars unless their duties require it. Report all such violations to mine foreman or assistant.
32. Don't wait for the general inspector to point out dangerous conditions.
33. Don't forget that one of your principal duties is to caution employees of dangerous practices.
34. Don't fail to stop and report any employees who carry a naked lamp in districts where locked safety lamps are used, or in any other section where naked lights are prohibited.
35. Don't forget that we expect you to help us educate the employees to take care of themselves, and this can be done best by personal attention and instruction.
36. Don't forget that thorough and efficient examinations and inspections before accidents bring better results than the same work after an accident.

Note—From Susquehanna Coal Co.'s Book of Instructions.



Montana's Coal Production

Montana, according to the U. S. Geological Survey, is essentially a metal-producing state. The values of its copper, gold, silver, zinc and lead represented in 1913 over 89 per cent. of its total mineral production. It is one of the most important Rocky mountain states in the production of coal. This production increased from 3,048,495 tons, valued at $5,558,195 in 1912, to 3,240,973 tons, valued at $5,653,539 in 1913.

Testing Appliance for Coal Washeries

The development of a testing apparatus adapted to determine the percentage of waste in a sample at any stage of the treatment of coal in a washery is due perhaps to L. D. Ford, who has recently given an account of its construction. The same instrument may be used to determine the data necessary for the plotting of the curves of washability of any coal in terms of the percentage of ash content or of the velocity of upward current necessary to hold given sizes in suspension.

The fundamental principle involved in the construction and operation of this instrument is that in virtue of which coal and mineral particles have for their various sizes corresponding velocities of upward current which will just hold them in suspension. Referring to the figure: A head of water *C* is kept constant in its container by the automatic inlet regulator *D*. The valve *J* controls the delivery of water into the downgoing side of a U-

Apparatus for Determining Waste of Coal in a Washery

tube. The upgoing side *B* is interrupted by the valve *I* and the connecting piece *E*.

The upper portion *F* is of glass, and is terminated above by a cup *G* and the metal nozzle *M*. A graduated reservoir *H* is provided with a number of inlet tubes *K*. The cup *G* may deliver to any one or all of these tubes. The nozzle is tapered on the interior in order to add to the velocity of a current passing through the instrument. A piece of gauze is placed in the connecting piece *E*, the mesh of which is finer than the mineral to be tested. Also, similar gauze is used at the bottom of the tubes *K*. The foregoing arrangements have in view the provision of an upward current in *F* of uniform velocity.

Upon opening *J*, a current of water will flow through the U-tube and discharge into the reservoir. The velocity in *F* may be calculated by noting the total quantity of water discharged into *H* in an observed interval of time and taking the cross-section of *F* into account. In order to avoid repeated calculations, a curve may be constructed once for all, showing the variations in velocity corresponding to variations in the position of the valve *J*. It will be convenient to have a circular scale attached to this valve in order to note its position with accuracy.

Eliminating the Question of Velocity

Another curve may be made which will show the variations in velocity compared with the variations in size of particles held in suspension in the glass tube. These particles should be free from refuse. Instead of making two curves, we may dispense with velocity altogether and construct a single curve comparing variations in valve position with variations in size of particles. We should thus eliminate all calculations on velocity.

Suppose now we wish to test a sample of coal or other mineral taken from a washery. The sample is supposed to contain particles of uniform size. We put it in the tube *F* and start the current. The valve *J* should now be opened to a point just a little beyond the point shown by the curve to correspond with the size of the mineral particles in the sample. The good material will now be driven out, the residue in *F* remaining on the gauze. This when dried and weighed may be compared either with the total weight before testing or with the weight of the particles driven out, caught in one of the tubes *K*, and similarly treated.

We may construct a curve of washability as follows: The sample, containing miscellaneous sizes, is put into the tube *F* and the current turned on gradually until the smallest particles are just floated off. We then observe the position of the valve *J*. The particles are collected in one of the tubes *K*. By opening *J* further and further, we may get a series of positions of the valve corresponding with a series of sizes. We collect these various sizes in separate tubes, and dry, weigh and calcine the contents of the tubes separately. A curve of washability may now be constructed charting the sizes and either the valve positions or the actual velocities.

Coal Production of the Transvaal

Although the gold-mining industry is of preëminent importance in the Transvaal, says the *Daily Consular and Trade Reports,* it has other valuable mineral deposits, including diamonds, coal and base metals, in the mining of which gratifying progress was shown during the past year. The purchases of coal mined in the Transvaal showed an increase from 4,751,850 tons in 1912 to 5,225,036 in 1913. An export trade for coal now having been established, there is every reason to believe that the Transvaal coal industry will continue to expand.

The total stores consumed by the mines of the Transvaal during 1913 amounted to $56,503,913, compared with $54,183,080 in 1912, an increase of $2,320,833. The purchases of machinery and machine tools and electrical machinery alone, which are practically all imported, amounted to $4,399,783. To show the predominance of the Transvaal over other Provinces of the Union as a customer for mine supplies, it is only necessary to state that of the total stores consumed by the mines of the entire Union of South Africa in 1913, amounting to $64,755,084, the Transvaal consumption was about seven times that of all other Provinces combined.

The Pittsburgh Coal Field in Western Pennsylvania

By H. A. Kuhn*

SYNOPSIS—The writer states that the Youghiogheny gas-coal field, which lies roughly between Marianna and Irwin, has a prospective life only one-seventh as long as the anthracite field. The exhaustion of the natural gas around Pittsburgh and the securing of freight rates for coke comparing favorably with those for coal together secure for Pittsburgh the prospect that fuel will not be largely shipped to other points for coking purposes, but will be coked at home. The southern Illinois coking-coal field does not seem a dangerous competitor of Pittsburgh.

The Pittsburgh coal field in western Pennsylvania is conceded to be the most important in the world. To measure its value it is necessary to understand the extent of its service to the various industries of the country. Probably 90 per cent. of the pig iron manufactured in the United States up to the present time has been made by using coke manufactured from the Pittsburgh coal seam in western Pennsylvania. This coal field is the foundation on which the city of Pittsburgh rests. It has caused the great growth of the iron industry in that district.

Pittsburgh would not be the natural center for iron and steel manufacture if it were not for its fuel. As it is, the ore is brought 1100 miles for treatment and the manufacturer is placed by the location of the industry at the mercy of the railroads.

The Outside Market of Pittsburgh

The illuminating-gas interests have shown an equal preference for Pittsburgh coal and 20 to 25 per cent. of the fuel used on railroads in the United States comes from this field. The Pittsburgh coal field is unquestionably the center of the industrial population of the United States, for in addition to the industries of the district and those closely adjoining, it has tributary to it all the cities and industries along the Great Lakes. Furthermore, practically all Canada, with the exception of the extreme western and eastern ends, is supplied with coal from this district. It furnishes the industries and population of points many hundreds of miles west of Duluth and Superior.

This coal is floated down the Ohio and Mississippi Rivers, supplying the towns *en route*, and is delivered in New Orleans, a distance of 2200 miles, for approximately 80 to 90c. per ton transportation cost. It is delivered on the docks of Superior and Duluth at a cost of transportation 50c. a ton less than the cost of transporting the same coal from Pittsburgh to a local consumer in Philadelphia. With other Appalachian coals it has large markets east and along the seaboard, especially for by-product-coke making and the illuminating-gas industry.

It is considered the leading railroad fuel because when consumed in a locomotive of any given size, it will haul more cars than any other coal in the world. Tests made at Altoona by the motive-power department of the Pennsylvania Railroad Co. show that Pittsburgh gas coal evaporates as much as 18.9 lb. of water per square foot of heating surface. It is stated that the lower-volatile coals, with a theoretically higher heat value per pound of fuel, do not evaporate more than 12 or 13 lb. of water for the same unit area of heating surface. For this reason this important railroad has adopted this coal as its standard fuel. By its use with the same crew and engine a maximum number of cars may be hauled.

Pittsburgh Coal from Pittsburgh District Supplies 28 Per Cent. of U. S. Production

These statements explain in part the enormous production of coal from this field and seam, which was, in 1913, approximately 100,000,000 tons. The Ohio production from the same seam was about 20,000,000 and that of West Virginia 10,000,000 tons. Thus a total tonnage of approximately 130,000,000 tons is produced from the Pittsburgh seam in this field. This is a large proportion of the total output of the United States, which was 470,000,000 tons in the same year.

Of the 170,000,000 tons of bituminous coal produced in Pennsylvania approximately 100,000,000 tons comes from the Pittsburgh seam. Fayette and Westmoreland Counties with only a small acreage left of unmined coal are now producing approximately 60,000,000 tons of coal annually; Allegheny and Washington counties produce about 20,000,000 tons each; Greene County has only recently started as a producer of coal but its capacity is now 2,000,000 tons a year.

The Regularity of the Coal Bed

The geology of the Pittsburgh coal measure is so well understood that it is not worth while discussing this field from that standpoint. Some practical features, however, which relate to its geology are interesting. The main feature of this seam from a geological standpoint is its persistency and integrity over the area which it covers. Though the coal may not have been opened on any given area, nevertheless those who are familiar with each zone or subdistrict (and the slow but uniform change from one basin to the next) can state unreservedly how thick the bed is within a small percentage, how much sulphur it will probably contain and about how many tons per acre may be recovered.

Thousands of miles of entries have been driven through this coal field in mining operations of the district and even where it is not being mined thousands of oil wells and gas wells have been drilled through it; from the records thus obtained several facts have been deduced which are worthy of comment.

The plant life which formed this field of coal was extremely luxuriant, increasing in depth or density toward the east. The purest and largest part of this coal field has been lost through corrosion. This seam in the Georges Creek field near Cumberland, Md., measures as

*President, Pittsburgh-Westmoreland Coal Co., Fulton Bldg., Pittsburgh, Penn.

Note—Article submitted to the American Institute of Mining Engineers at the Pittsburgh meeting, Oct. 9, 1914.

much as 16 ft. in thickness, whereas on its western outcrop in Ohio it is only about 3½ to 4 ft. thick. In the northwestern end of Allegheny County in western Pennsylvania near the state line the main or working bench of coal measures about 4½ ft. and the roof coal is 2½ to 3 ft. thick, the working bed being separated from the roof strata by what is known as the "draw slate" of the district, which averages from 8 to 14 in.

In the Connellsville field the coal at places attains a thickness of 8 ft. and on the southern boundary of Greene County near the Monongahela River it measures 9 to 10 ft. in thickness. In the southern extension of this seam in West Virginia the roof coal and main or working bed of the Pittsburgh district become practically one solid

The Fuel of the Gas-Coal Basin

The coal containing the least impurities from this seam in the Pittsburgh district is mined from what is known as the "gas-coal basin," which lies between the Pinhook-Murraysville anticlinal on the west and the Waynesburg-Saltsburg anticlinal on the east. The working bed of coal in this basin is on an average about 6 ft. thick. Above this bed and separated from it by the draw slate, 2 to 4 ft. of roof coal is found. The main working bed in this basin as prepared for market contains about 6 per cent. of noncombustible matter, and in some cases less than this, and the average coal contains not over 1 per cent. of sulphur. Coal in the Connellsville basin is equally pure, but because more of the seam is mined in that field

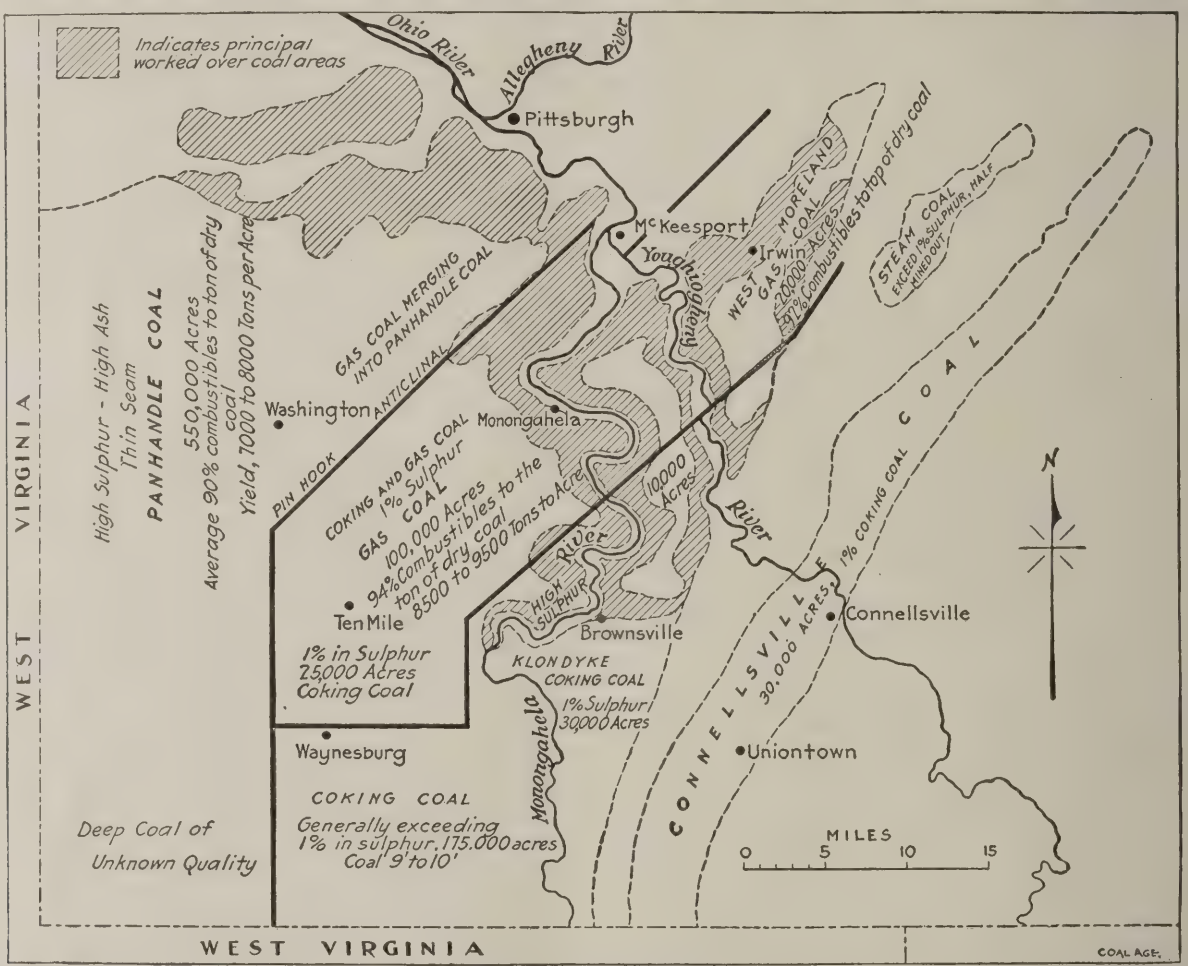


Fig. 1. Showing Number of Acres Unmined and Number of Tons of Recoverable Coal per Acre, Also Divisions of Quality

bench of coal with only thin laminations of slate marking the divisions which are so noticeable in the northern part of the field.

It may be said from an inspection of the geological map and from a knowledge of the quality of the coal that not only was the plant growth that formed this fuel much more luxuriant in the eastern end but that the coal was deposited with less impurities and under quieter conditions. The coal thins going west, but maintains its extreme purity as far westward as the Pinhook anticlinal running southwest from Pittsburgh through Allegheny and Washington counties. West of that anticlinal the change is gradual, the coal becoming more impure, higher in ash and sulphur with progress westward. The working bed or bench also becomes thinner.

the ash is usually higher than in the coal produced in the gas-coal field, the sulphur being about the same. In recent years it has been discovered that the lower or southwestern portion of the gas-coal zone makes a standard coke, the difference between it and that from Connellsville coal is that the former, because of its hardness, has to be crushed before it is put into the coke ovens, unless only the slack coal is used. This greater hardness is, however, an advantage in its sale as the lump coal is sold at the mine for shipment at a normal price of $1.40 per ton, which is equivalent to a price for coke (including its cost of manufacture based on beehive-oven practice) of $2.50 per ton on the car at the oven wharf.

The Pittsburgh coal field in western Pennsylvania west of the Monongahela River and within the state lines com-

prises about 850,000 acres of unmined coal today. In order to understand the available tonnage per acre in this field of coal and the values in various parts of the coal field it is necessary to subdivide it into zones of quality and thickness. To comprehend its value fully it is necessary to subdivide it further into zones differentiating production cost, this further division having relation to the cost of mining and of transportation. The thickness of the coal in the various parts of the field determines the available tons per acre, which in turn becomes a factor in the valuation of the land. To measure the value of the properties in the different subdivisions or zones, all the factors, quality, tons of recoverable coal to

OVENS AND ACREAGE IN 1912 IN CONNELLSVILLE FIELD

	Number of Ovens		
	Tax List	Connellsville "Courier"	Acres
Old Basin	22,985	20,361	32,461
Klondike	12,784	12,377	33,029
Total	35,769	32,738	65,490

OVENS GOING OUT OF BLAST IN CONNELLSVILLE FIELD, DUE TO EXHAUSTED ACREAGE

	Old Basin	Klondike	Total
In next 3 years	5,393	1,310	6,703
In next 5 years	7,097	2,052	9,149
In next 10 years	11,940	3,814	15,744
In next 15 years	14,529	5,270	19,799
In next 17 years	17,491	6,130	23,621

After 17 years there will be, of all the ovens shown, 5494 in the Old Basin and 5881 acres of coal land unex-

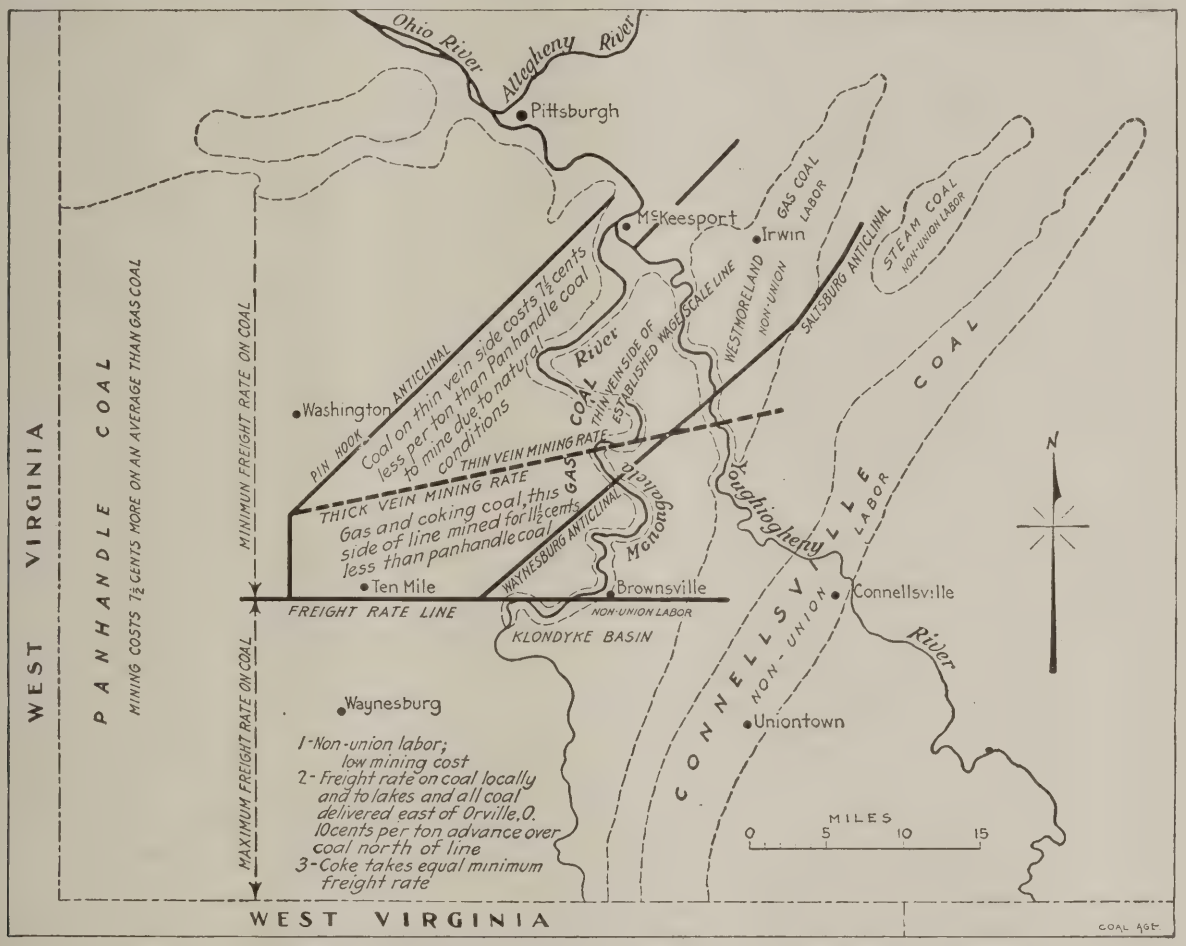

Fig. 2. Showing Divisions in Cost of Mining and in Freight Rates

the acre, cost of mining and cost of transportation to market, must be considered.

In Barely a Decade and a Half the Best Connellsville Basin Coal Will Be Exhausted

To measure the life of this coal field is an easy matter. In the Connellsville basin, the Lower Connellsville or Klondike basin, and other areas of coal east of the Monongahela River there are approximately 100,000 acres of the Pittsburgh seam available and unmined at this time. In 1912, I determined, from the assessor's books in each township comprised in the Connellsville and Lower Connellsville basins, the unmined acreage of coal and also the number of ovens attached to the properties. Thus my figures are based on the sworn statements of various owners of the coal lands and coke plants. I have added to these figures those published by the Connellsville *Courier*:

hausted. These ovens will have an average life of a little over 9 years. In the Klondike district there will be 6654 ovens and 9501 acres of coal. These ovens will be able to run a little over 13 years.

MERCHANT OVENS GOING OUT OF BLAST IN CONNELLSVILLE FIELD, DUE TO EXHAUSTED ACREAGE; ELIMINATING THE H. C. FRICK COKE CO.

	Old Basin	Klondike	Total
In next 3 years	2,575	1,310	3,885
In next 5 years	3,135	2,052	5,187
In next 10 years	4,691	3,814	8,505
In next 15 years	6,455	4,760	11,215

After 15 years there will be, of the present oven plants shown, 1039 ovens in the Old Basin, with 1653 acres of coal left. These ovens will have an average life of somewhat over 14 years. There will be 3842 ovens in the Klondike, with 5781 acres of coal left. These ovens can anticipate an average life of a little over 13 years.

NUMBER AND LIFE OF OVENS OF H. C. FRICK COKE CO. IN CONNELLSVILLE FIELD

	Tax List	Number of Ovens Connellsville "Courier"	Acres	Average Life, Years
Old Basin	15,491	14,199	23,896	14+
Klondike	4,182	3,664	14,271	31+

In addition to the above the H. C. Frick Coke Co. has 2935 acres in Redstone township, 1043 acres in Menallen township and 4423 acres in Luzerne township on which there are apparently no ovens. The coal from this property together with that from much acreage in adjoining townships will probably be shipped to byproduct ovens, making the total life of the Steel Corporation's coal lands in the Klondike district approximately 20 to 25 years, assuming that they draw on these lands to make up the decline in the Old Basin.

Gas-Coal Basin Will Be Depleted in a Few Years

It is clear from this accurate information that the original coking-coal fields of western Pennsylvania comprising these two basins of the Pittsburgh coal seam, which were thought to be inexhaustible a few years ago, have only a short life. More astounding than this, however, is the approaching end of the continued production of what is known as the Youghiogheny or Westmoreland gas coal, which comprises the coal in the gas-coal basin extending from Irwin on the main line of the Pennsylvania Railroad, east of Pittsburgh, in a southwest direction, crossing the Youghiogheny and Monongahela Rivers and extending into the northern end of Greene County. The coal from this basin has supplied probably 90 per cent. of the coal-gas illuminating plants in the United States up to the present time.

With the disuse of oil in gas making, steel heating and melting and in many other industries, the demand for this grade of coal will probably double within the next five years. Including the Westmoreland field and extending into the northern end of Greene County there is unmined and available in this basin approximately 150,000 acres. Because the southwestern portion of this basin makes a standard low-sulphur coke, various steel corporations have purchased large bodies of this land and there is now only available for the open market the product from about 70,000 acres of this coal.

The short life of the anthracite field is frequently matter for comment, but it can be shown that this particular grade of coal will be exhausted in one-seventh of the time necessary for the complete extraction of the anthracite coal in Pennsylvania, assuming that the peak of production in the anthracite field has been reached. The coal basin lying west and northwest of this between the Pinhook and Washington anticlinals will be called upon to supply the gas-coal from the Pittsburgh district when the gas-coal basin proper has been exhausted. In this discussion, however, all lands west of the Pinhook and Murraysville anticlinals are included under the name of "Panhandle" coal.

Fig. 1 shows the number of acres unmined in each subdistrict, the number of tons of recoverable coal per acre based on the past practice of the district in mining, and the divisions of quality in the district. Fig. 2 shows the divisions in the cost of mining and the freight-rate zones, both of which determine largely the values of the various lands of the district. Fig. 3 shows the estimated life of the various parts of the Pittsburgh coal field. The available and unmined coking-coal land may be divided into two parts, first, that containing coal running 1 per cent. of sulphur or under, and second, that underlaid by higher-sulphur coals.

This first includes the Connellsville basin, the greater part of the Klondike field and the eastern portion of Washington County east of the Pinhook anticlinal and southwest of Monongahela City, and the field in the northeastern portion of Greene County. The coking coal which has more than 1 per cent. of sulphur and which must be washed in order to make standard coke includes the upper portion of the Connellsville basin, the southern portion of the Klondike field and the southeastern portion of Greene County. The extreme thickness and large recovery of coal to the acre in the southeastern portion of Greene County and the low mining cost offset the expense incurred in washing.

The Pig-Iron Production Needs

An estimate of the pig-iron production tributary to this field up to October, 1912, was given recently in the *Iron Age* and a forecast was made showing the normal

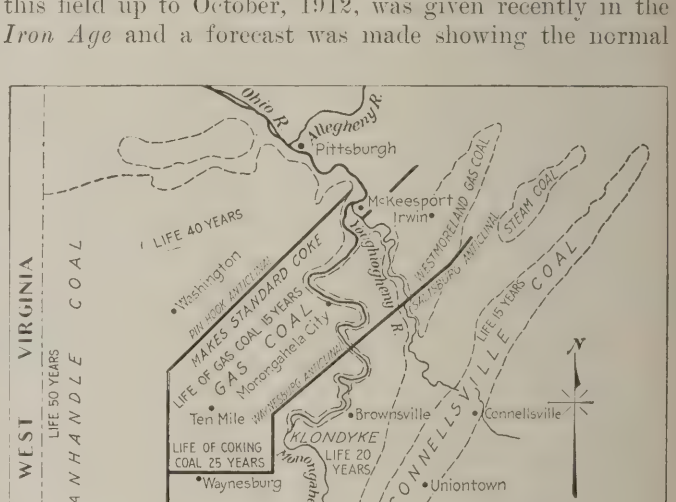

Fig. 3. Estimated Life of Various Divisions of Pittsburgh Coal Field

The calculations are based on the equivalent of a 4 per cent. annual increase for 12½ years. After that time and until the coal is exhausted a uniform production is assumed, which is taken as 50 per cent. greater than the present normal output. The assumption is also made that the high-grade coals will be mined first. The present output of gas coal is 45 million tons per annum, coking coal 40 million and Panhandle 15 million. The annual increases assumed are: Gas coal, 1½ million tons for two years, coking coal 2 million tons till 70 millions is reached, and Panhandle coal a half million tons till the exhaustion of the field.

increase. This calculation is taken as a basis on which I have made an estimate of the life of the various fields of coking coal. I have assumed in this inquiry that the coal from the new fields will replace that from the Connellsville basin as its output declines and will also provide for the increased consumption of coke as the output of pig iron in the area tributary to these fields increases.

The average annual rate of increase of pig-iron production, based on figures for 1900 to 1910, was approximately 1,171,334 tons. For the next 10 years 1,400,000 tons may be assumed as the average flat rate of annual increase. The productions from 1912 to 1920 would, therefore, be as shown below. This forecast allows little for increase in population or increased use of iron per capita.

PROSPECTIVE PRODUCTION OF PIG IRON AND ANTICIPATED COKE NEEDS

Year	Average Pig Iron Production, Tons	Coke Required for Smelting, Tons*
1912	29,115,000	45,419,000
1913	30,515,000	47,603,000
1914	31,915,000	49,787,000
1915	33,315,000	51,971,000
1916	34,715,000	54,155,000
1917	36,115,000	56,339,000
1918	37,515,000	58,523,000
1919	38,915,000	60,707,000
1920	40,315,000	62,891,000

* The coke requirement is based on the assumption that 1.56 tons of coke will be used to smelt one ton of pig iron.

The following table shows: (1) That 75 to 80 per cent. of all the iron production of the United States is located tributary to the coking coal of the Pittsburgh district, and (2) the quantity of coke required by the different iron-producing districts. This is obtained by taking the pig-iron production of the United States for the last five years and the coke production for a like period. The pig-iron production of the United States from 1907 to 1911, inclusive, was 117,445,261 tons, and the coke production from 1907 to 1911, inclusive, was 183,388,466 tons. The coke required for blast furnaces, foundries, smelters, and gas production is 1.56 times that of the pig iron smelted.

DISTRIBUTION OF PIG IRON PRODUCTION AND COKE DEMAND

District	No. of Stacks	Month of October, 1912. Pig-Iron Production, Tons		Coke Required, Tons	
Buffalo, New York	16	179,726		280,372	
Rest of New York	2	621,813		970,028	
Pittsburgh district	51				
Eastern Pennsylvania (small stacks)	35	227,106		354,285	
Western Pennsylvania	18	157,027		244,962	
Shenango valley (Penn.)	16	143,115		223,259	
Mahoning (Penn.)	20	256,711		400,469	
Central and northern Ohio	21	237,506		370,509	
Wheeling district (Ohio and W. Va.	10	118,037		184,137	
	— 189		1,941,041		3,028,021
Chicago district (Mich., Wis. and Minn.)	38	442,091		689,661	
	— 38		442,091		689,661
Southern Ohio	9	38,419		59,933	
New Jersey	1	5,370		8,377	
Southern states	41	239,686		373,910	
Western states	3	23,326		36,390	
	— 54		306,801		478,610
	281		2,689,933		4,196,292

Analysis shows that the net demand on the Pittsburgh district by the different iron-producing plants is approximately 35,000,000 tons of coke per year. In making this estimate the whole iron production for October, 1912, of the states of Pennsylvania, New York and northern Ohio and one-half that of the Chicago and the northern Lake district are taken into consideration. This total equals 40,485,212 tons of coke and from it must be subtracted 4,136,000 tons of coke manufactured in byproduct-coke ovens in Pennsylvania, New York and Ohio, and also 1,000,000 tons of hard coal used in iron smelting in eastern Pennsylvania.

Using the foregoing forecast as a basis and assuming that the pig-iron production tributary to the Pittsburgh coal field will be maintained at the same percentage to that of the whole production of the country, the life of the various subdistricts of coking coal may be stated approximately as follows: Connellsville basin, 15 years; Lower Connellsville or Klondike, 20 years; eastern Washington County, 25 years, it being assumed that one-half of this coal will be used for smelting iron ore and the other half used for gas making, steel melting and other purposes. The 175,000 acres in eastern Greene County will have a life of 40 years.

Merging all the acreage together the life of the coking coal in the Pittsburgh district based on a normal increase in the use of this coal in the iron and steel industry and as a domestic fuel to replace hard coal will be approximately 40 years. It may be assumed that the present type of ovens will be largely replaced by byproduct oven plants on the field and at the point of manufacture.

The Money Value of Coal Purity

The Pittsburgh coal field has been so largely operated and the coals from the different subdistricts tested that it is not only possible to determine approximately the number of tons of recoverable coal per acre but the value of the land can be calculated based on the number of heat units delivered per pound of coal. The purest gas coal is prepared for market with about 6 per cent. of noncombustible matter. The Panhandle coal as it leaves the tipple has 10 per cent. of noncombustible matter. The average difference in the ash of the two coals is therefore 4 per cent.

The average delivered cost of a ton of Pittsburgh coal, including freight rates, approximates $2.50. The lowest delivered cost in the Pittsburgh district is about $1.50 per ton. Coal shipped by way of the Great Lakes and into Canada and the West is delivered to the consumer at from $3.50 to $4.50 per ton; the average price, giving due weight to the tonnage, is approximately $2.50.

A difference of 4 per cent. in heat value on a basis of $2.50 delivered cost per ton shows a difference in delivered money value of 10c. per ton in favor of gas coal, and reduced to an acreage basis is equivalent to an excess value of between $800 and $900 an acre. As has been stated before, the gas coal merges gradually from the Pinhook anticlinal westward into Panhandle coal and there are points and locations immediately west of the gas-coal basin where the difference in value of heat units per pound of coal delivered would be much less than the average difference.

The value of any coal depends on the use to which it is put and the advantage of its use over other competitive coals in any special industry can be figured in cents per ton and therefore in dollars per acre of coal land. It has been stated by managers of illuminating-gas plants that the Pittsburgh gas-coal product has an ultimate excess value of 25 to 30c. per ton of coal over gas coals from other districts.

An Even Greater Premium on Purity When Ash Is Deleterious

The coking coal of the Pittsburgh seam in western Pennsylvania, because of physical and chemical properties, geographical location and freight rates, controls approximately 80 per cent. of the coke demand of the United States and Canada. Judge Gary, of the United States Steel Corporation, is credited with a public statement placing $2000 an acre as the value of coking coal from the Pittsburgh seam in western Pennsylvania. This checks up with a statement made to me by one of the Pig Iron Committee of a large steel corporation to the effect that a coke with the best physical structure containing 1 per cent. or less of sulphur is worth about 30c. a ton more in the manufacture of pig iron than a coke having a higher percentage of sulphur, for, in that event, additional coke and flux must be placed in the furnace in order to remove the surplus sulphur.

The Competition with Southern Illinois Coals

The geographical value of the Pittsburgh coking coal based on freight rates to distant markets has not been

fully grasped either by the steel companies or the public. For byproduct-coke making or gas making along the Great Lakes, at any point, it is possible to ship low-sulphur Pittsburgh coking coal to the lake front for a delivered freight cost placed on board vessel of 83c. a ton. The vessel rate from Lake Erie ports to any point on the Great Lakes ranges from 25 to 35c. a ton, making a total freight rate to Lake Superior points of $1.13 and to Lake Michigan points of $1.18 per ton.

The minimum railroad freight rate on coal from West Virginia and Kentucky to Chicago or Lake Michigan points is $1.90 per ton. A freight rate from southern Illinois based on about 3 mills per ton-mile would be $1.05 per ton to Gary, Ind. Coal shipped from the Pittsburgh coal field via lake to Lake Michigan points therefore shuts out all West Virginia and Kentucky coals by rail and can be put into the storage yard at the byproduct

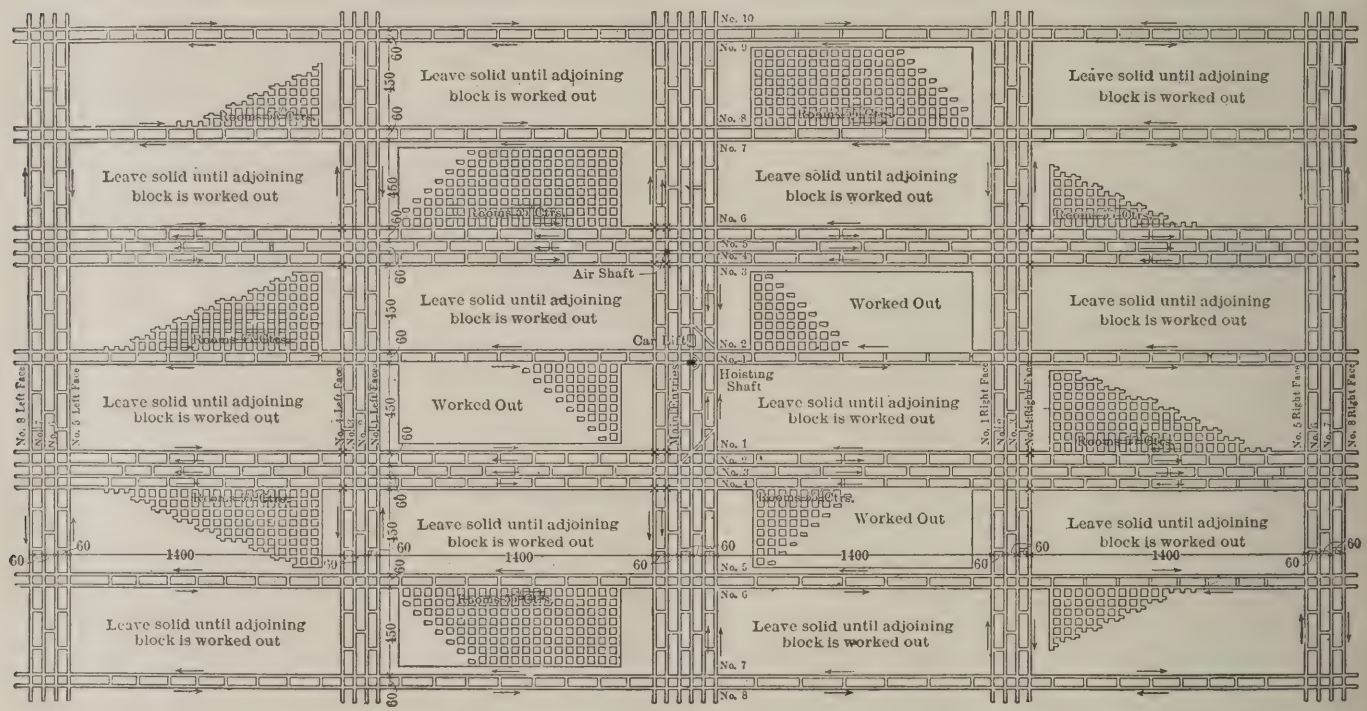

Fig. 4. Plan of Mining for Extraction of Coal by Mechanical Means

coke-oven plant in the Chicago district along the lake front (based on available carbon per unit of pig iron produced) at about an equal cost with southern Illinois coal.

According to a paper on Illinois coals,* the Franklin County coal contains from 18 to 21 per cent. of noncombustible matter as against the 6 to 7 per cent. found in Pittsburgh byproduct coal. I believe that recent developments indicate that these analyses of southern Illinois coals are too high in noncombustible matter, but taking this coal as now loaded into the railroad cars, 16 per cent. may be assumed as noncombustible matter, divided approximately into 9 per cent. ash and 7 per cent. water, or 10 per cent. ash and 6 per cent. water.

Freights Being Equal, Quality Will Determine the Issue

There would, of course, be certain losses in heat units in the coking of southern Illinois coal on account of the water that could not be charged to Pittsburgh coal, and excess sulphur in Illinois coal would also reduce the amount of available carbon per unit in the blast furnace. The foregoing facts when taken in connection with the superior coking qualities of Pittsburgh coking coal would indicate that southern Illinois coal for byproduct use in the Chicago district would not be as cheap ultimately as Pittsburgh coal shipped there by lake, based on equal cost of coal at the mines. A careful study of the situation indicates also that the pig-iron furnaces bordering on the Great Lakes, almost all the furnaces in northern and central Ohio, western Pennsylvania, furnaces in New York State, a large percentage of the furnaces in eastern Pennsylvania, and those in Canada will draw their fuel supply from the Pittsburgh coal field. As that industry increases in volume, the coal production will have to increase in the Pittsburgh coking-coal field and the life of the field will be shortened accordingly.

Wage-Scale Partition Line

The cost of mining is another factor governing the value of the coal and the length of life of the various areas of the Pittsburgh coal field (see Fig. 2).

The Union scale of wages divides the Pittsburgh field into two parts (known locally as the thin- and thick-vein mining-scale districts), the dividing line running from Port Royal on the Youghiogheny River west through Lock 4 on the Monongahela River, and extending still farther west through a point north of Bentleyville, Washington County. The coal north of this line has the thin-vein wage scale, which when reduced to a run-of-mine basis is 7c. per ton more than that obtaining south of this line. This, however, is not a true measure of the cost of mining coal in this district, as the natural conditions in various parts of the field modify the cost of extraction.

*Transactions of the American Institute of Mining Engineers, Vol. XL, p. 4 (1909).

The Pittsburgh Coal Co. made sworn statements before the Interstate Commerce Commission at Washington on the cost of mining 18,000,000 tons of coal from Apr. 1, 1910, to Aug. 31, 1911, as follows:

COST OF MINING PITTSBURGH COAL

	Production, Tons	Average Cost Mine-run Coal.*
Panhandle coal	8,174,880	$1.0434
Gas coal	5,070,600	0.9686
Thick-vein coal (coal south of wage-scale line)	5,052,887	0.9283

*Does not include interest or dividends.

Coal Land Worth $2000 per Acre

Because the tonnage is extremely large and covers a long period of time, and because the same accounting system was applied to the whole tonnage, and in like manner to each district, the statement is an accurate measure of the cost of mining Pittsburgh coal in the various subdistricts of the field, and for purposes of current operation places an accurate value on the land in the different districts. It will be seen that the fuel from the gas coal area in Fig. 2 was produced on board railroad cars for practically 7½c. per ton less than Panhandle coal. Reduced to an acreage basis this indicates that for current operating purposes gas coal costs $600 to $700 an acre less to mine than that classed as Panhandle. As a fuel for generating steam it has been noted before that it is actually worth, at a delivered cost price of $2.50 a ton, 10c. per ton more to the consumer, which makes its excess value above that of the average Panhandle coal about $1400 an acre, assuming that the consumer is willing to pay for the coal based on the heat units delivered.

The thick-vein coal was mined for 11½c. a ton less than the Panhandle fuel, or $1000 an acre. As a large part of this thick-vein coal is used for coke and gas manufacture, its value, based on delivered results, is almost equal to that placed on coking coal by Judge Gary, if we assume the average Panhandle coal as having a value between $200 and $300 per acre.

Profits Were Derived from Gas Coal

Another light may be thrown on the value of Pittsburgh coal lands by the sworn testimony of the Pittsburgh Coal Co. before the Interstate Commerce Commission involving the same period of time, by combining the foregoing statement with Comptroller Hornberger's Exhibit No. 5. That declaration before the court declares the average market value of all grades of run-of-mine coal at the mine for lake shipment during 1910 was $1.0708. If we assume that all three grades of coal were sold at the same prices, though the Panhandle coal is not of equal quality with the others, then the 8,174,800 tons of Panhandle coal earned the Pittsburgh Coal Co. $224,000 and the 10,123,487 tons of gas coal and thick-vein gas and coking coals earned this company approximately $1,338,000. But if the Panhandle coal secured only an inferior price, all the profits must have been made out of gas coal and the adjoining thick-vein gas and coking coal.

How the Freight Rate Aids

With all these accurate data in hand, it is easy to place relative values on the different parts of the Pittsburgh coal field. On comparing this district with those of West Virginia and Kentucky, we find that the excess freight rate now charged on coal from the Fairmont district in West Virginia to the lake front is 12c. per ton, and the same seam of coal is mined.

The charge for conveying coal from the Kanawha district and from West Virginia and Kentucky to the lake front is everywhere at least 19c. per ton higher than from this district. As compared with all-rail shipments as far west as Chicago, the freight rate on West Virginia and Kentucky coals lying nearest to Chicago is the same as the Pittsburgh rate, but by the way of the lake, the Pittsburgh field has an advantage of 12 to 19c. per ton over these coals, together with a higher market value based on delivered results.

The movement toward freight-rate adjustment will add additional value to the Pittsburgh coal field in western Pennsylvania. The certain failure of the railroads should they attempt to override the geographical disadvantage is illustrated by the misfortunes of the Cincinnati, Hamilton & Dayton R.R. when it sought to haul coal to the lake front for approximately 2 mills per ton-mile, as compared with the 5 mills paid by Pittsburgh coal.

It is reasonable to believe that changes in freight rates from the Pittsburgh district will be reductions, and that advances will be made in the tariffs from southern West Virginia and Kentucky, in order to maintain the solvency of the railroads which carry the coal. The Interstate Commerce Commission will find it necessary to fix the freight rates more nearly on the basis of cost of transportation, in order to maintain the solvency of the railroads themselves and to conserve the natural resources

Fig. 5. Advancing Plan

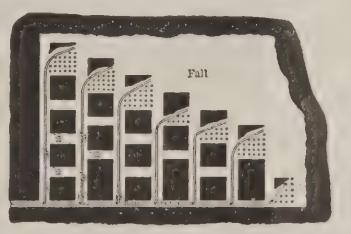

Fig. 6. Retreating Plan

of the country; all of which will tend to conserve the Pittsburgh coal field and probably extend its life over the estimates made.

The Poor Mining Methods of the Past

It may be stated that the Pittsburgh coal areas already worked over have up to the present only shown a recovery of 60 to 65 per cent. of the coal in the ground, though the Connellsville field has shown a better conservation.

In the old days of mining only the breast coal was saved and only cheaply extracted portions of this bench were hauled to the tipple. In recent years the more modern operations in the Pittsburgh district have adopted systems of extraction which permit a recovery of 85 per cent. and in some cases 90 per cent. is secured, but this percentage of recovery only represents the work of the last few years and only a portion of the district.

The Railroads Tried to Handicap Competing Districts

The destruction of the Pittsburgh coal seam in past mining operations in this district was made necessary by the fact that the railroads placed an extremely high freight rate on coal shipped, in order to divide the market with Southern railroads. The result

was that with nonunion labor and extremely high freight rates per ton-mile from the Pittsburgh district, and extremely low freight rates from West Virginia and Kentucky, it has been possible for operators in the Southern fields, to a limited extent, to enter markets which naturally belong to the Pittsburgh coal field.

It is obvious that it is bad public policy to permit the issue of railroad securities for transportation equipment, the effect of which is to destroy natural resources in the Appalachian coal fields, in order to secure an unnatural coal market for a distant coal field, and to increase the gross business of a railroad at no profit to the stockholders. As stated before, the present condition of the Cincinnati, Hamilton & Dayton R.R. illustrates the fallacy of this policy. The resources of the Pittsburgh coal field and those of the United States cannot be conserved unless the cost of service on railroads is a measure of freight rate. With gradual adjustments made in freight rates to cure this evil it may be assumed, basing our conclusions on present mining practices, that 90 to 94 per cent. of the Pittsburgh coal measures may be recovered.

The Connellsville field proper, under the supervision of Thomas Lynch, president of the H. C. Frick Coke Co., has employed methods in mining which are the most efficient in the United States. The recovery of coal in the Connellsville field through the system established by Mr. Lynch is about 93 to 94 per cent. The operations in this field from the standpoint of percentage of recovery, safety measures provided for guarding against death and accidents to miners, and improved living conditions around the mines, are an example for all coal-mining operations of the country. If the remainder of the Pittsburgh coal field, through adjustment in freight rates and mining costs, would adopt a modified system of the Connellsville plan of extraction, the life of the Pittsburgh coal field would be increased materially and the wealth of the district proportionately.

The Anticipated Improvement of Mining Systems

I have in a period of 10 or 15 years developed a system of mechanical mining to be applied to a modified system of extraction as practiced in the Connellsville field by the H. C. Frick Coke Co. (Figs. 4 to 5). After spending much time and money in this period of time, machines and methods were produced which have apparently reached a stage of perfection. Several of these machines have operated continuously for many months in the Pittsburgh coal field with small repairs and without any delays in operation. The results are so convincing that it can be announced without reservation that mechanical mining is established and that by means of machines now perfected and operating daily, and by adopting the modified plan of extraction equivalent to the methods in the Connellsville field, these results may be secured:

1. That 90 to 95 per cent. of the coal measure may be recovered mechanically.

2. That the cost of mining in thick seams averaging over 5 ft. will be reduced from one-third to one-half.

3. That one man operating the new machine, and using the methods now perfected and working, will be able to produce as much coal as four to six men produce under the present methods by the use of the existing machinery.

With all this in view the future of the Pittsburgh coal field is extremely bright and the wealth of the district is increased largely. It may be stated that the present beehive ovens or open ovens of the district will be used to exhaust areas of coal lands adjacent, but that future coke plants supplying the iron and steel industry tributary to this coal field will, to a large extent, be the retort type of oven with byproduct recovery. Some of these plants will be placed at the point where the iron and steel are manufactured and other plants will be placed in the coal field.

Why Most of the Pittsburgh Coal Will Be Coked in the District

The Pittsburgh district will face in a few years the total exhaustion of natural gas, or at least a large reduction in the supply. There are established throughout the district, and crossing the coal field, many large pipe lines which are now used as natural-gas mains. It is obvious that these mains may be used for piping retort-oven gas to various industries for industrial purposes and to the cities for domestic use. It is also obvious, since the anthracite field has approximately reached its peak of production, that small coke made at byproduct ovens will be used more and more to replace hard coal west of a line north and south running through Buffalo.

It is my opinion that the majority of the retort-oven plants will be placed in the coal field as the pipe lines are already established and as byproducts such as tar, ammonia and benzol may be shipped from the Pittsburgh district with as much economy as from practically any other point. Freight rates throughout the country have been established so that the cost of transporting a ton of coke to market from the Pittsburgh district is about equivalent to transporting 1½ tons of coal. This makes it possible to ship coke to the various points as cheaply as the coal necessary to make a ton of coke, so that there is no transportation advantage in shipping coal to a distant point to make byproduct coke.

The modern construction of railroad-coke equipment has reached a stage that enables the railroads now to haul a train of coke as cheaply as a train of coal of the same weight, the difference, if any, being slight. The tendency, therefore, will be to adjust coke freight rates on the basis of cost of transportation, which will be in favor of establishing coke plants in the Pittsburgh coal field.

With this adjustment in view, it would be more profitable to establish the byproduct-coke plants in the coal field, especially if the gas could be sold to the pipe lines now established. Or if the railroad lines are largely equipped for electric traction, it may be that it will pay to put the byproduct-coke plants in the coal field and by the installation of gas engines at the coke plants generate electric power which can be transmitted and sold to the railroads at low prices. The question of where to establish the byproduct-coke plant will be given an answer depending largely on whether the owner of the coke plant uses his own products or manufactures for the general market. It would seem, however, that a commercial coke plant would have a larger sale both for gas and coke if established in the Pittsburgh coal field than if placed elsewhere, as the established freight rates on coke would allow shipments to any point now available, and the local market for gas would absorb at fair prices the surplus gas of the plant.

The Labor Situation

SYNOPSIS—The orders of the War Office to the operators in Colorado reflect the probable action of the government in that state and in Arkansas. Troops have been dispatched to Hartford, Ark., to support the U. S. Circuit Court. In eastern Ohio the situation is unchanged.

It is important to operators everywhere to know just what action the government will take in mine disputes. Both Roosevelt and Wilson have been disposed to stretch the Presidential authority in the most autocratic fashion, and the War Office orders we now print will convince our readers that the editorial entitled "The Mailed Fist," in our issue of Aug. 29, was well justified.

Forbidding the Employment of New Men

Headquarters U. S. Forces,
Louisville, Colo., May 19, 1914.

Official in Charge,
Baum Mine.

Sir:

In view of conditions in this district, it is considered very undesirable, under existing conditions, to introduce any new labor into this district, or open up any mines which were not running just prior to the arrival of the federal troops in the Boulder-Louisville mining district.

New men entering the district should not be given employment, as such action would not be complying with the President's proclamation requiring all "to retire to their respective abodes."

Our first duty here is to enforce obedience to the law and restore conditions of peace and good order. In doing this, we are not justified in allowing new men to come into the district until conditions assume a more normal aspect and something approaching a settled condition has prevailed for a sufficient length of time to make it wise to do so.

You will therefore communicate this information to the proper officials of your mine.

Very respectfully,
CHAS. J. SYMMOND,
Major 12th U. S. Cavalry,
Commanding U. S. Forces.

War Office Eases Rule in Favor of Unsolicited Labor

Camp of U. S. Troops,
Frederick, Weld County, Colo., May 29, 1914.

The Official in Charge,
Baum Mine.

Sir:

In case of unsolicited applications for employment at your mine by men desiring to fill vacancies existing, caused by men voluntarily leaving, the employment of these men, under the conditions mentioned, will be approved, unless some special reason is known not to do so.

Men so employed must be promptly entered on the daily report, and in case their employment is not approved, notification will be sent you at once.

Very respectfully,
H. J. McKENNEY,
Captain 12th U. S. Cavalry,
Commanding Frederick District.

The War Office Requires All "Recently Hired" Men Not Citizens Be Discharged

Headquarters U. S. Forces,
Boulder-Louisville District, Aug. 17, 1914.

From: The Commanding Officer.
To: Baum-Consolidated Coal & Coke Co.
Subject: Employment of labor.

In compliance with instructions from the War Department, dated Aug. 14, 1914, the following regulations on the employment of labor will be enforced in this district. Laborers recently hired who do not conform to these regulations will be discharged:

1. Miners must seek work at the mines.
2. Miners must not be gathered and brought in by operators.
3. Miners must be citizens of the state of Colorado.
4. Miners must have complied with the laws of Colorado which relate to miners.

J. WATERMAN,
Lieut.-Col., 12th Cavalry,
Commanding U. S. Forces.

A Request for an Explanation

Aug. 19, 1914.

Capt. H. J. McKinney,
Troop I, 12th Cavalry, U. S. Army.

Dear Sir:

In order to obtain a clearer understanding of the last labor regulations you have issued, dated Aug. 17, 1914, we would like to have your decision upon the meaning of several things therein that are not now quite plain to us.

Does this regulation apply to merely "miners," as it states, or to all employees about a coal mine? A miner, as understood by us, is the actual coal digger—the man who shoots and loads the coal at the working face. This is generally so understood in all coal-mining practice.

I wish particularly to inquire, in this regard, what we are expected to do about the skilled labor, or craftsmen, who are so necessary to the operation of this mine and its machinery, and who, as a class, almost never apply at the mine in person for employment. This would include the following men: Mining engineers, draftsmen, helpers; office and supply clerks; master mechanics and electricians; shopmen—skilled laborers, such as blacksmiths and carpenters; hoisting engineers; firemen; foremen and bosses; certificate men—such as pit boss, firebosses, shot inspectors, etc., who are required by state law, and must have a state certificate of competency; pumpers and pipemen; weigh bosses, employed by the railroad weighing association; machine runners (skilled labor).

In regard to article 3, which requires that "miners be citizens of the state of Colorado," I beg to state to you that, if interpreted literally, it will practically close down this property. About 5 per cent. of our usual winter's operating force are Colorado citizens, and only about 20 per cent. citizens of the United States. Even restricting the employing of applicants to those who are **residents** of this state will more seriously handicap the operation of this mine than any of the regulations heretofore required.

Our intention is at all times to exactly comply with all rules and desires of the War Department regarding us. We are not evading these rules now, nor will we under any circumstances, even if we are seriously curtailed in our normal output this winter over what we have enjoyed for the last several years.

Therefore, we ask particularly about these points that we do not at present thoroughly understand.

Yours very truly,
C. W. SMITT,
Mine Superintendent.

The War Office Again Backs Down, But Is Still Unreasonable

Headquarters U. S. Troops,
Boulder and Louisville District.
Date, Aug. 22, 1914.

From: The Commanding Officer.
To: Baum.
Subject: Employment of labor.

In conformity with further instructions received from the War Department, dated Aug. 20, 1914, the following modifications are made in the circular letter to the mines, dated Aug. 17, 1914:

1. The word "miners" as used in the circular letter is construed to mean all employees of the mines.
2. Mines may retain all employees on their rolls Aug. 23, 1914, if employment complied with 1 and 2 of circular letter of Aug. 17, 1914.
3. One year's residence in the state of Colorado will be required of all employees hired after Aug. 23, 1914. Citizenship will not be required.

J. MALINE,
Lieut.-Col., 12th Cavalry,
Commanding U. S. Forces.

What Will Happen if Troops Retire

The miners seem to have made up their minds to resist the militia should it take the place of the U. S. troops and perhaps prospects of certain bloodshed following a withdrawal of his forces has made the President halt in his plans. J. F. Welborn states that:

At a meeting at Trinidad, Oct. 28, two organizers advised the men that it had been decided to drill the strikers and get ready for the militia. Within the last ten days an officer of the United Mine Workers of America, who is one of the leaders in the Trinidad district, stated in effect to a federal army officer that as soon as the federal troops are withdrawn the strikers will attack the state militia if recalled into the field, and will also destroy the property of the mining companies. He stated that in preparation for such an event union men in the neighboring states to the number of 3000 have been organized, drilled and armed and are in readiness to move when called on.

Is the Militia Entering the Coal Field?

On the other hand the U. M. W. of A. officials declare that armed militiamen are entering the mining district so as to be ready to protect the lives, liberties and property of the operators should the U. S. army be removed. But the officials do not so word their declaration. A message, stating that 14 militiamen in charge of Dr. Curry of the Victor-American Fuel Co., had been introduced into the coal field and condemning their intrusion as intended to incite trouble, was sent to the President on Oct. 21 by F. J. Hayes, J. R. Lawson, J. McLennan and E. L. Doyle, the policy committee of the strikers.

Mine Closed Down

The troops are still interfering with operation. The Jeffryes' mine at Starkville was shut down, according to one report, by U. S. troops because it had been opened without permission. A sergeant of the U. S. Army ordered the mine closed. Jeffryes refused and the sergeant returned to camp for four troopers and returning compelled the closing of the mine. The operation is run by the Jeffrye Coal & Mining Co. Our records show that the corporation produced 18,394 tons in 1910 and 24,214 tons in 1911 corresponding to daily tonnages of about 90 and 120 tons respectively. The government will soon interfere if John Smith, groceryman, hires a new clerk.

The Activities of the Militia on Behalf of Union

"Muckie" McDonald, the president of the Butte Mine Workers' Union; Joseph Bradley, the vice-president; Thomas S. Coyle and Mrs. Florence Gillis have been arrested. The first two are charged with deporting a miner, Edward O'Brien. The others were held pending investigation. McDonald is discovering that deportation of a union man is a crime of first magnitude in Montana, whereas in Colorado it is hard to secure conviction of a man for wilful murder, so uncertain is the administration of justice in union-ridden states. Still, McDonald may take comfort as he has been apparently mixed in even less creditable ventures than the one which is directly the cause of his arrest, namely, the seizing of 37 Federation men at the shaft mouth.

Sheriff Timothy Driscoll and Mayor Lewis J. Duncan have been found guilty of neglect in connection with the Butte riots by Judge Roy E. Ayres, of the district court. This is the sad fate of these socialist authorities. However, Butte still has a socialist in control, Clarence A. Smith, the president of the city council.

The Arkansas Situation

It will be remembered that on Apr. 4, the Bache-Denman mines commenced to operate on the "open shop" basis. There was constant disorder, as Arkansas is a strong union state. The company got an injunction from Frank Youmans, the U. S. district attorney, prohibiting interference with the operation of the mines. Franklin Bache was later appointed receiver. On July 17 and following days, when the mines were still under the authority of the court, the guards and miners were driven away, the tipples of five mines were burned, and two employees of the company were killed and their bodies cremated.

Judge Youmans asked for the assistance of the U. S. War Department. Until recently, the government has apparently been actively interfering with order, having required, it is said, the discharge of U. S. marshals, who before the burning of the tipples were guarding the property under the authority of the court. However, Lindley M. Garrison, Secretary of War and President pro tem, in the absence of Woodrow Wilson, issued an order for four companies of the Fifth Infantry to proceed from Fort Sheridan, Ill., to Fort Smith, Ark., to enforce the orders of the federal court. The commandant is Maj. Nathaniel F. McClure. Four miners have surrendered to the federal forces and perfect order prevails.

The Secretary of War says, relative to this action:

We have reached the conclusion that it is impracticable to enforce the law and the orders of the United States Court in Arkansas by any other means. The court had appointed a receiver for the coal mines; the mines had been blown up and the men who had been arrested charged with the crime had been forcibly released from the custody of the U. S. marshal by their friends. The U. S. court had been unable to enforce its processes.

The troops will not undertake to serve any processes; they will confine themselves to making it possible for the civil officers to perform their functions.

Immediate Reason for Action

On Oct. 28 members of a mob fired on two U. S. deputy marshals and on nonunion employees of Prairie Creek Mine No. 3, and burned eight unoccupied houses belonging to the Bache-Denman Coal Co. On the 31st they took government prisoners from Deputy Marshal Black. On the 5th of November six more houses were burned including a boarding house which had been designated as headquarters for the officers of the U. S. Cavalry force on its way to enforce the orders of the U. S. court.

It is said that the United States has not taken action since 1894 except on request of state authorities. At that time troops were sent by Grover Cleveland to Chicago to prevent the interference with U. S. mails and interstate commerce.

The Eastern Ohio Strike

No change is perceptible in eastern Ohio. Much political capital was made by Republicans out of the Mine-Run Law. The Democrats were urging its passage as a reason for continuing them in office. The Republicans urge that the bill was framed without any intention of ousting screens, showing that under its provisions the miners could still receive a lower price for slack than for lump coal; so low, in fact, might be the price paid for slack that the law would be practically inoperative. One of the propositions of the operators, it will be remembered, was to pay 2c. per ton for slack and 99c. for lump coal.

The case of the Rail and River Coal Co. against the Industrial Commission of Ohio, regarding the constitutionality of the Mine-Run Law is set for Nov. 30. Assistant Attorney-General Laylin filed a motion to dismiss the case. Chief Justice White announced the dismissal on Oct. 26 but finally granted an order for an argument of the case as stated Nov. 30.

Kentucky Workmen's Compensation Law

The validity of the Workmen's Compensation Law of Kentucky, enacted by the last legislature, was recently threshed out in court for the first time at Frankfort. It was argued that the law makes the administering board a judicial body, that it takes away the due process of law by practically coercing employers and employees into an agreement to arbitrate; that it does not allow sufficient compensation, and that it undertakes to bind the administrators of persons killed in industrial accidents as to the amount of recovery.

All these contentions are denied by the state, which maintains that the board has powers of arbitration only, and that the law applies only to those who elect to accept its terms; that the benefits stipulated are greatly in excess of the average amounts recovered in suits, and that a majority of industrial accidents are of a nature to deny recovery in the courts. The provision relating to administrators does not involve the validity of the law, it is declared, and may be left until some administrator brings suit under it.

The case was argued before Judge Stout, and an appeal will be taken from his opinion to the court of appeals, which will rule finally as to the constitutionality of the law. The compensation provisions become effective on the first of the year.

Illinois Problems

The three coal operators' associations in Illinois, known respectively as the Illinois Coal Operators' Association, the Central Illinois Coal Operators' Association and the Fifth and Ninth districts organization, agreed in the spring with the miners that they would appoint conjointly an arbitrator who would represent them. Edwin T. Bent, of Chicago, has met with the approval of the Illinois Coal Operators' Association and that of the coal operators of the Fifth and Ninth districts. Those in the Central Illinois Association refuse to indorse him, preferring George Wood, of the Chicago-Springfield Coal Co.

The Illinois Mine Workers have chosen John H. Davis, of Herrin, Ill., vice-president of the Seventh Subdistrict, as their representative on the arbitration board, and it is the intention of both parties to arbitrate under the agreement ignoring the Central Illinois operators, who will settle their difficulties in the old manner through the subdistrict and state executive boards.

Articles for Next Week

The Nov. 21 issue of COAL AGE will contain a number of articles sure to be of interest to all our readers. First there will be a detailed description of the new Loomis colliery just being completed by the Delaware, Lackawanna & Western R.R. Co. at Nanticoke, Penn. This plant is the last word in anthracite construction. Several articles intended for this week's paper were crowded out and will appear next week. One of these describes "A Modern English Mine-Rescue Station." A second article deals with the subject "Coal Waste in Mining Plants." Other articles will describe "A New Briquetting Plant," "Colliery Lubrication" and "Machine Mining in Pitching Seams."

Extracts from a Superintendent's Diary

Every payday we are reminded that we are not entirely separated from the outside world.

Early in the morning, collectors from near-by cities begin to arrive and throughout the day they wind about the streets of our village interviewing their clients wherever they chance upon them.

Installment furniture men, crayon-portrait solicitors, sewing-machine agents, phonograph agents, mail-order tailors, piano and organ demonstrators, all are present.

Time was when I looked upon solicitors of this class as parasites, and on more than one occasion, I have heaped insult upon some of them and then worked myself into a fury because they refused to be drawn into argument.

I first began to see things in a different light several years ago. We had a widow living in the camp who supported herself and a young daughter principally by taking in washing. Now the washing industry, like all other industries, strange though it may seem, has periods of depression, and it was during one of these hard-time periods (the miners of the camp were only working half time, and most of their women folk were counting their nickels and the dimes pretty closely) that the widow's financial affairs got beyond her control. I was appealed to and found that the straw that seemed to have broken the camel's back was a phonograph bought on the weekly installment plan.

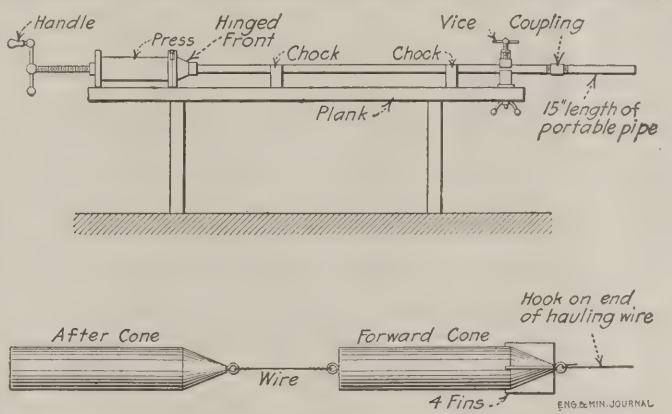
I paid a visit to the phonograph salesroom and proceeded to tell the manager what I thought about him and his business methods. The widow had paid in one-third of the price of the instrument and the dealer agreed to take back the phonograph and cancel the obligation. Then to encourage the widow, I gave her a check equal to the amount she had already paid on the phonograph.

The lady who had first mentioned the widow's plight to me assured me that this would enable the widow to reestablish herself on a self-supporting basis.

But it transpired that my lady informant and I reckoned without full knowledge of the hankerings and aspirations of the widow in question.

What did the widow do but go to the phonograph company and pay them the check that I had made out to her. This payment with the amount previously paid in installments left only a balance due on the phonograph of one-third of the purchase price. They agreed to give her as much time as she might desire on this balance.

I decided then and there that phonographs meant more to some people than I had imagined, and a little investigation convinced me that in many cases things bought on the installment plan, although often purchased at outrageously high prices, brought cheer and pleasure, which far outweighed their purchase price, even measured in terms of sacrifice and self-denial.



And now as I look back at my arbitrary high-handed rulings in the past in dealing with the installment men, I fail to find justification for my actions, even admitting that the purchasers could have gotten along without the things purchased.

Its pretty easy to justify offhand most any action taken on behalf of the weak and lowly, because the argument is always based on a lot of assumptions that we consider self-evident. They are self-evident only because we do not take the trouble to investigate closely. And it is quite possible that many of the misunderstandings around our diggings, and other people's diggings as well, could be traced back to ill-advised interference with everyday affairs of the humble, on the part of well meaning higher-ups.

Lining Pipe with Cement

Cement-lined wrought-iron pipes, because of their freedom from interior corrosion and stoppage, have been used for water service to some extent for many years. Recently, a company has been organized in Boston to line pipe on order, either taking pipe supplied to it or furnishing the pipe itself. This fact is of interest on account of the possible application of the cement-lined pipe to mine uses. The procedure in lining the pipe is described in *Engineering News,* Oct. 8, as follows:

A screw-piston press, 5 in. in diameter and about 18 in. long, mounted on one end of an 18-ft. plank, is used to force the mortar into the pipe. The forward head of the press cylinder is hinged to swing open; it has a central hole threaded for 2-in. pipe (other sizes are accommodated by use of bushings). The cylinder head is swung

Apparatus Used in Lining Pipes

open, the cylinder filled with mortar, and the head closed and locked. The pipe to be lined is then screwed into the hole in the cylinder head. By forcing the piston ahead, the cement is then shoved out into the pipe. After this the pipe is unscrewed and moved along into a vise at the front end of the plank. A coupling is set up on the forward end, with a portable length of pipe about 15 in. long screwed into it as far as another pipe would be fitted, usually about six threads; this keeps the threads clear of mortar for connecting one length of pipe to another.

A stiff wire is now pushed through the cement in the pipe, from the front end, and a pair of tapered mandrels pulled through the pipe by means of this wire, to core out the bore of the pipe. The mandrels are short lengths of brass pipe with tapered front end, fastened together by a loose wire. The outside diameter of the mandrels is ¼ in. less than the inside diameter of the pipe. The forward mandrel has four longitudinal fins, at 90° intervals, to center it in the pipe, while the rear mandrel is smooth and, following through the bore made by the first mandrel, finishes it to shape and surface. The result is a smooth ⅛-in. lining of cement mortar.

After inspection, the pipe is laid away for the mortar to harden. The short length of pipe at the point is unscrewed, but the coupling is left on. All tees, elbows and other fittings are also lined with cement mortar, giving a smooth and continuous interior surface.

Editorials

Alaska

The Mine Inspector for the Territory of Alaska in a recent report dismisses coal mining in that section of the United States in a few brief words. His reference is necessarily as short as one which might have been penned by a British governor relative to the iron industry in the American colonies when his Britannic majesty was disposed to believe that dependencies should not enter the mechanic industries and should be discouraged. He says:

> Coal mining has not received much attention. Two groups of claims were patented and operations begun on them. About 1600 tons of lignite coal was shipped from the Whorf property near Seldovia, on Cook Inlet. Much of the coal brought $4 per ton f.o.b. the mine, though some was delivered at Seward at that figure.

He goes on to tell about the expedition of the Bureau of Mines and its exploratory work and says:

> A small quantity of lignite was mined near Candle and Wainwright for local use, and patents were issued on claims in the Cook Inlet field and on Admiralty Island.

That is the summary of the coal production of the great coal districts of Alaska in the year of grace 1913. It sometimes seems as if Russia would have done better work in developing the Alaska coal than has the U. S. Government if she had only retained her American possession. The only real coal mine is at Seldovia. It mines 5 tons per day, the stint of one red-blooded man, and this mine was opened by the Russians years ago before the United States obtained Alaska.

The same inspector who thus reports a contemptible coal industry gives page after page of information on the gold, silver and copper outputs and mines. Ten thousand tons of copper came from the territory of Alaska in 1913 and only about 1600 tons of coal.

We cannot see why the general public believes gold and silver prospectors should be encouraged and coal miners harried and plundered at every available opportunity. For coal is power; it lightens burdens and gives warmth to all, whereas gold and silver are but the symbols of real things and the world would be almost as rich had men possessed neither.

American Coal and the War

The European war has changed the coal business at San Francisco from one of the most prosaic of trades to one of the most romantic. For several months past English and German cruisers have played hide-and-seek up and down the Pacific coast, just outside the three-mile limit in making efforts to capture merchant vessels of the opposite nationality engaged in the trans-Pacific trade. Numerous hairbreadth escapes have occurred on the part of the harassed merchantmen, and but few captures have been effected.

The problem of coaling has been a strenuous one for the German war vessels thus far and all sorts of strategic methods have been tried.

The steamer "Mazatlan" was held in San Francisco under suspicion of attempting to violate the neutrality regulations for some time before being allowed to sail for Mexico with coal. It has been claimed by interested parties that this coal was finally lightered out to a German war vessel after being delivered in Mexico and the case is still being threshed out by U. S. Government authorities.

A more celebrated case, however, is that of the steamer "Sacramento," formerly the Kosmos liner "Alexandria," a German steamer, which had been interned at San Francisco for several weeks, in company with its sister ship, the "Serapis." The North & South Steamship Co. was formed in San Francisco by local parties who purchased the "Alexandria" and registered it as the "Sacramento" and raised the American flag. A cargo of coal was loaded for South America, ostensibly for the use of an electric lighting plant. Rumors were started that the cargo was intended for German warships off the coast and much delay resulted, the vessel being kept under surveillance while protests were passed back and forth between San Francisco and Washington. Finally, the "Sacramento" was permitted to leave port and it is now well on its way to its destination, if it has not been captured by some British war vessel. In case of such capture, an international case of the highest importance will be developed.

The real danger to American trade lies in the fact that if German vessels are allowed to sail in this manner, and warships are coaled, the British are sure to raise the rates of war-risk insurance to a point that will seriously hamper our efforts to build up a merchant marine. It is reported on good authority that steps appear to have been taken already looking in this direction.

Panama Canal and American Coal Trade

One of the most important recent changes affecting the American coal trade is the impetus added to the shipping of American coal from the Atlantic coast to San Francisco and other Pacific ports through the opening of the Panama Canal. Heretofore the greater part of the coal that came around the Horn constituted shipments of steam coal for the United States Government for the use of the navy, and practically all of that was carried by foreign bottoms.

Now that the opening of the Panama Canal and the granting of American registry to foreign vessels is permitting a material increase in the United States merchant marine, a number of new steamer lines are sending scores of vessels via the Panama route to the Atlantic ports laden with lumber, dried fruits, canned fruits and a variety of Pacific coast products. These vessels must have return cargoes in order to operate successfully, and coal has already become a very important item in their westbound cargoes.

The Sudden & Christenson Steamship Line, which has six steamers engaged in the intercoastal-traffic, has already delivered several cargoes of coal at Pacific ports

and has more on the way. Other lines are seeking to build up a similar traffic. This Eastern coal trade will come into direct competition with the Australian bituminous coal, which has for many years been a favorable fuel for domestic use in San Francisco.

One difficulty Eastern producers of high-grade coal will have to face is the task of educating San Franciscans up to paying more for this American coal than they do for the Australian product. However, in the matter of price, some of the Alabama coal should be able to compete successfully with the foreign product.

In most parts of the Pacific coast, oil predominates as fuel. However, the coal trade is not inconsiderable even now and is certainly increasing. California is not a coal-producing state, although there are mines at Stone Cañon, Monterey County, which might produce a fair grade of fuel. Just at the present time, these mines are not operating, owing to difficulties in getting the coal to market, and also because of recent numerous fires in the mines.

In California there is probably 50,000 tons of Eastern bituminous coal used each year. This tonnage is now being brought by way of the Panama Canal, and because of the reduced freight rate is selling at $3 per ton under former prices.

As a further stimulus to the coal trade, it is predicted that the United States Government, in order to attract business to the Panama Canal in competition with the Suez route, will establish coaling stations in the Canal zone, which will enable steamers passing through the canal to replenish their coal supplies at this point. An article covering this subject will be published in COAL AGE about Nov. 28.

Proper Mining Laws

No matter is more vital to the coal industry than action tending to the passage of sensible, comprehensive mining laws. The industry should be carefully and completely regulated. It is not a business that can be ruled at random. The hazards are great. However, legislation can be enacted that will govern and yet not stifle progress. We can rule in the interest of safety and efficiency and still encourage the mine owner to broaden and develop his operations.

We therefore call particular attention to the discussion now starting on p. 798, and we sincerely trust that every coal man who can spare a few minutes' time will write us his views so that every phase of the subject will be brought to light. We need uniform laws—not legislation that handicaps one operator and benefits his competitor in another field. We also need laws that can be enforced; therefore they must be based on experience and a complete understanding of the economic and physical difficulties surrounding mining.

The folly of the coal industry has been the policy of its units to act independently. Individual initiative is all right, but beyond a certain point results can be attained only by united effort.

How can the industry, in your eyes, be benefited? How can the safety of men and property be advanced? How can coal supplies be conserved and efficiency of operation be insured? What laws are foolish, unfair or impossible? What and where is the remedy? How can we put the industry on a conservatively profitable basis?

When we have published a sufficient number of answers to these questions, COAL AGE will try and see that lawmakers in all coal states receive a copy of the correlated views of its readers.

A State of War and Yet No War

The correspondence in relation to the Colorado strike conditions published in this issue shows the undesirability of absentee control and the lack of knowledge of the situation in Colorado on the part of the President's cabinet. First, no man may be employed, then none but those who come unsolicited and to replace those not discharged, then none but citizens, and finally none but residents. The only consistent element in the rulings was the desire to hamper operations and help the union as far as possible without outraging public sentiment.

The President thinks it unreasonable to keep troops in Colorado indefinitely. The operators may well think it equally unreasonable for him to hedge their business operations with restrictions for such an extended period of time. In every case of martial interference with private business, coercion should be removed first, the troops much later. If coercion and offenses against liberty continue up to the end of the occupation, how can conditions be normal when the force is withdrawn?

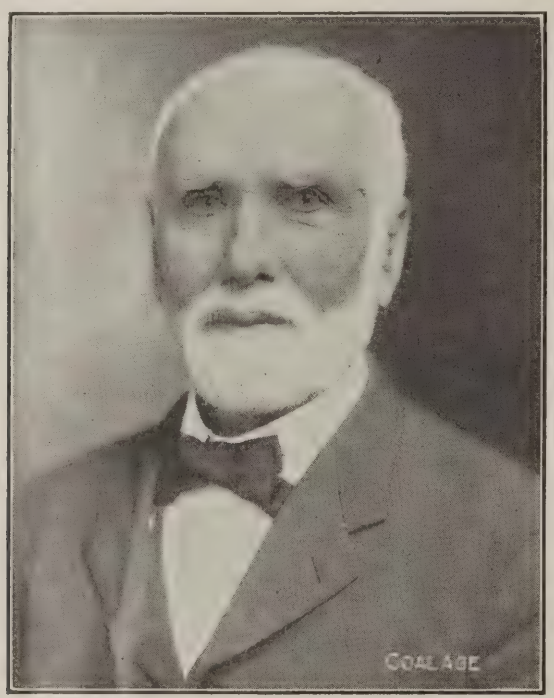
If operators cannot be allowed to hire men because a state of war exists making this inadvisable, how can the time have arrived for excusing the President in declaring that the war has come to an end and justifying him in the removal of troops?

British Face Difficulties

The supply of pit-props in Great Britain is fast disappearing. This is one effect the present war is having on coal mining in England and Wales. There is very little timber available in Great Britain for use as mine supports, and the supplies from Russia and other countries are greatly curtailed.

The question seems to be as to what material shall be substituted for wood. One company in meeting the situation has purchased a quantity of second-hand metal tubes. Some of these measuring 5 ft. long and 3½ in. in diameter were built into novel props. At the top and bottom there was a tapered plug which fitted tightly inside the tube; between these two plugs, coal dust and sawdust were inserted and compressed. The resulting prop was less rigid and would bear weight without buckling.

Truly, war creates necessity and necessity fosters invention.



It is no surprise to us that the voters of Ohio have signified their impatience with the high-handed methods of the retiring administration in that state. Certainly the issue was closely contested. But this was only to be expected when one remembers the spectacular appeal for the labor vote which Governor Cox made at the sacrifice of every other consideration. It is particularly gratifying, in the face of such a desperate effort, to note that the conservative element of the population still predominates. In the years to come, when the people of Ohio look back upon the record of the coal industry for 1914, this alone will be sufficient explanation for the present change in administration.

Who's Who in Coal Mining

Robert Lee

One of the pioneers of the coal industry of the Middle West is Robert Lee, of Rock Island, Ill. He was born in the County of Durham, England, July, 1834, and came to the United States with his parents when 14 years of age. The Lees settled first in Pittsburgh, later moving to Washington County, Penn., where they resided until the fall of 1851. In this latter year the family moved to Hawesville, Ky., a town on the lower Ohio River.

While in Kentucky, the elder Lee purchased a farm in Perry County, Ind. However, young Robert Lee had secured work in the coal mines near Hawesville, and continued in this employment after his father and the rest of

Robert Lee

the family had gone to Indiana to live on their farm. In August, 1856, Robert Lee married, and after spending a short time at his father's home in Indiana, left for Rock Island, Ill., where he secured employment with the Coal Valley Mining Co., being the first miner engaged to work for this newly organized corporation.

Mr. Lee continued in the employ of the Coal Valley Co. as a miner and tracklayer until the fall of 1861, when this same company proposed to him that he take a lease from them to open up a mine for the local trade. He accepted this proposition, signing a five-year lease, with the privilege of a three-year extension.

Shortly after Mr. Lee had opened up this new mine and put it on a producing basis, the Coal Valley Mining Co. offered him the superintendency of their railroad mines. He accepted this position, which change in his employment necessitated his turning over the management of the local mine to a partner, whom he had taken into his business some time previous.

In 1865, Mr. Lee, in conjunction with his partner, purchased the property and stock of a general store in the town of Coal Valley. This business was managed by hired employees, under the firm name of Lee & Bardsley. In October, 1869, Mr. Lee left the employ of the Coal Valley Co. to engage in the active management of his mercantile business. The following year he purchased his partner's interest in their commercial venture and devoted his full time to merchandizing. In 1875, his health failing because of too close confinement to business, he advertised for sale all of his store properties and stock of goods.

Officials of the Coal Valley Mining Co., in August, 1875, proposed to Mr. Lee that he locate and purchase a new coal field for their company in Mercer County. This work he accomplished, and in 1876 his employers built the Rock Island & Mercer County R.R., a branch line 26 miles long and extending to Cable. In 1894, this line was built on to Sherrard, where the Sherrard mine, a property still operating, is located.

In 1907, Mr. Lee was again confined to his home by illness, and in September of that same year wrote his resignation to Carl Scholz, president of the Coal Valley Mining Co. This resignation was accepted by Mr. Scholz on Sept. 11, the 51st anniversary of the day Mr. Lee first entered the employ of the Coal Valley Co. Since that time Mr. Lee has lived a retired life, his second son, Robert Lee, Jr., having succeeded him as superintendent of the Coal Valley Mining Co.

There is no man who has ever been connected with the coal-mining industry of the Middle West more universally beloved than Robert Lee, the daddy of them all in the State of Illinois.

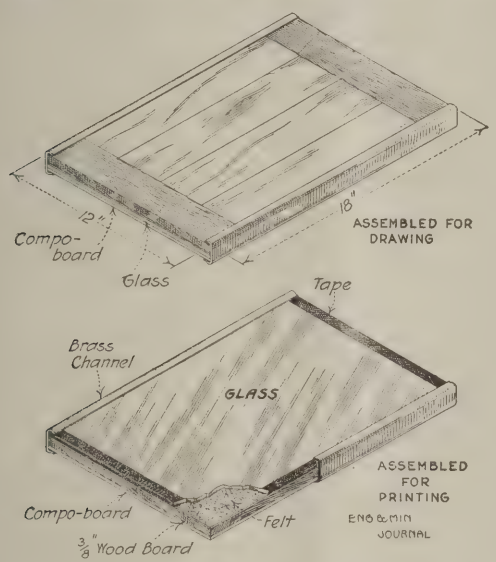
A Record Output in Illinois

The mine of the New Staunton Coal Co., located at Livingston, Ill., has been hoisting coal at a very rapid rate since business began to pick up for the fall. During the first half of September, working $9\frac{7}{16}$ days, they hoisted 42,289.8 tons, making an average of 4481 tons per day. During the second half of the same month, working ten days, they hoisted 45,822.95 tons; making an average of 4582 tons per day. This makes a total average of 4533 tons for every day worked during the month of September.

The best single day's hoist made at this mine was on Oct. 3, when an output of 4772 tons was brought to the surface, which required 1635 hoists. This mine is located on the Big Four R.R., in Madison County, and is a shaft mine. The shaft is 287 ft. deep to the No. 6 seam; the coal is mined by machines and is of a good quality.

The annual output of the mine for the past three years has been as follows: 1912, 737,632 tons; 1913, 848,715 tons, and 1914, 805,752 tons. There were several weeks that the mine was idle, during 1914, on account of the wage settlement. For the year ended June 30, 1913, this mine ranked first in the state in production; it was third in 1912, although during 1912 they made the best average for the whole year.

T. G. Hebenstreit is the superintendent in charge of the property, and great credit is due him for his able management. We can expect even greater records to be made under his careful and efficient supervision.



The need for boiler settings which will not leak air has caused the United Electric Light & Power Co., of New York City, and others to case their boiler settings with steel, using heat insulation between the brickwork and the metal to protect the latter.—Bromley in "Power."

Portable Combined Blueprint Frame and Drafting Board

Many engineers engaged in examination work have felt the need of tracings and blueprints to accompany their reports and often have had to wait to make them until a place was reached where there were facilities—with inconvenience to themselves and loss of valuable time. For this reason, an article by F. W. Foote in the *Engineering & Mining Journal* is of timely interest to coal engineers.

Mr. Foote has devised an outfit which is light and compact, fitting in a suitcase, and performing well the work required of it. It consists of a drawing board, 12x8 in., built with end cleats rather than back cleats; a piece of "Compo" board; a piece of clear glass of the same dimensions; and two channels of brass, 18 in. long and of the desired thickness.

The drawing board is ⅜ in. thick. If made up of several narrow strips and held together by the end cleats, the danger of warping is greatly reduced. One side is

MANNER OF ASSEMBLING FOR DRAWING AND FOR PRINTING

dressed for drawing and the other side is covered with felt. The glass is bound on the edges with adhesive tape to prevent chipping and lessen the danger of cracking where the channels come in contact with it. The channels are of sufficient depth to accommodate the board, glass, "Compo" board, a reasonable amount of tracing cloth, drawing paper and blueprint paper, the latter being kept in a black-lined case or tube to protect it from the light.

The drawings show the outfit assembled with the glass inside, for use as a drawing board; and also with the glass outside for blueprinting. Thus assembled, it can be set up in any window-sill in the sun and the blueprints washed in the bathtub if the engineer is in a hotel or in a hand basin if he is in the field. The whole outfit may be made for a dollar or so; if it does not have to be carried in a suitcase, the size may be altered as desired.

Our Front Cover This Week shows two installations of Jeffrey mine fans. The upper one is a view of a 16-ft. double-inlet exhaust fan, direct connected to a steam engine for the Delaware, Lackawanna & Western R.R. at the Truesdale Colliery, Scranton, Penn., and the lower view is a 20-ft. double-inlet exhaust fan, direct connected to an engine installed at the Woodward colliery of the same company.

Difficulties in Fan Shipment

The Henderson Coal Co., for installation at a new development at Hill Station, Penn., recently ordered a 150,000-cu.ft. capacity Sirocco fan, to be shipped from the factory assembled. As the limit of height for a railroad car was 15 ft., it was necessary to decidedly alter the construction of a flat car to accommodate this wheel.

As finally shipped, the fan wheel was supported on edge and extended down through the floor of the car, clearing the top of the rails by 6 in. This allowed the wheel to successfully pass under bridges and through tunnels on the railroad. The wheel alone weighed nearly 6 tons, while its steel housing made up a separate carload.

While many fans are at present in use of larger diameter than this one, it is seldom that the large sizes are shipped in one piece, or that such severe measures have to be taken in their transportation.

A Record Production

Ebensburg No. 1 mine of the Ebensburg Coal Co., at Colver, Penn., for the month of October, produced 102,700 net tons. This is remarkable, when it is considered that this is from a single opening, and the seam of coal only 3½ ft. high. It is doubtful whether this feat has been surpassed or equaled by any single opening in the United States operating in a low bed of coal.

COAL AGE especially invites data from coal companies recording instances of noteworthy achievement.

Erratum

R. V. Norris informs us that the equation for size of pillar in his article on "The Conservation of Anthracite Coal," republished in our issue of Oct. 31, on page 707, should read:

$$p^2 + \left(\frac{7}{3}T - \frac{DT}{300}\right)p = \frac{CDT}{300}$$

The equation $s = \frac{8fx'}{3ws}$ should read $s = \frac{8f}{3w}$;

$\frac{x'}{s}$ = number of cars per yard of chamber.

Coming Meetings

The American Society of Mechanical Engineers will hold its annual meeting in New York City, Dec. 1, 2, 3 and 4, 1914. Calvin W. Rice, secretary, New York City.

The American Mining Congress' seventeenth annual session will be held at Phœnix, Ariz., Dec. 7, 8, 9, 10 and 11, 1914. J. F. Callbreath, secretary, Denver, Colo.

The Coal Mining Institute of America will hold its winter meeting Dec. 8 and 9, 1914, at the Fort Pitt Hotel, Pittsburgh, Penn. Charles L. Fay, secretary-treasurer, Wilkes-Barre, Penn.

The West Virginia Coal Mining Institute's winter meeting will be held at Huntington, W. Va., Dec. 9 and 10, 1914. Prof. E. N. Zern, secretary-treasurer, Morgantown, W. Va.

The American Institute of Mining Engineers will hold its annual meeting in New York City, beginning Feb. 16, 1915. Bradley Stoughton, secretary, New York City.

The Kentucky Mining Institute's winter meeting will be held Dec. 4 and 5, 1914, at the Seelback Hotel, Louisville, Ky. Ivan P. Tashof, secretary-treasurer, Lexington, Ky.

Discussion By Readers

Mining Law, Legislation and Mine Regulations

Letter No. 3—In the issue of Coal Age, Oct. 31, p. 698, I note the invitation for comments and discussion relating to mining laws, legislation, or mine regulations, by those affected by such laws and regulations. This suggestion is most timely, and I hope that it will receive the cordial response that it deserves.

I am especially prompted to write this letter because of a very common misunderstanding in regard to the representation made by coal operators and operators' associations, before the state and national legislatures. There is no question that the coal operators have been too diffident in respect to the presentation of suitable laws for enactment designed to benefit the industry. Mining laws should involve both the safety of employees and the stability of the business, as the two go hand in hand. Any legislative measure that unfairly attacks the industry, sooner or later reacts upon the employees, either by affecting their wages or conditions of safety, or both. Therefore, proper representation by the coal operators before the law-making bodies is not only desirable, but *a positive obligation.*

Too often such representations are referred to as "lobbies," with the common understanding that a lobbyist is either a grafter or a person who, by undue influence over legislators or congressmen, endeavors to obtain a condition to which he is not properly entitled. No worse misconception could exist in respect to any honest and legitimate endeavor, on the part of those interested, to secure legislation that would benefit an industry.

With the many problems that confront our legislative houses, both state and national, it must be evident to thinking men that their representatives cannot possibly be thoroughly posted on the various matters that come before them and demand intelligent action. A legislator cannot possibly vote intelligently on a matter pertaining to a line of business with which he has little or no practical acquaintance, unless he can appeal to some authority for correct information and advice.

For example, it is not reasonable to suppose that a congressman from Florida would know much about the apex law, which is of the greatest importance to the metal-mining industry. Many similar examples can be mentioned, and it would seem necessary, therefore, for the various industries to have representatives available on whom members of congress can call for any desired information, which should be furnished them as accurately as possible. By such methods it can readily be seen that what was formerly known as a "lobbyist" would, instead, prove to be a most useful representative. I may add that with this purpose in view, solely, the American Mining Congress has maintained its office at Washington.

The mining laws of Illinois have been very carefully considered by a commission appointed for that purpose. The members of this commission were chosen from representatives of the mine owners, mine workers and the state and national governments. The work of this commission has resulted in giving to Illinois complete and effective mining laws, which afford greater protection to the mine workers than the previous statute. It has even been stated that the Illinois code is "as fine a body of mining laws as exists in the United States, and that its solicitude for the well-being of the worker has been carried to the point of injustice to the mine owner." This editorial statement, in one of the leading newspapers of this country, emphasizes the fact, which is quite generally true, that *mining conditions are viewed from the standpoint of the employee only.*

Besides its excellent mining code, Illinois has a Workmen's Compensation Act; and many of the mines of the state are being operated under that act. It yet remains to be seen, however, whether this will afford the expected protection of the mine workers; because as the old adage says, "You cannot get blood out of a turnip."

Consider, for a moment, the terrible results of the great mine disasters that have occurred and are still taking place in Illinois. In the case of the recent catastrophe at Royalton, it is generally hoped and believed that the company will be able to provide for the widows and orphans created by that disaster, just as the St. Paul Coal Co. was able to do in the Cherry disaster, Nov. 13, 1909. Fortunately for the families of the victims, in the latter case the company had the backing of a large corporation, which provided the desired protection.

But, from this condition, let us turn and ask, What would have been the effect of the Workmen's Compensation Act had the Cherry mine been owned by one of the many coal companies in this state not backed by other interests? Would it not have meant financial ruin to the company accompanied in most cases with no compensation to the widows and orphans? Under the present existing conditions of the coal industry in Illinois, it is a serious question whether, in the majority of cases, a great mine disaster would not mean the ruin of the coal company, without furnishing the desired compensation to the victims.

In order to be of value to the state, the coal industry must be placed on a sounder basis than exists at the present time. There must be coöperation. In the present order of things, coal-mine owners must deal with the miners' organization, in respect to the *wage scale.* In the matter of furnishing *protection to employees,* they must deal with the state of Illinois, either through the Compensation Act or by voluntary settlement of lawsuits. But, in the *sale of coal,* the coal operators stand singly and alone, with the result that the fiercest competition exists, which is destroying the industry by preventing an earning commensurate with the risk of the business. The present condition not only deprives the company of its just earnings, but robs the dependents of the employed, in case of accident, since no claim however deserving is of value when the company is bankrupt.

The coal operators do not desire a trust or a monopoly, and it is obvious this could not exist with the competi-

tion from other states. But, for the good of the industry, Illinois operators should be permitted, and, perhaps, required to coöperate in the sale of their coal, to the end that a price be obtained for the output that would enable them to pay proper wages and still realize a profit on their investment, besides providing for their employees, in case of accident. If wage scales are established and laws made effective by collective bargaining it is equally necessary that the same collective action should control the sale of coal.

In closing, permit me to say that no greater service could be rendered to society at large than the inauguration of a condition that would place the coal industry of the state on a stable basis, both in respect to the mining and selling of coal.

CARL SCHOLZ, President,
The American Mining Congress.

Chicago, Ill.

Letter No. 4—In his letter pertaining to mining laws, Letter No. 2, COAL AGE, Oct. 31, p. 722, I. C. Parfitt questions the wisdom and justice of the Pennsylvania bituminous mining law, requiring that all examination papers of candidates trying for certificates of competency as mine inspectors, foremen, etc., be retained and filed in the Department of Mines as state documents and not returned to applicants, after the examination is completed and the marks of proficiency determined. Although the mining laws of Tennessee have no mandatory act, requiring the examining board to file the examination papers of candidates in the State Mining Department as state documents, this is always done.

However, I am of the same opinion as Mr. Parfitt on this question, believing the work of the candidate before the board and his standing as determined and marked on each question by the board should be returned to him; thus giving him the benefit of the knowledge accruing from any mistake made by him in the examination. By this means, his work becomes a schooling to the applicant, giving him an opportunity to profit by his mistakes.

The examining board in Tennessee is composed of the chief mine inspector and his two district inspectors. The law requires the chief inspector to have had "six years' experience in mining," and also "possessed of a competent knowledge of chemistry, geology and mineralogy of Tennessee, so far as these sciences relate to mining, and a practical knowledge of mining engineering." The two district inspectors are required to have had six years' practical experience in mining and to hold a "Class A" certificate of competency. These requirements make the mine inspectors of Tennessee, who by law constitute the board of examiners for mine foremen, assistant foremen and gas bosses, well qualified to pass on the competency of candidates for certificates. The board is both technical and practical and, being appointed by the governor, is naturally fair and impartial to applicants and operators alike.

The method adopted and followed by the board is to select, as far as possible, practical questions; or, in other words, questions that can be answered by possessing only a practical knowledge of mining. The board seeks to ascertain by these questions, as far as it can, what the applicant knows about mining from experience; instead of what he has learned from others, in this respect. Each question propounded to applicants is given a certain value or is worth so many points if answered correctly. One question may be valued at 10 points, and another at 25 points. The value of a question thus fixed by the number of points given to it shows the candidate, at a glance, the importance of that question, and the value placed upon it by the board, as showing the candidate's knowledge of those things most essential to safety and the protection of life in mining, and his ability to successfully manage mines.

JOHN ROSE,
District Mine Inspector.

Dayton, Tenn.

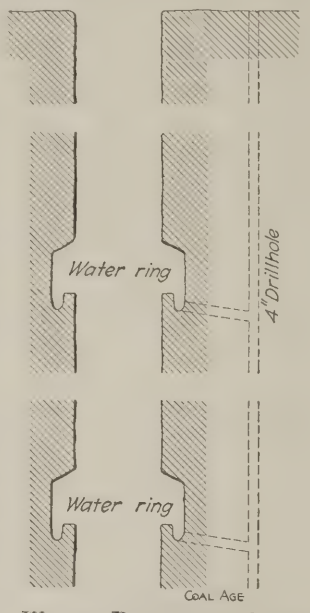
To Prevent Freezing of Mine Shafts

Letter No. 1—Replying to the inquiry of a Mine Superintendent, COAL AGE, Oct. 31, p. 725, asking for the best method of keeping his hoisting shaft from freezing during cold weather, will say that I would consider some other method before adopting either of the two he mentions. Unfortunately, the inquiry does not state whether the fan shaft is wet the same as the hoisting shaft; or whether the mine gives off gas, or is worked with open or safety lamps.

Assuming, however, that the mine is gaseous and is worked with safety lamps and that the fan shaft is also wet, I would suggest reversing the air current, thereby making the hoisting shaft the upcast. The warm return air from the mine would prevent any freezing in the hoisting shaft. In addition to this, I would heat the air in the downcast shaft to prevent it from freezing. By adopting this method, the danger of the pipes being accidentally broken is averted; the mine air gets the benefit of the added humidity; and the hoisting shaft now being the upcast instead of the downcast, the tipple dust is blown away from the mine instead of being carried into the mine, as is necessarily the case when downcasting the air at the hoisting shaft. This method will also eliminate the undesirable feature of the men working at the shaft bottom, in a warm, moist and enervating atmosphere.

While I consider the two methods referred to by Mine Superintendent as being practical, I believe the method I have described above has some additional good features, provided, of course, that the conditions will permit of changing the direction of the air current.

C. O. MESSENGER,
Mining Engineer.



Wilsonburg, West Va.

Letter No. 2—Replying to Mine Superintendent, COAL AGE, Oct. 31, p. 725, in regard to the best method of preventing the freezing of the hoisting shaft in cold weather, I assume that the hoisting shaft, in this case, is the downcast and that the fan is exhausting.

In the first place, I would suggest that the simplest remedy to apply is to reverse the air current, in cold weather, whenever this is possible. In other words, run the fan as a blowing fan and force the air into the mine instead of exhausting as at present. By this means, the fan shaft is made the downcast and the hoisting shaft the upcast for the entire mine. The air current in passing through the workings becomes heated and the freezing of the hoisting shaft is prevented.

If ice accumulates in the fan shaft, in this arrangement, the difficulty can generally be avoided by turning the exhaust steam from the fan engine into the shaft. This will, of course, produce a fog in the intake air current for a short distance from the bottom of the shaft; but that will disappear before the air reaches the workings. Such an arrangement is commonly adopted in many localities.

In regard to rendering the shaft waterproof by lining it with concrete by means of the cement-gun, I do not believe that this can be done successfully, as water will still come in around the timbers. While some shafts are lined with a tight curbing from top to bottom, others only have timber sets 4 or 5 ft. apart and, in others, buntons alone are used to carry the guides and pipe lines in the shaft. Assuming that the shaft in question has timber sets, say 5 ft. apart, the question arises, would it be possible to make this shaft waterproof around the timbers by the use of a cement-gun. Also, it must be remembered that when the timbers require to be renewed, it will be necessary to renew much of the cement lining.

WATER RINGS IN A WET SHAFT

I want to suggest a method of draining this shaft by water rings run around the shaft, just below the water-bearing strata. This method has been tried and has proven successful in draining the shaft to an extent that freezing is wholly prevented. As shown in the accompanying figure, the water rings are made by excavating an annular opening in the strata completely surrounding the shaft and providing a ditch in this opening, which is drained by means of a borehole connecting the ditch with a 4 or 6-in. drillhole sunk at the side of the shaft, from the surface. This drillhole should be about 4 or 6 ft. away from the shaft and drain the water to the sump at the shaft bottom, from which it is then pumped to the surface.

Where the shaft makes a considerable amount of water, it is often better to locate a sump at each water ring and install pumps at these points to handle the water draining into each sump. By this means, the water is pumped directly to the surface instead of draining to the bottom of the shaft, which decreases the cost of pumping.

PENNSYLVANIA MINING ENGINEER.

Uniontown, Penn.

Storage-Battery Locomotives in Mine Haulage

Letter No. 1—I read with interest the description of the Grant mine, by R. Dawson Hall, COAL AGE, Oct. 10, p. 576. We are always open to constructive criticism but feel that Mr. Hall failed to understand our aims and the circumstances with which we and other Indiana operators must contend.

It is our constant aim and endeavor to *mine coal profitably,* by the use of safe and economical practices. However, in the face of the present seeming inability to raise the selling price much above one dollar per ton for mine-run coal, and with the operators in the thick seams across the state line apparently bent upon compelling the consumer to accept their mine-run coal at 95c. per ton, the resulting cost-sheet necessarily modifies many of our ideals to a greater extent than can be grasped by the occasional visitor who comes to us fresh from the more prosperous fields where possibly *labor* bears some of the burdens that in Indiana must rest upon the operator.

One of the most important modifications in the methods of mining that Indiana operators have had to accept relates to pillar work. The prevailing idea in Indiana has been that the pillars could not be extracted, with profit; and up to the present time room breakthroughs have usually been slabbed and all room pillars left standing. But with the increasing cost of coal in the ground, we are being forced to aim at a more complete extraction. At the Grant mine we have adopted the principle that all pillar coal must be mined if it can be gotten profitably.

The extremely fragile character of the mine roof and its tendency to cut, under the alternate wet and dry condition of our mines—these together with the narrow margin between a fixed mining rate and an equally uncompromising selling price, make it imperative that all extraction within a given area shall be immediate. Any coal left behind is soon obstructed by falls and must be abandoned.

We have adopted the plan of driving our rooms 21 ft. wide, to a depth of 200 ft., with the track 5 ft. from the rib. When the room is worked to the boundary, the pillar is drawn back to the neck and all available timber and track removed as the work recedes, every effort being made to induce a fall of roof. Room pillars are left not more than 9 ft. thick, which is sufficient to support the roof during the process of working. A greater width of pillar would increase the cost of breakthrough yardage and inevitably require the turning of a track into each breakthrough, for a miner in this state cannot be compelled to throw his coal a greater distance than about 12 ft., and the company must pay for keeping up his track.

A breakthrough, in order to be driven without yardage cost, must be at least 18 ft. wide. Whether long or short, crosscuts of this width cannot be maintained without ample props and this item of expense soon eats up the saving of a wide breakthrough. For this reason, we have developed the mine in panels about 500x900 ft. each, with 100-ft. barrier pillars against the main haulageways, as shown in the plat, COAL AGE, Oct. 10, p. 578. In these panels, we aim to get as large an extraction of coal as circumstances will permit, and in doing this we encourage the roof to fall immediately behind the work. When it breaks, as it usually does, we have no trouble. Occasionally, it will not break, but rides the room stubs and crushes the chain pillar. In order to obviate this possibility, we are now working out four rooms on an entry, as we advance, leaving the next three rooms to be gotten on the retreat. This block of solid coal acts as a support to the roof when it will not break, and relieves the crushing strain on the room stubs and chain pillar.

Thus far, we have gotten the bulk of the pillar coal and, in an operation of about a year and a half ago, no miner has even been scratched by falling slate. The rooms are

well propped and if a piece of roof becomes dangerous no risks are taken to extract the pillar. If Mr. Hall will outline how, in his judgment, pillars in our seam can be *gotten profitably* it may stimulate a discussion and experiments that will lead to something better.

In regard to the storage-battery locomotives, it is presumable that there are as good or better makes. There has been some dissatisfaction with a few tried out in Indiana mines; but this is seemingly the fault of crude design; or disproportionate construction and use of too small a motor for the intended load; or batteries not fitted for the voltage or amperage of the motor; or poor transmission; or some other obvious defect. The Jeffrey motors with wormgear, carrying Edison storage batteries, have made good in our mine. They have shown a greater performance than the makers were willing to guarantee and are altogether up to our expectations in performance, in endurance and in economy of operation.

Given a thin seam of coal, you have the alternative of using a small mule and a little car or incurring the expense of taking up a large amount of bottom on all roads, during the entire life of the operation. Therefore, if such a mine is being developed with the assurance of a long life, justifying its being well equipped, there are strong reasons for gathering the coal with motors.

Some who have tried the reel or crab locomotives are enthusiastic in their praise. We have never used any motor of this type; but our experience with the storage-battery locomotives would make it hard for us to recommend any other type of motor for gathering.

Its obvious advantages are the elimination of the cost of trolley wire, rail bonds and reel-cables, and the absolute freedom of action that permits the motor to go anywhere on almost any kind of track and work equally well either pushing or pulling, to say nothing of the absolute quietness of the whole operation as compared with the sweat, stench, turmoil and profanity of the mule haulage. These items directly affect the daily cost-sheet by the saving they cause in drivers, mule feed, harness, shoeing, mule depreciation and hospital expense. With four motors we gathered regularly between 1400 and 1500 tons of coal, while with the six motors now operating, we expect to haul upward of 2200 tons without difficulty, when the mine will furnish that tonnage, which means that we are easily displacing four mules with one motor.

Such results, however, can hardly be obtained except in a panel mine, where the gathering operations can be confined within a given radius and the partings kept close to the working face.

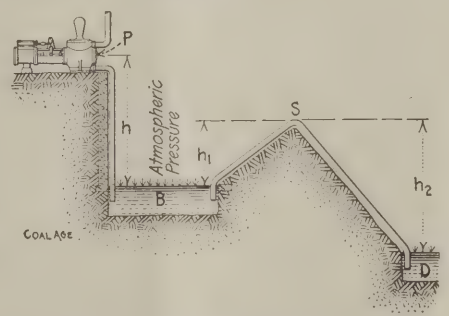
Study Course in Coal Mining

BY J. T. BEARD



The Coal Age Pocket Book

Siphoning or Pumping Hot Water—Since water vaporizes at all temperatures, the vacuous condition existing in the suction pipe of a pump or in the short leg of a siphon is reduced by the tendency of the water to form vapor under the reduced pressure in the pipe. In other words, the atmospheric pressure that forces the water up the suction pipe is opposed by the tension of the water vapor in the pipe, which reduces the atmospheric head effective in raising the water.

As shown by the table giving the saturated water-vapor pressures or tension, at different temperatures, the pressure of the vapor increases rapidly with the temperature; and at 212 deg. F. is equal to the normal atmospheric pressure at sea level (14.696 lb. per sq.in., or 29.925 in. bar.).

As shown by the table giving the normal atmospheric pressure, at different elevations above and below sea level, this pressure decreases as the elevation above sea level increases and vice versa. But whenever the vapor pressure is equal to the atmospheric pressure ebullition takes place (see Laws of Vapors). For this reason water boils at about 203 deg. F., at an elevation of 5000 ft. above sea level; or 193 deg. at 10,000 ft. elevation. The boiling point, for any given elevation, marks the limit of temperature for pumping with a suction pump or for siphoning, since the vapor pressure then conterbalances the atmospheric pressure and the water will not rise in the suction pipe.

The accompanying figure shows clearly that it is the atmospheric pressure acting on the surface of the water in the sump or basin B that forces the water up the pipe to the pump at P, or to the crown of the siphon at S, against the more or less vacuous condition at those points.

VERTICAL SECTION, SHOWING PUMP AND SIPHON AT WORK

It is evident that if the water is hot its vapor pressure will resist the atmospheric pressure and, to that extent, reduce the effective suction head. Obviously, therefore, the possible suction head of a pump or siphon depends on two important factors, aside from the mechanical perfection of the apparatus; namely, (1) elevation above or below sea level, as determining the atmospheric pressure; (2) temperature of the water, as determining its vapor pressure.

The Coal Age Pocket Book

Safe Suction Head, Vertical Lift—The safe limit of suction, in feet, when pumping or siphoning hot water, assuming a fairly vertical lift, may be taken as about nine-tenths of the effective barometric pressure, in inches; or, in other words, the height of the barometer, in inches, diminished by the vapor pressure expressed in inches of mercury.

Example—Find the practical limit of suction when pumping water from a sump where the temperature of the water has been raised to 150 deg. F., by the discharge steam of the pump, the elevation being 3000 ft. above sea level and the suction pipe vertical.

Solution—From the tables, the normal barometric pressure, at this elevation, is 26.813 in. and the vapor pressure of water, at a temperature of 150 deg. F., is 7.57 in. of mercury. The effective barometric pressure is, therefore, 26.813 — 7.57 = 19.243 in. The safe vertical suction may then be assumed as 0.9 × 19.243 = 17.3, or 17 ft. 4 in.

Inclined Lifts—When the suction pipe is much inclined, as when pumping in slopes, or as is almost invariably the case in all siphon work in mining, the frictional resistance of the pipe is much increased by reason of its greater length. This increased resistance reduces the effective head.

The length of pipe, for the same vertical height, varies inversely as the sine of the slope angle (a), and the loss of head likewise. But, for a vertical lift, the loss of head, in feet, was assumed as one-tenth of the barometric height, in inches, (0.1 B). Hence, for an inclined lift, slope angle a, the loss of head may be taken as 0.1 B/sin a, which makes the **effective head,** $B(1 - 0.1/\sin a)$, in which B is the effective barometric pressure, after subtracting the vapor pressure for the given temperature of the water, expressed in inches of mercury.

Example—Find the effective suction head of a mine siphon, the short leg or suction pipe having a slope of 30 deg. from the horizontal and the water to be drained having a temperature of 130 deg. F., the barometric pressure in the mine being 28.4 in. Also, calculate the length of the pipe for this maximum lift

Solution—The saturated vapor pressure at a temperature of 130 deg. F., is 4.52 in. of mercury; and the effective barometric pressure, in this case, is 28.4 — 4.52 = 23.88 in. The safe suction head is, then,

$$h = B\left(1 - \frac{0.1}{\sin a}\right) = 23.88\left(1 - \frac{0.1}{\sin 30^\circ}\right)$$

$$h = 23.88\left(1 - \frac{0.1}{0.5}\right) = 23.88 \times 0.8 = 19.1\ ft.$$

The maximum length of suction pipe, under the given conditions, is, then,

$$l = \frac{h}{\sin a} = \frac{19.1}{\sin 30^\circ} = \frac{19.1}{0.5} = 39\ ft.$$

In ordinary mining practice, it is fairly safe to assume the coefficient of friction, in water pipes as 0.01, which forms the basis of the above assumed percentage of loss.

Inquiries of General Interest

Ignition of Coal in Storage

I would like to ask of COAL AGE and its practical readers any information they can give in regard to the best method of avoiding the spontaneous combustion of coal stored in large quantities in a bin; as, for example, where a winter's supply of coal is stored in bins in the basement of a building. If this coal should become heated and fire, what means can be adopted to prevent the spread of the combustion throughout the entire pile.

As a practical example, I would cite the following instance: Soft coal of a good quality which was stored in a bin in the basement of a school, in one of the wards in this city, became ignited, and the city fire department was called out to deal with the situation. It was found necessary, later, to remove the entire amount of fuel from the bin to get at the seat of the trouble.

As we are storing from 100 to 250 tons of coal at a time in our bins, 30 ft. underground or in the sub-basement, and cannot afford to take chances on the safety of this fuel supply, we would appreciate any information given by COAL AGE or its readers that will enable us to safeguard our supply of coal against possible trouble.

ASA P. HYDE, Chief Engineer,
Security Mutual Life Insurance Co.
Binghamton, N. Y.

The subject of the spontaneous ignition of coal in storage has received much attention at the hands of experimenters and investigators of coal problems. It cannot be said, however, that the subject is well understood at the present time, although much progress has been made in determining the source of the ignition.

For a long time, it was held by good authorities that the most active factor contributing to the spontaneous ignition of coal was the presence of iron pyrites so commonly found in coal. It is now well established that, while the presence of iron pyrites in coal greatly assists its disintegration, and, as a result, fresh surfaces of the coal are exposed to the action of the air, the oxidation of the pyrites is not the responsible factor in the ignition.

More recent experiments have shown that there are two processes set up immediately after the coal is taken from the seam and exposed to the atmosphere. These processes are the following: 1. The exudation of the hydrocarbons contained in the coal, which consist chiefly of methane (CH_4). 2. The rapid absorption of oxygen from the atmosphere into the pores of the coal, which is immediately followed by the oxidation of the organic matter of the coal, causing heat and liberating combustible gas within the coal itself.

As these processes continue, the ignition of the gas is quickly followed by the ignition of the coal itself, resulting first in the slow combustion of the coal, but often followed by a more rapid combustion. The addition of water to arrest this process only makes the matter worse, as the action is more rapid under moist conditions. The quantity of water required to stop the progress of the combustion in the coal would be too large to be practical, under ordinary conditions.

In order to reduce the liability to spontaneous combustion in large storage bins, it is advised that the bins should be built of incombustible material and constructed in such a manner as to allow the free circulation of air about the sides and underneath the floor of the bin. The ventilation of the coal pile itself by introducing streams of air into the pile, as has been done in some cases, is not well regarded. It is claimed that the admission of fresh air into the coal pile itself supplies more oxygen, and, to that extent, increases the oxidation going on in the coal. What is needed is a circulation of air outside, to cool the walls and abstract the heat as much as possible.

It has been found in practice that coal should not be piled to a greater depth than 12 or 14 ft. in a storage bin. When the depth of coal in the bin exceeds this amount, heating and spontaneous combustion are more liable to ensue. We would be glad to have this subject further discussed by readers who have had experience in the storage of large quantities of coal.

A Conundrum

Assume that a pound of coal contains 14,500 B.t.u., and it is clear that the heat derived from "one pound of this coal will raise (the temperature of) one pound of water, 14,500 deg. F.;" provided all the heat of the coal went into the water and the latter was confined under a pressure sufficiently great to prevent the formation of steam; and, assuming, further, that the specific heat of the water remained constant, as the temperature increased, which assumptions are not realized in practice.

A more reasonable statement, however, is that the heat derived from one pound of this coal is capable of raising the temperature of 14,500 lb. of water 1 deg. F.; or, applying the same reasoning, the heat derived from one pound of this coal would be capable of raising the temperature of 68.4 lb. of water 212 deg. F.; or, say from 32 deg. to 244 deg. F., provided again that the pressure in the containing vessel be sufficient to prevent the formation of steam under this rise of temperature.

This line of reasoning is quite clear to me, but there is no steam yet; and I fail to see what this argument has to do with the "efficiency of steam" that I read about in another mining paper. Perhaps some reader of COAL AGE can explain the intended meaning.

W. L. A.

Pittsburgh, Penn.

The term "efficiency of steam" has no intelligent meaning, except in relation to steam being made *the medium through which heat energy is converted into mechanical work*, as shown by the Rankine, Carnot, or other steam cycle. The above "argument," if such it may be called, has no reference to any cycle; but considers only the possible rise in temperature of a pound of water, caused by the potential heat of a pound of coal.

Examination Questions

Mine Foremen's Examination, Held at Price, Utah, Sept. 15 and 16, 1914

(*Selected Questions*)

Ques.—Do you receive and read any instructive literature pertaining to the various systems of coal mining and points of safety in operating same? What magazines along these lines do you take?

This question, which obviously must be answered from the candidate's own experience, is inserted here to show the importance of all candidates for examination as well as other mining men keeping up their study of mining questions and reading mining literature and being regular subscribers to mining magazines.—Editor.

Ques.—What four principal things are bandages used for?

Ans.—Bandages are used for the following purposes:

1. To keep dressings in place.
2. To hold splints in place.
3. To stop bleeding, by pressure.
4. As slings.

Ques.—Name the different kinds of bandages generally used in first-aid-to-the-injured work.

Ans.—The three kinds of bandages most commonly used are the triangular, roller and four-tailed bandages, described as follows:

1. The *triangular bandage* made from unbleached cotton cloth or from any available material, such as bed sheets, pillow cases, napkins and handkerchiefs, is made by folding a square piece of the cloth diagonally and cutting in the fold, which forms two triangular bandages.

2. The *roller bandage* is made by cutting muslin, cotton cloth, flannel, gauze or cheese cloth into long strips of any desired width and rolling up the strips into a neat roll for use.

3. The *four-tailed bandage* is made from strips of a roller bandage from 5 to 8 in. wide and about 3 ft. long. These strips are torn down the center from each end, to within a few inches of the middle of the bandage, thereby providing four tails by which the bandage is tied or bound about the wound. This bandage is mostly used in binding up the head.

Ques.—Describe the Red-Cross, first-aid outfit.

Ans.—The Red-Cross first-aid outfit is a hermetically sealed package containing a long gauze bandage having a compress of gauze sewn to it in the center. This bandage is so folded that it is impossible to touch the surface of the compress, which will cover the wound, except through carelessness. The package also contains a triangular bandage, printed so as to show how it is to be applied, two safety pins and all necessary instructions.

Ques.—Name some stimulants you would give and state how you would give them.

Ans.—Stimulants should never be given for an injury in the head. They are necessary in case of shock resulting from injury or otherwise. The best stimulants for use in first-aid work are hot coffee or tea, or aromatic spirits of ammonia, a teaspoonful in half a glass of water. If whisky or brandy is given, the amount should not exceed one or two swallows, as a larger amount is apt to produce depression, instead of stimulating the system. If alcohol is given, this must be pure and diluted with three times its quantity of water. Wood alcohol or denatured alcohol is poisonous and cannot be given.

All stimulants should be given as hot as can be taken, as the heat alone has a stimulating effect. A hot-water bag placed between the legs or against the outside of these members; or between the body and the arm has a stimulating effect; also, a light hot-water bag placed over the heart stimulates the heart action. Great care is required to make sure that the heat applied is not sufficient to cause a burn, especially if the person is unconscious.

Ques.—When should you send for a doctor, or take the injured person to a doctor?

Ans.—In all cases of serious injury or shock, send for a doctor at the earliest opportunity. There should be no delay, however, in giving first-aid assistance to the injured one. Where bones are fractured, the injured person should not be moved until after careful examination has been made and the proper splints and bandages applied, so as to prevent any sharp splinters of bone from cutting the flesh and possibly causing dangerous bleeding. Immediate efforts should be made to stop the dangerous bleeding of a wound, give the necessary stimulants and perform other first-aid work.

Ques.—(a) What is shock? (b) When does shock occur? (c) Describe the treatment of shock.

Ans.—(a) Shock is described as "a more or less profound depression of the nervous system." It is more commonly known as "collapse" or "prostration."

(b) Shock may be caused by the receipt of bad news or may result from a severe injury; but all persons are not equally sensitive to shock. A person suffering from shock becomes pale and has an anxious expression, his eyelids droop, the eyes are dull and the pupils often enlarged. The skin is cold and a cold sweat pervades the body. The sufferer is more or less stupid and often partly or totally unconscious, or his mind may wander. The pulse is rapid and weak and the person often lies quiet and will not move unless disturbed.

(c) In treating one suffering from shock, send for a doctor at once, but warm and stimulate the body in every possible way while waiting for the doctor to arrive. Place the injured person on his back, with the head low to induce the flow of blood to the brain. If the person is able to swallow, give stimulants, hot coffee or tea, or aromatic spirits of ammonia in water. These should be given in small quantities, a sip or a swallow at a time. If the person is unconscious and cannot swallow, smelling salts, water of ammonia, or hartshorn, should be applied to the nostrils. The arms and legs of the sufferer should be rubbed toward the body, underneath blankets to preserve the warmth of the body. Every effort should be made to apply heat to the limbs and body by means of hot-water bottles, hot bricks or hot bandages, care being taken to prevent causing a burn.

Book Review Department

HOW TO BUILD UP FURNACE EFFICIENCY. By J. W. Hays, consulting engineer, Rogers Park, Chicago, Ill., 126 pp. 5x7¼ in. 23 illus. Paper cover. Price $1.

This little book is not a scientific treatise but an extremely readable little volume for people who don't know anything about boiler-furnace efficiency and perhaps care less but to whom the subject is of the most vital and pressing concern. The reader will find the introduction too long and the first chapter trying, but when he has gotten a little farther in its perusal he will stay steadily with the author to the end and the rest of the book will be read in one sitting.

Hays is an Irishman with true Hibernian wit and he makes the problem of combustion interesting. When you have read the book, hand it to your firemen. They will read it and appreciate the fact that a practical man has written it. The reviewer as soon as he finished reading the book ordered a copy for a friend. It is likely the reader will want to do the same.

The author says that a furnace should pass about 40 per cent. more air than is necessary for complete combustion. Enough air has to be supplied to assure that the fuel is all

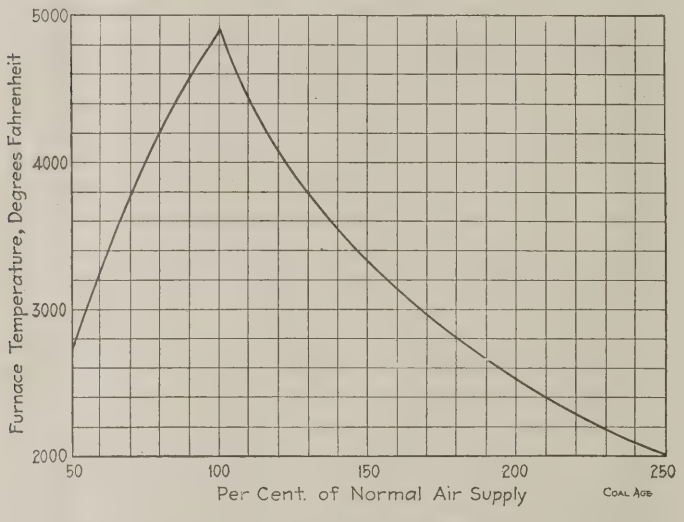


CHART SHOWING HOW TEMPERATURE OF COMBUSTION DEPENDS ON AIR SUPPLIED. TEMPERATURE IS HIGHEST WHEN AIR IS JUST SUFFICIENT FOR COMBUSTION OR 100 PER CENT.

consumed but a much larger current lowers the temperature of the furnace and wastes fuel. He explains how in some plants coal is lost by mixing with the ashes from the furnace and is wheeled out to the ashpit unconsumed. In other furnaces so much air leaks in through the furnace walls that the gases are cooled off and cannot heat the flues or the water tubes.

In this case "make a thin mixture of fireclay and stir cotton waste into it, first pulling the waste apart so that every fiber of it will be covered with the clay." Plaster this in the cracks and push it in with a calking tool. This will stay in place indefinitely. Then again bricks leak through their pores and a coat of paint will stop this leakage. But there are often large leaks which are not to be discovered without a candle or a torch. The boiler should be inspected for these especially around the boiler doors; only rarely are these tight.

Another loss is from leaving the furnace door open and excessive draft is yet another. There is a way of discovering the best thickness of coal to carry on the grates for a given draft. When you find it you can mark it on the furnace-door liners. The fire must be kept of equal depth all over, otherwise the air will pass through one part of the fire more rapidly than another and there will be too much air in one part with consequent temperature reduction. You can't keep down your excess air to the right figure if you have holes in your fire.

About 15 per cent. of carbon dioxide should be formed in good practice giving 38 per cent. of excess air. If less is found, air is being admitted without advantage, if more then there may not be, at least in parts of the fire, enough air for the monoxide of carbon to burn into dioxide, and much heat is lost because this final combustion is missed. If you could burn anthracite fuel without an excess of air you could get 20.7 per cent. of carbon dioxide but such a perfect result is unattainable. Bituminous fuel at best owing to the presence of hydrogen in the combustible material will not give more than 17 to 19 per cent. on complete combustion.

We recommend this book to those who are selling coal and who should understand combustion thoroughly if they would make satisfied customers. We commend it to mine operating forces because the study will enable them to save coal and make their boilers do more work and keep in order with little expense and attention. We suggest its purchase by firemen because they can save themselves from handling so much coal and wheeling out so much ash and because efficiency is always worth while. A fireman who reduces his work a quarter will certainly be awarded in ease of operation. As he will save that amount of fuel to his company, his wage will surely be raised if he is working for an appreciative management.

COAL-GAS RESIDUALS. By F. H. Wagner. XIV+179 pp., including index. 45 ill. Several tables. McGraw-Hill Book Co., Inc., 239 W. 39th St., New York. Cloth Boards. Price, $2.

This book fills a very present need, for it seems reasonable that coal-gas residuals and coke byproducts should be manufactured in this country. There are a number of products which have been mentioned as suitable to American enterprise, the manufacture of which in this country is far less feasible. The chemical industry is not one demanding a large amount of labor and the materials being at hand and seeking a purchaser almost in vain, are at a low price. Consequently it should be possible to meet foreign competition with profit and without the assistance of a tariff. The only difficulty is in the case of benzol. The low price of gasoline in America makes competition with this product difficult.

This book contrasts strongly with "Coal Tar Distillation and Working Up of Tar Products," reviewed in our issue of Feb. 21, as the subject is treated less from a severely practical and more from a chemical point of view. The first chapter treats of tar and the second of naphthalene ($C_{10}H_8$). This latter product has undoubtedly a great future, though at present it is a byproduct which is removed at an entire loss. It stops, by sublimation, the pipe connections in the distributing lines and so has to be removed if found in excess, even though it improves the quality of the gas. One per cent. of napthalene, says the author, raises the candlepower 25 per cent. It would seem that if some method could be discovered for injecting napthalene into natural gas it could be made as light-giving as the artificial product with or without the use of a mantle. It appears that napthalene has been used in France in an internal-combustion engine but no statement is made as to its success as a source of power in this connection.

Cyanogen (C_2N_2) is a profitable product and may be produced either by the Bueb or the Feld process. Of course, the amount obtained is dependent on the kind of coal coked but roughly 1.7 lb. will be obtained from a ton of coal. Small as this is, the author shows that a large plant will extract the chemical at a profit.

Of course, ammonia, treated in the fourth chapter, is the principal product. About 7¼ lb. of ammonia can be obtained per ton of coal, though there is enough nitrogen to make 48 lb. of product were there no losses in the conversion. About 28¼ lb. of ammonium sulphate can be manufactured from this ammonia. The writer in every case shows the costs of production of the materials but omits interest on plant, depreciation and obsolescence charges.

The writer quotes F. Puening, of the Koppers Co., stating that 2 gal. of benzol can be obtained from a ton of coal. This seems a small quantity, but were all the benzol saved which the coking of coal would produce, the output of the United States from this source would be 98,000,000 gal., or about 2⅓ million barrels. Owing to the war, the making of benzol is less attractive now than it was a few months ago.

Coal and Coke News

Washington, D. C.

There seems now to be a practical unanimity of assent that the forthcoming opinion in the renewed application of the Eastern roads in the 5 per cent. rate case will not be granted. This is reluctantly admitted by railroad managers, who are loth to concede that their hopes of an advance are not likely to be realized. Inasmuch as there seems to be such small chance of the granting of the roads' application as respects any commodities, the coal producers who have been fearful of the proposed increase in the past are now resting much easier. They do not believe that they are in any particular danger as things stand, being persuaded that the increase on coal asked for by the roads would hardly be granted even if there were to be an increase on other articles.

It is of considerable interest to note that the apparent indisposition of the Commission to allow any advance is due to the improvements in the revenues of the Eastern lines during recent months since the development of war in Europe. It had been stated as an argument in favor of the plan of reopening the case that the roads had been unfavorably affected by war conditions, and were in consequence unlikely to be able to endure the reduction of incomes to be expected. Hence the necessity of conceding to them, it was argued, an increase in the level of the rates.

Refusal to grant this advance now seems likely to be based upon the absence of a showing that the roads have suffered in actual income in consequence of the war. As to coal, it is being pointed out with considerable force that that article has been moving in undiminished quantity domestically, while exports have increased. The growth of exports has furnished export freight to the roads and has enabled them to improve their incomes from coal through increase in the density of traffic.

There is, it is argued, no reason in the coal situation for an advance in the charge made for transportation, since profits in the business are somewhat better than they were. Hence the attitude assumed with regard to the proposed advance of freight charges on that and other articles of like kind. It is the general impression that the agitation for an advance on coal is over for a good while to come.

Conditional Contraband

The British Government is taking decided steps to prevent contraband and conditional contraband articles from reaching Germany from the United States. Already a strong stand has been taken as regards copper and other articles, and it is understood a like position will be assumed with reference to coal if occasion demands. The position as to copper is embodied in a circular lately issued from the embassy and which it is understood will be paralleled in case of need by a similar document as to coal. In the copper circular it is stated that:

Information in possession of the British Government conclusively proves that very large shipments of copper, rubber and other commodities are passing through Italian ports on their way to Germany.

In New York large purchases of copper are being made by houses in Rotterdam, Amsterdam and Copenhagen who are working on German account. Directions are at the same time being given that these large consignments of copper are to be shipped through.

Meantime, official announcement is made here of arrangements between England and the Scandinavian countries for mutual observance of rights to neutral trade in noncontraband or conditional contraband articles, the list of which includes coal.

Getting Busy in Alaska

It is understood that the Interior Department is preparing regulations under which the exploitation of coal lands pursuant to the Alaska coal land leasing act may proceed.

The regulations are expected to cover a number of phases of the situation, and may require a good while in the process of working out. As soon as possible, it is understood the process of arranging to apply the act will be completed and arrangements will be made to begin operations in accordance with the law.

HARRISBURG, PENN.

Members of the Public Service Commission are highly pleased by the announcement from Washington that the Interstate Commerce Commission has reversed itself in the industrial railroad cases and decided that they may be given allowances. The Pennsylvania Commission had ruled in the Monongahela Connecting R.R. case from the Pittsburgh district that the industrial railroads or short lines were entitled to allowances for switching and other services, if they were really railroads.

The Interstate Commission, which had previously ruled the other way, came out during the past week with the decision that the industrial roads should have allowances restored.

The Public Service Commission on Nov. 7 heard the last of its dozen or so industrial cases, the point being to determine whether these carriers are really railroads.

The commission also heard the complaint of manufacturers of York and Lancaster that the rates for transportation of bituminous coal from the Clearfield region to those cities were discriminatory as compared with rates charged to Philadelphia and Harrisburg. The Pennsylvania R.R. defended the rates as reasonable, and was supported by counsel for the New York Central, Reading and Baltimore & Ohio.

PENNSYLVANIA

Anthracite

Hazelton—After being idle two months while the Beaver Meadow colliery of the Lehigh Valley Coal Co. was being modernized with new machinery and buildings, the 600 employees of that operation started work recently.

The fallacy of predictions of coal exhaustion is shown by the driving of a tunnel from the Buck Mountain to the Wharton vein in the Coleraine mine which, after yielding a fortune 30 years ago to W. T. Carter, of Philadelphia, was abandoned only to be reopened and reworked by his son who also retired wealthy. He let the coal rights pass to the A. S. Van Wickle Estate which has been extracting coal ever since. It is estimated that the new measures now being opened will give work for 15 years.

Tamaqua—Sixty men working in four-hour shifts recently saved Mart MacDonald, of Kaska William, from almost certain death after the man had been imprisoned in the No. 10 slope of the Mount Hope Coal Co., at St. Clair, for 8 hours. MacDonald, although uninjured, suffered from the cold and was placed under the care of Dr. R. T. Weaver, of St. Clair.

Sugar Notch—Maxwell No. 20 colliery, the largest operated by the Lehigh & Wilkes-Barre Coal Co., was thrown into idleness on Nov. 5, owing to the refusal of driver boys to work because one of their number did not receive pay for an extra hour. The boy demanded pay for this extra time, but the company foreman refused to hear his complaint.

Carbondale—The double frame dwelling house at the corner of Orchard and Green Sts., owned by Martin Kane, was badly damaged on Nov. 3 by a cavein at No. 1 mine of the Delaware & Hudson Co. The settling began at midnight and continued until 4 o'clock. At this hour the surface for 100 ft. square about the Kane property had dropped a distance of 5 ft. Other properties nearby were slightly damaged by water from bursting water mains.

Bituminous

Connellsville—It is reported that the coke production of the Connellsville region has dropped to approximately 200,000 tons per week, and the prospects are that it will go lower. Several blast furnace interests on the other hand have opened negotiations for Connellsville coke to cover their 1915 requirements. Efforts have been made to arrange for coke for the entire year on sliding scale contracts based either on pig iron average prices or trade journal quotations.

Uniontown—All efforts to check the fire which started Nov. 7 in the Martins mine of the Republic Iron & Steel Co., at Martins, having failed, the mine was flooded with water on Nov. 8 in an effort to extinguish the blaze. The damage so far is estimated at $10,000.

Monongahela—John Carroll, a mine foreman at the Shoenberger mine, recently entered a plea of guilty to a violation

of the mining laws by not taking certain precautions as prescribed at the mine door. He was fined $10 and costs.

Charleroi—Although the coal shipments for October passing through Lock No. 4 on the Monongahela River were larger than for many months, they did not reach the output from the river mines of 19,933,000 bu. for the month of October, 1913. Shipments through Lock No. 4 for October of the present year totaled 15,591,000 bu. of coal. The total passing through the lock in September was 14,739,000 bu.

Pittsburgh—Through the Pittsburgh offices of the Phipps properties a denial was recently made of the rumors of the exchange of several Phipps properties in a deal for coal land, the report having been that values amounting to $15,000,000 were involved. It had been extensively reported that the Fulton and Bessemer buildings, together with other holdings, were to pass to the hands of J. V. Thompson, of Uniontown, in exchange for large tracts of coal land.

WEST VIRGINIA

Bluefield—The Pocahontas Coal Operators' Association held its regular monthly meeting in this city on Nov. 5. This organization has a small auditorium and committee room on the sixth floor of the Law and Commerce Building. These have been newly furnished and serve well as a meeting place.

Goodwill—G. A. Bolden, assistant secretary of the West Virginia Commission of the Panama Pacific Exposition and N. E. Merhie, official photographer for the Commission, recently took a series of motion pictures of the Louisville first aid and mine rescue crew in action. This consisted of a demonstration given at the mine entrance. The crew was fully equipped with Draeger oxygen helmets and entered the mine after a supposed explosion, returning with a man apparently overcome by gas, also having some fractured bones. He was restored to consciousness by artificial respiration and afterwards given first aid.

Huntington—The West Virginia Coal Mining Institute dates of Dec. 9 and 10 have been changed to 10 and 11. President H. A. Zeller will shortly appoint a committee to arrange for the entertainment of the mine operators. The meeting is one of considerable importance and this year will no doubt have special significance owing to the depression in the coal business.

TENNESSEE

LaFollette—The employees of the LaFollette Coal, Iron & Ry. Co., who have been waiting nearly a year for payment of money earned Nov. 1 to Dec. 23, 1913, the company at that time having been placed in the hands of a receiver, were recently paid the amount due them by order of the United States court. Shortly after the appointment of the receiver 10 per cent. of back earnings up to $5 per man was paid.

KENTUCKY

Sebree—All the property of the Sebree coal mines, including machinery, tipple, tracks and mineral rights, was bought by J. D. Smith and J. W. Miller, of Birmingham, Ala., when it was sold a few days ago by the county commissioner. It is said that the purchasers are considering disposing of the property to other interests but that, should the deal not be consummated, they will reopen the mines the first of the year.

Owensboro—Receivership proceedings have been begun against the Fern Hill coal mines near here by T. A. Pedley, receiver for the Owensboro Savings Bank & Trust Co., who by this means seeks to protect the interests of the bank's creditors. Mr. Pedley alleges that the Fern Hills Mining Co., owner of the mines, is indebted to him in the sum of $935.55 and also for $30,000, represented by bonds and interest from Oct. 1, 1913. The court has not ruled on the question as yet.

Louisville—The Kentucky Mine Owners Association will hold a special meeting in Louisville on the evening of Dec. 3. One of the matters to be considered will be the raising of a fund to pay for the expenses the association has been put to in the matter of the Workmen's Compensation Act, it having retained attorneys from time to time to represent the association when the law was being prepared and since then, as progress has been made in applying it. The Court of Appeals is expected to hand down its decision on the law between now and the date of the meeting so that the members of the association will know where they stand.

Madisonville—Only three employees, the engineer, stable boss and pump man were left at work when the mines of the Nebo Consolidated Coal Co., at Circle City, were closed down for 60 days recently. No reason was given in the orders for suspension which were received from headquarters of the company at Louisville, where further inquiry failed to elicit explanation. This throws about 150 men out of work.

Madisonville—"Night Riders," or "Possum Hunters," have been active in the last few days in this part of the western Kentucky coal field. These lawless bands have been directing their efforts to drive negro miners from the western part of Hopkins County. At Carbondale 30 negroes formerly in the employ of the Carbondale Mining Co. failed to report for duty following an attack by "night riders" during which a negro child was shot and another wounded. On Nov. 3 two negroes were flogged at Daniel Boone. Here signs were posted ordering the negroes to leave. At Carbondale a wooden blockhouse has been erected and every night guards with high-power rifles watch for visits of the marauders. Another guard has been organized at Earlington while in other parts of the section the operators are taking similar precautions. Some operators affirm that the situation is serious enough to justify calling out troops but no one has appealed to the governor for them as yet.

OHIO

Cincinnati—Stock in several eastern Ohio and West Virginia coal companies, valued at $3,750,000, passed into the hands of John S. Jones, coal operator of Chicago, recently, as the result of an entry made by United States District Judges Warrington, Knappen and Denison, in a suit brought by the Government against the New York Central, and the Chesapeake & Ohio railroad companies, former subsidiary lines, and various coal companies controlled by them. The dissolution decree of the court was thus satisfied.

Martin's Ferry—The Elkins Coal Co., which recently leased and repaired the Buckeye mine, west of Bridgeport, and changed its name to the Locust mine, has released it to the International Coal Co., of Pittsburgh. It is expected that the new lessees will send a superintendent from their other workings to take the place of George Long, who has been in charge of the Locust mine under the Elkins company.

Coshocton—Coshocton operators and miners arrived at an agreement on the wage question at Coshocton Nov. 9. Both made concessions, but the terms of the agreement were not made public because they are subject to approval by the miners who will vote upon the contract this week.

Columbus—The new re-weighing rules promulgated by the Baltimore & Ohio R.R. have been put into force and B. F. Nigh, secretary of the Michigan-Ohio-Indiana Coal Association will wait to see how they work out before pushing the application for a change in re-weighing rules now pending before the Ohio Utilities Commission. The new rules provide for the weighing of cargoes at the nearest scales to the destination, which is a concession on the part of the railroad company. The old limit of 1000 lb. is retained, however. The application of the Coal Association provided for a limit of 500 lb.

INDIANA

Terre Haute—Thomas Archer recently asked $10,000 damages from the Otter Creek Coal Co., for injuries received while driving a mine mule. The jury, after a trial lasting several days, gave him $750.

Bureau of Mines Car No. 8 has left here for West Virginia under orders to stay there until July, in connection with a mining school. Car No. 3, in charge of Dr. August F. Knoefel and G. T. Powell, now at Evansville, will start on a training trip through the southern Indiana field. J. W. Paul, head of the government's mine rescue work, who stopped here on his way back to Pittsburgh from Royalton, Ill., where 327 men were caught by an explosion and all saved but about 50, said the bureau men worked 18 hours without stopping and with their breathing apparatus on all this time.

ILLINOIS

Percy—The mine near here, belonging to the Missouri & Illinois Coal Co., St. Louis, has closed down for an indefinite period of time. The output of this mine, for some years past, has been sold as company fuel to the M. & O. R.R. through a St. Louis coal company controlling most of the mines on the M. & O. Lack of business in the commercial field has compelled the St. Louis company to tighten up on outside coal and give their own product, as much as possible, to the railroad.

Murphysboro—The Big Muddy Coal & Iron Co. of St. Louis has bought the mine of the Gus Blair Big Muddy Coal Co., situated north of here on the M. & O. R.R. It was reported a few weeks ago that this mine would be abandoned on account of failure to obtain any further acreage. The Big Muddy people have, however, a tract of several hundred acres adjoining and it has been decided to purchase the Blair mine and work this acreage through the Blair shaft. Of the five mines in the Big Muddy field, three will now be controlled by the Big Muddy Coal & Iron Co., one by the

Gus Blair Big Muddy Coal Co., and the other by the Gartside Coal Co. of St. Louis. Another company formerly operating in this field, the Schmidgall Coal Co., abandoned its mine about two years ago.

Royalton—Operations were resumed Nov. 2 at the Franklin Coal & Coke Co.'s mine near here, which has not been operating since the recent disastrous explosion in which somewhat over 50 lives were lost.

Canton—The Mine Rescue Car, under the management of Messrs. Thomas Rogers and Thomas Trigg, has been moved to Dunfermline, where first aid and helmet work lessons will be given. The car was in Canton for approximately three weeks.

Springfield—It is stated by officers of the United Mine Workers that mine after mine has been closed throughout the state during the past two weeks and that the coal mining industry is decidedly disorganized. The conditions now facing the miners are said to be the worst in the history of the state exclusive of strike years. The general business depression existing throughout the United States is blamed as the chief cause of the bad conditions.

IOWA

Knoxville—The old Hawkeye mine, a short distance east of this city, and for many years the largest coal producer in Knoxville Township, has been permanently abandoned. The boilers and engines have been removed, and the rails and timbers torn out. During the past 16 years it is stated that over 750,000 tons of coal have been loaded onto the Rock Island tracks at Hawkeye.

FOREIGN NEWS

Edmonton, Alta.—J. T. Stirling, provincial inspector of mines for Alberta, reports that the coal mining industry of that province is at present in an unsatisfactory condition. In the Lethbridge and other Southern fields only about half the mines are working and they are on half time. Conditions are better in the Edmonton district, where the majority of the mines are fairly busy. The demand for coal this season has been light and the price has been lower than for some years, so that production at prevailing figures is unprofitable. As none of the dealers are laying in stocks a cold spell of any considerable duration may result in a shortage in the coal supply.

Glace Bay, N. S.—The production of the Dominion Coal Co.'s mines at Glace Bay and Springhill, N. S., for the 10 months ending with October is roughly stated at 4,071,000 tons as against 4,284,489 tons for the corresponding 10 months of 1913. While production at the Glace Bay mines has been curtailed owing to trade depression and the war, the output of the Springhill collieries, which have worked without interruption, has increased from 318,510 tons to 341,000 tons.

PERSONALS

Harry Dale, for many years past with the St. Louis Carterville Coal Co., and in charge of the Dale mine of that firm, has resigned his connection with the company and will engage in the mercantile business.

Joseph Pursglove and T. K. Maher, of the Pursglove-Maher Coal Co., have just returned from Logan County, West Virginia, where they inspected a piece of coal land. They are satisfied with the property and will probably close for it in the next two weeks.

Col. Harvey M. LaFollette, who was president of the LaFollette Coal, Iron & Ry. Co., at LaFollette, Tenn., prior to the appointment of a receiver on Dec. 23 last, and who has since been making his headquarters in New York, spent several days recently at LaFollette, Tenn.

H. C. Hequembourg has resigned as general purchasing agent of the American Locomotive Co., effective Nov. 15. It is not the intention to appoint a successor at this time, but until further notice the purchasing and storekeeping departments will be under the jurisdiction of Leigh Best, vice-president of the company.

John Whelan, Jr., formerly with M. A. Hanna & Co., of Cleveland, and general superintendant of the Massillon Coal Mining Co., of Massillon, O., has resigned these positions and gone with the Copen Creek Coal Co., as vice-president and general manager. This company has mines at Webster, Braxton County, W. Va.

W. P. Bross, general salesmanager for the Midland Coal Co., Kansas City, accompanied by U. A. Ralston, a salesman for the company in northern Kansas, is making a trip through the company's mines at Liberal, Minden and Pittsburg, Kan., for the purpose of learning how many cars can be expected for use this winter.

J. M. Roan, chief mine inspector of Ohio, was called to the Hocking Valley recently to settle a dispute over the weighing of coal at Mine No. 207 of the Sunday Creek Co. The company had been weighing the coal by building a bin under the scale and weighing the lump first and the fine coal second, with the same scales. This plan was approved by Mr. Roan.

Dr. W. A. Lynott, of Scranton, has recently been appointed a member of the medical and specialist staff of the Federal Bureau of Mines, by Doctor Holmes. Doctor Lynott was recommended for the position by a number of Philadelphia specialists with whom he practiced. He reported for duty on Nov. 1 at Pittsburgh and will have charge of the eye division of the medical bureau.

Erskine Ramsay, vice-president of the Pratt Consolidated Coal Co., was seriously injured, Nov. 7, suffering concussion of the brain caused by striking his head against the side of a barge. Mr. Ramsay, along with about 25 guests of the Pratt company, was at the shipyards at Holt, Ala., to celebrate the launching of the first barge by the company on the Warrior River. Mr. Ramsay stayed in the barge while it was being launched, and as it struck the water it tilted upward, throwing him against a beam. While his injuries are serious, it is stated that he will recover. He is one of the best known coal men and engineers in the country.

John Girdler, a coal dealer in Beverly, Mass., received congratulations Nov. 11, on the occasion of his one hundredth birthday. Mr. Girdler was born in Manchester, Mass., in 1814 and after an active business career in fitting out and managing vessels engaged in the Newfoundland fisheries he entered the coal business in Beverly in 1861 at an age when some men retire. He has since then been continuously in that business and on the same wharf, a prominent factor in the trade of that vicinity. Mr. Girdler enjoys excellent health and were it not for his slightly impaired eyesight he says he would be in as good condition as five years ago when he was giving close attention to every detail of his business. As it is, he stays at his office through the morning of each business day and takes a lively interest in market conditions and in what wholesale coal salesmen have to tell him. His friends wish him continued health and prosperity.

CONSTRUCTION NEWS

Ebensburg, Penn.—Active preparation for the manufacture of mine cars was recently begun at Colver. The shops of the company have been renovated and rearranged for that purpose, and some of the new machinery is already placed.

Massillon, Ohio—The Baltimore & Ohio R.R. has started to build a switch to Charlotte Mine No. 27 of the Massillon Coal Co. at Pigeon Run, which will soon be opened. Operations are expected to start Dec. 1 with 250 men.

Cleveland, Ohio—O. C. Barber, former "match king" and "millionaire farmer" of Summit County, is interested with Daniel Willard, president of the Baltimore & Ohio R.R. Co., in a Cleveland, Ohio, company which will spend more than $9,000,000 in reclaiming land and building vast coal and ore docks on the Cleveland lake front.

Floodwood, Ohio—The announcement is made by the officials of the Hocking Power Co., which is building a large power plant at Floodwood, that a portion of the plant will be completed by Dec. 1, when current will be sold. The work of constructing the service lines to carry the current to surrounding mines has been started. The company will furnish current to light 11 municipalities.

Buffalo, N. Y.—The Wickwire Steel Co. has filed with the Erie County Clerk a mortgage for $2,500,000 issued by the Bankers' Trust Co. of New York, the proceeds of which is to be used to enlarge its iron plant on the Niagara River between Buffalo and Tonawanda. A new wire works and byproduct coke plant are planned. The project is not new but it was supposed that nothing would be done till business revived.

West Union, W. Va.—The opening of new coal lands in various parts of West Virginia at present is calling for the construction of several railroads for the private use of the coal companies, which later may become a part of the general transportation system of the state. This has happened in a number of instances in the past, both in coal and timber land developments, and is usually a part of the plan of the companies in constructing new roads for private use.

Harlan, Ky.—M. P. Dotson, a capitalist of Wise, Va., and Pasadena, Calif., has been constructing a railroad from Ages to Evarts, a distance of about four miles. This road connects with the Louisville & Nashville at Ages. It is reported that it has been turned over to the L. & N., and that the engineers of this corporation will complete it. The finishing of this short line will open a market for some of the best coal in this field. It is thought that this is he beginning of a line that will connect with the Louisville & Nashville R.R., probably at either Big Stone Gap or at Appalachia, Va.

Huntington, W. Va.—C. W. McNulty, of Huntington, has been awarded the contract for the construction of the new central power plant of the Logan County Light & Power Co. at Logan. The building will be of fireproof construction throughout and the smokestack will be of brick 200 ft. high. Construction work will be started immediately and pushed as rapidly as possible with a view to having the power system in operation by Sept. 1, 1915. The turbines to be installed have already been contracted for and will have a capacity of 10,000 kw. The transmission line will extend to every mine in the Logan coal field with a total length exceeding 60 miles.

Fayetteville, W. Va.—The Virginian Power Co. is installing new electrical equipment in all the mines of the New River Co. The contract has been made with the central station company for a supply of alternating current, and the equipping of the mine with new machinery is under way. The equipment supplanted by the new electric power is to be sold. Two hundred and fifty and 550 volts have been standard in these mines since they were first electrified, and to save expenses these two voltages are being retained for haulage. The heavy pumping and ventilation equipment will be driven by 2300-volt current, and the lighting will be changed from 250 or 550 volts direct current to 110 volts alternating current.

NEW INCORPORATIONS

Joliet, Ill.—The Dermy Coal Co. has increased its capital stock from $100,000 to $200,000.

Cleveland, Ohio—The McCurtain Coal Land Co. has been organized with a capital stock of $50,000, to handle coal lands. Those interested are C. M. Horn, Paul J. Bickel, E. L. McCloskey, I. L. Evans and J. B. Putnam.

Nelsonville, Ohio—The B. R. Coal & Mining Co. has been incorporated at Nelsonville, Ohio, with a capital stock of $10,000. M. E. Pike, E. M. Patterson, F. W. Postle, A. L. Peters and Ralph Merchant are incorporators.

Fort Smith, Ark.—The Blue Ridge Coal Co., of Fort Smith was recently chartered with an authorized capital stock of $30,000. The officers are J. B. Jordan, president, C. E. Warner, vice-president, and H. P. Warner, secretary and treasurer.

East St. Louis, Ill.—One of the largest of the local coal carrying roads, the East St. Louis & Suburban R.R., has reduced its capital stock from $14,000,000 to $1,000,000, according to papers filed with the secretary of state in New Jersey. The company has reincorporated in Delaware with a capital of $12,000,000.

INDUSTRIAL NEWS

Columbus, Ohio—The report of the Hocking Valley Ry. for the month of September, 1914, shows a falling off of $51,000 in gross earnings from the figures of September, 1913. The net income was $169,634, or a decrease of $26,110.

Huron, Ohio—Supt. Gilmore, of the Wheeling docks at Huron, Ohio, is making arrangements for the accommodation of several lake freighters that will go into winter quarters at that place at the close of the navigation season.

Fayetteville, W. Va.—The Kanawha Coal Operators' Association recently held its annual session in Cincinnati, electing officers and discussing policies for the ensuing year. The reports of officers were heard and approved, the meeting being purely routine.

Louisville, Ky.—Delegates to the winter meeting of the Kentucky Mining Institute, which will be held here next month, will represent mines in which more than 30,000 miners are employed. The Engineers & Architects Club will hold joint sessions with the Institute.

Columbus, Ohio—Persons who have been given short weights in coal are requested to communicate the facts in the case to Fred C. Albrecht, sealer of weights and measures, and he will investigate all such complaints. This request is made to further the campaign against short weights claimed to be prevalent in many parts of Ohio.

Buffalo, N. Y.—The principal office of the J. B. Jenkins Coal & Coke Co. has been moved from Cincinnati to Buffalo by W. H. Hufstader, the vice-president, who left the Buffalo agency of the Pittsburgh & Buffalo Co. last year to take the new position. By the present arrangement the Jenkins company will sell the Pittsburgh & Buffalo company's coal in the Buffalo territory.

Sydney, N. S.—The Dominion Coal Co.'s combined collieries, Nos. 2 and 9, recently made a remarkable record. The ouptut of No. 2 for the single shift was 3961 tons, while No. 9 yielded 2087 tons. This made the combined total of 6048 tons for the shift. Both pits are worked by the same organization and the coal is hoisted through a common shaft. It is believed that but few mines in the world have ever passed the 6000-ton mark in a single shift.

Harrisburg, Penn.—The production of anthracite coal during October was heavier than that for October of last year despite the drouth which rendered mining difficult. The official statistics of shipments over 8 railroads announced by the Bureau of Anthracite Statistics, show 6,644,476 tons. The shipments in October of last year were 6,338,194 tons. However, production as a whole is still over a million tons less than during the first 10 months of last year.

Youngstown, Ohio—The establishment of a municipal coal yard in this city is being agitated by members of the city council, on the ground that such a business could supply fuel cheaply for city purposes, and could also take care of the annual charity coal distribution made by the city, as well as sell cheaply to the public. The plan has arisen in connection with charges made against a number of dealers of selling short weight, which have not so far been substantiated.

Jefferson City, Mo.—During the next four weeks the Public Service Commission will take charge of a test weight car operated by the Federal Bureau of Standards, and will test all master scales in the state and also every railroad scale. This will be the first governmental test of railroad scales in the state, and it is expected to lighten the troubles of the Commission from the continued complaints from shippers of coal both within and without the commonwealth as well as the consumers.

Lexington, Ky.—The output of the mines of the Consolidation Coal Co. in Letcher County is now between 70,000 and 90,000 tons a month as compared with from 90,000 to 110,000 tons for last year. The whole output for the country will be decreased probably from 200,000 tons, a normal average, to 100,000 tons monthly, until early spring, when, it is hoped, the market will open up again. All over the section the operators are relying on little besides domestic trade and have cut their production accordingly.

Toledo, Ohio—The Royal Collieries Co. has moved its general offices from Jackson, Ohio, to Toledo and is located at 1046 Ohio Bldg. E. W. Ervin is general and sales manager of the concern and Eben Jones, of Jackson, Ohio, president. The concern, which was recently reorganized, has mines in the Jackson Hill field of Ohio and also owns the Kentucky Gem mine at Offut, Ky. The concern also owns coal lands in that section and is planning to open up new mines which will triple the present output from the Kentucky fields.

Baltimore, Md.—Dismissing the suit of James C. Cobey and other stockholders of the Fairmont & Baltimore Coal & Coke Co. for the appointment of a receiver for that firm, Judge Dawkins in an opinion handed down Nov. 4 in the Circuit Court exonerates Alvin P., Howard and Irving Adams from all the charges made against them in the bill of complaint. It was alleged that the Messrs. Adams owning a controlling interest in the Fairmont & Baltimore Coal & Coke and other companies had conspired to defraud the complainant and the Fairmont company by selling coal mined by the latter to the Hamilton company at a price below market value. It was alleged that $30,000 had been lost which made the Fairmont company insolvent.

St. Louis, Mo.—Over 150 coal men of St. Louis and vicinity made a tour of inspection of the largest gas plant in the West, station A of the Laclede Gas Light Co., here, last Saturday afternoon, after which they were taken in a special train to the extreme southern limits of the city to view the huge new plant of Koppers byproduct retorts. The first battery of ovens is about completed but it will be the middle of the coming year before they will be put in operation. The entire party was taken back to the Century Boat Club where a banquet was tendered them and entertainment furnished. The inspection was made under the direction of the M. W. Warren Coke Co. of St. Louis, Western representatives of the Consolidation Coal Co., and the speakers of the evening were Secretary Woods of the Warren Co., W. F. Heinecke and E. J. Wallace of St. Louis.

Coal Trade Reviews

General Review

Anthracite marking time pending more seasonable weather. Bituminous operators becoming discouraged at the long delay in the expected improvement. Shortage in ocean freights.

The recent cold snap has caused a mild rush for hard coal and some difficulty is experienced in getting certain specific sizes but as a rule stocks are plentiful and the movement prompt. The current trade is showing a marked tendency to drag and the market lacks its customary fall snap. The situation hinges almost entirely on the weather, as is evident by the sharp activity in the dealer trade as a result of the recent low temperatures. Mine operations are still somewhat restricted.

Although the bituminous agencies continue optimistic as to the future, it is noted that many of them are beginning to question when the turn will occur. Some slight improvement was reported at certain isolated points during the week, but it is difficult to see any general movement in that direction. Spot business is at a minimum, while stocks continue at the maximum and with large volumes standing at some of the terminals, it is evident that much demurrage is accruing. Even the high grade coals which seldom suffer in a heavy market are beginning to feel the effects of the heavy pressure. But developments of a constructive nature are not entirely absent; some renewed inquiries for foreign shipments have developed and the market cargoes, so much in evidence recently, have been practically all cleaned up.

Ocean freights are looming up as an important factor in the situation. There is an authoritative estimate that the British Government has 1500 steamers under charter, which, together with the fact that practically all the German shipping is interned in neutral ports, has resulted in a shortage in vessel tonnage, causing a sharp advance in rates.

The current week witnessed a final winding up of Lake shipping out of the Pittsburgh district, and operations are down to 50% capacity; an attempt on the part of some of the producers to establish a new circular has met with only partial success. The closing of Lake shipping has caused a sharp restriction in Ohio also. With plentiful transportation facilities, and the surplus coal from the Lake trade, a demoralized market might be anticipated, but the situation has been unexpectedly well maintained so far. Prices are suffering and the production is much curtailed with many mines closing down entirely rather than flood the market. Southern operators are already beginning to anticipate the usual competition with the coals released from the Lake trade and prices are lower and very irregular. The fall business is so slow in opening up that the outlook is regarded as most discouraging.

A better tone to general business has created a more hopeful spirit in the Chicago market, and prices have been exceptionally well maintained in view of the adverse weather conditions. Considerable coal was shipped from the mines on consignment, in anticipation of colder weather, and this has proved a heavy burden to the market. Buying is confined more particularly to the domestic grades.

ATLANTIC SEABOARD

BOSTON

No change in the generally depressed market, although a better foreign demand is expected by some. New England stocks large. Pennsylvania coals on demurrage are offering at low prices. Georges Creek shippers secure some foreign business. Anthracite continues dull.

Bituminous—The week has developed no change in the generally depressed situation. A renewed foreign inquiry for special grades has encouraged a few of the shippers but the tonnage is relatively small and there cannot be said to be any favorable turn in prices at Hampton Roads. The Pocahontas and New River agencies have about despaired of finding any market coastwise for the present and the number of offerings the past few days has been noticeably less. A large volume of coal is still standing at all the terminals, the dumpings lately having been insufficient to materially reduce the accumulations of other weeks. Some heavy demurrage charges must have accrued during October.

Minimum prices continue to be heard, but the amount of spot business actually placed has been negligible. Stocks in this territory have been so large all season that with most plants it has been a physical impossibility to take on even the coal that was contracted for. The market cargoes lately offering at the various Eastern distributing points have now been practically all absorbed and delivered prices are somewhat steadier in consequence. Mills, however, are cancelling orders and the outlook for fall business is not encouraging.

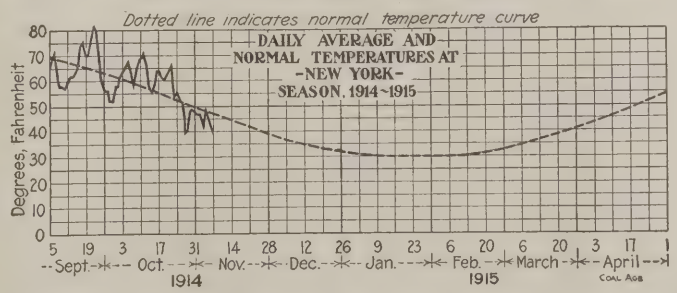
There have been further reports of Pennsylvania shippers with distress coal on their hands at New York and Philadelphia. Prices on first-class Cambria County coals have receded to the lowest level since the slump in April, 1912, and it may be that quotations will drop still further. The dullness of the bunker trade has an unfavorable effect all over the market.

Georges Creek is sharing in some of the off-shore business that has lately come up, judging from the number of foreign ships at the Curtis Bay piers. The New England demand is as light for this grade as for all the others.

Anthracite—The cooler weather is expected to cause a better demand on the companies but at this writing the trade is unusually dull. Many of the anthracite barges are available for the bituminous trade.

Quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*.....	$0.85@1.45	$1.15@1.50	$1.67@1.77	
Philadelphia*.....	2.10@2.70	2.35@2.70	2.92@3.02	
New York*.....	2.40@3.10	2.65@3.05	3.22@3.32	
Baltimore*.....	.....	.....	2.85@2.95	
Hampton Roads*.	.....	.....	.....	$2.50@2.75
Boston†.....	.....	.....	.....	3.45@3.73
Providence†.....	.....	.....	.....	3.30@3.68



* F.o.b. †On cars.

NEW YORK

Bituminous still awaiting an improvement in basic conditions. Trade slow and heavy. Large stocks of anthracite on hand and business slow but the general tone is excellent.

Bituminous—The raising of the embargo at South Amboy toward the close of last week seems to be the only encouraging development in the local situation. Operators continue optimistic regarding the future, but many of them are becoming uneasy over the long delay. Undoubtedly the situation hinges on developments in industrial lines, more particularly steel, any improvement in which, will be quickly reflected on other industries.

An excellent bunkering trade is having a steadying effect upon the situation, one of the important companies engaged in this business reporting the largest tonnage in its history last month. This is accounted for by the heavy export movement of grain, which has reached to such proportions that vessel tonnage is relatively short and in urgent demand. The heavy orders from abroad for various manufactured articles

including munitions of war, are also having a beneficial effect, it being noted that some plants are going on full time operations and a few on double time.

The technical position of the market is quite favorable considering conditions. Supplies are plentiful but still within reasonable limits and though low prices are occasionally noted, it is evident that not much coal is coming down on speculation, operators holding their production down rigidly.

The market is quotable on about the following basis: West Virginia steam, $2.50@2.60; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The hard-coal trade has slowed up somewhat as the result of the long continued mild weather, but a few more seasonable cold snaps will soon readjust this phrase of the situation. At the present time the main objectionable condition in the anthracite trade is the large stocks which are the inevitable result of the record breaking production last month, and the light consumption incident to the mild weather.

Plenty of stove coal is available, for the time being at least, at the regular circular and it is now in as free supply as most of the other grades. A continuance of the recent cold snaps will also bring about an active situation on pea and egg coal, when the apartment house demand gets fully underway. Even as it is dealers are now experiencing a mild rush and this will be gradually accentuated as the season advances. As a rule the steam sizes are weak and in poor demand.

The New York hard-coal market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	5.00@5.35	5.30	4.90@5.30
Stove	5.35	5.25	5 30	5.30
Chestnut	5.60	5.45@5.60	5.55	5.30@5.55
Pea	3.55	3 45@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.70@2.80	2.50@2.75	2.15@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.60@2.25
Barley	1.80	1.70@1.80	1.75	1.40@1.75

PHILADELPHIA

More seasonable weather creates an improvement in anthracite. Domestic sizes in good demand, and better call for steam grades. Bituminous trade still apathetic, with little prospect for any improvement.

Anthracite—More seasonable weather the past week brought calls from the house holders, which depleted the stocks of the dealers to the extent that there were increased calls on the wholesale operators. Stove and chestnut seem to be leading the van at present, while egg is showing a tendency to drag. Individuals are now concentrating their efforts to move egg at liberal concessions from the circular, and the large companies find themselves rather hard put to get rid of this size, in conjunction with the others. There seems to be a better call for pea, buckwheat and rice, particularly the former. This indicates that the small house holder is coming into the market, as pea coal is looked on as a domestic fuel, and is used largely for that purpose.

Prices at Tidewater about as follows:

	Circular	Individual
Broken	$4.75	$4.60 @ 4.70
Egg	5.00	4.65 @ 4.75
Stove	5.00	5.10
Chestnut	5.25	5.00 @ 5.10

Bituminous—Nothing favorable occurred during the past week that could be construed into the supposition that the bituminous trade was on the upward trend. Prices still continue low, even for the better varieties, with the demand considerably less than the supply. Extended cold weather may create a better demand, but the industrial depression continues, and improvement along these lines is the only salvation.

BALTIMORE

Colder weather creates a better feeling in anthracite. Soft coal conditions not at all satisfactory. Prices on the better grades are suffering.

More seasonable weather has come to aid the hard-coal dealer. Many householders have been forced to buy and most of the dealers have received fair orders the past week. The stocks on hand remain liberal, however, and in addition a prompt movement is reported. Some dealers have trouble in getting through special sizes as desired, but it is at no time serious. From now on about an average winter, or perhaps a little better than average, should be experienced by the hard coal dealer, though lack of employment that has hit many small homes may make some difference.

There is not much encouragement in the bituminous situation. Operating interests of West Virginia, Maryland and Pennsylvania all report a poor demand for fuel of all grades. In the past the better coals have usually held up in periods of stress, but the present depression has apparently hit all about alike. West Virginia three-quarter gas coals are selling around 85c., with slack about 50c., this latter being the only grade to show a gain in the past two or three weeks. Western Maryland coals are offering to the trade at from 75 to 85c. Pennsylvania off qualities are on the market at from 95c. to $1.10. Best coals are still maintained around $1.35 to $1.40.

HAMPTON ROADS

Movement for the week shows up well. No change in prices. Total dumpings for October 981,507 tons.

Dumpings over the piers at Hampton Roads for the week show up well. Some large cargoes have gone coastwise and the foreign movement has been good. Although Custom House records showing foreign clearances are not available it is understood that some heavy cargoes have gone to Rio de Janeiro, Montevideo, Genoa, Naples, Cardenas, and Port of Spain. Even though there is still a small excess of coal on hand above normal, suppliers are making no reduction in price on any of the various grades and there is no prospect of any cut being made; in fact the outlook is for a heavy movement during November and there may even be a slight advance in price on some of the grades.

The total dumpings at Hampton Roads piers for the month of October amounted to 981,507 tons of which quantity the Norfolk & Western dumped from Lamberts Point 436,647 tons, the Chesapeake & Ohio Ry. from Newport News 295,926 tons and the Virginian Ry. at Sewalls Point 248,934 tons. A comparison of figures for October of this year with the same month of last year shows that both the Virginian and Norfolk & Western fell down somewhat in their dumpings while the Chesapeake & Ohio made a fair gain. The total dumpings for October 1914 are about ten thousand tons ahead of the movement for the same month last year and although this gain is small there is some satisfaction in knowing that it was made under very different market conditions from last year.

OCEAN FREIGHTS

British Government believed to have 1500 steamers under charter. Vessels scarce and rates advancing rapidly, with the market hardly quotable.

It is almost impossible to quote rates on coal from this country to foreign ports with any degree of accuracy at the present moment, as the freight market is advancing daily owing to the increased demand for steamers for grain, general cargo, time charter, etc., and the scarcity of available November tonnage. We believe that the British Government now has under charter 1500 steamers.

Mediterranean rates we would quote at from $4.80@6, but owners favor grain under present conditions. Early last week we had a neutral steamer offered for coals from a United States port to Montevideo at $3.72, which was a very reasonable boat on the market, but since then the Dutch steamer "Hercules," 1372 tons net register, has been chartered to load coal at Baltimore for River Plate at $4.08. To the West Coast of South America, steamers are available at reasonable figures, as a few owners desire to place their boats in this position, and we would quote the rate to Valparaiso at $4.32, with 750 tons a day for discharging.—W. W. Battie & Co.

COAL CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Sunlight		Baltimore	Calais	349	
Mary F. Barrett		Baltimore	Galveston	1564	
Geo. H. Ames		Norfolk	Savannah	378	
Isle of Jura	British	Baltimore	Genoa	2485	
Dustin G. Cressy		Baltimore	Mayport	726	
Chas. H. Klinck		Philadelphia	Biddeford	4444	$0.95
Nonetta M. Porcella		Baltimore	Bangor	466	
Thomas H. Lawrence		Philadelphia	Rockland	323	0.90
Farmand	Norwegian	Philadelphia	Caribbean	861	
Margaret Haskell		Baltimore	Portsmouth	1870	

Note—Steamers are indicated by **bold face** type, all others being schooners.

LAKE MARKETS

PITTSBURGH

Some sellers have named new circular prices at $1.20 for mine-run, 10c. reduction from last season's prices, and are openly quoting prompt at a further reduction of 5c., but with scarcely any buying at any price. Lake shipments about over. Operations at not over 50% with prospects of 25 or 30% within a fortnight.

Some of the operators have announced new season prices, but others have refused to do so, regarding present conditions so poor that no circular could be maintained, and they are nominally quoting on the old basis—$1.30 for mine-run—expecting to name real prices about Apr. 1. The new schedule as announced by some operators is as follows: Slack, 85c.; nut and slack, $1.05; nut, $1.15; mine-run, $1.20; ¾-in., $1.30; 1¼-in., $1.40. For spot lots they are quoting 5c. less on mine-run and screened coal, but do not name corresponding

prices on slack and nut, prompt quotations being: Mine-run, $1.15; ¾-in., $1.25; 1¼-in. $1.35. There is no inquiry for contract coal so that the prices are practically nominal. As to prompt, there is occasional buying in a small way, but it is not probable that the prices quoted will generally obtain in the market during the next few weeks, because of the large surplus of productive capacity.

Slack for prompt shipment has continued to firm up, with the approaching end of the Lake shipping season, and in the past few days it has been firm at 60c., although selling at 50c. a fortnight ago and at as low as 40c. a month or six weeks ago.

This week has seen practically the end of shipments in the Lake trade, though a few belated lots may go forward next week. The insurance expires Saturday, Nov. 21.

The Pittsburgh district is operating at an average rate of not over 50% at the outside, and many mines are closed entirely or operating only one or two days a week. Within a fortnight production is likely to be down to 25 or 30% on account of the cessation of Lake shipments. There is a slight improvement in domestic demand, but the manufacturing demand is tapering off still more, and is not more than 50% of normal.

BUFFALO

Tone of the bituminous market not improved. Mines running very slow. Small prospect of activity this fall, on account of heavy overstock. Anthracite doing well.

Bituminous—Some operators in the Allegheny Valley state that they are now running scarcely more than two days a week and that it is difficult to sell even this reduced output. This is an extreme view of the situation, but it shows how deep the despondency is. But in spite of all this the bituminous trade is making a little money, at least where it is possible to mine the coal at moderate cost, and for that reason the operators refuse to take the off-hand advice of disinterested friends and shut down for the winter. They know full well that the working capacity of the bituminous mines is far beyond the needs of the country but it only takes a short period of car scarcity to advance prices and put them on their feet again.

So the output is kept up to the limit of the consumers' storage capacity in anticipation of the inevitable swing of the pendulum to the other extreme. In the meantime there must be waiting as there is considerable coal on track yet. Quotations are kept as near the spring circular as possible, some coal still selling on the basis of $2.80 for best Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with slack more active of late than sizes. Allegheny Valley sizes are quoted 25c. lower than Pittsburgh.

Anthracite—The trade is fair, perhaps even better than should be expected, considering the very warm weather so far this fall as indicated by our temperature charts.

The Lake movement keeps up well, considering the amount already on the Upper-Lake docks and it looks as if the shippers would go on till the lakes are closed by ice, as they usually do. Shipments for the week, according to the custom-house report, were 120,000 tons, covering ten receiving ports, which shows that the smaller Lake towns are laying in their last supply for the season from that source.

TOLEDO

Warm weather causes a restriction in the trade. Market heavy, but a better feeling prevails.

Warm weather has again caused a relapse in the domestic coal trade, which had improved materially during the brief cold spell. The steam trade has not been greatly improved, although dealers are hopeful that conditions will be better in a short time. Lake business continues, though it is far from being as heavy as it should be at this season of the year. There is no coal on track in this section, as it has practically all been cleaned up. Prices remain the same, but dealers seem to be holding closer to the list.

CINCINNATI

Continued mild weather has prevented a revival in domestic business. Steam demand still weak owing to industrial conditions. Prices holding well in view of the adverse conditions.

This section has been experiencing probably the mildest fall weather for several years. As a result few domestic consumers have as yet felt any need for fuel, and those who postpone their buying until cold weather are yet to be heard from. This fact, in connection with the practical certainty that most of the smaller dealers are not at all heavily stocked, makes it probable that the next cold snap will revive the domestic market very sharply. This will also help the steam business somewhat as there has been little call for screenings for heating purposes so far.

As to industrial demand there is practically none. The few manufacturers who have benefited by the war are greatly outnumbered by those whose foreign markets have collapsed entirely, and the industrial depression seems to be unimproved. Considering these conditions, prices are holding up very well indeed, the amount of distress coal offered being unexpectedly small.

CLEVELAND

Coal on track at the opening of the week aggregated 500 cars with a limited market, but no cutting of prices. It will take a week to clean up the market. The retail trade continues good.

Receipts over last Sunday, with what coal was carried over, amounted to 500 cars, mostly slack. The Pennsylvania R.R. had 260 cars; the B. & O. 150; the Big Four, 40; the Nickel Plate, 20; and the Wheeling 30. Not to exceed 60 cars were coarse coal. Operators and jobbers last week filled up the local trade and the market was limited as a result.

Very little of the coal on track was consigned. Most of it was brought in on contract or sent in to clean up mine tracks where Lake coal is being made. This week practically closes the Lake shipping season and jobbers and operators are working to divert shipments to northern Ohio markets away from Cleveland.

Panhandle, Youghiogheny, Goshen, Cambridge, No. 8 strip vein from Ohio mines, West Virginia No. 8, Fairmount, Hocking, and Pomeroy slacks were on track. Hocking was held at $1.50, which has been the current price for the last few weeks, while the others were quoted at $1.65 to $1.70.

The domestic trade is holding up well and sales are steady, but not of real winter proportions. Pocahontas and other prepared coals are not easily obtained. They are held firmly at quotations and there is enough demand to absorb the present production.

The Northwestern Fuel Co. shipped its last coal from Lorain and Toledo this week and will use only one boat for storage coal. Most ships leaving Lake Erie for Upper Lake ports are carrying storage coal. There is less coal being shipped now than in the middle of July and there is nothing to indicate there will be the customary rush the last two weeks.

Quotations for shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmount	W. Va. No. 8
Lump	$3.75	.....	.....	.....	.....
Lump, 6 in.	.....	.....	$2.45	.....	.....
Egg	3.75	.....	.....	.....	.....
Egg, 6 in.	.....	.....	2.10	.....	.....
Lump, 1¼ in.	.....	$2.40	2.25	.....	.....
Lump, ¾ in.	.....	2.30	2.10	$1.95@2.00	$1.95@2.00
Mine run	2.75	2.25	1.95	1.85@1 90	1.90
Slack	2.40	1.65@1.70	1.65	1.65	1.65

COLUMBUS

Mild weather and the final slowing down in the Lake trade has caused a further slump. Steam business is still quiet and the market will be a weather proposition from now on. Small sizes are growing stronger.

The coal trade in Ohio is quiet. The domestic demand is small, due to continued warm weather, and the steam business is also slow. This, coupled with the fact that the Lake trade is nearing the end, appears to affect every phase of the market. Prices are suffering and the prospects for the future are not as bright.

Production is being considerably curtailed by the high temperatures and lack of steam demand, and many mines have been closed down almost entirely. On the whole the production in the Hocking Valley has been about 65% of the average, and in the strictly domestic fields even lower. Jackson and Cambridge reports not more than 40%, and in the Pomeroy Bend field the output is about 75% of the average.

Lake trade is on its last legs. The greater part of the final shipments are now loaded, and while some coal will be put on vessels for storage up to Dec. 1, this will not be sufficient to affect market conditions to any extent. The docks of the Upper Lake ports are congested and the interior movement is not large. The Lake season was not a good one from any standpoint.

Steam business is slow in every way. Buying on the open market appears to be one of the rules, and contracts are not being readily renewed. Railroads are taking a larger tonnage.

Prices in the Ohio field are:

	Hocking Valley	Pomeroy	Kanawha
Re-screened lump	$1.55	$1.65	.....
Inch and a quarter	1.50	1.55	$1.40
Three-quarter inch	1.35	1.40	1.35
Nut	1.15	1.25	1.15
Mine-run	1.10	1.10	1.10
Nut, pea and slack	0.35	0.40	0.35
Coarse slack	0.25	0.30	0.25

COKE

CONNELLSVILLE

No current transactions of note, but some inquiry for next-year furnace coke. Prices unchanged, with production and shipments decreased further.

Practically no furnace coke sales have been made for November. Three or four inquiries have developed for first half or all of next year, and as low as $1.70 is claimed to have been quoted for the six months. Nearly all contracts expire with this year, but consumers are not likely to be in a hurry to make fresh contracts. We continue to quote: Prompt furnace, $1.60; contract furnace, $1.75; prompt foundry, $2.15@2.50; contract foundry, $2.35@2.50, per net ton at ovens, the contract quotations being for the very best grades.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Oct. 31 at 205,964 tons, a decrease of 23,555 tons, and shipments at 207,004 tons, a decrease of 7128 tons.

BUFFALO

Little doing in coke, as the furnaces are running slow and many are shut down.

Prices are supposed to be at the bottom, where they will remain till there is a genuine stir in iron. It is expected that a revival will take place as soon as the lull has lasted long enough to permit business in general to take a long breath. Predictions of wholesale failures are not now heard and the European war cannot prevent us from consuming a large amount of iron. Coke prices remain on the basis of $4.25 for best 72-hr. Connellsville foundry, with stock coke $3.30.

BIRMINGHAM

There is absolutely no business being done in furnace coke, and foundry coke is in only slightly better demand.

CHICAGO

Coke is quoted at: Byproduct, $4.95; Connellsville, $4.75@4.90; Wise County 72-hr. (select), $4.25; gas coke, $4.25; furnace coke, $4.40@4.65.

THE STEEL INDUSTRY

Shrinkage in production continues, and November output will show a scaling down from October. Our pig-iron statistics show how the industry has been receding. In October, production was 1,783,045 tons, or 57,518 tons a day, against 1,882,577 tons in September, or 62,753 tons a day. The October rate was the smallest since January, 1911. The net loss in active furnaces in October was 18, there being 158 in blast as November opened, with 53,253 tons daily capacity, against 176 furnaces and a daily capacity of 60,427 tons one month previous. Many steel works furnaces have been blown out and the recent increases in pig-iron stocks of the steel companies are likely to add more furnaces to the idle list. Export trade in wire products is still good and there is fresh inquiry for barb wire. Horseshoe works will be able to run full until February on European orders.—"The Iron Age."

SOUTHERN

LOUISVILLE

Lake trade closing down, and this coal will soon be diverted to the Kentucky markets. Prices lower and very irregular.

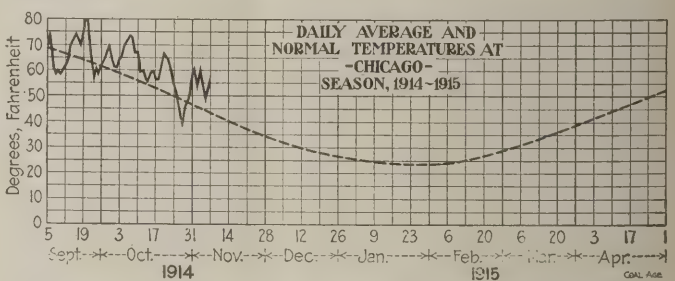
The improvement in the domestic demand, due to the low temperatures two days in succession, was only temporary. Industrial requirements seem to be even less than heretofore, while the shipping season on the Great Lakes is closing, and coal which was required there will soon begin to compete in Kentucky markets.

Prices are irregular and probably even lower than in October. This is accounted for by the fact that operators who have contracts for their high-grade coals are being forced to give their screenings away to get rid of them. The range of prices is very wide and is governed by the exigencies of each shipper's case and the conditions he has to meet. Lump coals are selling anywhere from $1.50 to $2.35, round from $1.10 to $1.75, and screenings all the way from nothing to 25 and 30c. and on up to 65c., according to grade; all prices are f.o.b. mines.

BIRMINGHAM

Lump market slightly improved but steam business is quiet. Bunkering trade a disappointment.

The past two weeks has shown little change in the Birmingham coal market. Business on lump coal may be a shade better, but the demand for steam fuel is so quiet, that it handicaps filling lump orders. While some steam coal is being shipped to Gulf ports for bunker purposes, this tonnage is not as large as had been expected, and the Birmingham operators are rather discouraged over this fact.



Many of the mines are closed down, and few are working more than three or four days per week. Blacksmith coal is holding its own; this grade has been more uniform both in price and demand for the past twelve months than any other grade, quotations ranging from $2 to $2.25 per ton f.o.b. mines for the better qualities. No immediate improvement is in sight on the lump and steam business.

MIDDLE WESTERN

CHICAGO

General dullness prevails. Summer weather lessens demand for domestic sizes. Anthracite market quiet. Prices of screenings rising, due to smaller production.

The only encouraging feature in this section during the past week has been the improvement in the demand for steam coals. This symptom of better conditions, which everybody in the trade is hoping for and which bids fair to lead to further advances in the near future, is said to be due to two causes. First, a material reduction in shipments, largely due to operators unloading screenings at the mines to be reloaded later when market conditions warrant. Second, a better tone in general business conditions in the Central West. Several manufacturers, particularly in Chicago and St. Louis, report the receipt of large orders for goods from foreign sources, and some idle plants have recently been reopened.

Chicago yards are full of coal, but a cold snap of any duration would soon change the situation radically. The colder weather only continued for a few days and made but little impression on the domestic trade. Prices for domestic sizes are holding astonishingly firm considering the weather conditions. Eastern coals seem to have benefited more from the fitful spell of cold weather last week than others, but have again resumed their former listlessness.

Franklin County coals have somewhat weakened this week; there is an over-supply of all sizes, and some coal has been moved at prices ranging from 15 to 20c. per ton under list.

There has been some reduction from circular quotations in the price of anthracite, but the tonnage moved is relatively small.

Prevailing prices are as follows:

	Franklin Co.	Springfield	Harrisburgh	Sullivan	Clinton
Lump	$1.75	$1.50@1.75	$1.50@1.75	.....	$1.40@1.75
4-in. lump.	.....	.....	.....	$1.50@1.75	.....
Steam lump	.....	.....	.....	.....	1.20
2½-in. lump.	.....	.....	.....	1.35@1.60	.....
1½-in. lump.	.....	.....	.....	1.25@1.35	.....
Mine-run	.....	.....	1.10	.....	1.10
Egg	1.60@1.75	.....	1.50@1.75	.....	.....
6x3-in. egg.	.....	1.35	.....	.....	.....
Nut	.....	1.30	1.40@1.75	.....	.....
No. 1 nut	1.60@1.75	.....	.....	.....	.....
Screenings	0.50@0.75	0.35@0.75	0.40@0.75	0.45@0.65	0.35@0.50

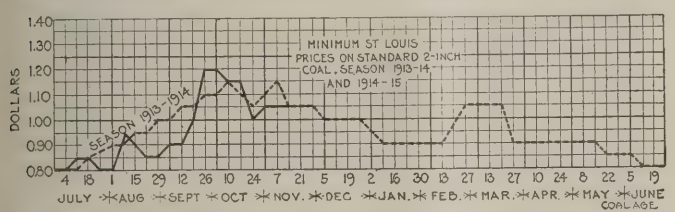
Hocking Valley 1¼-in. lump, $1.40@1.60; mine-run, $1.25.

New River and Pocahontas lump and egg, $2.25; mine-run, $1.35@1.40.

Somerset Smokeless lump and egg, $2.15@2.25; mine-run, $1.20@1.40.

INDIANAPOLIS

Indiana trade more cheerful. Some factories reopening and others are increasing forces. Mild weather makes a very poor market for domestic grades. Mine operations generally unchanged.



The weather is much against the trade. With the temperature well above normal as noted on the accompanying charts, the trade and prices are about on a par with the summer level. Slack has improved considerably, No. 4 selling at 80 to 90c. and hard to get on account of the light output of lump. Buyers who would ordinarily be taking eight to ten cars at a time at this season of the year are now ordering only two to three cars. The money situation has tended to reduce the size of orders and trading is largely on a cash basis.

The running schedule of mines has not changed much. Most of them are making half-time but some are doing better. The competition in the open market is keen, with resultant low prices made on occasions. Railroad buying is only moderate. There is considerable slowing down in the demand for coal from the large buildings in cities, the necessities being small in warm weather. These purchases are about one-third of what they are in normal fall weather. Buyers offer the minimum price for the free coal now on the market.

ST. LOUIS

Prices seem to have touched antirreducible minimum. Considerable coal on consignment. Number of mines shutting down.

The local market is practically at a standstill. Prices seem to have gone as low as possible and summer conditions exist. The only improvement the past week was in high-grad screenings, which increased a little in both price and demand. Not only is the steam market demoralized, which has been the case now for several weeks, but the domestic trade is also in a somewhat deplorable condition.

Anticipating cold weather, several of the operators shipped coal to different reconsigning points, with the result that there is an unlimited amount of coal on consignment. Continued warm weather has caused the retailers to shut off purchasing almost entirely; they are unable to take any of the coal, even at prices far below what that now in their bins cost them.

The prevailing wholesale prices are:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	....	$1.30	$1.05@1.10	$1.15@1.20
3-in. lump	.....	....	1.40	....	.....
6-in. lump	$1.40@1.75	....	1.50	1.25@1.35	1.30@1.35
Lump and egg	1.85@2.15	$2.25	.....	....	1.35
No. 1 nut	1.30@1.45	....	.....	0.75@0.80	.....
Screenings	0.40@0.50	....	0.80@0.85	0.15@0.25	0.20
Mine-run	1.05@1.10	....	.....	0.75@0.80	.....
No. 1 washed nut	1.50@1.60	2.25	1.60	....	.....
No. 2 washed nut	1.25@1.35	....	1.35	....	.....
No. 3 washed nut	1.05@1.15	....	.....	....	.....
No. 4 washed nut	0.95@1.05	....	.....	....	.....
No. 5 washed nut	0.20@0.25	....	.....	....	.....

Retail prices are: Franklin County and Carterville, $3.50; Mt. Olive, $3; Standard, $2.75; Pennsylvania chestnut, $8.50; egg and stove, $8.25; grate, $8; Arkansas anthracite, $7; West Virginia smokeless, $6@6.50.

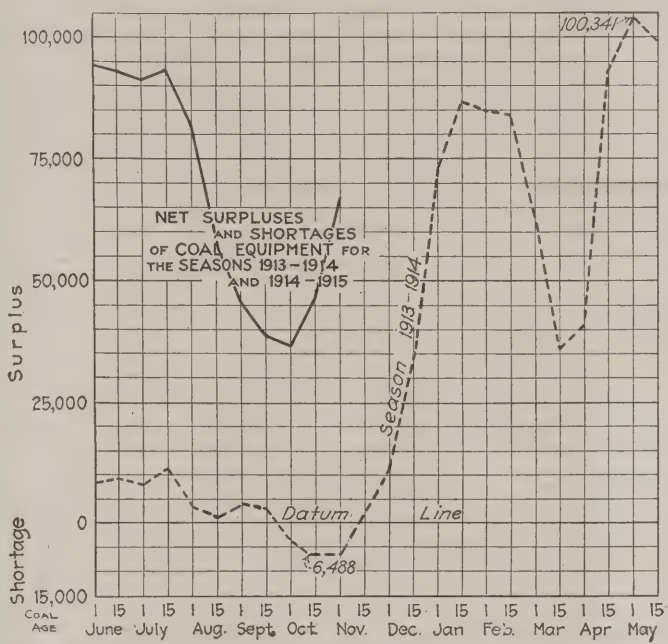
PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

Anthracite shipments for September and the first nine months of this year and last year were as follows:

	September		9 Months	
	1914	1913	1914	1913
Phila. & Reading	1,092,056	1,232,367	9,961,608	10,736,917
Lehigh Valley	1,391,144	1,162,850	10,941,943	10,834,778
Cent. R.R. N.J.	892,386	906,525	7,452,435	7,701,931
Del. Lack. & West.	990,570	895,252	8,128,793	8,253,236
Del. & Hudson	678,104	625,049	6,032,697	5,928,124
Pennsylvania	611,593	593,800	5,308,918	5,204,132
Erie	773,866	709,400	6,943,394	6,828,702
Ont. & Western	214,757	212,951	1,942,269	2,132,259
Total	6,644,476	6,338,194	56,712,057	57,620,079

SOUTHWESTERN TONNAGE



The following is a comparative statement of the Southwestern tonnage for February and March of the years 1913 and 1914:

State	February		March	
	1913	1914	1913	1914
Missouri	260,586	259,270	259,270	263,593
Kansas	414,413	492,304	492,304	501,841
Arkansas	130,888	113,354	113,354	165,037
Oklahoma	297,004	257,162	257,162	296,484
Totals	1,102,891	1,122,090	1,122,090	1,226,955

This statement only covers the tonnage of members of the association, which is estimated to be at least 95% of the entire production.

THE CAR SITUATION

The net coal car surplus on Nov. 1 was 67,345 as compared with 46,635 on Oct. 15. Detailed statement arrived too late for publication in issue and will appear next week.

FOREIGN MARKETS

ENGLAND

Trade heavy and unchanged. Vessel rates stiffen up.

The London coal trade continues slow. Prices are stationary, but with a tendency downward. Factories have bought for forward deliveries rather more freely, but the depot trade is weak.

Dear tonnage and high freights continue to act as a drag upon trade. On the Tyne this burden is acutely felt, the volume of business being very limited.

During the week the Miners' Federation of Great Britain has discussed the question of the relief of soldiers' and sailors' dependants, and the necessity for a state scheme dealing with unemployment, which is becoming serious.—"Colliery Guardian."

Oct. 23—Strong conditions are well maintained and there is a great scarcity of Admiralty List descriptions for early loading. Dry coals also are not easily obtainable, but Monmouthshire large and Cardiff smalls are in ample supply at present. Quotations are approximately as follows:

Best Welsh steam	$5.04@5.28	Best Monmouthshires	$4.02@4.08
Best seconds	4.56@4.80	Seconds	3.84@3.96
Seconds	4.38@4.56	Best Cardiff small	1.86@1.92
Best dry coals	4.92@5.16	Seconds	1.20@1.56

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, exclusive of wharfage and for cash payment.

Freights—Chartering is fairly active and rates steady at approximately the following figures:

Gibraltar	$1.68	Venice, Ancona	$3.00	Singapore	$2.64
Malta	1.68	Alexandria	2.40	Las Palmas	1.68
Marseilles	1.76	Port Said	2.28	St. Vincent	1.80
Algiers	1.56	Aden	2.40	Rio Janeiro	2.94
Genoa, Savona	1.86	Colombo	2.46	Monte Video	2.52
Naples	1.92	Sabang	2.46	Buenos Ayres	2.76

Coal Contracts Pending

Contract No. 4—Boston, Mass.—Rhode Island Co. is in the market for 90,000 to 100,000 tons of Pocahontas, New River, Georges Creek, or Somerset run-of-mine. Shipments are to be made in about monthly proportions for a year, and the point of delivery is Providence, R. I. All communications should be addressed to J. H. Sanford, Purchasing Agent, New Haven, Connecticut.

Contract No. 6—New York—The Connecticut Co. is in the market for 22,000 tons of a good grade, low volatile, low ash, low sulphur bituminous coal for 10 months, Nov. 1, 1914 to Sept. 1, 1915. Shipments are to be as required f.o.b. boats, to be placed by the company at New York loading ports. Bids should be submitted to J. H. Sanford, Purchasing Agent, New Haven, Connecticut.

Contract No. 7—Zylonite, Mass.—The Berkshire Street Railway Co. is in the market for 21,000 tons of a good grade, low volatile, low ash, low sulphur bituminous coal for 10 months, Nov. 1, 1914 to Sept. 1, 1915. Shipments are to be as required and price to be made f.o.b. cars at mines for Tunnel Power plant at Zylonite, Mass., B. & A. R.R. Bids should be submitted to J. H. Sanford, Purchasing Agent, New Haven, Connecticut.

Contract No. 8—Portland, Ore.—Proposals for furnishing and delivering about 5000 tons of bituminous coal for use on the Dalles-Celilo Canal construction work will be received at the U. S. Engineers' Office, Portland, Ore., until 11 a.m., Nov. 27, and then publicly opened. All communications should be addressed to Major of Engineers, Jay J. Morrow, U. S. Engineers' Office, Portland, Oregon.

Contract No. 9—Fort Wayne, Ind.—The Municipal Light, Heat & Power Co., of Fort Wayne, is in the market for 20,000 tons of screenings. Deliveries are to be made in hopper bottom cars during the next year. Address the Municipal Light, Heat & Power Co., Fort Wayne, Indiana.

Contract No. 10—Chicago, Ill.—The Chicago Coated Board Co. is in the market for 300 tons of screenings per day. Deliveries are to extend over a period of one year, and to be made at Chicago, Ill. Address the Chicago Coated Board Co., 420 E. North St., Chicago, Illinois.

Contract No. 11—Portland, Maine—The Portland Gas Light Co. is in the market for 30,000 tons of Penn Gas, Westmoreland, or any good grade, three-quarter screened, gas producing coal for delivery between Mar. 1, 1915 and Mar. 1, 1916. Shipments are to be as required, about in equal monthly proportions, to wharf through one bridge, Portland, Maine, ample water alongside. All communications should be addressed to C. H. Tenney & Co., Managers, 201 Devonshire St., Boston, Massachusetts.

Contract No. 12—New York—The National Guard of New York is in the market for 2600 long tons of anthracite buckwheat No. 1, for use at the various armories in the Boroughs of Manhattan and the Bronx. Prices quoted should be delivered. Security aggregating 30% of the total amount involved in the contract will be required, together with an initial deposit of 1½% of the amount bid. Bids will be received at the office of the Mayor, City Hall, until 3:30 p.m., Nov. 16. All communications should be addressed to Armory Board, Room 6, Basement, Hall of Records, Manhattan, New York.

Contract No. 13—New York—Sealed bids or estimates are requested by the Department of Water Supply, Gas and Electricity for furnishing, delivering, storing and trimming coal. Security aggregating 30% of the total amount involved in the contract will be required, and the bidders should state the price per unit for each item contained in the specification. Different sections of the contract run to Dec. 31 of the current year, and to July 1, 1915. The bids will be received until 2 p.m., Nov. 16. Copy of the contract and specifications can be had on application to the Department. All communications should be addressed to William Williams, Commissioner, Department of Water Supply, Gas and Electricity, Room 2351, Municipal Building, Borough of Manhattan, City of New York.

Contract No. 14—Panama, C. Z.—Sealed proposals will be received by the Panama R.R. Co., until 12 o'clock noon, Nov. 24, for furnishing all or any part of the company's requirements, estimated at 500,000 tons of coal, as required during the year ending Dec. 15, 1915. Coal is to be of the best quality steaming, semi-bituminous, mine-run, with at least 40% lump, dry and free from slate, sulphur, dirt and other impurities, suitable and acceptable for use in stowage in the bunkers of steamers operating in tropical waters and susceptible of being stored in the climate of Panama without danger of fire through spontaneous combustion. Prices are to be quoted f.o.b. any loading port the contractor may designate on the Atlantic or Gulf coast, and the contractor will be notified on the twenty-fifth of each month of the amount required for the succeeding month. The contract will be awarded on a heat unit basis with a standard of not less than 70% fixed carbon and 14,700 B.t.u. per pound of dry coal. Bidders must state the commercial or trade name of the coal, together with the designation of the bed or beds and exact location of the mine from which they propose furnishing the coal. All bids must be accompanied by a certified check for $1000 and, upon formal execution of the contract, the company provides that security not to exceed $30,000 shall be required for the faithful performance thereof. Payment will be made 30 days after presentation of bills of lading signed by the captain of the collier accompanied by certificates of the companies operating the coal piers, indicating the number of cars and weight of each car load of coal dumped into the colliers. Contract form and specifications can be obtained on application to R. E. Rutherford, Assistant Purchasing Officer, Panama Purchasing Dept., 24 State St., New York.

COAL CONTRACTS LET

Contract No. 2—Norfolk, Va.—This government contract, previous notices, including bids of the various companies, having been published in this column, has been awarded to the Smokeless Fuel Co., under a guarantee of 14,800 B.t.u., at $2.63 per ton.

FOREIGN

Guayaquil, Ecuador, South America—La Compania de Alumdrado (Lighting Company) is in the market for 3500 tons of gas coal. Prosepctive bidders should state the specific gravity, weight per cubic foot, and space occupied by one ton of gas coal. Give approximate analysis, including moisture, fixed carbon, sulphur and ash, and a commercial analysis showing the gas per ton of coal, gas per cubic foot of coal, illuminating power of the gas in standard sperm candles, value of one cubic foot in grains of sperm, sperm value per ton of coal, coke per ton of coal (good quality), coke per cent. of coal, ash in coke, sulphur eliminated with the volatile products, sulphur in the coke, tar per ton of coal. Quotations should be c.i.f. Guayaquil. Address The Manager, Compania de Alumdrado, Guayaquil, Ecuador, South America.

South America—An American consular officer in that country has transmitted detailed information relative to tenders which will be received, until Nov. 1, for the supply of coal for government steamer service. American coal dealers who are interested should apply to the Bureau of Foreign and Domestic Commerce, mentioning item No. 14,016 for the reserved information.

South America—Supplementing a previous notice, the Bureau of Foreign and Domestic Commerce at Washington states that details regarding a certain inquiry from South America have been forwarded to the department, and that complete information, including blank forms on which to submit bids for supplying coal under the conditions specified can be had on application. All inquiries should mention item No. 14,048, and be addressed to the Bureau of Foreign and Domestic Commerce, at Washington, D. C.

Santiago, Chile, S. A.—Bids are wanted on 300,000 tons of coal a year during the next three years, according to press reports. The coal is to be used on the Chilean Railway. All communications should be addressed to the Department of Materials, Santiago, Chile, S. A.

Latin America—An American minister in Latin America has transmitted, by telegram, information relative to the coal market in his district. Full particulars may be had on application to the Bureau of Foreign and Domestic Commerce and its branch offices, by referring to their item No. 14,133.

COAL AGE

Vol. 6 NEW YORK, NOVEMBER 21, 1914 No. 21

Here is a little incident that happened during the depression of 1907. It's worth repeating now as a warning, because of the present unfavorable condition of the soft coal industry.

A MINE SUPERINTENDENT was given orders by his general manager to bring his cost sheet down to a certain figure or shut up shop. The figure in question was the contract selling price of the coal. At the time the contract had been closed, the mine was running full time and the price obtained left a fair profit per ton of coal; but during the depression, orders were gradually cancelled until the output had to be reduced about 50 per cent. Naturally, the mining cost began to climb and the general manager found himself facing a loss on every ton produced.

The superintendent realized immediately the manager's predicament and explained the situation earnestly to all of his subordinates; between them they made some substantial reductions, but in spite of all of their efforts, they still found a difference of about 8c. between the cost of coal and the contract selling price. Now it happened that 8c. per ton was the exact cost of yardage advancement for the mine, and this fact arrested the superintendent's attention and eventually led to his undoing.

He suggested to the manager that they might at least break even if he could discontinue for a few months all yardage advancement.

He explained further that when market conditions became normal again, he could gain back the exhausted yardage reserve by double shifting all narrow work.

This appealed to the manager, and the superintendent was patted on the back.

But at the end of a few months, market conditions did not improve. This time the manager suggested taking chances and insisted on holding back on narrow work a few months longer.

To make a long story short, when market conditions did again become normal, the superintendent found that, with the working places available, he could not get over 60 per cent. of the output required, and at best it would take him several months to effect a noticeable improvement.

He explained conditions fully to the manager.

The manager fussed and fumed and insisted that it was all a great surprise to him and always wound up by persistently maintaining that he had been misled by the superintendent from the beginning, else he would have frowned on such a course at once.

RESULT

The Superintendent found things so unpleasant that he resigned.

MORAL

It's so very easy to overrun a credit account.

Buildings and Breaker of the New Loomis Colliery

By F. K. Brewster*

SYNOPSIS—The Delaware, Lackawanna & Western R.R. Co. is developing a new tract of virgin coal in the Susquehanna Valley. This article deals with the construction of colliery buildings and breaker, all of which are modern and erected with a view to permanence and fireproofness.

The Loomis Colliery of the Delaware, Lackawanna & Western R.R. Co. is located in Hanover Township, Luzerne County, Penn., about one mile from Nanticoke, on the east side of the Susquehanna River.

It is an extensive development on what was formerly known as the Dundee tract, and the Dundee shaft, which was first opened in the fifties but abandoned a few years later on account of gas, modern ventilating devices not being then available, is part of the new mine.

The Loomis tract adjoins three other mines of the Delaware, Lackawanna & Western, the Truesdale, Auchincloss and Avondale.

Two shafts have already been sunk to the Hillman vein, and the No. 1 slope has gone to No. 5 vein. No. 3 shaft is now being sunk, and thus the Loomis will be developed by four shafts and a slope, with perhaps an additional opening later. The development will extend over a long period of years.

The buildings of this colliery were designed primarily for permanence and fireproofness, but attractiveness of design has not been lost sight of. The result is at once pleasing to the eye and proof against time and the elements. The plans were drawn in the office of F. J. Nies, Delaware, Lackawanna & Western architect, Hoboken, N. J. Brick and concrete were employed throughout from foundation to roof, while considerable reinforced work is to be found. In two engine houses concrete girders 5 ft. in depth at the center by 47 ft. in length carry the roofs and ventilating monitors, while in the stable the roof girders are 39 ft. long.

A pleasing architectural feature of the buildings is the presence of decorative blocks of concrete set in the brick on the sides of windows and doors. Furthermore, diamond disks of concrete and brick have been placed between windows, which have also been designed large and with arched crowns for adequate lighting.

Soldier courses of brick on end, just above the foundation water tables, and also between windows and at the roof line, break the monotony of plain brick walls and add to the general appearance. The cornices of the larger buildings are of reinforced concrete, overhanging the walls, and provided with protective parapets above the roofs. These were poured at the same time as the slabs and girders, and are monolithic with them.

General View of Surface Plant at New Loomis Colliery.

The group of buildings thus far consists of 14, in addition to the breaker and washery annex. These are the boiler house, three engine houses, a lamp house, a blacksmith and machine shop, an office and storehouse, an oil house, a fan house, an ice house, a lime and cement house, a stable, a wash house, and a powder house.

The Boiler House Is Convenient

The boiler house is a building 51 ft. 5 in. by 102 ft. 5 in. with basement, air duct and subways. Eighty feet of its length is used for the boiler room proper, which has three vertical-type boilers of 300 hp. each, built by the Erie City Iron Works. Directly in front of the boilers are the reinforced coal pockets, fed from the washery annex by a scraper line, with convenient bottom openings in front of the fire doors.

*1527 Gibson St., Scranton, Penn.

A temporary conveyor is now employed to feed the coal pockets. This will continue in use until the annex is put in operation.

The boilers and furnaces rest upon concrete foundations built to form ash hoppers and chutes to the subway. Fires are cleaned by dropping ashes through trap doors, just inside of the fire-doors into the hoppers beneath. From thence the ashes move by gravity through the chutes into ash cars in the subway. From here they are hauled by dinky locomotives to the dump. This avoids all accumulations of ash dirt on the main floor and all wheelbarrow work.

In the west end of the building are located the pumps and feed-water heater, while underneath the floor is the fan room with engines and fans for supplying forced draft through the air duct to the fires. Damper doors, with shafts, chains and levers enable the draft to be regulated by the firemen on the main floor.

Provision has been made, both in the location and size of the stack, which is 12 ft. in diameter and 125 ft. high, for the extension of the building eastward and an increase in the number of boilers used, as the need develops for the same.

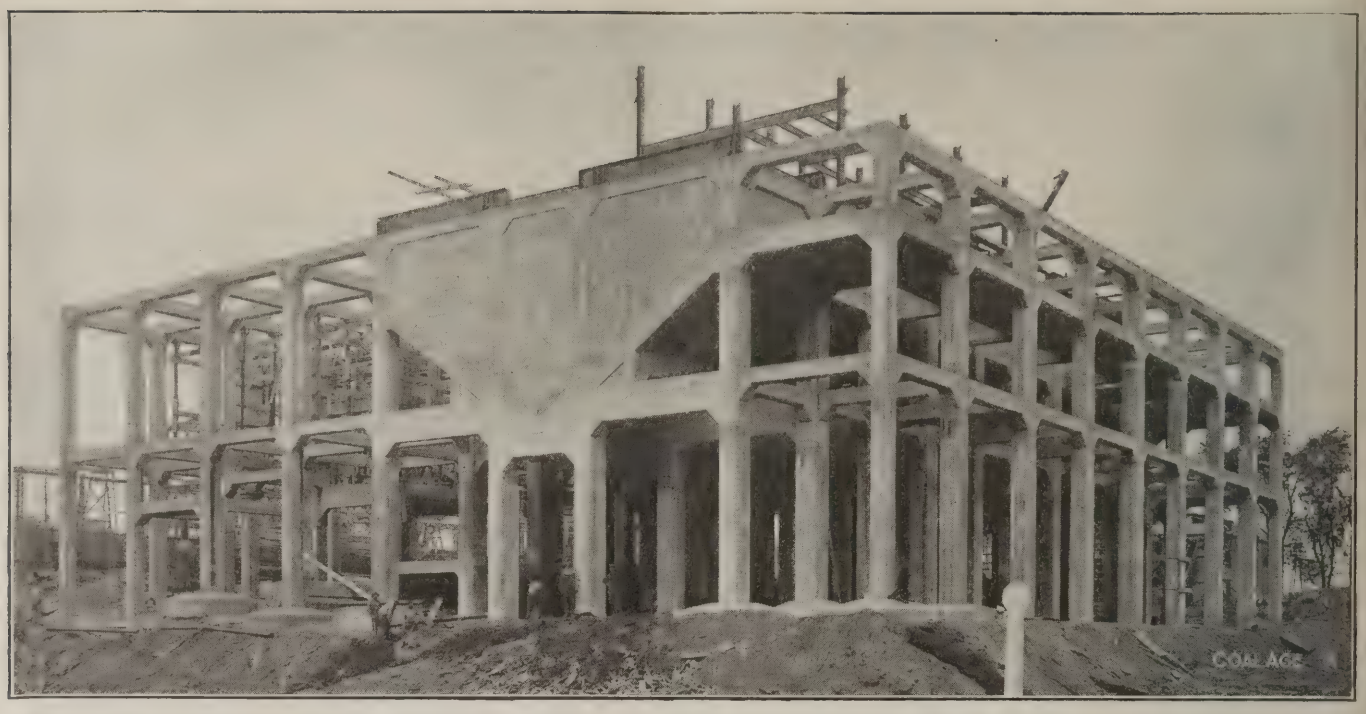
A locker room, with toilet, wash sink and shower bath for the comfort of the men employed completes the equipment.

The boiler house, in common with the other buildings of the plant containing steam pipes, has a roof of hollow-tile blocks, with small concrete beams between, and a 2-in. slab of concrete over all, plastered with cement plaster on the under side. This treatment, it is believed, will reduce condensation and dripping to a minimum. A ventilating monitor with windows operated by chains from the main floor carries off gases and steam.

Engine houses Nos. 1 and 2, located about 100 ft. from Nos. 1 and 2 shafts, respectively, are identical in design, and conform to the general lines of the boiler house as to foundations, walls and roof. Both have hollow-tile roofs and monitors. They each contain 34x48-in. duplex simple Corliss engines, operating a 14-ft. double conical drum, each half having a rope capacity of 1500 ft. Each machine is equipped with powerful steam brakes and a Welch overwind preventer which, when a dangerous speed is attained, or when a cage goes too high, automatically shuts of the steam and applies the brakes. These hoisting engines were built by the Vulcan Iron Works.

The headframes of Nos. 1 and 2 shafts are of steel, 85 ft. high, and will eventually be equipped with automatic dumping cages, so that cars may be hoisted and coal dumped directly into the main receiving hopper midway between the shafts. This main hopper will also receive coal from Dundee shaft, No. 3 shaft, and No. 1 slope. A main conveyor will carry all coal thence to the top of the breaker, where it will be delivered to shaker screens and rolls for preparation.

The Stable Is Well Planned and Sanitary



The stable is a brick and reinforced-concrete building, in the basement of which double stalls provide room for 26 mules, while upstairs are a loft and granary. The basement is well lighted, and the walls, floor, stall partitions, feed boxes and mangers are all of concrete. A middle passageway lengthwise of the building is used for distribution of hay and grain. This is wide enough to allow employees to avoid danger from vicious mules. The stalls are paved with cork bricks laid in sand on concrete and made tight with cement grout. This makes a comfortable standing and stamping place, which slopes slightly to the rear, where a concrete gutter affords ample drainage.

An added feature is the longitudinal ventilating flue placed just beneath the floor of the loft, with a vertical shaft to the roof at one end. This maintains good ventilation of the basement and greatly reduces the stable odors common to such places. The building is unusually dry, clean and warm. The cornice and roof are similar to those of the other large buildings, except that no tile were here used in roof construction.

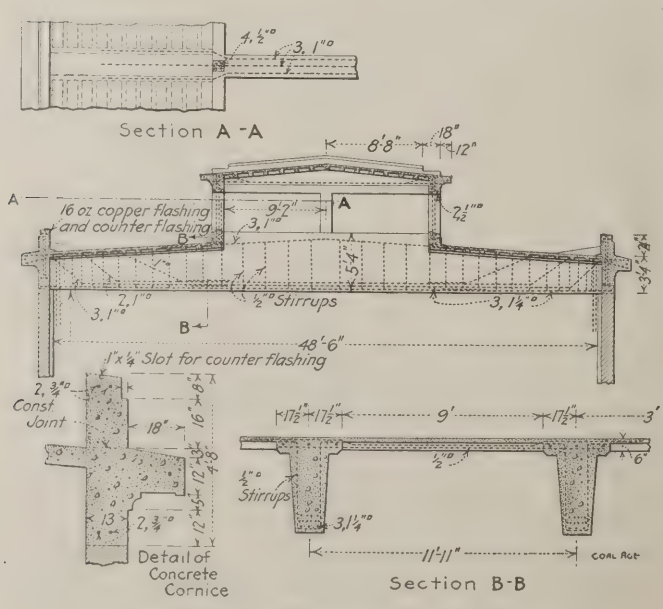
The wash house, situated near the stable, deserves a better name than the colloquial "shifting shanty," for it is a good-sized building, adequately warmed and venti-

Showing Power House, Steel Headframes and Large Mule Barn

Reinforced-Concrete Portion of Loomis Breaker

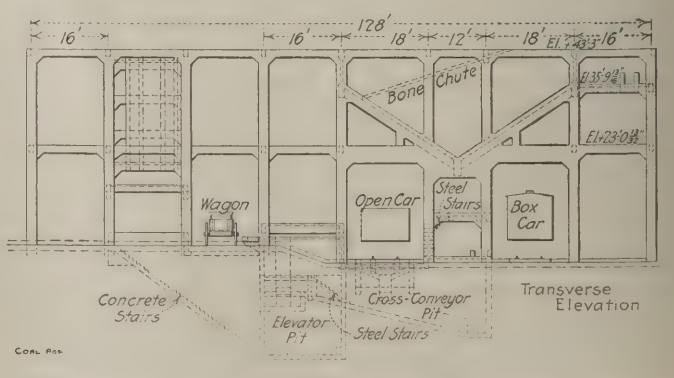
lated and equipped with shower baths and lockers for hundreds of miners.

The storehouse and offices are in one building, near shaft No. 1. This has brickwork, roof and cornices similar to that of the other main buildings. Outside loading platforms at the elevation of box-car doors, the edges of platforms being protected with 6x6x3/8-in. angles anchored to the concrete, are provided.



The remaining buildings of the group are smaller, have gable roofs and eaves, while cornices are placed at two ends only. The roofs of all buildings are covered with Johns-Manville asbestos built-up roofing applied to concrete slabs. Copper flashing was employed at all angles of cornices and monitors.

The concrete was mixed at one central mixing plant, and transported in side-dump cars by mule power to the different buildings. When roofs were being concreted it was dumped into a hopper at ground level, thence into a bucket suspended from one end of a revolving T-arm at the top of a gin-pole, and when hoisted to the right elevation the T-arm revolved to a position so that the bucket could be dumped on the roof. As much as 85 yd. per day have been thus placed, with a comparatively small gang of laborers. W. H. Gahagan, of Brooklyn, was the general contractor for all these buildings, except the fan house.



Concrete for foundations was mixed in the proportions of 1:3:5, and for roofs and all other reinforced work, 1:2:4.

The Breaker

The Loomis breaker, when completed, will be the most modern, best lighted and one of the largest owned by the Delaware, Lackawanna & Western R.R. Co. In construction, it is a combination of reinforced concrete and structural steel, and it is believed the result will be more satisfactory than the use of either material exclusively. The reinforced construction extends from the footings to the top of the coal pockets, an elevation of 43 ft. 3 in. above datum or track level at the center of the breaker. Above this the steel work is built up to a total height of

Details of Engine-House Roof

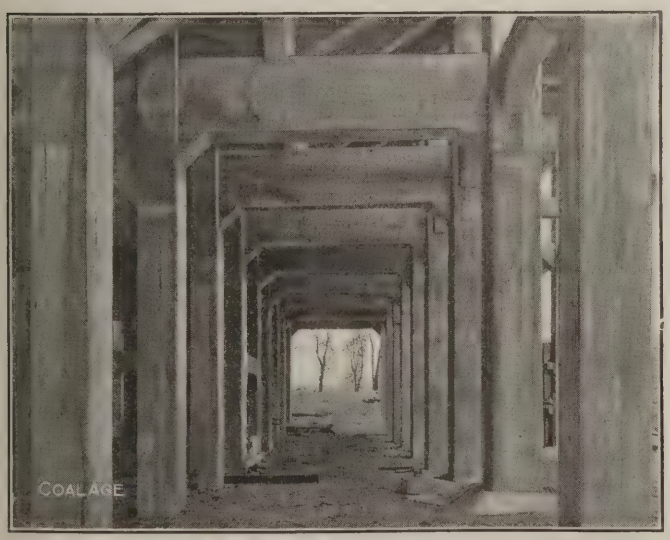
Elevation of Loomis Breaker Concrete Base

169 ft. 4 in. above datum. The size of the breaker is 125 ft. 8 in. by 129 ft. 8 in. outside to outside of columns. It is designed to prepare 3500 to 4000 tons of coal per day, and will probably exceed that amount.

One of the most striking features of the breaker is the glass siding, consisting of Fenestra sash glazed with ¼-in. wire glass, which totally incloses the structure and gives to it the distinction of being a "daylight breaker"—a new departure in Delaware, Lackawanna & Western design.

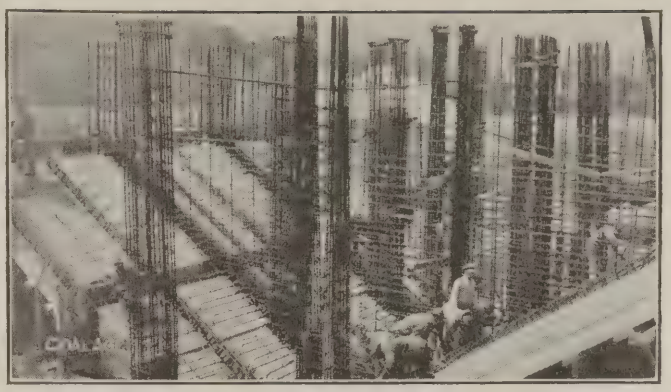
The reinforced portion of the building contains 2680 cu.yd. of concrete and over 500,000 lb. of reinforcement. Corrugated bars of 50,000 lb. elastic limit were used in beams and columns, and the American Steel & Wire Co.'s tri-mesh reinforcement was used in floors.

Eighty-nine concrete columns, varying in cross-section from 20 in. square to 36 in. square, carry the coal pockets and steel work above. These columns are joined together by two sets of tie-beams, 18 in. square, at mid-point and top, reinforced top and bottom. Furthermore, at all columns these beams have 18-in. corbels on lower side, insuring greater rigidity and greater shearing strength.



The column bars are hooped with $\frac{5}{16}$-in. wire, spaced every 10 diameters of main bars. That is, if a column has 1-in. bars, the hoops are 10 in. apart. All column bar "cages" were framed on the ground and hoops wired to bars before placing in a vertical position. This method resulted in economy of time, rigidity of bars and greater ease of handling, derricks being used to erect and hold the parts in position while the splices were thoroughly wired. All splices are of 40 diameters length.

The percentage of reinforcement in columns normally varies from 1 per cent. to 1½ per cent., and only exceeds the latter amount in the center columns of the coal pockets, where the size was restricted to give side clearance on loading tracks.



Excavations Were Carried to Solid Rock

All excavation was carried to solid rock, in some cases as much as 32 ft. below ground surface, and the columns were built on top of reinforced footings properly doweled to receive the vertical rods of the columns.

A large elevator pit and a cross-conveyor pit, with reinforced walls, are sunk 20 ft. below datum, with hop-

A near View of Columns and Beams under Coal Pockets

Showing Coal Pockets under Construction

pers to receive lip screenings, condemned and bony coal which it may be found desirable to hoist to the top of the breaker for crushing and rescreening.

Transversely the breaker is divided into sections *A, B, C*, etc., to *I;* and longitudinally into bents 1, 2, 3, etc., to 9.

Two loading tracks pass under the pockets between bents 2 and 3 and 4 and 5, with a grade of 1.4 per cent. toward the loaded yard. In order to maintain uniform head clearance for cars, the main beams of the coal pockets are built to a similar grade. The apex of the pockets is between bents 3 and 4, and on either side are the openings in the pocket slabs from which cars are loaded.

There are ten pockets, two each for egg, stove, nut, grate and pea coal, with a total storage capacity of 3000 tons.

Pocket Construction

The main beams of the pockets are 18 in. by 3 ft. 11 in. in section, heavily reinforced with 1-in. bars and ⅜-in. stirrups. The partition walls are 8 in. thick, doubly reinforced horizontally from column to column, so that the filling of any pocket with coal, when the next one is empty, will be taken care of. The pocket slabs are 9 in. thick near the apex, and 8 in. thick above. They are reinforced with ⅝-in. rods, alternate rods being bent up over intermediate beams.

All pocket slabs will be covered with 3-in. plank, laid on sleepers and protected with a sheathing of malleable iron plates. These plates not only cover the bottom, but are carried up the partition walls, to prevent the coal from wearing away the concrete.

Construction joints are normally in the center of beams, but in the longitudinal beams of the coal pockets it was found impossible to place joints at the center, owing to the junction of the sloping beams at that point. These joints were therefore offset 24 in. and special diagonal reinforcement was introduced to care for the shear stresses.

All columns were usually poured to the bottom of the corbels of the beams next above, and then allowed 24 hr. to set before these beams were poured. But in this matter also a discrimination was made in the case of columns on bents 2 and 5, which were allowed to stand for about two hours and were then completed to the top of the pocket slab, in order to make the job monolithic. No cracks have developed.

All concrete was machine mixed in proportions of 1 : 2 : 4, and no stone was used that could not pass a 1-in. ring. The stone was also required to pass a test of 90 per cent. insolubility in dilute hydrochloric acid as a precaution against the corrosive acids of mine water.

Reiter, Curtis & Hill, of Philadelphia, had the contract for the concrete work.

The superstructure of the breaker is of steel, Bethlehem H-sections being used in columns, I-beams and channels for floors, and angles for diagonal bracing.

Mild steel is specified for the structural members and an allowable unit stress of 16,000 lb. in tension is called for. The columns are designed by the formula

$$p = 16{,}000 - \frac{70\,l}{r}$$

in which

p = Allowable compressive stress;
l = Length of column, and
r = Radius of gyration.

About 1000 tons of steel are employed in the structure. In addition steel towers and angle trusses carry the sloping main conveyor line from the coal-receiving hopper to the top of the breaker. This will be a 10x60-in. flight conveyor with two strands of 2-in. monobar chain.

There are many floor levels in the steel work to facilitate operation, but all these will be concrete slabs on steel beams. No more wood than is absolutely necessary will be introduced. Protective railings and machinery housings will guard employees as much as possible. "Safety first" has been constantly in the minds of the planners.

The Guerber Engineering Co., of Bethlehem, has the contract for steel work. The breaker will not be ready for operation before the latter part of 1915.

The total cost of the breaker and all buildings will exceed a half million dollars.

Merging the Interests of Coal Exporters

The Latin-American Trade Committee, recently appointed by Secretary Redfield, has submitted a report, making suggestions and recommendations for furthering our export trade in South America.

After discussing financial questions, the suggestion is made that, instead of individual merchants and manufacturers maintaining individual representatives at considerable expense, associations be formed in each line of business that would send out one or more representatives to look after the interests of such associations. This seems to be a wise and practical suggestion and its consideration is recommended to coal operators and sales agencies.

The idea is not entirely new to Eastern coal men; it was taken up in 1911 by the president of a large Eastern, New River sales agency, and came near to being put in operation at that time, in regard to the New River coal field; but the plan failed owing to internal disagreements among those interested. The present would seem to be an excellent time to take up the matter again.

To illustrate, an association of Pennsylvania operators and sales agencies, having both steam and locomotive coals suitable for export, could maintain a consolidated foreign-sales agency at a small expense to each member. One man could be designated to look after the steam coals and another, the locomotive and gas coals, the maintenance expense to be divided in proportion to the output tonnage of the several companies merged.

I will not go into any of the details of such a plan, but its advantages may be broadly summarized as follows:

1. It would relieve the pressure on the domestic markets to take more coal than they actually need; or, in other words, the plan would take care of any overproduction, which is fast becoming a vital question.

2. It would do away largely with the handling of coals by competitors or their business associates, something that has always been a detriment to coal and its sale.

3. It would result in maintaining better average prices for coal, as a natural result of securing wider markets and an increased demand.

4. By increasing the export of coal, it would help to throw the balance of trade in our favor.

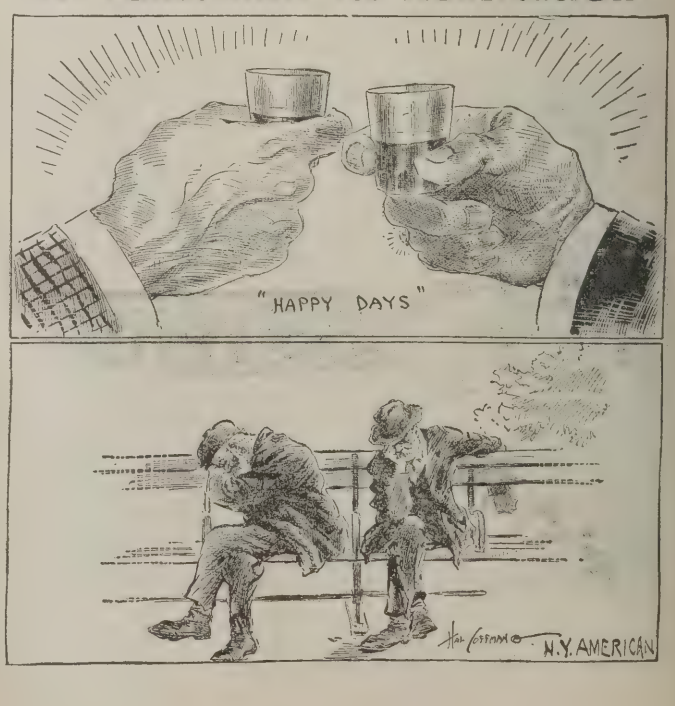
5. It would give the mines steadier operation, which means reduced cost of operation.

6. It would also reduce the cost of selling the coal.

7. It would mean a greater development of the coal fields, and make easier the securing of capital for improvements and development.

8. It would bring about a closer business relationship between operators and agencies, and tend to stop price cutting.

9. It would enable the railroads to give better car service, by keeping a larger percentage of their equipment on their own lines, besides tending to reduce cost of transportation.



10. The members of such an association would obtain a wider knowledge of foreign-trade conditions, coals and transportation, and would learn the value of properly preparing and mining their coal.

11. It would have a tendency to reduce ocean freights, owing to the movement of a heavier tonnage and a steadier demand for ships, thus turning the currents of trade our way.

12. The question of foreign credits and banking facilities would be more easily handled.

Finally, it would assist this country in getting into closer touch with other countries, by learning to know other people, their needs and customs, a thing that cannot but broaden our influence in world politics, as well as make us better fitted to handle our own affairs. Coal operators, it is for you to say; let us have your criticisms. Why would not such a plan be both feasible and profitable?

A Toast and Its Realization

Colliery Lubrication

By Edwin M. Chance*

SYNOPSIS—Oils of good quality can often be purchased on specification at a better price than can oil of lower quality by ordinary merchandizing. This is well known to the large buyers for export or domestic use, but not understood by the industrial purchasers. The best way to contract is for an oil similar to sample and not for one having simply certain physical characteristics.

Colliery lubrication is the one problem connected with the production of coal upon which the progressive mine executive has probably the least accurate information. This condition has grown from two main causes—first, the apparent cost of lubrication is relatively small when compared with that of many of the other items combining to form the cost of the production of a ton of coal, and second, the great oil companies have systematically pursued a policy of silence and have rather fostered the belief that the science of lubrication is a sort of "Black Art" and that its deep mysteries can be fathomed only by the initiated.

If a careful inspection be made of the lubrication supplied to the average coal-mining company a rather unsatisfactory state of affairs will be found to obtain. It is probable that either oils of fair grade are supplied at an unreasonably high price or if the mine operator has succeeded in securing low prices from the oil companies the very dregs of the market will be found to have been foisted on him. And in some aggravated cases high prices are being paid for extremely low-grade products.

The Undiscriminating May Get Oils from Asphaltum Crude

The reasons for these unsatisfactory conditions are not far to seek. In the first place the mine official coming into direct contact with the problem of lubrication is at a hopeless disadvantage, as an offhand inspection is his only means of judging the quality of the product supplied and moreover there is too often a tendency at the main office to consider lightly the complaint of the man in the field on this score.

The markets supplied by the great oil refiners can be divided into two classes, the first being the discriminating and technically controlled domestic and export trade. In this class and especially when the oil is purchased for export the quality of the product supplied is carefully controlled by a thorough technical examination. The second class is the domestic trade as typified by the coal-mining industry.

Now enormous quantities of asphalt-base crudes are refined annually, with the production of a great amount of relatively low-grade lubricant, while the production of high-grade Pennsylvania-type lubricating oil is relatively small. It is clear then that as these better-quality oils are most readily salable in the markets mentioned under the first classification, they will be but reluctantly supplied to the markets of the second type or if furnished to such markets will be sold at a price far above that at which they could be purchased if a full knowledge of the trade were brought to bear.

The question then arises, how can these conditions be so met that a really high-grade lubricant, well adapted to meet colliery conditions, can be secured at a reasonable price? To this end, two things are essential: An accurate knowledge of the requirements of colliery machinery and an expert familiarity with the testing, refining and properties of lubricants. With this knowledge an intelligent opinion can be formed of the relative values of various oils for a given purpose, and by a system of competitive bids the purchasing agent can be assisted in securing the best and cheapest lubricants. This plan, however, entails a modified form of purchase based upon specification.

Prejudice against Specifications

Now the literature of the subject is filled with more or less violent attacks upon the system of purchasing oils under specification. These attacks generally take the form of quotations from contracts drawn by those who, not being thoroughly conversant with oil technology, have embodied glaring anomalies in their specifications. They are paraded before the oil consumer, and an attempt is made to deduce from such errors the fact that a specification is but an uncertain criterion of the quality of a lubricating oil.

Then too, the case is frequently cited in which an oil of a certain character has been specified for a given purpose. It is then shown that one radically different in nature would meet these conditions equally well. The inference is that this being true the specification is worthless. For example, we will assume that a Pennsylvania neutral with a gravity of 30.5 deg. and a viscosity of 200 has been specified for engine lubrication. It will then be shown by the critic that a paraffin oil with a gravity of 24 deg. and a viscosity of 300 will meet these conditions. Whereupon an attempt will be made to convince the consumer that, if two oils so different in constants will meet the same conditions, the specification must be of little value.

Specification Is for Oil of Certain Type

Now the aim of a specification is not to describe every oil that will meet a given service, but to specify a certain oil which has been chosen for this work. Thus while the Pennsylvania neutral and the paraffin oil may both meet the conditions of the actual service in question, still, for reasons having weight with the chemist preparing the specifications, the Pennsylvania neutral oil was desired. If the paraffin oil had been wanted a specification would have been prepared that would require such an oil to meet its conditions. Thus the contention that a single specification will not cover all the oils that will give excellent service under a given condition is not valid.

In the ultimate analysis a specification is nothing more nor less than a scientific description and like any other description may be faulty, if the person making it is not familiar with the object described. To my mind a weakness in the preparation of oil specifications lies in the fact that they are given too much weight. Such specifications should be prepared solely for the guidance of the oil refiner in submitting samples and should be so prepared as to indicate accurately to him the nature of the oils desired.

*Consulting chemist and engineer, Wilkes-Barre, Penn.

By the guidance of specifications so drawn he will be in a position to supply samples of the products sought. When such samples have been received from a number of sources they can be submitted to a critical examination by a chemist and engineer thoroughly familiar with both the oil trade and the requirements of colliery lubrication, and the set of oils meeting the conditions best both in price and quality can be adopted.

Specifications Remade so as to Prevent Substitution

Upon the acceptance of such a set of oils, the samples themselves should automatically become the standard and should supplant the original specifications. In this way many of the real difficulties besetting the path of the intelligent purchaser of lubrication are removed. For example, we will assume that the specification originally called for a dynamo oil of 180 viscosity. There are a number of recognized instruments in general use for the determination of viscidity but we will consider here only the Tagliabué and Saybolt viscosimeters. Not only do these two instruments differ in their values for the same oil but those of the same make vary among themselves to a marked degree. Thus the refiner may submit an oil in good faith but because of the lower reading of the testing chemist's viscosimeter, this oil may not meet the viscosity requirements of the specification.

This oil, however, will probably compare favorably with the oils submitted by other refiners under the same specification. Suppose that the testing chemist finds the viscosity of this oil to be 165 as given by his viscosimeter. Now if the other oils submitted by refiners upon the specification of 180 average about 165, there is a strong presumption that the testing chemist's viscosimeter is reading 15 points too low. Assume then that this oil is accepted. It is clear that deliveries during the life of the contract giving a viscosity of 165, upon this viscosimeter, will be satisfactory.

Assume, however, that a complaint has arisen, a delivery has been condemned and the services of an outside testing laboratory have been secured. If the umpire chemist reports the same viscosity upon the condemned sample as upon the sample submitted with the bid there can be no question that the delivery should be accepted even though the actual figures may be in error. Thus samples of deliveries tested during the life of the contract can always be compared with the original oil, and in case of a dispute there can be no doubt whether the oil is of the same quality as the sample originally submitted.

Determinations of Chemists Differ

It is only too true that the same oil when tested by different chemists will give decidedly different values. Hence, an oil may meet a given specification when tested by one chemist and may fail absolutely to pass the same specification when tested by another. If, however, we have a sample of the original oil for comparison these variations disappear to a large extent, as the question then involved is not whether the oil meets a given specification but whether it gives the same values as the sample originally submitted.

As a matter of fact a large proportion of the lubricating oils exported, and also of the oils supplied to jobbers in this country, are sold directly upon a rigid specification. The refiner supplies the jobber or the foreign house with the values for the flash, fire, gravity, viscosity, etc., of his oils and the contract is awarded and deliveries made upon this basis. This fact, however, is scrupulously kept in the background by the before mentioned critics of such a method of selling lubricating oils.

Colliery Needs Are Peculiar

Another factor to be considered in securing efficient lubrication is the fact that the requirements of colliery machinery are different from those of the factory or general power plant. The oil trade has developed various classes of oils to meet general power-plant and industrial requirements, but these oils, unfortunately, do not always satisfy the more exacting demands of colliery machinery. For example, many of the steam-consuming units in and about the anthracite mines are supplied with steam by long pipe lines. The steam is thus very wet and frequently low in pressure when it reaches the cylinder. Hence, a different cylinder oil from that in general use is required to meet such conditions.

Another special use is that for pump-plunger lubrication. Many of the greases supplied for this purpose are worthless when used upon the plungers of mine pumps, for they are usually soap-thickened and decompose rapidly in the acid of the mine water, losing their consistency and at the same time their lubricating and protective value. Did space permit, the number of instances in which lubricants giving admirable service under normal power-plant conditions have proven themselves to be most inefficient at collieries could be considerably lengthened. Enough, however, has been stated to illustrate the point.

When we consider under what adverse conditions colliery machinery must function, the conclusion that the best obtainable lubricants are none too good becomes even more evident. For the first cost of these lubricants is lower than that of oils such as are usually supplied when the consumer throws himself upon the mercy of the oil company, and the saving in wear and tear, the increased amount of work that can be done, and the freedom from time-consuming stops are incalculably great when these high-grade oils are employed.

Value of Good Car Oil and Pump-Plunger Grease

As an example, we might consider the question of car oil. It is true that a large proportion of this oil purchased by a coal company never reaches the car journal but is used principally to lubricate the road bed. For this reason it has been assumed that the cheapest possible oil should be purchased. This assumption might be correct were the cost of high-grade car oil excessive. This is not true, however, for an excellent Pennsylvania car oil can be secured at a very reasonable price.

When such an oil is used not only will the mules and mine motors be able to handle more cars to the trip, but the wear and tear on wheels and journals will be materially diminished. Moreover, it is an axiom that it is the tired mule that is injured and I have no doubt that in the long run the costly injuries to mules can be to a certain extent diminished by efficient car-wheel lubrication.

Pump-plunger grease has always been considered to be one of the materials for which it is unwise to pay a good price. As pointed out before, the usual grade of this

material is unsuited by its nature to withstand the service for which it is intended. Now the cost of repacking the water end of a large mine pump is so great that it would seem wise to do everything possible to make this work as infrequently necessary as possible. Fortunately, at a very small additional first cost it is possible to secure a pump-plunger grease which, being unaffected by the sulphuric acid and soluble sulphates of the mine water, meets the conditions admirably.

There are many oils upon the market, selling at from 50 to 75c. per gallon, which are supposed to possess certain marvelous properties, undetectable by the chemist and only to be observed with the eye of faith. These oils as a general rule are purchased by the proprietor of the brand or trade mark in question in bulk, from the refiner in the open market, and are usually standard products. They generally acquire their miraculous properties merely by the application of a gaudy label or brand and the expenditure of much money in advertising.

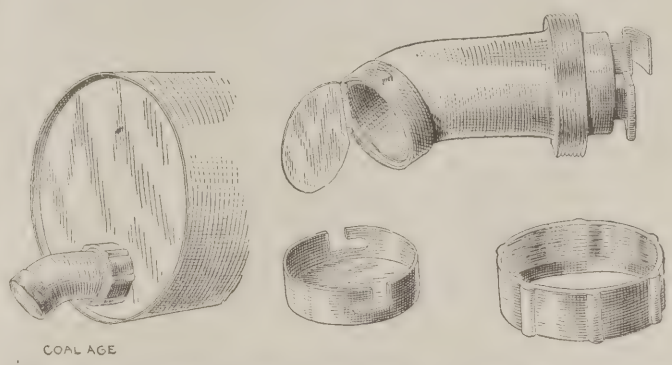
This type of lubricant for colliery use is most commonly seen among the compressor oils. I know of one such lubricant, dispensed by a large and reputable oil company under an attractive brand name at a high price. It is an acid-treated paraffin oil which when heated to a temperature of four or five hundred degrees Fahrenheit decomposes rapidly with the production of much tarry matter. This oil was used in the lubrication of a large new air-compressor installation with the result that the valves carbonized and stuck badly, seriously impairing the efficiency of the plant. Finally the air receiver exploded. Whether this accident was due to the compressor oil is open to conjecture.

It is too often the practice about the mines to use the ordinary engine oil in the compressor. This practice should be condemned, as a really good compressor oil can be obtained at a price but two or three cents above that of the engine oil.

The same principles apply to the purchase of cup and car-journal greases, and it is certain that the same or even greater economies can be secured in purchasing this as in the buying of lubricating oil.

These principles have been applied to the purchase of the lubricating oils and greases of a number of coal companies with a saving of from 25 to 35 per cent. in the first cost of lubrication and a still greater though not easily determined saving through the enormously increased efficiency of the lubrication secured. There has been another source of saving in addition to these two. With the high-grade lubricants, not only is the cost per gallon reduced, but the total number of gallons of oil used for any one purpose is cut down, as these high-grade oils, gallon for gallon, supply lubrication for a longer time than those which are inferior.

The Coal Miner



———He must work in gas and see in the dark,
The music he hears is the air drill's bark,
It isn't no picnic in the park,
It isn't no cinch he's stole!
He's carpenter, plumber, machinist, yes,
A sort of surveyor, too, I guess,
A little of everything more or less,
The miner who digs the coal!

—Berton Braley, in "Illustrated Sunday Magazine."

A Safety Powder Tube

The accompanying illustration shows an improved form of powder tube that can be quickly attached to the opening of an ordinary powder can or detached therefrom when not required. When attached to the can this tube serves not only the purpose of a spout by which the powder can be easily poured out of the can into a cartridge; but, at the same time, the tube forms a convenient handle for carrying the can and protects its contents from exposure to the air and from accidental ignition by sparks dropping into the can.

The tube is the invention of John H. Jones, of the Jones Manufacturing Co., Oakland City, Ind., who has recently patented the device, which is now on the market. The illustration makes clear the operation of the tube, which is secured to the powder can by two lugs. One of these lugs forms a fixed projection on one side of the tube, while the other is attached to a spring that enables it to be snapped or sprung into the opening of the can.

Showing Safety Tube Attached to Powder Can and the Detached Parts

The fixed lug is first inserted into the hole in the can, after which the other is sprung into place by a gentle pressure.

When the lugs are in place, the tube is firmly secured to the can by screwing down the coupling, as when tightening a union joint. For the purpose of detaching the spout from the can, a small opening is left underneath this coupling and immediately over the spring that secures the spout to the can. To detach the tube, the coupling is unscrewed and a nail or other small instrument is used to push back the spring while the spout is withdrawn from the can.

A hinged lid closes the mouth of the tube and protects the contents of the can from the danger of sparks dropping into it. A screw cap, shown in the illustration, is also provided and fits over the mouth of the tube when the can is not in use. This tube is made out of composition metal that resists the action of the mine air and corrosion by dampness. It will last a lifetime and is claimed to save a miner enough powder in six months to equal double the price of the tube. The device is simple, cheap and lasting. It supplies a long-felt want in coal mining. The security furnished by the tube against possible accident in the handling of powder when filling a cartridge, is well worth the price of one dollar asked for the tube. As a practical means of preventing such accidents to miners at the face, it should appeal to all operators, superintendents and mine foremen, who should urge its general adoption by all miners in their employ.

West Virginia Coal Exhibit at Panama Exposition

The coal-mining industry of West Virginia will be well represented at the Panama Exposition in San Francisco next year, and arrangements to make the exhibit as attractive as possible are now under way in the smokeless fields. Several thousand feet of moving-picture films have recently been made in the Pocahontas field, which will represent one of the greatest subjects of the kind ever produced. The mining operations will be shown in varied and interesting forms, as well as demonstrations of life-saving crews, pictures of outcropping seams of coal, panoramic views, etc., the whole reproducing life motion pictures of the production of coal in this great field.

Then the Norfolk & Western R.R. officials have arranged to picture the shipment of coal over their lines from the mines to the seaboard, the loading of the coal in sea-going vessels at Lambert's Point, and the vessels laden with West Virginia coal putting out to sea. It is the intention also to have a film showing vessels laden with West Virginia coal entering and passing through portions of the Panama Canal. At the Exposition these pictures will be shown each day in connection with the state's coal exhibit.

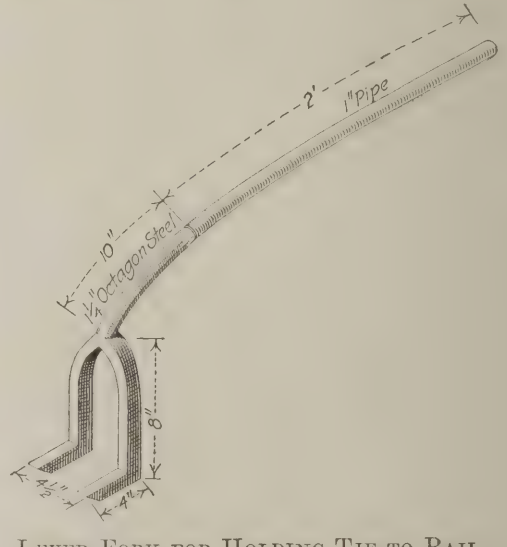
It is expected that this exhibit at the Exposition will have the effect of advertising the coal industry of West Virginia on the Pacific Coast and establish a permanent business through the Panama Canal with that section.

The Cost of Anthracite Mining

If the preparing of anthracite for market after it is mined were conducted as a separate industry, it would require a capitalization of at least $100,000,000. The entire capital invested in anthracite mining in 1909 was $246,700,000, according to the returns of the Bureau of the Census, but that many of the companies are undercapitalized is shown by the fact that the value of the output in 1911 was $175,189,392 and in 1912 it was $177,622,626. The total value of Pennsylvania anthracite produced in 1909 was $148,957,894, and the total gross expenses of anthracite mining that year were $139,110,444. Fully twenty per cent. of the cost of mining and preparing coal comes after it enters the breaker above ground.

There are about 300 of these breakers in the anthracite region of Pennsylvania, and their average cost is $200,000. Some of the larger and more elaborate ones of steel and concrete cost $300,000, $400,000 and even $500,000. Their chief function, in contradistinction to their name, is to keep from breaking the coal into small sizes, because the larger sizes are more desirable. The coal bill alone for the steam plants of these breakers would amount to over $10,000,000 a year, as it is now necessary to burn over 12 per cent. of the anthracite mined in order to run them.

Depreciation Costs Are Enormous



The depreciation costs in anthracite preparation, if it were separated from actual mining, would be enormous. The life of a wooden breaker, especially where water is used, is from eight to ten years, at the end of which time the repairs have been so many that it is an entirely new structure. The action of the water which, in the anthracite region, contains a large proportion of sulphur, eats away the iron of the machinery in a year or two, so that it has to be replaced.

The machinery in breakers is subject to severe and heavy shocks, to excessive wear, to vibration and to the action of the sulphur water mentioned above. In wooden breakers, shafting and drives get out of alignment through the uneven settlement of the timbers, bringing tremendous strains on the machinery and increasing the amount of power required to drive it. Many of the wooden breakers have caught fire and burned to the ground in the last twenty years, causing a direct loss of $100,000 to $200,000 and eliminating the possibility of profit for many months thereafter.

As a separate industry, in fact, it would be difficult to make the preparation of anthracite pay, and it would be necessary to allow a wide margin of profit. And yet this industry is at the present time an integral part of the anthracite mine operators' efforts to prepare their coal for market, sorted into the standard sizes and ready to burn, and to secure a fair price for it. This supposition concerning the manufacture of anthracite as a separate industry may throw some light on the wholesale price of anthracite and why it has been necessary to increase it slightly on two occasions in the last ten years to meet increases in taxation and wages.

Rail and Tie Holder

In laying or repairing mine tracks, it is not always possible to have the rails resting upon all the ties before spiking, due to the unevenness of drift and crosscut floors, says the *Engineering & Mining Journal* in its issue of Oct. 31, 1914. To overcome the difficulty of spiking under such conditions, the tool shown in the accompanying illustration was devised. One end of a 2-ft. length of 1¼-in.

Lever Fork for Holding Tie to Rail

octagon drill steel was split for 1 ft. and shaped into a fork, the end of each prong for a length of 4 in. being bent forward at a right angle; the other end of the drill steel was drawn out so that it would just slip into a piece of 1-in. pipe; this pipe serves as a handle and lever. By placing the fork over a rail and slipping the prongs under a tie, the latter may be held up firmly against the rail while being spiked.

The Labor Situation

The tobacco-raisers' night-riding in Kentucky seems to have induced a similar form of violence among the miners in the west of the state, in that important center of mining—Muhlenberg and Hopkins Counties. Henry Allen, who had taken part in the night-riding, was under indictment. It was believed that he would confess or had confessed, so the night-riders lynched him. These men term themselves the "Possum Hunters," and their violence is directed at those who hire negroes or nonunion men. They have murdered men and boys, beaten women and fired houses. Helpless negroes have been dragged from their houses at night, tied to trees and beaten almost to death with rawhide whips and switches.

Citizens Arm Themselves Against "Possum Hunters"

The citizens of Earlington, Madisonville and Carbondale, like the operators of Colorado, have been compelled to form civic guards. At the first mentioned town, a blockhouse has been built and provisioned. A guard is kept in this, night and day.

About three weeks ago, a band of at least a hundred men invaded the village of Carbondale in the small hours of the night and shot up the town, killing an 11-year-old negro boy and riddling several houses with bullets. The parents found the dead boy after the marauders left. The federal troops are expected and, indeed, seem sorely needed.

Attempted Organization of Fairmont District

An attempt is being made to organize the Fairmont district of West Virginia. It was hardly anticipated that this section would be singled out for attack as its competition had not been felt in the union districts. It had been quite openly stated that Logan County would be the next center of labor trouble, but it appears that Fairmont is selected.

The alleged wrong to be redressed is the payment by car instead of by weight, while the main concession sought is the union check-off. There are 25,000 miners in the region, most of whom are employed by The Consolidation Coal Co. Thomas Haggerty addressed a meeting urging union activity at Flemington, W. Va., on Nov. 13. On the 16th he is due in Philadelphia for a three-day session of the international executive board.

Coshocton District of Ohio Is Still on Strike

The miners in the Coshocton district of Ohio have just refused to accept the recommendations of the joint scale committee as formulated early in the past week, the vote being 265 to 220. W. H. Hawkins, the head of the operators' organization, has declared that all the propositions of the operators are withdrawn. President Thompson, of the miners' organization, declares that the miners are willing to permit their proposition to stand, and that they will sign a contract on that basis with any operators who will accept it. The joint-scale convention adjourned sine die on Nov. 13. Thus all the miners in the district will remain idle, except those at the Davis mines in Conesville and at the Tyrone mines, which have been operating for some time.

The bone of contention was not the scale proper, as the mining rate was acceptable to both parties. The difference arose over the pushing of cars from the neck of the room to the face and out again when loaded. The men are unwilling to perform this service.

Eastern Ohio Operators Look to West Virginia

In the eastern Ohio district, the expected conference of operators and miners failed to materialize. The long-drawn-out strike continues, and the operators seem disposed to buy coal lands in West Virginia, where such severely restricting obstacles to profitable mining do not exist.

The Discharge of a Pit Committee in Kansas

It was thought that when the miners of districts 14, 25 and 21 met in Kansas City, in September, and ratified the new joint interstate agreement, there would be no more trouble. However, the usual dissensions have again sprung up. The discharge of three members of the pit committee of the Cherokee & Pittsburg Coal & Mining Co., located at Pittsburg, Kan., is the most recent cause of dissension. The men demand that the discharged officials be allowed to return to work. This strike affects about 2000 men, all of whom walked out, after cleaning up, taking their tools with them. The company is willing to put the matter before a board of arbitration as laid down in the agreement; however, the miners refuse to do this. A section of the agreement anticipates for such a situation, and provides that during the settlement of disputes the men shall continue to work. The section reads:

If the president of the district, or his representative, and the commissioner of the Operators' Association, or his representative, fail to agree, they must either submit the matter to arbitration or refer the case in dispute and the records in connection therewith to the District Joint Board of Miners and Operators for final settlement. Pending the settlement of any dispute, the mine shall continue operation, and all miners, mine laborers and parties involved shall remain at work, except discharged employees.

Explanatory Note—What is meant by final settlement is that the district joint board shall dispose of all grievances referred to it without strike or stoppage of work.

Under this provision the strikers are said to lay themselves liable to a fine of one dollar a day for every day that they are out, since they refuse to return to work pending the settlement of the dispute.

Meeting of the American Federation of Labor

The American Federation of Labor has been meeting in Philadelphia, Penn., and there Mother Jones delivered one of her soul-stirring harangues. If the press is to be credited—and the words sound like hers—she now claims she was at Ludlow when the camp was burned. The principal resolutions from a coal-mining view were those desiring the abolition of efficiency systems by which workmen are speeded in their work, the introduction of legislation placing a minimum of 66⅔ per cent. of the wages paid any man as the rate to be paid relatives of men killed at their employment, and requiring that compensation be paid to children of miners who are accidentally killed till these dependents reach the age of 18.

The Federation also resolved that workmen's compensation laws should be administered by state commissions, and that employers' liability insurance be eliminated from the scheme of workmen's compensation. An excellent resolution to do away with discrimination in favor of unmarried and childless men advocated the passing of laws making the state the beneficiary where men were killed who had no dependents. However, this would not work any benefit where the state is itself the insurer of the workman.

Coming Meetings

The American Society of Mechanical Engineers will hold its annual meeting in New York City, Dec. 1, 2, 3 and 4, 1914. Calvin W. Rice, secretary, New York City.

The American Mining Congress' seventeenth annual session will be held at Phœnix, Ariz., Dec. 7, 8, 9, 10 and 11, 1914. J. F. Callbreath, secretary, Denver, Colo.

The Coal Mining Institute of America will hold its winter meeting Dec. 8 and 9, 1914, at the Fort Pitt Hotel, Pittsburgh, Penn. Charles L. Fay, secretary-treasurer, Wilkes-Barre, Penn.

The West Virginia Coal Mining Institute's winter meeting will be held at Huntington, W. Va., Dec. 9 and 10, 1914. Prof. E. N. Zern, secretary-treasurer, Morgantown, W. Va.

The American Institute of Mining Engineers will hold its annual meeting in New York City, beginning Feb. 16, 1915. Bradley Stoughton, secretary, New York City.

The Kentucky Mining Institute's winter meeting will be held Dec. 4 and 5, 1914, at the Seelbach Hotel, Louisville, Ky. Ivan P. Tashof, secretary-treasurer, Lexington, Ky.

Extracts from a Superintendent's Diary

One of our mine foremen is a born diplomat. If there were only a sufficient number of his type in the business, the trials of mine superintendents wouldn't be worth considering.

If he finds that he is accumulating too much narrow work, he sounds a few of the heading men and soon has them dissatisfied with narrow work and clamoring for rooms. Perhaps in a few months the conditions will be reversed and he is more than apt to have some of these same men suggesting their disappointment with room work and requesting a change back to narrow work.

Our coal varies in thickness considerably in different parts of the mine. Some miners prefer thick coal and others thin; when conditions change in a room after a miner has chosen the room, following careful investigation, as a rule he becomes discontented and begins to grumble. Mr. Diplomat makes short work of such grumblings. The miner who prefers thick coal to thin, after a short talk with this foreman becomes convinced that his preference is not well grounded and the advantage, if ad-

vantage there be, is in favor of the thin coal. And in quite the same manner the miner who prefers thin coal goes away pleased with the place in which he is working.

Then there is the constant variation in the proportion of working places in rooms and pillars. The Diplomat never quarrels with engineers' orders; if it becomes necessary to stop one hundred pillars on one day's notice, he promptly orders them stopped. His men, who declare that they will leave the camp rather than go into rooms, find themselves working in rooms in a few days, and well satisfied at that.

But the supreme test of this man's ability to handle men has just been completed and I doubt very much if he realizes that he has accomplished anything unusual.

At his mine we had always used the entire output of coal for coking purposes. The seam of coal being rather dirty, it has been necessary to crush the coal and then treat it in a washer before sending it to the ovens. If the miners became careless about separating the impurities before loading their mine cars, the waste at the washer would begin to climb, but some variation now and then was always expected and no noticeable shakeup would follow.

Last month, however, conditions became such in the coke trade that it was necessary to discontinue coking operations and the entire output of the mine was thrown on the market as run-of-mine steam coal.

Now steam-coal users are always on the lookout for cars that have a sufficient amount of bone and slate to attract attention, and we almost had our entire contract canceled before we got our bearings.

Then we got busy and found that it would be necessary to change the grade of explosive used, also modify the system of mining. And this was not all; even with all these changes the miners would have to be extremely careful or the coal could not be properly cleaned.

Miners do not take kindly to changes of any sort, and I assumed that they would not meet our views without cutting up considerably.

They did meet our views, however, and they didn't show their teeth.

Truth is, our foreman put the proposition before them in such a way that they followed his wishes without realizing that they were being asked to do anything unusual. And the foreman in turn didn't seem to realize that he was doing anything unusual himself.

The Pacifier

Written Expressly for COAL AGE *By* BERTON BRALEY

WHEN I comes home from work at night
All tired out from minin' coal
An' black an' sweaty to the sight
I ain't th' gladdest kind of soul;
Th' world don't make no hit with me,
I'm mighty weary with my lot,
An' every bloomin' thing I see
Just seems to feed th' grouch I've got.

THE *World Don't Make No Hit with Me.*

I CUSSES at my daily work,
I damns the Pitboss to th' Pit,
I thinks of all th' dust an' murk
Of minin'—an' I cusses it;
I thinks, "Us miners ain't no men,
We're pore dumb beasts that's hitched an' drove;
I starts once more to swear—an' then
I smells th' supper on th' stove!

IT mebbe ain't so very much
(A miner ain't no millionaire)
But when I scents that stew an' such
I—well, I half forgets to swear;
From worries an' from troubles, too,
My thoughts begin to stray an' rove,
An' life assumes a dif'runt hue,
When I smells supper on th' stove!

THEN *I Smells the Supper on the Stove.*

AN' when they brings that supper in
An' wife an' kids an' me sets down,
I finds a sort of pleasant grin
Has chased away my ugly frown;
I puts away all thought of strife,
My appetite I gives the call,
An' thinks, "Oh, well, this miner's life
Ain't nothin' awful, after all!"

Power Department

Coal Waste in Mining Plants

By Henry D. Jackson

SYNOPSIS—In extremely few mining plants are means provided for keeping track of the quantity of water fed to the boilers or the coal that is burned under them. The carelessness prevalent in such plants makes the proposition offered by the central power stations appear extremely attractive.

It seems somewhat like "carrying coals to Newcastle" to suggest to men in the coal-mining industry that they had better take more care in their use of fuel, if they have any interest in cutting the cost of mining, also if they care to prevent being compelled sooner or later to purchase current from the power companies which are fast springing up throughout the coal fields and whose sole reason for existence is the wasteful use of fuel by the people who mine it.

This may appear like a strong statement, but the facts justify it. How many coal plants are provided with any means for weighing the coal used under their boilers? How many are provided with meters or any apparatus for measuring the water fed to their boilers? In other words, how many of them have any idea of the actual amount of water evaporated per pound of coal?

Perhaps it is quite natural that this condition should have existed in the old days when the range between the price of coal as mined and sold was fairly large; but today, when the competition is keen and the margin of profit small, it cannot be said to be good business to have the costs run any higher than they must.

In the East where coal costs in the neighborhood of $4 per ton (the same fuel that is used by many of the coal producers as it comes from their mines), many plants not over 100 hp. in size manage to produce power at a cost of not over 2 cents per horsepower-hour, including all charges. And of this cost the coal represents in the vicinity of 60 per cent.

This means that the coal cost is about 1.2 cents per horsepower-hour. As coal at the mines has a value of about $1, the expenditure for fuel on the same basis of costs would be one-quarter of that in the East, or 0.3 cent; and if the rest of the expenses were in proportion to those in the East, the total outlay for power would be about 1.1 cents. Since the taxes are lower as are also wages, it should be found that even in the smallest coal plants the cost of power should not exceed 1 cent, and should run much lower in the larger ones, especially in those which have to operate in part at night, as the stand-by losses which exist in manufacturing plants would not then occur.

In the larger and better equipped and better managed plants in the East, even better results are possible than those above named; and it is by no means an uncommon thing to find them getting a horsepower-hour for about 1 cent. This being the case, the plants in the coal region should be able to better these figures as coal is there cheap.

That this is not the case, is shown conclusively when many colliery managers are willing to pay over 1 cent per kilowatt-hour to the power companies for current, in addition to the fixed charges on the machinery to use the same, as well as to scrap their present plants or to hold them and continue to pay the interest charges on the old investment. This latter point is one that is frequently lost sight of when power is purchased—that is, the owner forgets that his original investment is still there and eating up the dividends.

Why Is Power Being Purchased?

In the light of what is shown above, why is it that the coal companies are coming to purchase power, if it is not due to their waste of coal or inefficient operation of their plants?

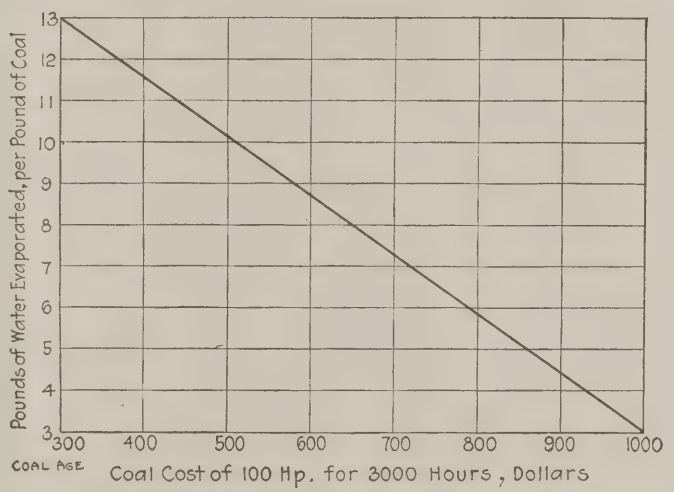


Fig. 1. Cost of Power with Varying Rates of Evaporation

The very fact that coal has a value of but 80 cents to $1 a ton, is one answer. For why spend the money necessary to secure efficient engines and good boilers or feed water heaters or purifiers, or in fact any of the devices to save coal; also why do everything to find out how much coal is burned or how much water is evaporated, if the resultant saving will in any case be small? That this is a mistaken idea, it is my intention to prove, and I hope to be able to show it so conclusively that every plant will take steps to ascertain what it is doing, and if the results are not what they should be, take further steps to find out why and make the corrections required.

In a good boiler, clean and well handled, it is possible to evaporate about 12 lb. of water per pound of coal, the latter possessing a heat content of about 14,000 B.t.u. This presupposes that the fuel is well fired and that the boiler setting is adapted to the coal, for much of the success in burning fuel depends on the proper setting as well as firing. In fact, quite as much heat is wasted

through improper settings as through poor firing, and these two are responsible for the greater part of the waste of coal.

The other waste points are cold water and dirty boilers. Few people who have not spent considerable time in the study of power plants, realize to what an extent waste can develop without its being actually noticed. Neither do they realize that even a small amount of scale or soot or both seriously affect boiler performance, while the effect of heating the feed water is to them but little more than conjecture. All of these items are of as much importance in a plant where the coal costs little, as where it costs much, for they in turn seriously influence the cost of coal, and, therefore, the price at which it may be sold at a profit.

The feed-water heater will effect a saving in fuel of 1 per cent. for each 10 deg. rise in feed temperature. Figure this out for your plant. If the average temperature of your feed water as it comes from the mains or snpply, is 60 deg. F. and you can raise it to 200 deg. by the heat left in the exhaust steam, you have added 140 deg., and by the rule given, you will have decreased the coal needed 14 per cent. besides saving the boilers from dangerous and injurious expansional stresses.

Boilers which are dirty, either inside from scale or outside from soot, are equally wasteful, so that care should be taken to avoid the use of water carrying scale-forming material, either by careful selection of the source or by purifying the water before it enters the boiler.

The use of boiler compounds is, generally speaking, not to be recommended, as this is only treating the disease after it has gotten into the system. The better way is not to allow the disease to enter, by removing the impurities before the water gets into the boiler. Such treatment costs but little and may save much trouble, besides saving considerable in coal, as a very thin layer of scale will reduce the evaporation by a large amount. The same applies to soot. Keep it away from the heating surface or its cost in wasted coal will be large.

Details Are Important

It is only by attention to details that the cost of coal and power can be reduced to a minimum and kept there. But is that attention not justified when the results will pay handsomely? When everything has been done to secure good results, there is no reason why the evaporation should not be in the neighborhood of 12 lb. of water per pound of good coal; with lack of attention and even where care is taken, unless there is some device for weighing the coal and for measuring the water, it will be found that the evaporation is by no means where it should be, so that the very first things required for results are those which will indicate to the owner what is going on in the plant.

It would be impossible in these days of close competition, for a coal operator to guess at what his coal costs and sell it on that basis. He knows pretty exactly what each ton costs and what he must get for it in order to make a profit. To do this, he must know what each step costs and take into account every detail of the work.

The power costs are lumped, and unfortunately in many cases the entire services of the master mechanic and electrician are charged against the station, when much of their time is spent in following up work in no sense connected with the cost of making power. In justice to the plant, such services should be charged up to repairs, maintenance, or wherever they belong, and not to power cost. Then when the power companies attempt to sell current, some real figures will be at hand to compare with those they offer.

It is safe to say that any plant having 500 horsepower in boilers and having use for that amount of steam, with engines of any good make and with the plant operated with any real attention to economy, can produce its own power cheaper than it can buy it, and this without taking into account the fixed charges on the new apparatus that will have to be secured in order to make use of the power when purchased. It must not be lost to sight that the lines of the power company have to run over long distances and are subject to many disturbing factors, any one of which may mean a shut-down to the coal mine, also that the contracts are frequently so worded that there is no redress in case of such suspension.

Central-Station Cost Is Not the Entire Cost

The claim that owing to their size these power companies can produce current at a lower price, may be true, but the cost of power at the central station is not the cost that counts. To this must be added the fixed charges on the lines to transmit the power, also the cost of the power lost in transmission, and in transformation, as well as the expense of the business department for obtaining the business and collecting the money for the power sold.

When this is added to the cost of current at the plant, the total cost of the power must be from two to six times the station cost. Take this into account and consider, "Is it possible that we, without all of these costs to add to our operating expense, cannot produce power at least as low as we can buy it?" If not, why not? And then get busy.

For every 100 hp. of boiler plant, the coal consumption should not exceed 2.7 lb. per horsepower-hour, or 270 lb. with the boilers in good condition and everything about the plant in shape for economy. This means an evaporation of about 12 lb. If things are not kept up, the evaporation may fall as low as 5 lb., which is by no means unknown, and the coal required per horsepower-hour may increase to 6.4 lb., or 640 lb. per 100 hp.-hr., and according to the conditions it may vary anywhere between these limits.

For every 3000 hours' operation of the plant, the coal may vary between the low limit of 810,000 lb. and the high limit of 1,920,000 lb. With coal costing $1 per long ton, the variation will be from $361.60 to $861.10, the difference representing the interest at 6 per cent. on an investment of $8325, or more than the entire cost of a fairly high-class plant.

Considering these facts, is it not worth while taking steps to ascertain what you are doing, and to maintain your plant in the very best possible condition in spite of the low cost of coal, for, after all, this expense for fuel is an important factor in the cost of coal mining and the saving made in it may go a long way toward paying a dividend on your plant.

There are but few coal operations where the boiler plant is smaller than 200 hp., and the majority are much larger. A 200-hp. plant would show a range of double the above figures, and so on, according to the size of the plant. The cost of 100 boiler-horsepower for 3000 hours, with coal

at $1 per ton of 2240 lb., at varying rates of evaporation, is shown in the accompanying curve.

At 12 lb. evaporation, the cost would be approximately $361. At 3 lb. evaporation, the cost is approximately $1000. This is a graphic illustration of the value of knowing what is going on in your boiler plant, for of all places this is the one where the greatest loss can occur without its being apparent, unless the plant is equipped to keep track of the evaporation, which means weighing the coal and measuring the water.

Records Must Be Kept

Results cannot be obtained by letting things go, even with the best of plants, but records must be kept on file showing at all times just what is being done. Not only the quantity of coal and of water must be known, but the feed water must be maintained at high temperature, the boilers kept clean both inside and out, and last of all, the methods of firing must be closely watched so as to see that fuel is not wasted at this point, for more coal can be lost through poor firing than by dirty boilers or cold feed water.

Another point well worthy of consideration is the type of boiler setting employed, for no type of setting is adapted to all kinds of coal. In fact, each character of fuel should have a setting specially adapted to it, as each coal varies so widely in its constituents, that the amount of air required, as well as the height of the boiler above the grate, will vary for good results. High-volatile coal requires a setting with a considerable distance between grate and boiler, and grate bars having big air spaces, also in all probability a large air opening in the fire door so as to allow an excess of air over the fire, in order to properly burn the volatile matter and possibly the fixed carbon.

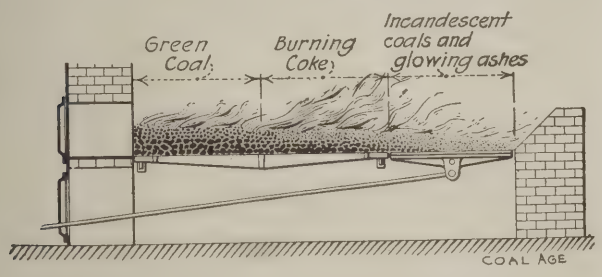

Fig. 2. The Proper Condition of the Fire

Other coals with less volatile will require the grates close to the boiler and fine air spaces, as well as no extra air over the fire, so that for the best results the boilers should be bought and installed with due consideration of the coal to be used.

The average boiler employed throughout the coal region is the horizontal return tubular. This boiler was originally designed for the use of anthracite coal. When modified for the use of bituminous coal, the grates were lowered somewhat. They were not, however, lowered enough for most characters of bituminous or semi-bituminous coal, nor were they adapted to these fuels in many other ways, such as the location and arrangement of the bridge-wall or for the supplying of air over the grates. Furthermore, little attention has been paid to the proper methods of firing for economical results.

Most engineers are aware of the great saving in fuel made by the under-fed type of stokers, but not all are cognizant of the reason for this economy. In the first place, the coal is fed upward to the fire. All of the gases are distilled off, mixed with air also coming through the bed of coal, and passing through the incandescent fuel above, are ignited and consumed, thus utilizing all of the volatile matter which is capable of being burned.

As most of these stokers operate under forced draft, it is quite possible to supply the exact amount of air necessary to burn not only the gases, but also all of the fixed carbon in the coal. This is almost impossible of accomplishment by hand firing with the present arrangement of settings.

It is also to be noted that the larger number of under-fed stokers have the bed of the fire much farther away from the boiler than is the case in the ordinary setting. This also assists in a thorough burning of all the gases, because the latter do not get into contact with the shell of the boiler before ignition.

The Usual Results of Hand Firing

With hand firing, coal is distributed over the fire, the gases are distilled off, rise, strike the boiler, are chilled below their point of ignition and are driven off unconsumed, carrying with them a considerable proportion of unburned carbon in the form of dust. That this is poor economy, has been shown again and again by different types of so called smoke consumers, which do nothing more than properly mix air with these gases and force them over a bed of incandescent coal. The same results could undoubtedly have been obtained by raising the boilers considerably above their present height, and firing properly.

The use of dumping grates, making the last third the dumping portion, would also serve to assist, as by this means cleaning the fire would not mean opening up the entire grate. This last third could always be kept covered with live, full-burning coal, while that on the forward section of the grate would be in process of coking and partially burned. The general condition of such a fire is represented in the ccompanying drawing, which shows the first section of new coal, the second partially burned, and the third section of incandescent coal and ashes.

When this third section is burned out, it is dumped; the second section is pushed back to take its place, the first takes the place of the second, and the first is renewed. By doing this under one-half of the boiler at a time, the most economical results can be obtained. Not only this, but the fire can be forced to a limit not possible under ordinary conditions of firing with the common flat grate.

Another common result from the cost of coal being low is the purchase of engines that are wasteful of steam, the idea being that since the cost of steam is low, it is hardly worth while buying expensive machinery to save it. This is especially true when it comes to the engines operating the fans. How false and futile this reasoning is, can be shown by a few figures; also how this very saving in the first cost of the engines actually entails an actual increase in the cost of the plant as a whole.

For instance, assume the purchase of an engine using 30 lb. of steam per horsepower-hour and of 100-hp. capacity. This engine will use 3000 lb. of steam per hour, and with an evaporation of 6 lb. of water per pound of coal, would require 500 lb. of fuel. If the engine would

do the work on 24 lb. of steam per horsepower-hour, the coal would be reduced to 400 lb., or a saving of 100 lb. per hour. In 3000 hr., the saving would be 300,000 lb., or an equivalent of $134, and for every 6 lb. advance in steam consumption, the increase in coal will amount to $134.

Therefore, it is advisable to purchase an engine which is not wasteful in steam. There is, of course, a limit, and that limit is reached when the saving in steam is equal to the interest and depreciation on the increased cost of the engine.

Many engines are wasteful in their use of steam, either on account of their construction or through neglect, so that 50 or even 60 lb. per horsepower-hour is by no means uncommon. In addition to the wastefulness of an uneconomical engine, there is also an increase in the actual investment by the purchase of a machine of this character.

For instance, if an engine of 100 hp. capacity is purchased, requiring 30 lb. per horsepower-hour, a 100-hp. boiler can easily handle it. If, however, the engine requires 60 lb., it will take a larger boiler to supply this steam. Therefore, it is to the interest of every coal operator to see that a good engine is purchased, in order to keep down the ultimate investment, as well as the operating cost.

This done, it is "up to" the operator for economic reasons, to see that the boilers are run with as little coal as possible, which means care and attention to details, as well as the installation of those devices which will show at all times what results are being obtained for the fuel consumed.

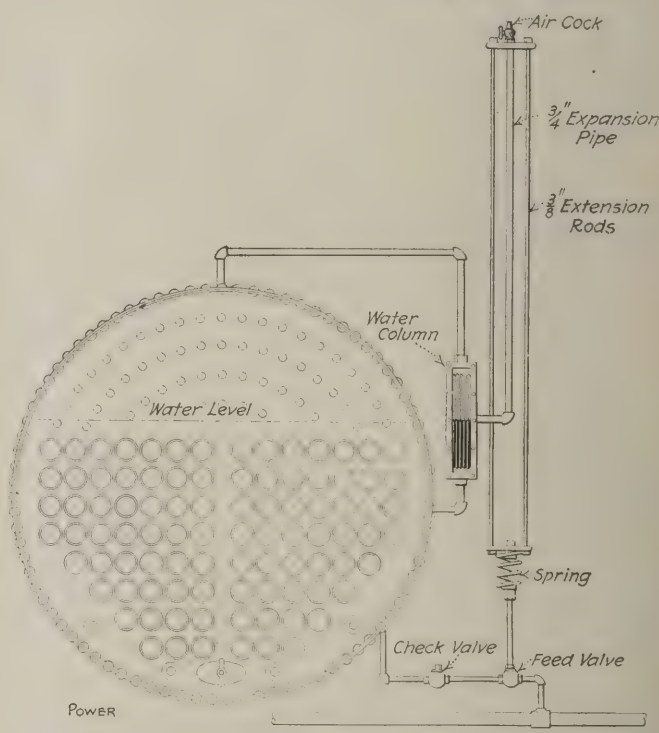
Pump-Motor Troubles

A three-stage pump, driven by a compound, direct-current, variable-speed motor, handling drainage water in a mine, gave trouble by taking too much current and tripping the circuit-breaker in the power house when the speed was increased to give the required head, saws William Salt, in *Power* for Nov. 10, 1914. At first it was thought to be due to stoppage at the inlet of the pump. Accordingly, the casing was opened several times and the parts examined, but they were free and properly assembled.

The machine was a mile from the power house, and had over 300 ft. of lift. The motor was started in the usual manner with full field, the speed being increased by weakening the shunt field until the pump began to deliver water. The slight rise in speed necessary to increase the flow resulted in a heavy increase in current, causing the circuit-breaker to go out.

Several trials convinced me that the trouble was due to a wrong series field connection, for when the motor was brought up to speed by weakening the shunt field, the series field became stronger by the increased current until at a certain load it overcame the shunt field, and, being in the opposite direction, tended to reverse rotation with the results as noted. Accordingly, the series field connections were reversed, after which the machine was put into service and took only normal load current.

In another instance a small three-phase motor driving a centrifugal pump heated excessively when first put in service. An ammeter in the line showed overload current, and, believing the trouble to be caused by over capacity of the pump on account of the nature of the liquid handled, the piping was changed so that a test for head and capacity could be made. This showed the motor to be a little overloaded, but not enough to account for the excessive current.



A wattmeter connected in the lines near the motor showed that the trouble was done to the auto-transformer used in starting. All three lines were closed when in the starting position, but in the running position one line was open because of a broken contact finger. This was repaired and the motor operated satisfactorily.

Home-Made Feed-Water Regulator

An engineer called my attention, says Luke Mathier in *Power* for Nov. 3, to his home-made feed-water regulators. He had made them out of odds end ends of pipes and rods about the plant and claims to have the simplest regulator in the world. I do not doubt his statement.

He says they have never fooled him yet and he has perfect confidence in them. The illustration is self-explanatory.

The process is one of balance, the feed valve is maintained in a certain position, feeding gradually and continuously maintaining an almost even level of water in the boiler. When the water lowers below the second gage cock, steam enters the "expansion pipe" and raises the rod, opening the feed valve. When the water in the column gets above this gage, water enters the "expansion pipe" and contracts it, pushing the rod down, thus closing the valve shutting off the water.

Regulator Connected

Electric firing eliminates all accidents due to short fuses and reduces the number of those arising from retarded ignition. The use of self-contained electric detonators eliminates the danger which is always present in the handling of loose primers which are intended to be ignited by a fuse. This method of firing also saves time and labor, as all shots are fired.

Editorials

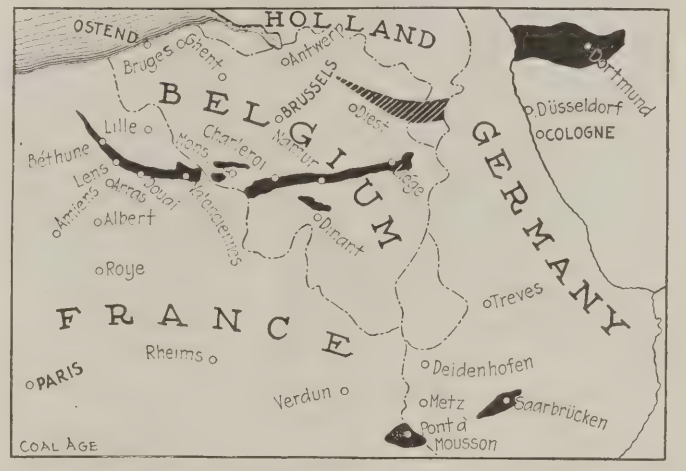
Wanted: A War Correspondent

It is reported that Judge Youmans, of the U. S. Court, has ordered the reopening of the Bache-Denman properties. The U. S. cavalry forces are to be used to aid in this resumption. At the same time the U. S. forces are invoked to keep mines closed in Colorado. Thus a situation grim, but still ridiculous, has arisen. The nation has two heads, the executive and judicial. One believes itself above the law and the other believes the law supreme. Strange to say, the judiciary has been able to make the executive enforce the laws in Arkansas though the President proclaims a higher law in Colorado.

There is also a night-riding insurrection in Muhlenberg County, Kentucky, and federal troops are liable to be called out to prevent violence on negro and nonunion miners. In Butte, Mont., the state militia is still in control of the mining situation. Though we have a brevet captain of the Illinois National Guard and veteran of the Spanish war on our editorial staff, his military experience has been acquired with the rifle, not the pen, and we may yet have to look for a competent war correspondent.

The War and the Foreign Collieries

The war has already closed the best collieries in France. The fighting is both over and in close proximity to the best coal field in that republic, that is, the field lying between Quiévrechain and Fléchinelle, including such well known mining centers as Lens, Liévin, Béthune, Valenciennes, La Clarence and Courrières. The smaller and unimportant field of Pont-à-Mousson is also suffering the rigors of war.



In Belgium, as might be expected, every acre of coal territory is in the hands of the Germans. The main coal field lies along the Sambre to its junction with the Meuse, and is found along the latter river as far as and beyond Liége. It is a continuation of the field in France, but there is another isolated patch of coal also along the Meuse at the town of Dinant.

To mention the towns in these Belgium fields is to cite a long list of the places where the Belgians, British and French made heroic resistance to the valor of the German arms. Thus at Liége the Belgians repelled the advance forces of the German army; at Mons and Charleroi the British, few in numbers, made a brave resistance and a courageous retreat in the presence of a superior force and at Dinant the Senegalese and French captured the heights only to lose them twice. Namur was also a scene of severe fighting.

It is said that the Germans destroyed the mines in Belgium on their advance toward Paris. If so, it was an inexcusable piece of folly, for the output of these mines would be of great value to the invaders. The story is probably not true, but it is quite likely that the French and Belgian mines *will* be destroyed if the Germans withdraw, for it has always been regarded a justifiable act to demolish such property of the enemy as would otherwise help him to continue his resistance. Both North and South in the Civil War destroyed the coal mines of the enemy whenever they could not avail themselves of their resources.

Thus we may expect to find the output of both French and Belgian mines much reduced after the war. We do not regard the Germans as morally justified in destroying the mines on their retirement, because the British have enough coal to make such destruction of the property of the Allies a negligible factor in the war, but we cannot expect the Germans to observe such considerations, as the Allies have seized, as have also their opponents, every ship they could find on the high seas in a manner which would be piratical were it not justified by every precedent in history.

But how about the Teuto-Turk alliance? In the forefront of the advance of both Western and Eastern allies

THE COAL FIELDS IN FRANCE, BELGIUM AND GERMANY

The shaded field in Belgium is extremely deep and at present produces little coal. Its extent and shape are not clearly defined.

are the coal fields of Germany, Austria and Turkey. The western German fields are between the Ruhr and the Lippe in Westphalia and near Saarbrücken. If these should be invaded by the Allies, it is likely they will endeavor to do them the minimum amount of harm because they will by that time be so clearly superior to the enemy that retreat will be unlikely. They will have every interest in preserving the property of Germany, seeing that only by so doing can they collect from that country an indemnity which will make good the tremendous losses of the war.

On the eastern frontier of Germany are the Silesian fields, which are also exposed to the Russian advance, being situated partly in Russia and Austria. Here the outcome of the war will probably be less favorable, because the Russians have been making a different campaign from the other Allies. They have been disposed to press the offensive with mobile troops which move far ahead of their main line. Consequently, these light troops are

liable at any time to sustain a defeat. When they are attacked in overwhelming numbers they retire to the shelter of their main forces, doubtless doing all the damage they can on their retreat. Only assurance of success makes a victor indisposed to destroy property.

It is unlikely that the Germans will destroy their own mines on the eastern frontier because of the certainty that the British can supply all needed coal from England and Wales. On the western frontier they will be equally indisposed, because, owing to the Russian method of warfare, it is quite likely that the Germans may regain tomorrow a fair proportion of what they lose today.

Consequently when the war is over France and Belgium will be found the principal sufferers. The tipples in France are extremely high, some say as much as 200 ft. They serve admirably for rapid-fire gun platforms, for snipers and for wireless stations and doubtless will suffer severely.

The output of Belgium in 1912 was only 25 million short tons, and the two principal mining departments in France, Pas de Calais and Nord, now ravaged by Germany, produced only 33 million short tons in that same year. So that it is hardly likely that the tonnage loss in Europe after the war is over will be greater than the reduction in market demand.

The Turkish field in Heraclea, which produces about 800,000 tons per anum, will be one of the early spoils of the war. It is probable that as the coal outcrops to the surface it can be readily reopened no matter what the Turks may do to the improvements already erected for its exploitation. They will feel little regret in destroying the present plants, as they are owned in France.

However, as we go to press, we learn that the Russians have rendered the coal mines practically unworkable by a bombardment of "Zungulday" (probably Zoongooldak) It is likely, however, that they will be reopened speedily so that the operations of the Turkish fleet will only be temporarily inconvenienced.

The Progress of Germany

In our issue this week, Samuel Dean, an Englishman, writes on his visit to the mines in Germany. It cannot be contended that he is pro-German, but his account certainly must be considered as flattering to the people of Germany. Were Napoleon living, he could hardly be induced to believe that the Teutons alone could confront all Europe.

Mr. Dean, himself, is not disposed to take seriously the remark made by a Frenchman with whom he traveled. The billion dollars paid by France to Germany after the war of 1870 is certainly not the cause of Teutonic prosperity, though such a payment seems an immense amount of money. When, however, we think in terms of nations, billions of dollars roll naturally from the tongue. Thus the revenue of the German Empire amounts to about nine-tenths of a billion dollars. The Germanic States separately collect in addition one and a half billions and the colonies 28 million more. So let us not deceive ourselves, there is something *in* Germany and *of* Germany which accounts for its progress. If we in America can find it and imitate it we shall do well.

Somehow we have never been impressed with the transcendent powers of the Germans as individuals. To us they have always appeared "just people," man for man, very little different in intelligence from ourselves, and not markedly different from the citizens of the island across the North Sea. And we do not see either where Germany has resources in any way superior to our own or those of the British Isles. In fact, we have distinctly an advantage.

We are, therefore, disposed to accept the solution that the excellence of the German colliery plants is due to profits and that profits have been due to syndicates which the government has fostered. Even before these trusts were created, the Germans did not oppose the system of which they were the outcome, and large profits in business were not considered inequitable.

Let us suppose that all business be conducted without profits in America for a number of years and let us grant that the working people save absolutely nothing, but live from hand to mouth. Then if industry is to be enlarged even as fast as the growing population demands, capital must flow from outside.

So, if progress is to be made, it must be, as we recently stated, either by profits or by thrift. We have heard men who made $400 a year say that they could not save a dollar. Others said the same who were making $600, $2400 and $5000. Whatever the wage, the wage-earner seems unable to put anything by.

The people who are saving are the very rich. Some of them are making so much that only by giving their money away can they keep from growing richer and richer year by year. Thus, it is that profits are a surer source of capital than thrift. We leave it to our readers and ask them how many of them who are wage-earners are saving anything which can make a capital fund for the America of which they believe they are good citizens. The capital fund cannot grow where profits are nil and when the wage-earner spends all he makes in securing impermanent possessions.

Perhaps the German way is not well, but we think if it be continued year by year, in a few decades the growth of capital will be such that the workingman can have out of profits, due to increased mechanical efficiency, as much as he would get today where no profits are made, and his employer will nevertheless make enough out of his labor for the erection of plants which would assure continually increased efficiency.

Thus the German laborer may lag a generation in his wage scale, but ultimately, if the wealthy classes do not become corrupt, he will more than gain on other workmen by reason of increased efficiency in operation. Of course, such increased wealth might make those who receive it corrupt, leisurely and incompetent, but so far it seems in Germany for the most part to have done none of these things.

We do not want to advocate unreasonable profits. Rather would we recommend a degree of thrift, based on careful judgment. But he who will not save, must not venture to lift his voice against those who make profits, for such men are the *benefactors* of the nation. We use the word advisedly and as just fresh from its Latin source. Benefactors may not help us out of any regard for us; they may not be citizens whom we respect and applaud, but whether they are good or bad, whether we like or detest them, they are benefactors when they do us good. And those who build up the capital of the nation are such benefactors, condemn them and dislike them as we may.

An English Mine-Rescue Station

By Edwin Husband*

SYNOPSIS—The coal companies in Europe have large rescue stations which they support for their common advantage. This describes one in the Midlands of England and the methods of training there pursued.

The Midland Counties of England have near Mansfield, Nottinghamshire, one of the first and best equipped mine-rescue stations in Great Britain. At present it serves 150 mines in the counties of Nottingham and Derby, but two new substations are now being built, one at Chesterfield in Derbyshire and the other at Ilkeston in Nottinghamshire. When these are completed all the mines in the two counties will be within 10 miles of a rescue station.

Already over 100 teams of six men have been trained at this station. After the men have been instructed and have passed a rigid examination they are awarded diplomas but are required to come to the rescue station at stated periods for an efficiency test.

The practice building consists of two long circuitous and narrow galleries, in one of which the conditions have been made to resemble as nearly as possible those of a mine where an explosion has actually taken place.

There are small openings over the imaginary roof falls measuring about 21x24 in. Through these, the rescue party must pass, encumbered as they are with their Meco breathing apparatus. They must also take with them on a steel stretcher a dummy, weighing as much as an average man. During the final training the teams are required to stay for two hours without coming out into fresh air in a poisonous atmosphere produced by the burning of hay, straw, shavings and sulphur.

While there the men are required to load a car with brick, push it along a portion of the gallery, build a properly bonded 9-in. wall, set props and hang brattice cloth, then dismantle the work and remove it to another place. During the practice, at a favorable opportunity, the superintendent who carefully watches the team through the windows, rushes in and disarranges the breathing apparatus of one of the students, at the same time calling attention to that fact.

The rescue work ceases immediately, and the men at once turn their attention to the comrade whose apparatus is out of order. The captain carries, strapped to his belt, a small tin can which contains an outfit, to be used only when the breathing apparatus of any of the team is disarranged. He takes out the emergency outfit and connects it to a spare cylinder of oxygen. The mouthpiece of the injured apparatus is removed from the mouth of the wearer and that of the emergency outfit substituted.

All this is done in much less time than it can be described, and so neatly and quickly is it performed, and so well, that the wearer does not experience the least inconvenience by the change. The captain then repairs the injured apparatus, which is then readjusted, and the emergency outfit is replaced in the can ready for use again whenever required.

The course of instruction extends over a period of 12 weeks, and commences with a series of lectures by the superintendent on the various aspects of rescue work. The men are then allowed to wear the apparatus in the galleries and do practice work, but the chamber is not filled with irrespirable gases. During the eighth week for the first time during their training the galleries are filled with noxious gases, and the team is instructed to do nothing but sit still for one hour, after which the men walk about the galleries for an equal length of time. The next lesson consists of rescue work under conditions similar to those which usually exist after an explosion.

Creswell No. 2 Colliery Rescue Team at Mansfield, Nottinghamshire, Eng.

The superintendent's final instructions to each team before entering the poisonous atmosphere are: Keep together. Watch each other's gages, and if any man's apparatus goes wrong, don't put him out, but instead immediately apply the emergency outfit.

The Mansfield rescue station has a fine rescue car, somewhat similar to the one used by the U. S. Bureau of Mines. The building is equipped with a gas-testing machine, constructed under the Oldham patent, changerooms, baths, oxygen storehouse and cylinder-charging machines. There is also a comfortable house for the superintendent where, after practice, each team is provided with a substantial meal. This rescue station is financed by the various companies operating in the two counties, and is governed by a board appointed by these companies. Every man receiving training is paid by the corporation which employs him.

After completing the rescue course, each man is instructed in gas testing and must undergo a rigid examination before receiving a certificate of efficiency for mine-rescue work. This test consists of the art of detecting small percentages of firedamp in the Oldham gas-testing

*Superintendent, Wadsworth Red Ash Coal Co., Helena, Ala.

machine and stating the different percentages to the examiner. It is now one of the British mining laws that all firebosses in order to retain their positions must pass the above named tests once every five years.

Since my visit to this rescue station, the mine owners have decided to use a liquid-air rescue apparatus, termed the Aerophor, instead of the oxygen type, and have built a liquid-air plant, which does not require a skilled attendant. It consists of a three-stage air compressor, the air being drawn through a purifier and compressed to 200 atmospheres. After passing through another purifier, it goes to the liquifier and expansion engine, and is then drawn off and stored in vacuum bottles. The weight of the apparatus, including a full charge of about 10 lb. of liquid air, is 30 lb., and, of course, the load gets lighter as the liquid air becomes used up by the wearer.

The English Language in the Coal-Mining Regions

By James Steelman

SYNOPSIS—English should not be taught to foreign miners as a book language but as a living tongue. The teacher by performing the actions which his words describe, and by inducing the pupil to imitate both words and action, can teach him English even when the instructor is entirely ignorant of the language or languages which the pupil can speak.

Employers are everywhere awaking to the truth that a reasonable amount of money spent upon improving the efficiency of the employees is a good investment, the returns on which are prompt, sure and adequate. We should not be surprised then to learn that coal operators are beginning to realize that, if they can remove from the foreign laborer the handicap of ignorance of English, they themselves will be greatly benefited, so greatly in fact that they can afford to spend time and money on solving the problem presented.

The strained relations that so often exist between employer and employees are undoubtedly due in large measure to ignorance on either side of the conditions under which those on the other side are laboring. A grievance gets under way. It is bound to grow in an atmosphere of ignorance of the facts. Now the basis of a common understanding must depend upon a means of communication. Otherwise, grievances cannot help growing. But, how can the management keep in touch with masses of men speaking many languages, of which English is not one?

Again, the proper conduct of mining operations turns on the men understanding the orders and directions. Their safety depends largely on their comprehension of regulations. Here again, English is the great need.

In short, there can be no doubt that a mine or any other enterprise will run much more smoothly—that is, much more economically—if the men have a grasp on the fundamentals of English; if they understand the spoken word, and the printed rules and regulations. It is just as reasonable to pay money to provide a lubricant here as anywhere else. Of course, it is impossible to express in definite figures just how much benefit there is to the employer. But the matter is sufficiently clear to make it a reasonable proposition for the coal operator to provide for the instruction requisite.

Little Knowledge of English Required

About one-half of the population in the coal regions of Pennsylvania is foreign. Nearly all these foreigners speak something other than the English tongue. A large proportion know little or nothing of the language of the management. How shall it be remedied, if indeed there is a remedy?

It is important to note that the required cure is easily provided. We need to teach foreigners English; but this does not mean that any real grammatical training is at all necessary to meet the situation. The amount of English actually necessary is inconsiderable. Syntactical exactitude, extensive vocabulary, perfection in pronunciation—none of these is required. All that need be sought is to impregnate the foreign workman's mind with a grasp of English which every American child possesses.

This means a vocabulary of perhaps 300 or 400 common words; certain terms belonging to his everyday activities will, of course, have to be included, but it will be a child's knowledge of language, nevertheless. He will not have to know how to parse. It will be an unnecessary refinement for him to learn that he ought to say, "I walk slowly," instead of "I walk slow," or that "which" should not be used when referring to persons. If he has trouble with the pronunciation of certain sounds, and persists in saying "dat" and "winegar" and the like, what of it? His pronunciation of a small circle of words must be good enough to be intelligible, that is all.

A good working knowledge of a small vocabulary will cover his principal requirements. If he is to be taught to read in order that printed directions may not remain unknown to him, it will perhaps be necessary sooner or later that he shall get some idea of spelling. But this will be limited to his vocabulary. Ordinarily, it will be unnecessary to teach him to write more than his own name. When the actual necessities of the case are taken into consideration, it will be seen that the matter is greatly simplified. In fact, the acquisition of enough language to meet modest necessities is quickly possible for untrained minds.

Progress Made among Illiterates in Kentucky

In the United States there are districts where a considerable percentage of the population is unable to read and write. They use English as a spoken language; but reading and writing are beyond their knowledge. Kentucky is a good example. This state is by no means the most illiterate of all; still 12 per cent. of her population over 20 years of age are unable to read and write. Here is a problem concerning men and women. It is not a question of school children at all. Thus it is a difficulty comparable with that existing in the coal regions. In Kentucky, the problem is to teach the printed not the spoken language. No doubt, it is easier to teach an American how to read English than it is to teach a foreigner the same thing. On the other hand, the educational effort in Kentucky does not shrink from dealing with the oldest pupils—persons over 70 and 80 years of age. It is being demonstrated there that even old people can be taught. Indeed, it is being shown that for this only a short period of training is needed.

Two or three years ago, one of the Kentucky school superintendents, Mrs. C. W. Stewart, stirred up her band of teachers and made through them a determined and successful effort to inaugurate evening schools for

the illiterate. On Sept. 4, 1911, the teachers of the whole district of Rowan County, visited the homes of the people in their several neighborhoods and notified them that upon the following evening a school would be opened. More than 1200 persons responded at once. The ages ran from 18 to 86. It turned out that these people were most eager to learn; that nothing in the way of physical difficulties would stop them. The movement spread to other districts. Now Kentucky has for her slogan, "No illiteracy after 1920."

I will give some illustrative examples of the results. A woman 70 years of age was able to write a legible letter after 8 nights of work; a man of 50 did the same after 7 nights; another man, 30 years old, succeeded in the same task after 4 nights. Pupils were accepted who could read and write, but who wanted to make further progress. But in the second term, there were 300 illiterates out of a total enrollment of 1600. The movement is succeeding. It is old enough now to have failed, if there had been some fundamental defect in its conception. It shows that grown people can be interested and taught the most elementary things. It may not be possible in so brief a time to get the same results with a mass of men from foreign countries as have been obtained with citizens in Kentucky, because they have greater difficulties to surmount. But the work is worth doing, even though it may not be possible to do it in a couple of weeks or so.

The Teaching of Foreigners in New York City

In New York City, the problem of teaching foreigners the English language has received much attention. It will readily be understood that with her immense and ever-growing foreign population, New York has been almost forced to attack and solve the question. The Board of Education maintains classes for the purpose and has been doing so for a number of years. In fact, as far back as 1906, a definite method was formulated and adopted. This system seems to differ from that of Peter Roberts described in Coal Age for Aug. 22, pp. 350 to 352. On the other hand, there are prominent similarities. As the New York system has the prestige of proved success behind it, it will be well to learn precisely how it is carried out, so that teachers in the mining communities may have exact knowledge.

In the New York system, a beginning is made by making an appeal to individual self-consciousness and utilizing a point of contact between the pupil's native language and English. I will make this plain by giving a typical example of the manner in which the teacher gets under way. The class is supposed to be assembled, whereupon the instructor calls out the name of some pupil. The name will be alike in English and in the pupil's native tongue. Perhaps no one replies. Nevertheless, the pupil is pretty sure to manifest a degree of self-consciousness. Besides, others in the class will recognize the name and direct their attention to the pupil called.

The teacher will now plainly direct his eyes to the pupil in mind, and say, "Johann Schmidt, stand." As he utters the word "stand," the teacher will get up from his seat and thus exemplify in his action the meaning of this word, which is really the only English word in the sentence. If the pupil fails to get the meaning, or for some other reason does not stand up, still the teacher may be sure that some of the others have caught the drift of things. So he will turn to another name on his list, and say "Antonio Nicoletti, stand." He will now, or else a little later with some other name, get a response. However, the teacher must rise, whenever he enunciates the word "stand." After one response, others will be easy to obtain.

The teacher will give a word of commendation after every success; such as "Good!" "Right!" "Yes!" "That's right!" He will nod or otherwise *act* approval in addition. The situation now is that the teacher and a number of pupils are on their feet. He will now say, "Antonio Nicoletti, sit," and at the same time resume his own seat. If Antonio fails to get the idea, another pupil is addressed; but the teacher in each and every case acts the meaning of "sit" upon speaking the word, at least until a proper response is obtained. We have, in the foregoing, illustrations of one of the fundamental rules of the method: *First the idea, then the word;* or, *Simultaneously act and word.*

Pupils and teacher are now seated. He turns to one of the successful pupils, and says, "Antonio Nicoletti, stand." He goes on, looking at the pupil and pointing to him, and says, "Your name is Antonio Nicoletti." He calls upon another to get up, saying, "*Your* name is Zelig Kaliski." After a number are up, the teacher will say, pointing to himself, "My name is Mr. Brown." Then, looking straight at one of the pupils standing he says, "What is your name?" After some effort, a correct response will be obtained: "My name is Zelig Kaliski." The procedure is then continued, until all have resumed their seats. The words to which particular attention has been secured are: *Stand, sit, my, your, name, is, what.*

Not Only Teacher but Pupils Also Illustrate Words

The foregoing may constitute the first lesson. In a second lesson, the teacher will ring the changes on the words previously learned, particularly the verbs. Thus, he will say, pointing to himself and rising, "I stand." He resumes his seat, saying, "I sit." Then turning to the class, he will address one of the pupils and say, "Antonio Nicoletti, stand"; following the request with another, "Antonio Nicoletti, sit."

Of course, the teacher sees to it that properly responsive actions are given to both requests. Now, he asks Antonio again to stand, he himself getting up at the same time and saying, "I stand." If Antonio says nothing, the teacher urges, "Say, I stand," and persists until success is obtained. The same procedure is followed in teaching, "I sit." But always now the pupil performs the act before or at the time he is required to say the word.

Next, pointing to several pupils one after another, the teacher will say, "Zelig, stand"; "Johann, stand." He seeks to get both action and word. Similarly, with the word "sit." Then, leaving off the name, the pronoun is introduced—"You stand"; "You sit." After exercising along this line for awhile, the teacher will exclaim, "Antonio, Zelig, stand." Then he will follow up this with, "All stand," making some gesture to indicate that the whole class is meant. Then, "All sit."

After spending some time on a review of this character, the teacher will proceed to introduce a new verb. The old must be conveyed first, or at least simultaneously. The old words may be utilized and all unified in a single group of actions. Thus, performing the several actions, the teacher will say, "I sit, I stand, I walk, I sit."

Illustrating Pronouns

A pupil will now be requested to go through the actions and the sentences. Then a number of pupils are asked to act and speak in a group, "We sit, we stand, we walk, we sit." A new pronoun is thus brought in. As the group moves over the floor, the teacher will say, "They walk." The pronoun "you" may suitably be introduced at about this stage. But always there must be the association of action and word.

If possible, the action should be that of the pupil; but it will at times happen that the teacher must be the one to act; especially will this be the case where the word is new. Sooner or later, however, the pupil must have, if possible, his own personal relation to the act, at the same time uttering the word—he must *perform* it or *request* it, or in some way have *to do with* it.

It will be seen that by following this method through several lessons, the nucleus of a vocabulary will be built up. The *sound* of the words will be associated with a real knowledge of the *meaning*. It may be well to stop a moment here and explain the value of having the pupil connect the sound with his own personal activity rather than with that of some other person. Of course, a pupil can learn the meaning of "stand" by *seeing* the teacher or another pupil go through the act; but it will undoubtedly be a harder process and a longer one to associate the sound with the act than if the pupil himself participates.

What one does himself makes a livelier impression than what he sees another do. Consequently, associations based upon such lively impressions will be stronger, more vivid and last longer. No doubt, the fact is due largely to the principle that we are more interested in ourselves than in other people. What *we* do awakens our keen and interested attention. By all means, then, the pupils should be made to go through the acts and otherwise associate themselves with the ideas. The words should be pronounced at the time, so that act and word may connect themselves in the memory.

And Now Prepositions Are Added to the Vocabulary

But let us go somewhat further. In what may be the third lesson, the teacher will utilize the three verbs already learned in adding to the general vocabulary. Thus, he points to an object and says, "The desk." Then, seated at a distance from his desk, the teacher will say, "I stand, I walk, I walk to the desk," suiting his action to the words. Then, "Johann, walk to the desk." The pupil will be encouraged to imitate the teacher, saying and acting, "I stand, I walk, I walk to the desk." In this way a new word or expression is introduced and old ones reviewed. Similarly, "to the window," "to the door," etc., may be brought into the conversation.

Mature persons probably have more difficulty in some respects than children. Thus, the vocal chords of the older people will be less flexible and they consequently will have more difficulty in pronunciation. On the other hand, the mature persons may be expected to have a greater determination.

In New York, a man of perhaps forty acquired in three weeks a sufficient knowledge of English to make a speech and win a prize ($5 in gold). He had been only four weeks in America. His pronunciation was inexact; but it was intelligible, which is the main point. This is an extreme case. We cannot expect continually to repeat this result. For a night class, which meets five nights a week, it will probably require from four to six months to impart the amount of English deemed necessary for a workman's needs.

The Method Is Used in Germany

In Germany, after fourteen weeks' instruction—in this case the pupils appear to have been young persons—such results as the following were secured: The boys were standing when the teacher entered the room. He said, "Sit down." They obeyed, saying as they did so, "We sit, we are sitting." The teacher went to his desk; whereupon, without speaking, by simply looking at various boys, he obtained from them an account of his actions.

Now one pupil, now another would respond to the teacher's look and act, saying, "You are standing on the platform;" "You are going to your desk;" "You are sitting;" "You are taking your pen;" "You are writing your name;" "You are putting the pen on the table;" "You are taking the blotting paper."

At this point, a boy was called up and asked to go to the door. He obeyed, saying, "I am going to the door." One section of the class said, "You are going to the door;" another said, "He is going to the door." Similarly, the following expressions were dealt with: *Opening the door, shutting the door, leaving the room,* etc., etc.

The exercises went on to more difficult matters. The teacher asked, "What are you going to do?" "What are you doing now?" "What have you just done?" The pupil was required to answer; other pupils were required to address him and to speak of him. These exercises related to the three questions as to the immediate future, the present and the immediate past.

The Adverbs Are Also Taught by Illustration

The exercises proceeded after a little, the teacher requiring two boys to rise and walk round the room. Sometimes at the same pace, sometimes with the one boy walking more rapidly. The teacher said, "You must first see it and then speak about it." Such sentences were spoken as these: "You are walking more quickly than your friend;" "You are not walking so quickly as your friend." The two boys were required to place themselves, one before, the other behind, the teacher.

As they did so, either had to state what he was doing. The teacher addressed to the class the questions: "Who is standing in the middle?" "Who is standing before me?" "Who is standing behind me?" The two boys, one being taller than the other, were placed side by side, when such responses to the teacher's questions were made as, "Wilhelm is taller than Johann;" "Johann is not so tall as Wilhelm." Various persons of the verb were introduced: "I am not so tall as Wilhelm;" "You are not so tall as Wilhelm;" "He is not so tall as Wilhelm." This is not all; but it is sufficient to show what may be done in a reasonably short time. It should be borne in mind that in this actual case there was probably more attention paid to the niceties than would be at all necessary with miners learning simple English.

The pole star for the teacher handling such work is, *First the idea, then the word.* Associated with this rule is this other, *Impress the idea by the personal participation of the pupil.* If these companion rules are faithfully followed as far as circumstances permit, then prompt success may be expected, whether the pupils are boys or men; whether they are especially intelligent or not.

The Knoxville Meet

SPECIAL CORRESPONDENCE

"The Interstate Miners' Field Day" held under the auspices of the Society of Tennessee Mine Foremen at Chilhowee Park, Knoxville, Tenn., Oct. 24, was the most successful yet held by the society. Eighteen teams competed in the first-aid contests, and the work was of the highest order. In commenting upon the splendid work done by the first-aid men, one of the judges remarked that some of the work was equal to that expected of a hospital interne.

Several departures were made from previous methods. The field was arranged in the shape of a rectangle, which was itself subdivided into smaller rectangles, each team being allotted one of these. Only five teams were working at once, which, of course, lengthened the time of the entire event but added greatly to the efficiency of the judging. Another innovation was the use of Boy Scouts, who assisted in every way possible. A Scout was assigned to each team, and to the one doing the most efficient work a prize was offered.

The chairmen of committees were as follows: D. T. Blakey, general; H. H. Ashmore, awards; J. R. Williams, publicity; H. H. Braden, first-aid organization; Geo. E. Sylvester, advisory; E. A. Sehorn, field.

The chief marshall and chief usher were Boy Scouts, the chief recorder was W. D. Barton, and the local representative of the Red Cross, and chairman of the board of judges was Dr. S. R. Miller.

H. M. Wilson, engineer-in-charge of the Bureau of Mines at Pittsburgh and secretary-treasurer of the American Mine Safety Association, and E. B. Sutton in charge of the work of the Bureau at Birmingham, Ala., were active in promoting the meet. The Pruden Coal & Coke Co.'s employees' band of 15 pieces from Pruden, Tenn., furnished the music.

The teams competing were as follows: Proctor Coal Co., Lewis Francis, captain, Red Ash, Ky.; High Cliff Coal Co. Joseph Rigsby, captain, Pruden, Tenn.; Pruden Coal & Coke Co., R. C. Speaks, captain, Pruden, Tenn.; Black Diamond Coal Co., Wm. Craven, captain, Coal Creek, Tenn.; Knoxville Iron Co., John E. Woods, Jr., captain, Briceville, Tenn.; Royal Consolidated Coal Co., Ed. Wilkes, captain, Briceville, Tenn.; Stearns Coal & Lumber Co., J. L. Butler, captain, Stearns, Ky.; Black Diamond Coal Co., E. L. Hendren, captain, Coal Creek, Tenn.; Piedmont Coal Co., Geo. Vinsanty, captain, Oliver Springs, Tenn.; Roane Iron Co., J. Phillips, captain, Rockwood, Tenn.; New Careyville Coal Co., J. W. Duncan, captain, Careyville, Tenn.; Stonega Coal & Coke Co., E. Drennen, captain, Big Stone Gap, Va.; Westbourne Coal Co., auxiliary team, Jefferson Hill, captain, Westbourne, Tenn. Among the events were the following:

One-Man Events: Right cheek and right foreman cut and bleeding.

Lacerated scalp on top of head, left hand crushed.

Machine boy while running fell and cut a vertical gash on his kneecap and punctured the palm of his right hand with a machine bit, bright red blood; treat and carry 50 ft.

Two-Man Events: Left collar bone broken, simple fracture of left thigh.

Miner found lying face down unconscious, on a live electric wire, abdomen badly burned; rescue and give treatment.

Left arm twisted around shaft of mechanical post auger. Release arm and dress for two compound and three simple fractures below elbow.

Three-Man Events: Left ear torn off, left shoulder dislocated; compound fracture of left leg.

Head, face, neck, arms and hands burned by gas ignition

Tamping bar blown through right thigh, causing compound fracture, bar remaining in wound.

STEARNS COAL & COKE CO. TEAM
Winners of first prize. Score, 100 per cent.

Four-Man Events: Patient unconscious from gas inhalation, right forearm broken, improvise stretcher and carry 50 ft.

Fingers and left hand lacerated by sprocket wheel and chain, bright red blood; compound fracture of right forearm.

Man is found lying on his back on live electric wires, unconscious, back burned at waist line; demonstrate three methods for his removal; treat and carry on stretcher 50 ft.

Team Event: Burns on face, neck, cheek, back and arms; carry over obstruction.

The first grand prize was $25 in gold, silver medals of the American Mine Safety Association and bronze medals of the

THE FIVE JUDGES WHO DECIDED THE MERITS OF ALL CONTESTANTS

American Red Cross won by the Stearns Coal Co., Stearns, Ky. The second prize was awarded to the Knoxville Iron Co., of Briceville, Tenn., and the Tennessee cup went to the same team. There were about 25 prizes in all.

Bathhouse Hint

BY DAVIS CROW*

In the bathhouses at the mines of the Houston County Coal & Mfg. Co., live steam was used to heat the water for bathing, but the steam in mixing with the current made its flow irregular, causing it to "flutter." We did not wish to take hot water from the boiler at a point below the water level, for, if the hot-water valve were accidentally left open, it might drain the boiler until the water level was dangerously low.

To overcome these objections, a discarded jet pump was used, connecting the steam line from the boiler to the steam connection of the jet, and also connecting the suction end of the jet to the water supply. The delivery end of the pump was connected to the line leading to the bath sprays. We found the arrangement satisfactory, as it gave a steady flow of water, the temperature of which could be easily regulated.

While we use the jet pump in connection with showers, it would serve equally well for tubs or other forms of baths. If a jet pump is not available, a discarded injector or ejector would give satisfaction in its place.

*Engineer, Houston County Coal & Manufacturing Co.

Glen White School

One of the uptodate towns in Raleigh County, West Virginia, is Glen White. Robert S. Gatherum of the faculty of the University of West Virginia is organizing the educational work in this village. At the age of 14 he entered the mines as a trapper-boy. He dug coal for eight years, and then went to the University and graduated as an engineer. He has started a school at Glen White at which will be taught reading, writing, arithmetic, properties of mine gases, ventilation, geology of coal, mining methods, care of safety lamps, physiology, sanitation, etc.

The Benton, Ill., Rescue Crew

The first team of helmetmen on the scene of the Royalton explosion was that of the State Mine-Rescue Station, Benton, Ill. They arrived about 2½ hours after the catastrophe and were able to do most effective work.

From left to right in the illustration the names of the men are as follows: James Towal, superintendent; M. J. Carraher, assistant superintendent; Walter Nichols, assistant superintendent; William Watson; James Thompson; Alex. Marshall, captain; Walter Anderson and Mungo Marshall.

STATE MINE-RESCUE TEAM OF BENTON, ILL., STATION

Discussion By Readers

Mining Laws, Legislation and Mine Regulations

Letter No. 5—I am glad to see suggested, in Coal Age, *the need of a thoroughly practical discussion of existing mining laws and mine regulations. There are many things that require careful consideration and immediate attention in this respect. The most important of these is unquestionably the enforcement of many good mining laws already on the statute books of many states. It might be a leading question to ask, but it is nevertheless a most important one: How many mine inspectors enforce the existing laws? Again, do the mine inspectors, in many states, dare to enforce some of the laws on the statute books?*

It is sad to say that we all know too well the full meaning and import of the phrase so commonly heard spoken, "He has a good stand in;" or "He has a good pull." These phrases are most commonly used in relation to the acknowledged condition of a successful candidate in a state where the appointment of mine inspectors is made by the governor. It is only too true, in a majority of cases, that the successful candidate has the indorsement of and secures his appointment mostly through the large coal companies of the district wherein he resides or is best known. Without reflection on the man's honesty of purpose, it may be stated frankly that, under these conditions, it cannot be expected the appointee on entering office will willingly, or can successfully, oppose the wishes and plans of his friends who secured his appointment. What is the result? *Can the full enforcement of an offensive law be expected under such conditions?*

I give this brief outline merely as a thought in passing to what I consider *a most important law* in coal mining, and one that should be enacted and enforced in every coal-mining state. I refer to the law requiring the examination of mine workings, including all airways, passageways and working places, by a competent fireboss at from 3 to 4 hr. before the time for commencing work in the mine. Such a law should also define, in detail, the manner in which such examination should be made, the means used and the extent of territory required to be examined by each fireboss.

While I am unable and cannot be expected to furnish statistics confirming my belief in this regard, I am fully convinced that many mine fatalities occur every year, which are caused by inadequate mine inspection, at a safe time limit before the hour for the miners to start work in the mines.

My experience, however, enables me to testify to the looseness and incompleteness of the mining law in several states, in regard to the inspection of the mine before the time for the men to enter. This is particularly notable in Indiana and Alabama. In these states, it is a common thing for the fireboss to start his examination of the working places anywhere from 6 to 8 hr. before the time for the miners to commence work. The danger from such loose laws relating to the safe operation of mines is only too obvious. I would ask, Is it possible for a fireboss to tell a man that his place is "O.K." when his examination of that place was made 8 or even 6 or 5 hr. previous? I answer, No fireboss, in a gaseous mine, can truthfully say that a place is "free from gas" 6 or 8 hr. after making his examination. The most he can say, in that case, is that the place contained no gas when he made the inspection.

I could name several accidents caused by miners entering their working places after those places had been O.K.'d by the fireboss and were supposed to be safe for work. Even the excellent editorial, entitled "The Mulga Inquest," Coal Age, Oct. 31, p. 715, furnishes ample evidence that, in *this* case, there was something wrong in the regulations of the mine, to say nothing of the requirements of the state mining law, respecting the manner in which the examination by the fireboss should be made.

I want to say, in closing, the state mining law should require coal companies to employ a sufficient number of firebosses to make it possible for each man to examine carefully all the places in his charge, and to start such examination not more than 2 hr. before the time for the men to enter the mine. While this is but one of the many evils existing in the mines of this country today, it is a feature of mining law that, if corrected, would, with the help of fearless and honest mine inspectors, go far toward reducing the number of mine explosions.

William Crooks, Mine Foreman,
T. C., I. & R.R. Co.

Edgewater, Ala.

Gasoline Mine Locomotives

Letter No. 4—I have read with interest the letter signed "Mining Engineer," Coal Age, Oct. 24, p. 683, drawing attention to the comments of O. P. Hood, mechanical engineer of the Federal Bureau of Mines, in his paper entitled "Gasoline Locomotives in Relation to the Health of Miners," read at the Pittsburgh meeting of the American Institute of Mining Engineers, October, 1914.

In his paper, Mr. Hood makes a few statements that tend to prejudice the mind against the use of gasoline locomotives in mines, although we believe this is not his intention, as he states at the close of his article, that "A wide field of usefulness for these locomotives remains, where it is believed there would be no injurious effects upon health."

In referring to these statements, Mining Engineer says:

> He (Mr. Hood) adds that the percentage of this gas (carbon monoxide) in the mine air will depend upon the amount of gas present in the exhaust, as compared with the quantity of air passing on the haulage road; but he (Mr. Hood) considers that it will be necessary to provide ventilation for the worst condition that can result.

Permit me to say in reply to this statement that no employee of our company will sell a gasoline locomotive to any coal operator before he, as engineer, has made a complete examination of the mine or mines in which the

locomotive is to be used; and if, in our opinion, there is the slightest chance that danger will arise from such an installation and the necessary changes to eliminate such danger cannot be made, we refuse to furnish this type of locomotive.

It is worthy of note that, wherever our gas-driven locomotives have been installed, their operation has been successful. It may also be added that, under gaseous conditions that would prohibit the use of an electric locomotive, the gasoline locomotive may be successfully installed.

Again, in the next paragraph, the following statement is made:

> It is stated that while, under normal running conditions, this gas rarely exceeds 6 per cent. of the total exhaust, the quantity may, owing to a bad adjustment of the carburetor, be increased to 13.5 per cent. It is clear that since such a wide variation in the percentage of this dangerous gas is possible, this fact coupled with the possibility of a slack ventilation on roads or in places where the locomotive may be working, makes it necessary to observe great caution in the use of these machines.

The responsibility for this condition rests with the company and the man running the motor. Where a competent motorman is employed, such a condition should not arise. Also, in a well ventilated and thoroughly equipped mine, it seldom happens that there is any slack ventilation on the haulage roads where motors are in operation.

Another paragraph draws attention to "the possibility of the locomotive running in the same direction in which the air current is traveling, and perhaps with the same speed or velocity, in which case the gas would reach a dangerous percentage in the air to which the engine runner would be exposed." In the same paragraph it is said that Mr. Hood mentions the "danger of permitting a gasoline locomotive to stand idle for any length of time, except in an ample ventilating current, and advises the use of a self-starter on all gasoline locomotives."

In reply to this suggestion, I would say that the addition of a self-starter is generally a source of unnecessary expense and trouble. Such a self-starter is not required on one of our locomotives, which are equipped with a patented cranking device that cannot kick back, no matter how long or how short is the pull given by a motorman in cranking.

Permit me to say, in closing, that this type of locomotive has met with a considerable amount of ill use, abuse and condemnation, simply because it has been *installed under improper conditions* and, again, *forced to operate under overloads.* As stated previously, such unfortunate installations are avoided in our practice, by making a careful and intelligent investigation before the installation is permitted.

G. W. Hamilton, Mining Engineer,
Milwaukee Locomotive Mfg. Co.
Chicago, Ill.

Letter No. 5—In the reading of G. W. Hamilton's letter on Gasoline Mine Locomotives, Coal Age, Sept. 12, p. 440, my attention was drawn very strongly to one point in particular. For some time since, I have wanted to add a few words of caution in respect to that point. In his letter, Mr. Hamilton makes the following statement:

> The further statement that the exhaust from a gas-driven engine vitiates the mine air is not true when this type of locomotive is used for haulage on main or cross-entries, because the exhaust has now been deodorized so that it is not perceptible in a mine where these locomotives are installed. The odor of the gasoline cannot be detected even in the main-return entries of such mines. The only reason that the motors cannot be used for gathering work in rooms or chambers is that the carbon monoxide given off in the exhaust requires to be diluted by an air current in order to render it harmless.

Before commenting on this statement, permit me to remark that this is an age of endeavor along educational lines, in which almost all people engaged in the coal industry are taking part. Operators, technical magazines, colleges, federal and state bureaus of mining and many other organizations are trying to provide a fair measure of both common and technical education that will be adapted to all classes of mine labor, in the hope that all will profit thereby. The way in which the miners themselves are responding and the movement gaining headway is gratifying indeed. This is realized by no one more than by those actively interested in prosecuting the work. Manufacturers of all classes of mine equipment are equally interested in this campaign, and, in general, are active in giving it their support.

What I have to say in criticism of the statement of Mr. Hamilton to which I have referred is written chiefly for mine managers (foremen), miners and all underground employees. I have been prompted to write this comment, on overhearing a recent remark made by a mine foreman, which was something to this effect, "By George, these gasoline locomotives don't give off any gas at all. Why, you cannot smell anything." I want to say that it is the *absence of odor* in the discharge that makes the latter even more dangerous than where the smell reveals the presence of the gas. Because there is "no odor" to the discharge, the sense of danger is largely eliminated; while, on the other hand, the odor when present assists to emphasize the danger that may often exist in the discharge of this type of locomotive.

It should be recognized as a fact that *the absence of odor does not indicate any reduction in the quantity of carbon dioxide* (CO_2) *present in the exhaust gases;* in fact, there may be more carbon dioxide produced, assuming perfect combustion to have taken place. Nor does *the absence of odor* necessarily mean *a less percentage* of the extremely poisonous gas, carbon monoxide (CO). I am informed that *the deodorization of the gasoline does not reduce the quantity of carbon monoxide produced in its combustion; but this is solely dependent on the supply of available oxygen, which must be sufficient to burn the carbon monoxide to carbon dioxide.* In other words, there must be sufficient available oxygen in the cylinder of the engine to enable the complete combustion of the gasoline.

Recognizing, then, that the gasoline locomotive may give off both carbon dioxide and carbon monoxide in quantities that would be dangerous to the health of underground workers, it becomes necessary to confine the operation of these motors not only, as Mr. Hamilton states, to "haulage on main or cross-entries," but I would add, their operation should be confined to such main and cross-entries as are used for the return of the air current or to entries ventilated by an air current that does not pass into the working places of the mine.

The character of both carbon dioxide and carbon monoxide is too well known to make any comments necessary here, further than to say that neither of these gases has any odor, but the presence of either or both tends to vitiate the mine air. While small quantities of *carbon*

dioxide (CO_2), in the air breathed, are not inimical to health or dangerous, it is important to remember that extremely small quantities of *carbon monoxide* (CO) may prove fatal, the presence of 0.1 per cent. of this gas, in air, being sufficient to produce death when breathed for a sufficient length of time. It is quite well known that the effect of carbon monoxide on the human system is cumulative. The gas is quickly absorbed by the hemoglobin of the blood and retained largely until a sufficient amount is absorbed to prove fatal. The affinity of the hemoglobin of the blood for this gas is more than two hundred times as great as that for oxygen.

In all these matters, it is important that we not only keep ourselves well informed of possible danger, but avoid deluding, by careless statement, those whose lives may be dependent on this knowledge.

The Foreigner in Mining

Letter No. 9—The criticisms of Charlton Dixon, Coal Age, Oct. 3, p. 561, and J. D. Jones, Oct. 17, p. 643, followed by the general remarks contained in Letter No. 7, p. 644, urging the cultivation of that trait of human kindness that makes the whole world akin, if true, would stamp me as a being wholly devoid of humanity and not possessing the qualities of true American citizenship.

In my article bearing on this subject, Coal Age, Sept. 12, p. 440, I attempted an ethical analysis of the characteristic traits of the foreign element with which I have come in contact and of whom I have had charge. It is a mistake to suppose that such an ethical analysis describes my relation to and treatment of the individual. In endeavoring to find a solution of the vexed problem of foreign labor in mining, it was necessary to analyze the characteristic traits of this class of immigrants, in order to discover if they possessed the fundamental principles on which American citizenship is founded, before attempting to formulate a method for the assimilation of this element. My analysis failed to reveal such principles.

I repeat again, the Latin-European is a product of misgovernment. It is not his fault but his misfortune; and, in this respect, he deserves the sympathy and support of all true men. His assimilation to our social customs depends, however, on his manifesting such a desire. He has inherited a moral fear and perversion of character, by reason of which it is impossible for him to break away from these associations and adopt the principles of American freedom.

Charlton Dixon infers that he must appreciate freedom "having fled the tyranny and injustice of his own country." I would like to feel assured of the truth of the premises on which such a conclusion is based. I would ask, Does the foreigner come to this country actuated by the *desire of freedom* or the *desire of gain?* If his love of freedom is so strong, why are thousands of these foreigners now returning to their own soil, willing to lay down their lives for the country from which they have fled? That he is actuated more by the love of gain than that of freedom is shown by the fact that he remains separated from his family for so many years and sends home good American gold to support the powers that claim him body and soul.

Mr. Dixon doubts "if any mine official can recall a foreigner declaring his belief that earthly rulers exercise their authority by divine appointment." No doubt the answer to such a question would be in the negative. I have asked foreign miners simpler questions than that, which they have answered in the negative, though obviously their answer was contrary to their practical belief. Ask a foreign miner if he believes himself equal to the monarch of his country; and compare his answer with the one you would receive from an American citizen, in response to a question of *his* being the equal of the president of the United States.

Mr. Dixon testifies "to the loyalty of the foreign miner toward his employer," which I have failed to find true in my own experience. I might ask, Does the foreign miner consider the interest of his employer when desiring to take a holiday to commemorate the institutions of his homeland? Is it not a fact that many large plants have been compelled to suspend operations on such days and have worked short-handed for days following such a celebration?

I have been unable to harmonize Mr. Dixon's solicitude (?) for the education and moral welfare of the foreigner, with his statement that "whatever the foreign miner is or is not, we know, certainly, that he is a first-class man for loading coal. . . . Indeed, it would be a calamity if this class of immigration were to be replaced by a more highly educated type." The natural inference to be drawn from these remarks is that the foreigner is a good coal loader, which would not be the case if he were better educated. Therefore, he should be kept in ignorance.

In closing, Mr. Dixon eulogizes the humanity of Mr. Hogarth toward the foreigner. While such sentiments are just, they add nothing to Mr. Hogarth's American and Christian virtues. From personal acquaintance and knowledge, I know Mr. Hogarth to be a man who has the courage of his convictions and who practices what he preaches; and I do not believe that he regards his advocacy of such methods as in any way peculiar to himself, but rather considers them the practical virtues of every true American citizen.

Briefly, then, my argument is that the foreigner naturally possesses all the inherent attributes of his race, nation or class, which fact renders him morally perverted, although he is still capable of mental education. It is no argument to say that our own people frequently manifest similarly depraved moral natures, as I believe it can be shown that such depravity in them is always accompanied by a consciousness of wrongdoing, which eliminates the idea of moral perversion. But, when moral depravity is accompanied with a sense of right-doing, the subject so afflicted is morally perverted.

As a native born American, I hold very dear the principles laid down in the Declaration of Independence and embodied in the constitution of the United States. I regard no man as my inferior or superior, but consider all men "free and equal"; and, on this account, desire to treat every man with courtesy, kindness, consideration, humanity and justice.

I. C. Parfitt,
Asst. Mine Foreman.
Jerome, Penn.

Method of Working Underlying Coal Seam

Letter No. 5—The problem of working a seam of coal 4½ ft. in thickness and underlying another abandoned seam about 40 ft. above it, as presented by Mr. Lyman, COAL AGE, Aug. 29, p. 357, has not met with the response, from COAL AGE readers, that I had expected.

The main difficulty to be encountered, in the case under consideration, will arise from heavy roof falls. It is stated that frequent caves were experienced in working the upper seam, with similar roof strata, these breaks often extending to the surface. On this account, it may be assumed that the upper seam is full of water, which will prove a danger in working the lower seam. In any case, large water feeders may be expected should heavy caves occur. The flow of water from these feeders will vary with the wet and dry seasons.

I well remember a seam worked under similar conditions which was partially flooded and the mine laid idle for nearly two months. The water in that case broke through on the side of a fault, which extended to the old workings above.

From the fact that Mr. Lyman suggests driving the entries direct to the boundary, it may be assumed that the question of the mine paying immediate dividends is not, in this case, of the first consideration. If such is the case, I am strongly in favor of driving the entries, at once, to the boundary. I would adopt the longwall-retreating system, on reaching the boundary.

It will be necessary to timber the roof at the face, well and systematically. It will also be necessary to "take up bottom" or "brush the roof," in order to make headroom on all the main entries, crossroads and levels. The choice between these two methods will depend on the nature of the material in the roof and floor. If the fireclay bottom is liable to give trouble, it should not be disturbed. The material taken from the roof can be used for building material at the roadsides. The stalls should be at such a distance apart as to give a rapid advance of the working face and keep the miner under a new roof.

The first weight, in longwall work, is almost invariably a source of trouble; and a good flow of water may be expected from the upper workings when this break occurs. However, after this trouble has once been overcome, a more gradual settlement of the roof will follow, in operating under this system of mining, and a further inflow of water will be largely prevented. Also, by this method, the effect of the pillars in the old workings above will be reduced to a minimum.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

PUMPS

Definition—The term "pump" relates to any device, machine or mechanism by which water, oil or other fluid is impelled or forced through a pipe line; or elevated from a lower to a higher level; or air or vapor is compressed into a tank or exhausted from a vessel or chamber. The action, in any of these cases, is termed "pumping;" and the device or machine used is called a "pump."

Classification—Pumps are classified in many ways, according to their style, type, action, mode of construction and use for which they are designed, and other distinguishing features too numerous to mention. The following are the more important classifications:

1. **Style**—Horizontal, vertical, power, flywheel, etc.
2. **Type**—Single (simplex), duplex, or triplex; simple, compound, or triple-expansion.
3. **Action**—Reciprocating or rotary, single- or double-acting, direct-acting, suction, lift, or force pumps, displacement pumps, jets and turbines.
4. **Kind**—Piston or plunger, outside- or inside-packed, etc.
5. **Use**—Air pumps, boiler-feed, sinking pumps, etc.

The above terms are, for the most part, self explanatory. A few, however, require to be defined, in order to make clear their meaning or significance.

A **power pump** is a pump driven by a separate engine or motor with which it is connected by a belt or chain or by gears, in distinction from a **direct-connected** or **direct-acting pump,** in which the steam or air cylinder and the water cylinder or pump barrel have a common piston rod and a common stroke.

A **flywheel pump** is one whose action is equalized and made more uniform through the energy stored in a heavy flywheel. The flywheel is more commonly used on a high-duty **geared** or **power pump;** or a single direct-acting pump when the steam or air is cut off before the end of the stroke.

A **single pump** is one having a single pump rod, regardless of the number of steam or water cylinders.

A **duplex pump** is one having two pump rods and water cylinders so connected as to operate alternately on the water column. In like manner, a **triplex pump** has three cylinders operating uniformly, in turn, on the water column.

A **simple pump** is one in which the steam-end is not compounded, in distinction from a **compound pump** having two steam cylinders operating a single pump rod; a **triple-expansion** with three steam cylinders on one pump rod; or a **cross-compound,** which is a duplex pump having two pump rods and water cylinders, but in which the exhaust steam of the high-pressure cylinder is discharged as live steam into the low-pressure cylinder.

In **reciprocating pumps,** the action is to and fro; while in **rotary pumps** the impellers rotate on an axis.

A **single-acting pump** draws water in one stroke only and discharges it in the following stroke; while a **double-acting pump** draws and discharges water in each stroke of the piston. A **direct-acting pump** is one where the steam and water-ends are in line and connected so as to have a common stroke.

The Coal Age Pocket Book

Suction—In actual fact, there is no such thing as "suction." The term is used, by common consent, however, to describe the effect of atmospheric pressure when exerted against a vacuous space from which the air has been partially exhausted.

A **suction pump** is one that acts to draw water only. In a **lift pump,** the water column is lifted by the upward movement of the piston; while in a **force pump** the water is forced upward or through the pipe line by the piston or plunger, which may be moving in either direction.

The action of a **suction pump** is clearly illustrated in Figs. 1 and 2, where the water is shown to be entering the pump barrel through the suction valve A, in each case, while the piston P is moving upward as indicated by the arrows.

The action of a **lift pump** is also shown in the upper portion of Fig. 1, where the water above the piston P is being lifted by the upward stroke and passes through the discharge valve B into the discharge or column pipe D.

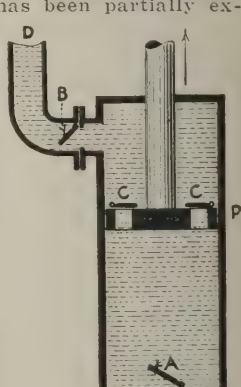

FIG. 1. SINGLE-ACTING SUCTION AND LIFT PUMP

The action of the **force pump** is also shown in Fig. 2. When the piston P moves downward, the suction valve A will close and the discharge valve in the pipe D open. The piston thus forces the water out of the pump barrel into the pipe line or column pipe, from which it is discharged against any head, limited only by the pressure of the steam in the steam cylinder of the pump.

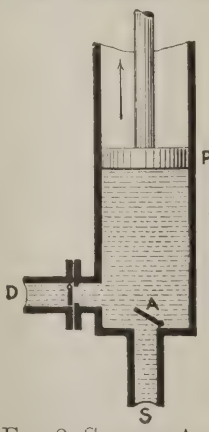

FIG. 2. SINGLE-ACTING SUCTION AND FORCE PUMP

Displacement pumps are a class of pumps in which the water is displaced or caused to move by direct contact with air or steam, the former taking the place of the water and driving it out; and the latter, by its condensation, creating a vacuum into which the water rushes.

A **jet pump** or **injector** is a device in which a jet of steam issuing from a nozzle entraps sufficient air to create a partial vacuum in the chamber surrounding the nozzle. As a result, water fills the chamber and, condensing the steam, is discharged through a tube.

Examination Questions

Mine Foremen's Examination, Held at Price, Utah, Sept. 15 and 16, 1914

(*Selected Questions*)

Ques.—In the event of your firebosses finding danger from gas, bad roof or other causes, what precautions would you insist on their taking to keep workingmen from entering those places?

Ans.—The fireboss should at once fence off the entrance to such place, by putting a suitable danger signal there, to prevent anyone from entering the place unwarned. The same precaution should be taken in respect to all the openings or entrances to the place. He should also make a note of the danger and, on his return to the shaft bottom after completing his examination, he should remove the checks of the men working in those places, holding these and turning them over to the mine foreman, at the same time informing him of the nature of the danger in each working place.

It will then be the duty of the mine foreman to see that immediate steps are taken to remove the danger and to prevent the men working in those places from proceeding into the mine. No miner should be permitted to pass into the mine without having first received his check; and the absence of this from the check board should be sufficient warning for the man not to enter the mine.

Ques.—What is meant by "splitting the air current," and what advantages are derived from such methods?

Ans.—The term "splitting" relates to the dividing of the air current into two or more separate currents, each of which will ventilate a separate portion of the mine or district before returning to the bottom of the upcast shaft.

The advantages to be derived from splitting are, briefly, as follows: 1. The ventilation of the mine is under better control, since it is then possible to regulate the quantity of air passing in each district, according to the existing conditions. 2. Better air is supplied to the working face in each district, since the gases generated in one section of the mine do not pass into another section, but return at once to the main-return airway. 3. A larger volume of air can be circulated with less power than where the air current is undivided. 4. The air travels the working face at a more moderate velocity, thereby decreasing the danger and inconvenience to the workmen, common to a high velocity. 5. Finally, a local explosion of gas or dust occurring in one district is less liable to be propagated throughout the mine.

Ques.—If you were a mine foreman in a gaseous mine, how would you arrange and distribute the air current to insure the greatest safety to life and property?

Ans.—As far as practicable, a gaseous mine should be divided into separate ventilation districts. Each of these districts should be ventilated by a separate split of air taken from the main current. The return air from each district should be conducted at once into the main-return airway. The quantity of air thus supplied to each district should be proportioned to the needs and conditions in the several districts. The quantity of air passing in each district should not be less than 150 cu.ft. per man, per min.; and, in a dusty mine or a mine generating large quantities of gas, not less than 200 cu.ft., per man, per min., should be allowed. The size of each district should be limited so that the quantity of air required, on this basis, will not cause too high a velocity at the working face. This velocity should not exceed 5 or 6 ft. per sec., and is commonly less.

Ques.—There is passing through an airway 35,000 cu.ft. of air per min.; what will be the velocity per second if the size of the airway is 7.5×5.5 ft.?

Ans.—The sectional area of this airway is $7.5 \times 5.5 = 41.25$ sq.ft. The volume of air passing per second is $35{,}000 \div 60 = 583.3$ cu.ft. Therefore, the required velocity of the air current is $583.3 \div 41.25 = 14.14$ ft. per second.

Ques.—What will be the reading of the water gage when the pressure per square foot is 20 lb.? Explain fully.

Ans.—The weight of a cubic foot of water may be taken as 62.5 lb. This weight corresponds to a pressure of 62.5 lb. per sq.ft. when the water is 12 in. deep; or, as we say, for a water column of 12 in. Therefore, the pressure, in pounds per square foot, for each inch of water column, is $62.5 \div 12 = 5.2$ lb. To produce a pressure of 20 lb. per sq.ft. would require a water column (water gage) of $20 \div 5.2 = 3.84$ in.

Ques.—(a) Explain the formula for finding the weight of air per cubic foot, at different temperatures and under different pressures. (b) Find the weight of one cubic foot of air at 60 deg. F., barometer, 30 inches.

Ans.—The formula for finding the weight of a cubic foot of air at any temperature t and barometric pressure B is

$$w = \frac{1.3273\ B}{460 + t}$$

The constant 1.3273 is the weight of one cubic foot of dry air, under a pressure corresponding to 1 in. of mercury column and 1 deg. absolute temperature, of the Fahrenheit scale. This is multiplied by the barometric pressure, in inches of mercury, and divided by the absolute temperature of the air; because, the weight of air per cubic foot increases directly as the pressure and inversely as the absolute temperature. The constant, 460, is the absolute zero of the Fahrenheit scale.

Ques.—If 13 cu.ft. of air, at a given temperature and pressure, weigh 1 lb., how many tons of this air pass through a mine in 8 hr. when the current measures 52,000 cu.ft. per min.?

Ans.—The weight of air passing per minute, in this current, is $52{,}000 \div (13 \times 2000) = 2$ tons. The weight of air passing in 8 hr. is then $8 \times 60 \times 2 = 960$ tons.

Coal and Coke News

Washington, D. C.

While actual governmental measures affecting the coal industry are in abeyance, pending the reassembling of Congress, there have been few occasions when so many large administrative undertakings certain to exert a powerful indirect effect upon the industry were under way and approaching a climax. Both in regard to control of the form of industry, the establishment of new conditions affecting credit, and the favorable regulation of charges for transportation, as well as in several other directions events are leading up to significant changes in the situation.

Prospect for Rate Case

The Interstate Commerce Commission is now quite definitely understood to have finished its deliberations in the railroad rate case, wherein an advance of 5 per cent. was demanded by the Eastern lines. The consideration of the case has been unofficially announced as to take place during the first half of November, the period of the "November conference" which terminated Nov. 16. This signifies, it is understood, the handing down of a decision by about the middle of December.

Despite the lack of any absolutely official announcement on the subject the opinion is still generally and confidently entertained in well informed quarters that there will be little or no disposition to alter the position taken in the former decision in the five per cent. case. The prospect that that decision will stand seems to be strengthened in a material degree by the reliably reported determination not to regard the war and the investment conditions growing out of it as having any immediate connection with the rate question.

The elimination of the war itself and of its probable effect on the sale price of securities from consideration, means that the case is left much where it was at the end of the discussion of last summer. This in fact appears to indicate that the chief argument adduced in favor of reopening the case—the effects of the war and the probable consequences as regards both railroad revenues and railroad credit—had been ignored or ruled out of court. The attitude taken is such as to apparently throw a double safeguard around the prospects of shippers of heavy commodities such as coal.

Trade Commission

The inauguration of the new Trade Commission plan of dealing with the "trust question" within the next few days is expected to exert an important influence upon agreements in the coal industry. It will be recalled that during the early stages of the legislation an effort was made to secure the insertion of special provisions relating to the coal mining business. This was on the ground that mining of bituminous coal was then being conducted upon an extremely close margin of profit so that operators desired to be allowed to enter into agreements, such agreements, however, to be subject to close government supervision and regulation.

Bills to this effect were subsequently introduced but never made much progress. The act as finally adopted, however, contains authority for the Trade Commission to investigate from time to time trade conditions in any branch of business, while elsewhere power is given to secure the taking of steps designed to determine any improper or unfair business or trade methods. The belief now prevails in trade circles that as a result of these powers the new commission will yield to the desires of various coal interests and will make a careful study of conditions in the coal industry which, it is predicted, will lead to the tacit or open sanctioning of suitable working agreements among miners designed to govern the working of the mines, upon a reasonable and equitable basis.

The Banking Legislation

The coal industry among others is looking with interest to the effect of the new banking legislation upon the trade and confidently expects to see it exert a beneficial influence upon the general condition of business. This will be twofold in nature as it will tend to bring about the use of short time paper in the industry itself and in branches of business closely connected with it; while it will release much capital heretofore unnecessarily "tied up" in over-large bank reserves. The effect is expected to show itself in a quickening of industry in many directions, as well as in greater stability of business everywhere and in the elimination of the various shocks to which trade has been subject in consequence of uncertainty of credit and unexpected stoppages from time to time.

One phase of the situation that is of special interest in the coal mining regions is seen in the greater protection of postal savings deposits expected to be secured through the placing of the deposits in member banks by the post office department, thereby securing for them the safeguards established by the system as a whole. Postal savings deposits are made to a large extent by foreigners accustomed to the postal savings systems of European countries. There is an unusually large number of foreign depositors of this class among the miners in the various coal-mining communities in different sections of the United States, and their funds will gain added protection under the new system of banking.

PENNSYLVANIA

Anthracite

Scranton—Under the direction of the Board of Trade, petitions are being circulated through the city to be presented to the various coal mining companies asking that the retail price of coal here be put on the same basis as that in Wilkes-Barre, where the rate averages 20 per cent. lower.

Pottsville—John Evans and William Schreiner, coal miners who had been imprisoned for four days behind a fall of coal, were finally rescued alive. The rescuers, who felt sure that the men could get sufficient air for several days, worked in a limited space, digging desperately in an effort to reach the imprisoned men, the greatest excitement prevailing meanwhile at the mine opening.

Hazleton—Because of the scarcity of water in this section the mine operators are threatened with a situation that will make it necessary for them to close down the mines unless rain arrives soon. It is stated that already eight or nine collieries are in grave danger from a scarcity of water.

White Haven—A force of men has been at work for some time dismantling the Pond Creek Coal Co.'s breaker. On account of the property being flooded out and the continuous litigation between owners of the land and the coal operators, it now looks as if the mine will remain closed indefinitely.

Mahanoy City—The Philadelphia & Reading Coal & Iron Co. has issued a sweeping order that hereafter employees found smoking on the premises either inside or outside the mines will be summarily dismissed.

Bituminous

Cresson—The mines of the Pennsylvania Coal & Coke Co. have been closed because of the great falling off in orders. Officers of the corporation state that there is no truth in a report which has been widely circulated that labor troubles caused the shutdown. There has been no trouble between the company and its employees, the officers state.

Johnstown—The Valley Smokeless Coal Co. recently broke all records for daily output, when a total of 1700 tons of coal per day was mined. There is much interest in the operations of this company, whose mines are nearly within the city limits. Several hundred men are employed by the company. Recently new mining machinery was installed.

Portage—The Blue Bird mine of the Portage Coal Mining Co. has been closed temporarily for repairs and improvement work. While the mine is closed down the Red Bird mine will take care of the normal output of the neighboring workings.

Connellsville—The position of the coke trade at the present time is one of "watchful waiting." While conditions are not improving, they are not getting worse, and production and output hang around 200,000 tons per week, which it is believed is the bottom.

Ebensburg—What is thought to be a new record in coal production for this immediate vicinity was established during the month of October, when mine No. 1, of the Ebensburg Coal Co., at Colver, produced 102,000 net tons. The output all came from a single opening and from a coal measure 3½ ft. thick. Officials of this mine predict that they will have an output of 4500 tons per day by spring.

Pittsburgh—Coal mining is on a somewhat more active basis at present than it has been in the immediate past. This is accounted for by the fact that Lake shipments are being pushed forward before the ending of the shipping season. Furthermore, retail coal men have been buying more freely.

Washington—Alleging that he was injured and disfigured for life in an accident in the Allison mine at McGovern, on Nov. 16, 1912, Frank McCoy recently filed his suit in the courts to recover $25,000 damages from the Pittsburgh Coal Company.

McDonald—Seven mines of the Pittsburgh Coal Co., along the Panhandle R.R. near here, were closed temporarily Nov. 14, affecting about 2500 men. It seems to be the consensus of opinion, however, that the shut-down will be but a matter of a few weeks.

Shankstown—Mine No. 5, of the Greenwich Coal & Coke Co., recently resumed operations after an idleness since May 15 last. About 150 men went to work.

WEST VIRGINIA

Clarksburg—Announcement was recently made that 10 or more mines in this section operated by the Consolidation Coal Co., would be closed indefinitely, general conditions being assigned as the cause. As far as is practicable the miners will be transferred to operative mines.

Bluefield—It is stated that business has shown an improvement throughout this section of the coal field during the past few days. It is alleged that many more men are at work and the production and shipments are much brisker, with the outlook of a substantial increase soon.

Fairmont—Officials of the United Mine Workers of America have again planned to make an effort to organize the coal miners of the Fairmont district. This effort will doubtless meet with resistance and it is feared trouble may follow. It is thought that the first move of the coal companies against the proposed organization will be the securing of an injunction restraining union agents from entering upon the property of the operating companies.

KENTUCKY

Jenkins—The Consolidation Coal Co. has closed a number of mines in this vicinity pending better coal markets. The Elkhorn Mining Co. has also closed several operations at Fleming, Haymond and Hemphill, throwing over 1000 men out of work.

Frankfort—On account of the fact that large numbers of employees of coal mines and other operations in the eastern part of the state have been laid off, the State Board of Arbitration, which is administering the Workmen's Compensation Act, has extended until Dec. 5 the date on which employers may file with the board the reports of payrolls for August, September, October and November.

Lexington—Mining students in the College of Mining Engineering in the State University were recently given a demonstration of the pulmotor and the uses to which it can be put in resuscitating miners overcome by mine gases. Prof. T. J. Barr, of the College of Mining Engineering, conducted the demonstration.

Henderson—The Deepwater Coal Co., it is announced here, will begin operation of the Spottsville mine in January. This is one of the numerous mines in this part of the country which this firm recently took over.

Louisville—Conditions in the western Kentucky coal field, where "possum hunters" were perniciously active some time ago, have quieted down to a degree, though for a time several of the mine owners considered appealing to the governor for troops. The most recent case of disorder was near Central City, where, it is reported, a gang of "possum hunters" a few nights ago "shot up" a negro settlement which was known as "Galilee." No serious damage was done, though it is reported 1000 shots were fired.

OHIO

Cincinnati—The United States District Court has been asked by Aaron A. Ferris, receiver of the Dominion Coal Co., for permission to advertise and sell at public auction a number of the company's old accounts which are rated as desperate and uncollectible by ordinary means.

Columbus—Agitation has been started in many places in Ohio for an increase of the death benefits to be paid under the workmen's compensation law, which at present is limited to $3700. In order to get at the matter properly, a special committee has been named by the Ohio Industrial Commission to investigate the matter and report to the coming session of the General Assembly. In case the death benefits are raised, it will mean a large premium to be paid by coal operators.

Cleveland—Coal operators in Belmont, Jefferson and Harrison Counties anticipate extending their operations in order to be independent of the Ohio coal mining situation. Both the Purstlove-Maher Coal Co. and the Lorain Coal & Dock Co., it is said, are about to close deals for large acreages of coal lands in West Virginia. The latter company is said to be in the market for 20,000 to 25,000 acres of coal property.

Bridgeport—It is stated that actual want and destitution exist among the families of the 8000 striking miners of the 8th Ohio district. It is alleged that hundreds are facing starvation and death from cold and hunger. In many homes the children have scarcely enough clothing to cover them, and many of them are wasting away for want of substantial food.

INDIANA

Terre Haute—The nomination of officers of the United Mine Workers in District No. 11, which includes practically all of Indiana except the block coal field, has been closed and a ballot is to be prepared for the 150 locals having a membership of more than 20,000 for a secret vote next month. Only those persons who have consented to be candidates are on the ballot and the term of office is for a period of two years.

Linton—The Little Giant mine, which has been idle since Apr. 1, has resumed work. It employs 350 men.

Brazil—The official board of district No. 8, Indiana Mine Workers, is backing the miners in a strike at the Mary mine of the Otter Creek Coal Co., northwest of this city. Day men removed portions of the floors of rooms in the mine necessary to the laying of tracks. The miners contended this was their work, at $1.10 a yard. The company agreed to give the miners half-pay for the two weeks which the job took but they demand full pay.

ILLINOIS

Belleville—On account of the open weather prevailing thus far, with no demand for coal, the somewhat extraordinary conditions in the mining country surrounding here, are expected will bring to a crisis a difference of opinion between the miners' organization and several of the members. With no employment, the miners are facing starvation, and there is talk of openly seceding from the union and leasing idle mines to be worked on a coöperative basis, if the union does not give its consent to an arrangement of this kind. This means a price war that will bankrupt every operator in the field that attempts to run his mine on other than a coöperative basis.

Glen Carbon—The fire which started in the pump room of mine No. 2 of the Madison Coal Corporation of St. Louis, on Nov. 8, spread to the boiler house, engine room, and air compressing station, and damaged the property to the extent of about $25,000. This mine was recently dismantled and $70,000 was expended in repairing old equipment and erecting new. It is one of the largest mines in southern Illinois and employs about 425 men, and has a capacity of about 6000 tons of coal per day. It is expected that it will be a month or more before operations can be resumed.

IOWA

Guernsey—It is stated that a 7-ft. vein of coal has been discovered at a depth of 72 ft. in practically the center of town. This discovery was made while a well was being bored for water. This place is 25 miles north of What Cheer, where coal has been mined for years. Speculators are already offering to take options upon the land, while prospectors are at work to ascertain the extent of the field.

COLORADO

Denver—According to the annual report of James Dalrymple, state inspector of coal mines, for the year 1913, increases are shown both in the number of men killed for each 1000 employed and for each million tons of coal produced in the state of Colorado. During the year in question 110 men met accidental death in the mines of the state. It is stated that there has been a steady increase in Colorado in the number of lives lost in the coal mines during the last three years, that is, 1911, 1912 and 1913.

PERSONALS

Dr. R. F. McHenry recently resigned his position as surgeon for the Penn-Mary Coal Co. at Heilwood, Penn.

Dorsey J. Parker, of Alabama, has been probationally appointed by the Secretary of the Interior to be a mining engineer in the Bureau of Mines in Pittsburgh, Penn.

E. D. Glenn, chief clerk for the Cabin Creek Consolidated Coal Co., has accepted the position of chief clerk to J. R. Carey, general superintendent of the Chesapeake & Ohio R.R. Co., with offices at Clifton Forge, Va.

Edwin W. Laubenstein, mine inspector for the Consolidation Coal Co., was recently presented with a watch and chain as a token of the esteem and appreciation of his services by the employees in the company's various mines.

Erskine Ramsey, who was recently injured at Tuscaloosa, Ala., during the launching of a coal barge, and whose injuries were for a time considered serious, is now said to be entirely out of danger.

W. S. Ingraham, of Bristol, Conn., a well known clock manufacturer, has just made a trip of inspection over his mining properties in southern Illinois, comprising several thousand acres now operated as the Illinois Fuel Co., with headquarters at Sparta.

John A. Schroeder, formerly general sales manager of the Hyatt Roller Bearing Co., has resigned, his resignation taking effect immediately. There will be no other change in the personnel of the organization so far as is now known. Mr. Schroeder's successor has not yet been appointed.

Governor Hatfield, of West Virginia, has appointed the following persons to represent the state at the convention of the American Mining Congress, to be held at Phoenix, Ariz., Dec. 7 to 11: J. G. Bradley, E. O'Toole, F. F. Bayles, Percival Smith, Ernest Chilson, W. S. Mandt, Samuel Butler, O. Tibbitts, William Gillis and John O'Brooks.

W. K. Kavanaugh, president of the Southern Coal, Coke & Mining Co. of St. Louis, has just returned from an extended trip on the Atlantic seaboard of South America. The trip was made for the purpose of ascertaining a future market for Illinois coals to move via either rail or water to New Orleans and Mobile. The Southern Coal, Coke & Mining Co. has recently installed a coal dump at East St. Louis, on the Mississippi River.

Dr. Harold B. Dixon, who left England last June to attend a convention of British scientists in Australia, is now on his way home. While stopping for a few days in Canada, he took the opportunity to pay a flying visit to the experiment station of the Federal Bureau of Mines, at Pittsburgh, Penn. Dr. Dixon has done much important work in the study of explosion waves in gaseous mixtures, in connection with mine explosion problems. While at Pittsburgh, a visit was made to the experimental mine at Bruceton, where two explosion tests were made for his benefit. Dr. Dixon expressed himself as greatly interested in the results of these tests. While in New Zealand, he was called upon to assist in the investigation of a recent mine explosion at that point.

OBITUARY

Henry J. G. Melcher, for the past 15 years treasurer of the W. J. Rainey Estate, died recently in New York City. Mr. Melcher was born in Cleveland and was 57 years old. He had been connected with the Rainey Coal & Coke Co. for 30 years, starting in its employ as a clerk. He is survived by his widow, two daughters and one son.

CONSTRUCTION NEWS

Bens Creek, Penn.—Work on the $200,000 improvement to be made in the operation of the W. H. Hughes Coal Co., was recently begun.

Barbourville, Ky.—A railroad line is being surveyed from Jellico on the Kentucky-Tennessee border for a distance of 16 miles through coal and timber fields of northern Tennessee.

Beaverdale, Penn.—Improvements which will cost many thousands of dollars are being made by the Beaver Run Coal Co. at this place. A large new tipple with the latest apparatus for the handling of coal is being installed.

Sharondale, Ky.—Contracts have been let for constructing a tipple and several houses by W. L. Bailey, general manager of the Williamson Coal Co., of Williamson, W. Va., and others. They will develop mines in this locality.

Carrolltown, Penn.—It has been announced that the Milson Coal Co. will make a new opening on its tract near the workings of the Carrolltown Coal Co. This is the latest development in this region and the only one for some time past.

Nelsonville, Ohio—The B. R. Coal Co., of Nelsonville, Ohio., which was recently incorporated with a capital of $10,000, will develop a tract of coal land near Nelsonville. S. P. Booth has been elected president and G. D. Ridenour, secretary-treasurer.

Johnstown, Penn.—M. M. Sheesley & Sons recently completed the sinking of the air shaft for the Conemaugh Smokeless Coal Co. near Seward, and headings are now being driven. The shaft is 205 ft. deep, and the output of the mine will be eventually 1500 tons per day.

Scranton, Penn.—Timothy Burke has been awarded the contract by the Delaware, Lackawanna & Western R.R. Co. to strip a bed of coal in West Minooka. This bed runs from 8 to 15 ft. in thickness, but, on account of bad roof it was impossible to mine it, and stripping was decided upon.

Greenville, Ky.—The W. G. Duncan Coal Co. has bought equipment for a machine shop. This also includes electric power generators to be housed in fireproof buildings now nearing completion. A contract for a steel tipple of 3500 tons capacity has been let to the Roberts & Schaefer Co., of Chicago.

Wheeling, W. Va.—The survey of the proposed new railroad line to connect the rich coal district lying between Short Creek and West Liberty, has been completed, and the new line will be built next spring or at least started then. The proposed road will start at Short Creek, branching off the Pennsylvania R.R. at that point. The exact route is yet uncertain.

Bellaire, Ohio—The Johnson Coal Co., which owns and operates the mine at Pike Creek, 10 miles south of this city, has recently completed a number of improvements to its property. These include an air shaft, new boilers, new electric dynamo and engine, and the balance of the mine property has been repaired and placed in first class condition. The mine is now ready to resume work as soon as the strike in the eastern Ohio coalfield is settled.

Berwind, W. Va.—J. J. Boxley & Sons, of Roanoke, Va., have been given a contract by the Norfolk & Western Ry. to grade five miles of roadbed and build a 300-ft. tunnel from Riffe, W. Va., to the Cucumber Branch of Dry Fork of Tug River. This line will open up mining property of the Berwind Coal & Coke Co. The estimated cost of the proposed construction is about $275,000, and the operators who have recently completed another job for the railroad company on Wolf Creek near the Narrows, Va., will push the work immediately. Two steam shovels and 200 men will be employed.

NEW INCORPORATIONS

Pittsburgh, Penn.—The Duquesne Coal & Coke Co. has increased its indebtedness $60,200.

Boston, Mass.—The New England Coal & Coke Co. has increased its capital stock one million dollars, making its present capitalization $1,500,000.

Chicago, Ill.—The Austin Coal & Coke Co. has been organized with a capital stock of $5000 by William T. Carlin, Samuel D. Rosenberg and William H. Holley.

Brookfield, Mo.—The Linn County Coal Mining & Land Co., of Brookfield, has been organized with a capital stock of $4000. The incorporators are Albert Tamm, William H. Ashley and John J. Rafferty.

Springfield, Ill.—The Groveland Colliery Co. has been organized with a capital stock of $15,000. The incorporators are G. W. Solomon, Edward C. Solomon and Peter H. Solomon. The company will mine and deal in coal.

Holidaysburg, Penn.—The Oliver Coal Mining Co. has been organized here to mine coal in Blair and Clearfield Counties. The capital stock is $5000 and the incorporators are all members of the Hewitt family of Holidaysburg.

Liberal, Mo.—A license to do business in Missouri was recently issued to the Liberal Coal & Mining Co., with a capital stock of $35,000. All of the capital of the company is to be employed in Missouri, and the office will be at Liberal.

Beaumont, Tex.—The Vinton Production Co. has been organized with a capital stock of $6500, for the purpose of developing coal, petroleum and other minerals. The incorporators are W. P. H. McFadden, George W. Newman and W. D. Gordon.

New York, N. Y.—The American Consolidated Cannel Coal Co. has been incorporated in Manhattan to do a general coal-mining business. The capital stock is $100,000 and the incorporators are P. I. Hoffman, T. G. Macy, of New York, and J. R. Rose, of Loveland, Ky.

Charleston, W. Va.—The Lone Jack Coal Mining Co. of Iaeger, McDowell County, will have its chief works in the Sandy River district, in McDowell County. It has an authorized capital of $2500 and its incorporators are John Damron, V. T. Strickler, Charles E. Horton, Eva Damron, Callis Horton and Margie Strickler, all of Iaeger.

Charleston, W. Va.—A charter was recently issued to the Dominion Co. of Pittsburgh, Penn. This firm will mine, manufacture, and deal in coal, coke and lumber. Its chief works and business offices will be located in Pennsylvania. The authorized capital is $15,000, and the incorporators are Simon P. Patterson, Charles Alvin Jones, John Hunter, Robert M. Marshal, and George Cahoon.

INDUSTRIAL NEWS

Washington, D. C.—During the month of September there were 195 men killed in and about the coal mines of the United States, as against 173 for the corresponding month of a year ago. Practically all of these accidents occurred underground.

Columbus, Ohio—B. F. Nigh, secretary of the Michigan-Ohio-Indiana Coal Association, announces that a large number of new members are being received daily. There is much interest in organization affairs since the fall season has opened.

Columbus, Ohio—Retail dealers of Columbus are considering the plan of having retail quotations published in the local newspapers along with other market reports. It is believed that this would have the effect of making the market more steady.

Wellsburg, Ohio—The heirs of Josiah N. Scott have recently conveyed to John A. Bell a tract of coal land in Independence Township, coal and surface included, but subject to certain oil and gas rights. The area of the farm was 142.42 acres, and the consideration was $18,514.60.

Cincinnati, Ohio—The receivers of the Cincinnati, Hamilton & Dayton Ry. Co. have published a notice calling upon all creditors to present their claims to the receivers on or before Jan. 1, 1915, at Cincinnati, under penalty of having claims not submitted disallowed by the court.

St. Louis, Mo.—The Heidbreder Coal Co., one of the oldest established retail coal companies in the city, turned its affairs over to its creditors during the past week, and it is understood that the business will be conducted in the future by the creditors, until it is on a paying basis again.

Columbus, Ohio—At a recent meeting of the Columbus Coal Exchange steps were taken to secure heavier sentences on persons convicted of stealing coal from cars. A number of persons arrested recently have been given 5 days in the city prison, whereas formerly a sentence of 30 days in the workhouse was invariably given to coal thieves.

Hazard, Ky.—The Ashless Coal Co., at Lowthair, recently announced the prospective building of another short-line branch of railroad from the Louisville & Nashville to reach a new coal-mining plant on Davidson's Creek, the work of construction to start on or about Dec. 1. A first-class coal-mining plant will be opened, the preliminary work having already started.

Charleston, W. Va.—The State Department of Mines has recently issued a list of fatalities occurring in the mines of the state during the month of October. This shows that 34 deaths resulted from various accidents during that period; 26 of these were caused by falls of roof and coal; three by mine cars and locomotives; three men were electrocuted, one crushed in tipple machinery and one met death by an explosion.

Toronto, Canada—Judge Carpenter, who was appointed as a commissioner to investigate the Hillcrest colliery explosion, in which 180 lives were lost, has issued his report, the gist of which is as follows:

The only solution that I can arrive at, as a result of the whole evidence adduced at the inquiry, is that the disaster was caused by the explosion of gas, the origin and seat of which is unascertainable. This explosion was augmented by the ignition of dust throughout the mine.

Washington, D. C.—The causes of the Colorado coal strike will be sought by the United States Commission on Industrial Relations in a series of hearings to be begun in Denver, Dec. 1. The commission will make no effort to bring about a settlement of the strike, but will limit itself to studying the conflict in its relation to the general problem of industrial unrest. Operators, union officials, public officials, citizens and officers of the militia will be called to testify.

Columbus, Ohio—Application made to the Ohio Utilities Commission for a change in the authorization for the purchase of equipment by the New York Central Lines has been granted. The former authorization provided for 1000 box cars to cost $1,025,000 and 2400 gondolas to cost $2,237,000, the latter for the Toledo & Ohio Central. The amendment provides for the purchase of 2500 gondolas and nine Mallett locomotives for the Toledo & Ohio Central to be used in handling coal.

Cincinnati, Ohio—The proximity of Cincinnati to three great coal fields—those of Kentucky, West Virginia and Ohio—is given as the reason for the fact that power costs less here than in any other city in the country, the price per horsepower year being figured at $13.64. At Buffalo, where electric power generated by Niagara Falls is available, the the cost is $14.96 per horsepower year, while at other cities the cost reaches much higher figures, Cleveland being near the top with a cost of $37.11.

Columbus, Ohio—No announcement has been given out by John S. Jones, the purchaser of the stock of the Sunday Creek Co., as to the future of the concern. Mr. Jones, who is well known in Ohio coal fields, was in Columbus for a few hours last week but no statement was forthcoming. As far as is known the present officers of the Sunday Creek Co. will continue. They are E. A. Cole, president; Stewart C. Gailey, vice-president and auditor; C. J. Andrews, vice-president in charge of sales; H. J. Reese, secretary and treasurer and N. D. Monsarrat, manager of mines.

St. Louis, Mo.—The banquet of the St. Louis Coal Club, held at the American Annex Hotel, on Nov. 11, which 225 coal men attended, was a record breaker for a coal trade gathering in the Middle West. The speaker of the evening was F. S. Peabody, one of the largest coal operators in Illinois, who discussed coal trade conditions as they are today, and delivered a talk on "A Piece of Coal," illustrated with moving pictures, showing the methods of mining at mine No. 3 of the Peabody Coal Co. The second reel of pictures showed the workings of the Nokomis mine of the same company. Other speakers of the evening were T. P. Brewster, president of the 5th and 9th District Operators' Association; Edward Devoy, a prominent retailer of St. Louis, and T. J. Frier, purchasing agent of the Wabash R.R.

St. Louis, Mo.—It is understood that negotiations, which have been under way now for about three months, for the purchase, outright, of 45 mines in the 5th and 9th districts of Illinois and which proposition has been recently taken over by Hugh Murray, a former coal operator of Equality, Illinois, will be put through between now and the 15th of December. If the syndicate which is negotiating for these properties succeeds in getting them, it is understood that at least 8 mines will be dismantled and abandoned. The tonnage of the remaining operations will be restricted so that there will not be a surplus of coal on the market at any time. If this deal goes through, it will be one of the biggest transactions ever recorded in coal mining circles in the Middle West, and will involve between $12,000,000 and $15,000,000.

Salt Lake City, Utah—A decision regarding coal land was recently rendered by the Secretary of the Interior, which will reverse other decisions made in similar cases by the General Land Office, necessitating refunds in cases where land filed on before reclassification has been paid for according to the new valuation. In 1911, W. S. McCormick filed on a quarter section of land in Emery County, which, under the classification at the time of filing, was worth $25 per acre. When final proof was submitted, he paid $4000, the entire amount of the purchase price stipulated, but, meanwhile, a second classification had placed the value at $117 to $135 per acre. The $4000 offered was accepted by the Land Office and held as part payment under the new classification, awaiting the decision of the Secretary of the Interior. The decision holds that McCormick accepted the offer of the government to sell the land for $25, and that the government would be breaking its contract if it refused to sell at this price, providing the purchaser, in making final proof, complied with the regulations of the department. All previous decisions in conflict with this one are recalled

Coal Trade Reviews

General Review

Anthracite shippers are aggressively canvassing for orders but the recent cold snap has steadied up the market. Tidewater bituminous stocks continue at a maximum and substantial concessions are obtainable. Situation generally unsatisfactory.

The recent cold snap the early part of the week had a much needed steadying effect on the anthracite situation which was rapidly slowing down as a result of the long continued warm weather. Tonnage was becoming difficult to move, even under the elastic circular of the individual dealers, and it is evident that the first important break in the market was only avoided by a narrow margin. The situation is still uncertain, with shippers actively canvassing for orders, and it will take considerable cold weather to place the business on a seasonable basis.

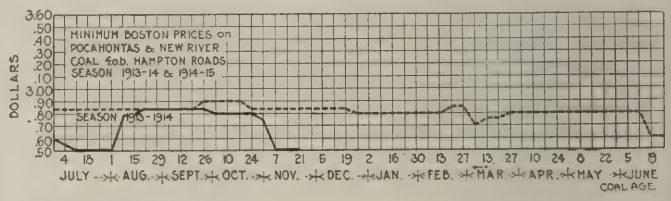
In spite of the rigid curtailment at the bituminous mines, the volume of coal at Tidewater continues at the maximum, and more free cargoes were noted during the past week forcing prices down to the low levels again. Substantial concessions are necessary in order to keep the mines working, even on the present restricted basis. In the export trade the movment is being seriously interfered with by the heavy vessel demand for general cargo purposes. But in spite of these discouraging developments the improved sentiment following the recent election still persists and operators are hopeful for the outlook.

While substantial concessions on the old circular are readily obtainable in the Pittsburgh district there is such a meager inquiry that operators see little to be gained by establishing a reduced schedule. With general manufacturing down to a minimum and the Lake shipping definitely closed, the market is entirely dependent upon the domestic demand for any improvement; the colder weather recently has resulted in one or two spurts in this business which, together with an occasional increased demand reported at different points, has given a slightly better tone to the market.

The closing of the Lake shipping and the unusually mild weather has also caused a further restriction in Ohio. Retailers are showing no disposition to order except for forward delivery, and production is at a low point, but a turn in the weather may precipitate a heavy rush for coal since domestic stocks are believed to be at a minimum. Prices in the Southern market are irregular. Domestic coals are accumulating on demurrage as a result of the long continued high temperatures, but there seems to be indications of an increased demand for steam fuel.

There is little of an encouraging nature in the Middle Western market. The domestic coals are weak and competition so keen that prices are touching new low levels. The reaction has been furthered by heavy overshipments in anticipation of the expected cold weather. Conservative observers predict a further decline before there is any general improvement.

ATLANTIC SEABOARD



BOSTON

Outlook still discouraging. Some foreign inquiry but bottoms scarce. $2.85 price liberally shaded on occasion, and market cargoes still in evidence. Anthracite also slow.

Bituminous—The volume of Pocahontas and New River at, and en route to Hampton Roads continues at maximum figures in spite of the rigid curtailment that has been in effect now for several weeks. The trade is about as lifeless as ever and there are almost no indications of any improvement in the near future. There has been a further renewal of certain foreign inquiry and it is felt that an increasing tonnage might be going off-shore but for the dearth of suitable carriers.

The coastwise trade shows no change whatever. What demand appears is confined closely to loading tonnage that is on time charters; other than this there is no relief to the prolonged dullness. The past week a few more "market cargoes" have turned up and prices at the distributing points are once more forced down to low levels. The $2.85 price at the Virginia terminals is only nominal and spot sales when made are at figures down to $2.50. The new contracts still open are being held in abeyance because of the softness of the market and the expectation on the part of buyers that a few weeks more may see conditions still more favorable from their standpoint.

Georges Creek shippers are again getting behind on their orders, strange to say, but it is thought this is due partly to the very heavy curtailment at the mines and partly to a renewed call for export. This is a special condition, however, and cannot be said to apply to any other coal in the market.

Pennsylvania grades are having only the very lightest business. Marked concessions are still being made in the effort to keep mines running even if on a greatly reduced basis. Aside from a small contract movement there is little or nothing doing. All-rail the situation is no better than at tide-water.

Anthracite—All the shippers are actively canvassing for orders and the trade is having the first break-down this year. The independent operators have been making every effort to market their coal but even with elasticity of price they are unable to move any tonnage to speak of. Even stove size is now in plentiful supply with several of the companies and it would be a little difficult today to place an entire cargo of stove at any port in New England. There will hardly be any improvement until colder weather sets in.

NEW YORK

Bituminous movement badly congested on the Pennsylvania R.R. Market heavy but with an encouraging undertone. Anthracite steady at average levels and in a technically strong position.

Bituminous—Market optimists still consistently adhere to the opinion that there is a strong undertone to the trade, but with the Pennsylvania R.R. so badly congested that the movement to Tidewater is seriously delayed, and with the Berwind-White Co. still embargoed at South Amboy, it is difficult to accept such a hopeful view of the situation. On the other hand, it must be agreed that there is an improved sentiment as a result of the election returns, which manufacturing interests have construed in a favorable light. The impetus resulting from this has not been of large proportions, but it has been along conservative lines, and well maintained. Thus it is noted that some plants which were closed down entirely are beginning to resume operation on a small scale, while others are increasing their working schedules.

The bituminous market is spotty and decidedly irregular. Business is confined almost entirely to contracts, requisitions on which are probably at 60 to 70% normal. Though scarcely any business is being negotiated in the prompt market, prices are quotable on about the following basis: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The cold weather of the early part of the current week started the retail trade moving actively, but it will have to persist for some time before the improvement will be reflected in the wholesale end. As is always the case at this period of the year, it is purely a weather market

from now on. At the moment there is a healthy undertone to the situation, and business is steady at average levels, but it is clear that a serious break was impending had the cold weather not developed.

The outlook for the winter is most optimistic. The sales deparments uniformly report a much reduced buying through the summer months, due no doubt to the scarcity of ready money. At a result, the trade is entering upon the winter business with very little available in the way of emergency surplus, and the situation is replete with grave possibilities. When the cold weather finally drives the consumers into the market, there will be such a rush that it will be necessary to limit the allotments temporarily, and this condition invariably creates much anxiety among the buyers, and causes a heavy run on the sales deparments.

Prices are not quotably changed from last week, which we continue as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	5.00@5.35	5.30	4.90@5.30
Stove	5.35	5.35	5 30	5.30
Chestnut	5.60	5.45@5.60	5.55	5.30@5.55
Pea	3.55	3.45@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.70@2.80	2.50@2.75	2.15@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.60@2.25
Barley	1 60	1.70@1.80	1.75	1.40@1.75

PHILADELPHIA

Anthracite trade still lagging on account of unseasonable weather. Bituminous shows some indications of a slight improvement in demand, but not in prices.

Anthracite—It will require considerably more cold weather than has as yet visited this locality to instill the snap into the market that should characterize it at this season of the year. Compared with the corresponding period last year, the trade is commencing to fall behind. The market for stove and nut continues good, and some of the companies are drawing on their stocks to supply the demand for these sizes, but egg is inclined to lag, and offers of as low as 50c. off the circular have been made by some of the individuals to dispose of this size. While this may be the exception, at the same time it points to the apathetic demand for this size, and still further emphasizes the fact that householders have not been called upon to replenish their stocks. Pea seems to be a little improved over the week previous, but buckwheat and rice are difficult to place.

Prices at Tidewater rule about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	4.75 to 4.85
Stove	5.00	5.10
Chestnut	5.25	5.25

Bituminous—The past week has seen some slight improvement in the bituminous situation, but more in the shape of increased demand than in better prices. The standing coal at Tidewater has been considerably reduced, but operators are still rather loth to forward any coal to Tidewater points except on specific orders. Some substantial demurrage bills have been incurred, which has taught the traders to be cautious in the matter of forwarding coal to be sold on arrival.

BALTIMORE

Mine operations still further reduced and careful management now necessary. Demand and prices for soft coals poor. Anthracite brighter. Export trade holds up.

Mine operations, in line with railroads and all other industries, have been still further curtailed during the past week. Some important mines are now running on an average of not more than two days a week. The entire effort is to prevent overproduction at a time when sales are frequently ten to fifteen cents below actual costs.

In the West Virginia regions the demand for three-quarter gas has so far fallen off that the production of slack is now close to the actual needs of the immediate market, and that grade is the one exception in point of strength. While three-quarter is freely offered at from 80 to 85c., and run-of-mine coal around 70 to 75c., slack has moved upward from the recent low mark of 35 to 40c. to around 55c. Steam coals of West Virginia and Maryland are quoted at 80 to 85c. in many cases for less desirable grades. Pennsylvania low grade fuels can be had at 90 and 95c., while medium to best grades are selling at from $1.15 to $1.35.

The anthracite business here as a whole is brighter. Except for steam sizes the local demand is almost, if not quite, up to the seasonal average. Most coal men are now busy with deliveries. Movement from mines to tide and terminal yards here continues good.

In export lines there is a good tonnage moving. A large number of charters have also been announced for late November and December loading, assuring a continuance of a healthy foreign trade for some weeks at least.

HAMPTON ROADS

Dumpings for the week showing improvement. Prices firm. Stocks on hand about normal.

Dumpings over the piers at Hampton Roads for the past week have shown up well and indications are that shipments for the month of November will be considerably above those for October. Foreign and coastwise cargoes have made a good showing during the week and there has also been a fair number of bunker steamers taken care of. Although it is rather difficult to get information as to clearances of cargoes, it is understood that export coal has moved to Cristobal, Havana, Genoa, St. Lucia, Para, and ports in Chile and Peru. The coastwise shipments have been principally to the New England market with one cargo for San Francisco.

Quotations at Hampton Roads remain at circular with some little improvement in the demand for New River and Pocahontas run-of-mine but for the other grades there is only a small inquiry.

Stocks on hand in cars in the various railway yards are near normal. Some of the shippers have evidently been without sufficient coal to supply immediate orders as it is understood that coal has been taken from the storage plant at Sewalls Point to take care of some New England business. Of the coal moving coastwise, Boston and Providence have been about the largest receivers although Portland, New Bedford, Plymouth, and one or two other New England ports have taken fair sized cargoes.

Authoritative announcement of destination of vessels is no longer made but the following have cleared, presumably for the ports noted:

Vessel	Destination	Vessel	Destination
Driebergen	St. Lucia	Berwindmoor	Havana
Luigi Parodi	Genoa	Falk	(Unknown)
Robert Dollar	San Francisco	Denis	Para
Copenhagen	Chile and Peru	Haugarland	Canal Zone
Auchendale	Cienfuegos		

Note—Full cargoes were taken by all vessels except the "Denis" which had only a small quantity.

OCEAN FREIGHTS

Heavy demand for steamers in other lines and few vessels available. High rates prevail.

It is almost impossible to quote probable freight rates as the demand for steamers for grain, general cargo, horses, cotton, etc., continues unabated, and owners seem to be able to secure about any rates they ask on such business. There are a few steamers proposed for Mediterranean coal at rates varying from $6 to $6.60 and also steamers that will entertain coal to Valparaiso at about $4.80, possibly $4.32 with quick discharge guaranteed. Steamers do not respond to rates offered on coal to Brazil and the River Plate, notwithstanding the high offers on grain from the River Plate which should make the outward business attractive. We had no difficulty in closing the few boats that were offered for West Indian coals, although none of these charters have been reported.—W. W. Battie & Co.

COAL CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Edna N. Smith	British	Baltimore	Martinique	735	
Florence Creadick		Philadelphia	Mayport	657	
Helen W. Martin		Philadelphia	Boston	2021	$0.60
Wm. H. Clifford		Baltimore	Porto Rico	1378	
Nor	Norwegian	Philadelphia	Sagua	811	
F. Matarazzo	British	Baltimore	West Coast Italy	1779	
Levnet*	British	Baltimore or Virginia	River Plate	2065	3.96
Commodore Rollins	Norwegian	Baltimore	Guantanamo	962	
Thomas Winsmore		Philadelphia	Charleston	381	1.00
Belgien	Danish	Philadelphia	Havana	877	
Sangstad	Norwegian	Baltimore	Preston and Banes	1459	

Note—Steamers are indicated by **bold face** type, all others being schooners.
*(previously)

COKE

CONNELLSVILLE

Rumors of a wage reduction making prospective purchasers for future delivery more cautious. Market continues extremely flat.

There has been considerable inquiry for contract furnace coke for next year, chiefly, it is believed, because consumers felt the market could not grow much worse, but in the past few days the talk of a prospective wage reduction has made the inquirers somewhat more cautious as a wage reduction

might result in another lowering of prices. No positive confirmation has been obtained that a Buffalo consumer has closed a contract for 10,000 tons or more a month for two years, on a sliding scale based on pig iron. Only small lots of prompt furnace coke have been selling. We quote prices partly nominal as follows: Prompt furnace, $1.60; contract furnace, $1.75; prompt foundry, $2.15@2.50; contract foundry, $2.35@2.50, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Nov. 7 at 211,554 tons, an increase of 5590 tons, and shipments at 203,743 tons, a decrease of 3261 tons, production thus appearing to exceed shipments by 7811 tons. In 33 weeks the net surplus of production over shipments appears to have been 38,377 tons.

BUFFALO

Furnaces running slow or closed down everywhere and coke is still heavy. Ore and pig iron accumulating.

There is too much pig iron in the yards of the furnaces and too many furnaces are closed for the coke market to move yet. Iron men are hopeful, though, for they believe the present period of slow trade is about at an end. The export trade is looming up in raw material so that manufactured goods must soon be added to the list which will do much to relieve the situation, if iron is to be consumed. Prices remain on a basis of $4.15 for best 72-hr. Connellsville foundry, with stock coke $3.20.

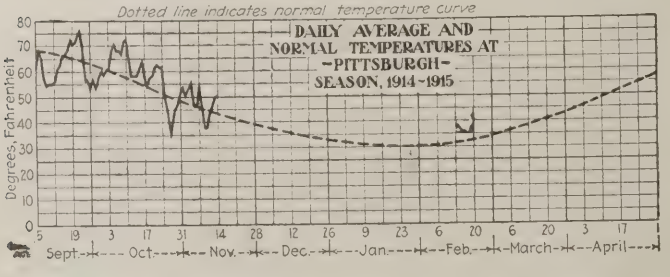
CHICAGO

Coke is quoted at: Byproduct, $4.95; Connellsville, $5@5.25; Wise County 72-hr. (select), $5 to $5.25; gas coke, $4.25; furnace coke, $4.50@4.65.

THE STEEL MARKET

The trade continues hopeful but there is no improvement yet. October orders show a steady decline.

The better sentiment in the steel trade, which was evident one week ago, is more generally recognized, but it has not yet affected buying. The decline in orders shown by the Steel Corporation's statement as of Oct. 31 has not been checked, but the nearness of 1915 and the small provision made for the needs of manufacturing consumers beyond December bolster hopes of a turn near at hand.



A smaller loss in the Steel Corporation's unfilled orders last month than in September would give more reason for favorable comment had not October operations steadily declined. This week the situation in the Chicago district stands out, with the nearly complete closing down of the Gary works. Other mills there are running single turn and only part time. —"The Iron Age."

LAKE MARKETS

PITTSBURGH

Naming of new circular prices not general. Lake shipments over and production decreasing to below 50%. Retail demand improved by weather.

Producers have been decidedly reserved about making official announcements of circular prices on contracts. As noted a week ago some of the producers have named a new series of prices, but the movement has not become general. The idea seems to be that as there is no inquiry for contracts it is just as well to allow the figment of the old circular prices, based on $1.30 for mine-run, to remain for the present. There is no doubt that most operators would gladly close a contact on the basis announced by some, $1.20 for mine-run.

The market is extremely quiet as to both prompt and contract. Shipments to the Lake trade are now practically over and the district is faced with very light operations for the next few weeks at least, at well under 50% of capacity. Manufacturing demand has decreased somewhat more and the retail demand is the principal dependence of sellers. This week has seen the inauguration of real winter weather, a sort of mild blizzard arriving Monday, and retail demand is materially improved. The market feels the effect of wintry weather more keenly than would have been the case if retailers had not been so very conservative in recent weeks in their purchases. We quote nominal prices on contract as follows, prompt sales being usually made at 5 or 10c. less, with occasionally deeper shading: Slack, 85c.; nut and slack, $1.05; nut, $1.15; mine-run, $1.20; ¾-in., $1.30; 1¼-in., $1.40, per ton at mine, Pittsburgh district.

BUFFALO

The feeling is better as a rule as there seems to be no good reason for the light consumption. Anthracite moving in a satisfactory manner.

Bituminous—There is here and there a bituminous shipper who finds his trade a little better, with now and then a good day and sometimes a whole week, but the demand always drops off again. A stronger market often starts in this so there is a more hopeful feeling; in fact, there seems to be no good reason for a continuance of the light consumption. Export figures are astonishingly large, and there is considerable demand for manufactured goods.

One difficulty is that Canada is doing so little. The Canadian factories are shut down almost as tight as the European. There is less complaint of coal standing on track unsold. Jobbers usually throw back demurrage charges on the mines, which puts an end to such shipments as a rule. The weather is not yet favorable to any coal movement, but it must turn in the proper direction soon and many coal men hold that the upturn cannot be far away. Quotations remain on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with slack more active than formerly.

Anthracite—The trade is quiet so far as wholesalers are concerned but it has seldom ever been in better shape at this time of the year. There has been about a normal amount of it sold and there is no clamor for any particular size. Egg is rather too plentiful but will improve with a turn in the weather. The New England demand is perhaps a little too heavy at present for the good of the Western trade, as it has lately cut down the supply in this direction, but the Upper Lake docks are well stocked as it is. At the same time the movement is steady, the amount reported by the custom house for the week being 140,000 tons, which is a good mid-summer average. The small ports have also been taking coal freely of late, so that all should be well supplied.

TORONTO, CAN.

Trade dull due to mild weather and industrial depression.

The coal trade remains quiet owing to the continuance of unusually mild weather and the financial stringency, which deters many purchasers from laying in supplies ahead of their immediate requirements. Prices for anthracite were again advanced the first of the month, and quotations are as follows: Retail, anthracite egg, stove and nut, $8; grate, $7.75; pea, $6.75; bituminous steam, $5.25; screenings, $4.35; domestic lump, $6; cannel, $7.50. Wholesale f.o.b. cars three-quarter lump, $3.78; screenings, $2.64.

COLUMBUS

Dullness prevails in all branches. The Lake business is about over and warm weather is still having an adverse effect on domestic demand. Prices weaker.

The chief feature of the past week was the virtual closing of the Lake trade, which removes the last active department of the business. With unfavorable weather prevailing domestic business is still dull and as there is little demand for steam sizes, the entire trade is quiet. There are no immediate hopes for improvement, although a spell of colder weather would help materially. The tone of this market is not bad, considering conditions.

The Lake season has not been a satisfactory one to Ohio operators. Several valuable months were lost earlier in the year because of the strike. When the scale was finally settled in the Hocking Valley, a good deal of coal was rushed to the Northwest via the Lakes, but the total is only about two-fifths of normal seasons. Eastern Ohio did not share at all in the Lake trade. Some coal will be loaded during the latter part of November to be held in storage at the Upper Lake ports, but a considerable congestion on the docks there has been reported.

Domestic business is still slow, being curtailed by the mild weather. Retailers' stocks are not as heavy as formerly but dealers are not inclined to buy though some orders for delivery in December are being booked at current quotations. On the whole the trade is quiet and collections are bad.

Steam business is slow and there are little hopes of immediate improvement. Some strength has developed in the fine grades such as nut, pea and slack and coarse slack,

ue to the curtailed production of domestic lump. Other rades of steam coal are rather weak.

Production is at a low point. The Hocking Valley district s producing only 40% of normal and the same is reported rom Cambridge and Crooksville. In Jackson only 25% of he normal tonnage is being produced. The Pomeroy Bend istrict is in the best shape with a production of approxiately 80%.

Prices is the Ohio field are:

	Hocking Valley	Pomeroy	Kanawha
e-screened lump	$1.55	$1.65	.....
ch and a quarter	1.50	1.55	$1.40
hree-quarter inch	1.35	1.40	1.35
ut	1.15	1.25	1.15
line-run	1.10	1.15	1.10
ut, pea and slack	0.40	0.50	0.40
oarse slack	0.30	0.40	0.30

TOLEDO

Steam buying reduced to the minimum. Shortage of fine oal as a result of the closing of Lake shipping.

Railroads are reflecting the stringent financial condition nd in an effort to minimize expenses are buying nothing eyond their immediate requirements. Factories are nearly ll running light and do not appear to be at all anxious as o the future possibility of securing fuel. They are therefore uying from hand to mouth only, and contracts for future elivery are few and of little consequence.

So warm an autumn, with so little domestic demand, has ot been known in this country for many years. Of course here is some domestic demand, but the actual consumption s light. Slack is holding firm more because of the shortage n production than an increased demand. The cessation of ake shipments cut off a large percentage of the fine coal upply. All demands are being met, however, and it is only question of time until this phase of the business readjusts tself to the new conditions. Coal men are optimistic as a ule and profess to discern a marked improvement as a result f a loosening of the money market, and a general stimulaion in all lines.

CINCINNATI

Warm weather and industrial inactivity cause further estrictions in the market. Prices remain steady in anticipaion of impending changes.

Unseasonably warm weather continues to the detriment of he coal trade. The domestic consumption, considering the ateness of the season, is abnormally low. But there seems o be little doubt that dealers are lightly stocked, and as oon as cold weather begins, operators will find themselves wamped with orders for immediate delivery.

There is a slight improvement in business noted among team users, giving rise to a belief that the situation will mprove before long. Operations are necessarily much retricted, mines running only about three days a week in the Vest Virginia field.

CLEVELAND

Inquiry for certain grades of fine coal has given the trade decided brace, but the coarse coal market is weak. Busiess shows an improvement and sales are larger.

The Consolidation Coal Co. is buying all the Fairmount lack that it can find; jobbers and brokers are selling it at 50 o 55c. at the mines. It is being shipped to Michigan and Vestern trade. Considerable coal has been reconsigned to the ccount of this company. Pennsylvania slack is being held rmly at 70 to 75c. The Carnegie Steel Co. and La Belle ron Works plants in the southern part of Ohio are buying all he Panhandle and Youghiogheny slack they can get. The roduction is light and the supply limited. West Virginia No. operators have sold so much slack they are forced to make repared sizes to fulfill contracts for fine coal.

With these conditions prevailing the current price for fine oal is $1.70 to $1.75 for slack on track Cleveland, excepting locking which is being sold at $1.50@1.55. The out of town rade has been taking larger quantities of fine coal for the ast three weeks and the Cleveland trade is showing a steady nprovement. With 500 to 600 cars of coal on track at the pening of last week and a like number this week, the market s holding its own.

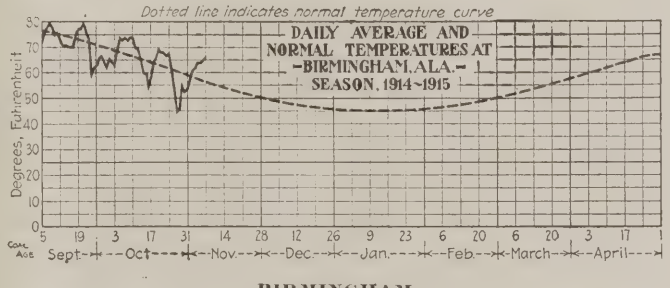
It was cold and windy Sunday and Monday of this week. While no marked inquiry for coal resulted, the weather had a eneficial effect and operators and jobbers refused to let go of he coal on track at bargain prices. They also were enouraged by the larger business of a week ago when the market stood up under an unusually heavy load. Smokeless coals re not in brisk demand and prices are holding firm at slightly ower levels.

The Lake trade is gradually cleaning up. The larger operators have shipped all the coal they will send forth this seaon although there are a number of cargoes to be moved, especially hard coal. The soft coal that is going forward now is all for storage in vessels. The hard coal shippers will load for delivery at Upper Lake docks as late as Nov. 30, the last day of the official season of navigation.

Quotations for shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmount	W. Va. No. 8
Lump	$3.75	.....	.....	.....	.....
Lump, 6 in.	.....	.....	$2.45	.....	.....
Egg	3.75	.....	.....	.....	.....
Egg, 6 in.	.....	.....	2.10	.....	.....
Lump, 1¼ in.	.....	$2.40	2.25	.....	.....
Lump, ¾ in.	.....	2.30	2.10	$1.95@2.00	$1.95@2.00
Mine run	2.75	2.25	1.95	1.85@1.90	1.90
Slack	2.40	1.70@1.75	1.65	1.65@1.70	1.65@1.70

SOUTHERN



LOUISVILLE

Domestic coals accumulating on demurrage. Steam grades unchanged but more inquiries are noted. Prices irregular.

Though business conditions show indications of immediate improvement, the continued warm weather has seriously affected the domestic market. This is paricularly true in the cities, though in the country sections the demand for domestic sizes is continuing fairly strong. Large quantities of domestic coals are on demurrage in Louisville and other railroad centers.

The market for steam coals is unchanged, though inquiries are said to be increasing and prospects are bright for better business in the near future. Many tons of low-grade screenings have been used as ballast on new railways; there is small market for that grade of fuel, and the operators have been turning it over to the railroad companies to be hauled away. Steam and small sized coals from several sections have no definitely established prices at present.

In a general way block coal may be said to be bringing from $1.75 to $1.90, though there are times when certain operators are glad to dispose of their output at little or no margin over the cost of production. Egg sizes range from $1.25 to $1.40 and nut and slack anywhere from 25 to 70c., according to grade.

BIRMINGHAM

Lump coal less active during the past week. Steam coal quiet though a slight improvement is evident.

Although one or two cool days slightly increased the demand for lump coal, it was only temporary, and with the return of warm weather again the market has taken a slump; there is practically nothing doing in this line, though a few days of cold, wet weather would materially increase the demand. Steam coal is just about the same as it has been for some time. The demand does not seem to increase, and contrary to the expectations of the operators, the bunker business at the Gulf ports is taking only a small tonnage. Prices on both lump and steam coal remain about stationary. Blacksmith coal is moving in about its normal tonnage, and the price is holding up well. There is little doing in the pig-iron business.

MIDDLE WESTERN

CHICAGO

Business further restricted and no improvement is noted. Continuance of mild weather causes additional price reductions. Screenings slightly stronger.

The exceptionally warm weather as shown on the temperature chart last week has caused a further weakening in prices and the market for all sizes is generally in a demoralized condition. Indiana and Illinois mines are curtailing production, and the bottom was again touched in screenings prices, although later they have stiffened somewhat, due probably to the lessened production of lump.

Cessation of activity in the packing industry has also been a large factor in the reaction. Some well informed producers predict that further declines will occur before there is any improvement. With Indian summer prevailing in the middle of November the situation seems about as hopeless as it could be. The domestic demand is weak and the competition for orders to absorb surplus production is so keen that all sizes of lump are being offered at lower figures. A considerable amount of free coal has been thrown upon the market in Chicago with a depressing effect. A number of cars of screenings were sold for freight charges here during the early part of the week, and several shipments sold at 5c. per ton.

The production in Indiana and Illinois is about one-half normal, and even this is more than ample to take care of immediate needs. Some Indiana mines have been closed down during the past week, and will not reopen until colder weather increases the demand. This should help the screenings situation. The Springfield district reports a little better demand for steam coal, and prices slightly increased.

The anthracite situation is very dull, although prices are held firm. The large consumers have not yet stored their winter supply of coal. A large tonnage is on hand in the local yards in case a cold snap should arrive.

Hocking Valley coals show but little activity. A considerable amount of splint coal is on track and the demand is weak with prices low. Franklin County mines are operating 40% normal; prices are off on all sizes except in screenings. Pocahontas remains weak, only contract obligations being fulfilled. Eastern Kentucky coals have been cut as much as 20c. per ton, without increasing orders which shows the folly of forcing the market when there is no demand.

Prevailing prices are as follows:

	Franklin Co.	Springfield	Harrisburg	Sullivan	Clinton
Lump	$1.55@1.75	$1.35@1.50	$1.40@1.75	.....	$1.50@1.75
4-in. lump	.....	.....	.....	$1.55@1.75	.....
Steam lump	.....	.....	.....	.....	1.15@1.20
2½-in. lump	.....	.....	.....	1.35@1.50	.....
1½-in. lump	.....	.....	.....	1.20@1.35	.....
Mine-run	.....	.....	1.10	.....	1.10
Egg	1.40@1.75	.....	1.40@1.75	.....	.....
6x3-in. egg	.....	1.35	.....	.....	.....
Nut	.....	1.25	1.25@1.75	.....	.....
No. 1 nut	1.35@1.75	.....	.....	.....	.....
Screenings	0.45@0.60	0.40@0.50	0.35@0.50	0.40@0.50	0.35@0.50

Hocking Valley 1¼-in. lump, $1.40@1.60; mine-run, $1.25.

New River and Pocahontas lump and egg, $2.25; mine-run, $1.25@1.40.

Somerset Smokeless lump and egg, $2@2.25; mine-run, $1.25 @1.40.

Carterville lump, $1.50@1.75; 6x3 in. egg, $1.50@1.60; No. 1 washed egg, $1.60; No. 2 washed egg, $1.35.

INDIANAPOLIS

Situation irregular, with improvement in spots. Mild weather much against the trade. Mines working half-time on the average.

The November weather has been more like September as will be observed on the temperature charts. This means the minimum use of coal for all purposes and everything depends on the weather situation now.

About the only change in the market is a further sagging in the price of screenings. But the market is far from being back to the record-breaking low prices of a few weeks ago. In the open market slack commands about 50c., which is double the low point of the season. The steel plants at Gary, Ind., are running "on and off," operating one week, closed the next. On the other hand factories at South Bend and other cities have been increasing operations, due to large orders received from European governments.

November, like Ocober, is going to show a material falling off from normal in volume of trade, though a good cold spell will help the situation materially. There is nothing to cause a movement of domestic lump, except the advancing season. Eastern coal is in the same condition as Indiana domestic. Mines are on about half-time. Prices are generally unchanged both at the mines and retailers' yards.

ST. LOUIS

Overshipments in anticipation of cold weather have brought the market to a standstill. Mines working two to three days a week. Weather proposition from now on.

Continued warm weather has brought the coal business to a standstill, both in the steam and domestic markets. Anticipating colder weather, some of the operators shipped out quite a tonnage of coal to reconsigning points, and this coal has the market flooded; dealers' sheds are loaded to capacity and the railroads are making more from demurrage charges than from freight.

In the Williamson and Franklin County field there is practically nothing doing, except on contract coal. The mines are working two and three days a week, and usually have from one to two days' supply of coal on track. There is absolutely no domestic market which has enabled the shippers to take care of the steam sizes, even though there has been no advance in price.

There is no demand at all for anthracite and a considerable tonnage of it is under car service on the east side. There is no smokeless coming in and there is no demand. From this time on it is strictly a weather proposition, and the retailers, while doing nothing now, anticipate a somewhat more regular business in the way of small orders than in past years.

The prevailing wholesale prices are:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	....	$1.25	$1.05@1.15	$1.20
3-in. lump	.....	....	1.40	....	.....
6-in. lump	$1.35@1.60	....	1.50	1.25@1.35	1.40
Lump and egg	1.85@2.15	$2.25	.....	....	1.35
No. 1 nut	1.20@1.40	....	.....	0.75@0.80	.....
Screenings	0.40@0.50	....	0.80@0.85	0.15@0.25	0.20
Mine-run	1.05@1.10	....	.....	0.75@0.80	.....
No. 1 washed nut	1.50@1.60	2.25	1.60	....	.....
No. 2 washed nut	1.30@1.35	....	1.35	....	.....
No. 3 washed nut	1.10@1.15	....	.....	....	.....
No. 4 washed nut	1.00@1.05	....	.....	....	.....
No. 5 washed nut	0.20@0.25	....	.....	....	.....

KANSAS CITY

Continued mild weather has resulted in the accumulation of a large surplus of coal.

There has been practically no change in temperature and the weather continues mild. The trade is overloaded, and when a ten-cent raise was considered for the first of November it was decided that the market could not stand it. It is feared that unless cold weather does not come within a short time there will be a break in the market, especially in slack. Few of the mines in Missouri, Oklahoma and Kansas are working more than half time. It was thought last week that in case the weather should suddenly turn cold there would be a car famine, but there is an overabundance of cars.

PORTLAND, ORE.

Demand light, consumers neglecting to store for winter. Wood prices lower than a year ago due to the large supply of common labor.

It seemed a few weeks ago as if the coal dealers would have a good business, but the demand for domestic coal is light throughout the Pacific Northwest. This due to the belief that there will be no advance in prices and hence it would not benefit the consumers to store any large quantity. Buying so far this fall is considerably behind that for the same period last season. Wood has been cheaper as a result of a greater abundance of help and this has cut into the coal business to a considerable extent. Prices are the same as Sept. 1 and these will probably be maintained till next spring.

SAN FRANCISCO

The weather has been unusually warm so far this fall, resulting in a light demand for domestic and steam coal. Steam coal is wholesaling at $6.50 and domestic at $7.50, these being considered about normal quotations for this season of the year. There is a fair demand for anthracite, which is selling at from $9.50 to $11, according to the freight rates the shipper is able to secure. The retail dealers are well stocked and are anticipating a revival in the demand within the next week or so.

PRODUCTION AND TRANSPORTATION STATISTICS

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for April and the three months of the years 1913 and 1914:

	February		March		April	
State	1913	1914	1913	1914	1913	1914
Missouri	260,586	259,270	259,270	263,593	204,255	179,723
Kansas	414,414	492,304	492,304	501,841	444,142	378,192
Arkansas	130,888	113,354	113,354	165,037	136,153	87,002
Oklahoma	297,004	257,162	257,162	296,484	246,155	239,443
Totals	1,102,891	1,122,090	1,122,090	1,226,955	1,030,705	884,360

This statement only covers the tonnage of members of the association, which is estimated to be at least 95% of the entire production.

THE CAR SITUATION

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended, Nov. 1, as follows:

	Surplus	Shortage	Net*
New England Lines	631	0	**631**
N. Y.; New Jersey, Del.; Maryland; Eastern Penn	11,131	0	**11,131**
Ohio; Indiana; Michigan; Western Pennsylvania	32,532	0	**32,532**
West Virginia, Virginia, North & South Carolina	6,904	10	**6,894**
Kentucky, Tenn.; Miss.; Alabama, Georgia, Florida	6,339	0	**6,339**
Iowa, Illinois, Wis., Minn.; North & South Dakota	4,773	0	**4,773**
Montana, Wyoming, Nebraska	824	0	**824**
Kansas, Colorado, Missouri, Arkansas, Oklahoma	1,535	136	**1,399**
Texas, Louisiana, New Mexico	202	3	**199**
Oregon, Idaho, California, Arizona	2,748	125	**2,623**

***Bold face** type indicates a surplus.
Note—The usual car supply chart appeared last week.

BITUMINOUS COAL MOVEMENT

The following is a summary of the movement of coal and coke over 13 principal railroads during July and the first seven months of the last two years, in short tons:

	July		7 Months	
Anthracite	1913	1914	1913	1914
Baltimore & Ohio[1]	80,404	72,223	839,103	784,007

[1] Includes coal received from connecting lines.
[2] Includes company's coal.
[3] Does not include company's coal hauled free.
Note:—The Southern Railway hauled 321,374 short tons of bituminous coal during June, 1914, and 1,947,470 short tons during the six months ending June 30, 1914.

VIRGINIAN RAILWAY CO.

Shipments over this road for September and the past four months, with details of leading operators, were as follows, in short tons:

Shipper	June	July	August	Sept.
Knw., Glen Jean & E. R.R.	32,920	24,084	22,588	36,356
E. E. White[1]	26,073	29,424	34,884	29,654
Gulf Smokeless	21,869	22,294	26,028	22,598
Loup Creek Colliery	20,717	19,139	18,389	13,943

Winding Gulf Colliery	13,278	14,268	18,938	20,049
Long Branch	12,454	10,545	17,789	15,557
Bailey Wood	11,707	11,544	13,141	9,845

[1] From Glen White. [2] From Stotesbury.

Gross shipments from all mines totaled 379,113 tons as compared with 361,906 tons last month, 286,354 tons in August and 321,626 tons in July.

FOREIGN MARKETS

GERMANY

Coke used as railway fuel. Resumption of shipments to Belgium. Companies passing dividends.

There have been greatly increased sales of coke, for which the chief cause may be found in the decision of the railway management to try the use of blast furnace coke, in place of coal, for steaming purposes. As the results were satisfactory in every regard, large orders followed, with a corresponding decrease in the accumulating stocks of coke which were beginning to be a source of anxiety to the operators. Further improvement in this business is looked for.

The demand for small sizes continues strong, with deliveries hard to obtain on a large tonnage.

From Duisburg on the Ruhr it is reported that shipments to Belgium, which had stopped with the outbreak of hostilities, had been renewed since the occupation of Antwerp, and have reached important proportions. An improvement of great promise to the entire coal and coke trade is the increase of transportation facilities.

Complaints of the passing of dividends are being made by stockholders to whom this action is a cause of distress, but from the point of view of the management no other policy is conceivable.

The war has already enacted a heavy toll from the younger men who were active in the management of the coal properties of the Empire; and this loss will be an added handicap to Germany in regaining her former position after the close of hostilities.—Translated from the "Frankfurter Zeitung."

The German output of coal during August and the eight months was as follows:

	August		Eight Months	
	1913	1914	1913	1914
Coal	16,542,626	8,477,214	127,318,665	119,187,604
Lignite	7,250,280	4,377,955	56,658,980	56,401,120
Coke	2,747,680	1,522,250	21,418,997	20,127,970
Coal briquettes	507,693	263,275	3,910,817	4,019,897
Lignite briquettes	1,874,830	1,128,616	14,084,566	14,529,090

ENGLAND

Trade dull and lifeless with some collieries closing down. High ocean freights are seriously restricting export business.

The London coal trade continues dull and lifeless. Huge quantities are arriving in the metropolis, and prices are difficult to maintain. The colder weather has slightly improved the demand, but buying is slow. Slacks and small nuts are plentiful. Bakers' nuts are firm. House coals are neglected. Only best hard steams are steady.

Scarcity of tonnage, high rates of freight and war risks insurance continue to remain the order of the day, and, of course, a great drawback to successful business. The inquiry is quite good, and better supplies of tonnage would immediately cause a revival in the export coal trade.

Two large collieries in Northumberland, the Newburgh Colliery and the Pegswood Colliery, have found it necessary to close down.

The question of the recent Minimum Wage Award for West Yorkshire has again claimed the attention of the Yorkshire Miners' Association, who have resolved to urge the Miners' Federation of Great Britain to take immediate action in the matter.—"Colliery Guardian."

Nov. 6—Business is on restricted lines at present owing to shortage of tonnage. It is anticipated, however, that the high rates of freight ruling will attract more tonnage, and on this account most contractors are not disposed to sell for forward shipment on the same terms as for prompt loading. Quotations are approximately as follows:

Best Welsh steam	$5 01@5.28	Best Monmouthshires	$4.02@4.08
Best seconds	4.56@4.80	Seconds	3.84@3.96
Seconds	4.32@4.44	Best Cardiff small	1.86@1.92
Best dry coals	4.92@5 04	Seconds	1.32@1.56

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, exclusive of wharfage and for cash payment.

Freights—Chartering is more active but orders are more numerous than steamers available, and rates continue to advance appreciably. Rates are today approximately as follows:

Gibraltar	$2.40	Venice, Ancona	$3 36	Singapore	$4.20
Malta	2.76	Alexandria	3.72	Las Palmas	2.28
Marseilles	3.56	Port Said	3.72	St. Vincent	2.52
Algiers	2.70	Aden	3.96	Rio Janeiro	3.60
Genoa, Savona	2.76	Colombo	4.08	Monte Video	2.64
Naples	2 76	Sabang	4 08	Buenos Ayres	2.88

Coal Contracts Pending

Contract No. 8—Portland, Ore.—Proposals for furnishing and delivering about 5000 tons of bituminous coal for use on the Dalles-Celilo Canal construction work will be received at the U. S. Engineers' Office, Portland, Ore., until 11 a.m., Nov. 27, and then publicly opened. All communications should be addressed to Major of Engineers, Jay J. Morrow, U. S. Engineers' Office, Portland, Oregon.

Contract No. 9—Fort Wayne, Ind.—The Municipal Light, Heat & Power Co., of Fort Wayne, is in the market for 20,000 tons of screenings. Deliveries are to be made in hopper bottom cars during the next year. Address the Municipal Light, Heat & Power Co., Fort Wayne, Indiana.

Contract No. 10—Chicago, Ill.—The Chicago Coated Board Co. is in the market for 300 tons of screenings per day. Deliveries are to extend over a period of one year, and to be made at Chicago, Ill. Address the Chicago Coated Board Co., 420 E. North St., Chicago, Illinois.

Contract No. 11—Portland, Maine—The Portland Gas Light Co. is in the market for 30,000 tons of Penn Gas, Westmoreland, or any good grade, three-quarter screened, gas producing coal for delivery between Mar. 1, 1915 and Mar. 1, 1916. Shipments are to be as required, about in equal monthly proportions, to wharf through one bridge, Portland, Maine, ample water alongside. All communications should be addressed to C. H. Tenney & Co., Managers, 201 Devonshire St., Boston, Massachusetts.

Contract No. 12—New York—The bids on this contract, which provides for furnishing 2600 tons of anthracite to the National Guard for use at the various armories in the Boroughs of Manhattan and the Bronx, were as follows: The Meyer-Denker-Sinram Co., $4.25 on buckwheat, $7.65 on nut, and a total of $11,560; John S. Conabeer, $3.95 on buckwheat, $7.44 on nut, and a total of $10,793.50; Henry E. Meeker, $4.39 on buckwheat, $7.19 on nut, and a total of $11,834; Garfield-Proctor & Co., $4.10 on buckwheat, $7 on nut, and a total of $11,095; Thomas F. Farrell, $4.30 on buckwheat, $7.70 on nut, and a total of $11,052. Previous notices regarding this contract have appeared in this column. Address C. B. Rhinehart, Secretary, Armory Board, Hall of Records, New York City.

Contract No. 14—Panama, C. Z.—Sealed proposals will be received by the Panama R.R. Co., until 12 o'clock noon, Nov. 24, for furnishing all or any part of the company's requirements, estimated at 500,000 tons of coal, as required during the year ending Dec. 15, 1915. Coal is to be of the best quality steaming, semi-bituminous, mine-run, with at least 40% lump, dry and free from slate, sulphur, dirt and other impurities, suitable and acceptable for use in stowage in the bunkers of steamers operating in tropical waters and susceptible of being stored in the climate of Panama without danger of fire through spontaneous combustion. Prices are to be quoted f.o.b. any loading port the contractor may designate on the Atlantic or Gulf coast, and the contractor will be notified on the twenty-fifth of each month of the amount required for the succeeding month. The contract will be awarded on a heat unit basis with a standard of not less than 70% fixed carbon and 14,700 B.t.u. per pound of dry coal. Bidders must state the commercial or trade name of the coal, together with the designation of the bed or beds and exact location of the mine from which they propose furnishing the coal. All bids must be accompanied by a certified check for $1000 and, upon formal execution of the contract, the company provides that security not to exceed $30,000 shall be required for the faithful performance thereof. Payment will be made 30 days after presentation of bills of lading signed by the captain of the collier accompanied by certificates of the companies operating the coal piers, indicating the number of cars and weight of each car load of coal dumped into the colliers. Contract form and specifications can be obtained on application to R. E. Rutherford, Assistant Purchasing Officer, Panama Purchasing Dept., 24 State St., New York.

Contract No. 15—New York Harbor—Bids received on the United States Navy contract for 20,000 tons of steam coal were as follows, prices in all cases being delivered f.o.b. suitable lighters or barges alongside at Navy Yard, Brooklyn: American Coal Exporting Co. (14,429 B.t.u.), $3.05; Consolidation Coal Co. (14,533 B.t.u.), $3.38; W. P. W. Haff (14,300 B.t.u.), $3.05; Keystone Coal & Coke Co. (14,600 B.t.u.), $3.11, (14,100 B.t.u.), $3.09; F. P. Long & Co. (14,400 Bt.u.), $3.15; Pennsylvania Coal & Coke Corporation (14,500 B.t.u.), $3.10; Quemahoning Coal Co. (14,300-14,700 B.t.u.), $3.12; J. Tatnall Lea & Co. (14,480 B.t.u.), $3.07; Willard Bros. (14,500 B.t.u.), $3.30; J. H. Weaver Co. (14,567 B.t.u.), $3.25. Archibald McNeil & Sons Co. submitted five bids, with coal ranging from 14,500 to 14,750 B.t.u., and prices from $3.03 to $3.28. Navy Department, Bureau of Supplies and Accounts, Washington, D. C.

Contract No. 16—New York Harbor—The bids received for furnishing and trimming approximately 17,000 tons of bituminous coal required by the United States dredges in New York Harbor were as follows: W. P. W. Haff, Abrams Creek Coal (13,500 B.t.u.), $3.60; Commercial Coal Co., Commercial Bituminous No. 1 (14,200 B.t.u.), $3.60; Commercial Bituminous No. 2 (13,750 B.t.u.), $3.50; Commercial Bituminous No. 3 (14,790 B.t.u.), $3.85; Geo. D. Harris & Co., Inc., Margaret Coal (14,400 B.t.u.), $3.60; New Creek Coal (13,700 B.t.u.), $3.27; Hite & Rafetto, Bird Quemahoning (14,400 B.t.u.), $3.43. Bids were opened Oct. 8. Maj. G. J. Dent, Corps of Engineers, Army Building, N. Y.

Contract No. 17—New York—Sealed bids are requested by the Department of Public Charities for furnishing and delivering anthracite, bituminous and gas coal. Security aggregating 30% of the total amount involved in the contract will be required, and no bids will be considered unless accompanied by a cash deposit of 1½% of the total amount of the bid. The contract covers the period from Dec. 1 of the current year to Apr. 30 of next year, and bids will be opened at 2:30 p.m., Nov. 24. Blank forms and all further information can be obtained on application to Contract Clerk of the department, Room 1034, Municipal Building, Borough of Manhattan.

Contract No. 18—Brooklyn—Sealed bids are requested for furnishing and delivering 560,000 lb. of anthracite pea coal to the 26th Ward Disposal Works, at the foot of Hendrix St., Brooklyn. Bids are to be made on the basis of 1000 lb. and must all be in by 11 a.m., Nov. 25. Security aggregating 30% of the gross amount involved in the contract will be required. Delivery will be as required, and will be concluded previous to Jan. 1. Blank forms and all other information can be obtained on application to the Bureau of Public Buildings and Offices, Borough of Brooklyn, Room 1003, No. 50 Court St.

FOREIGN

Guayaquil, Ecuador, South America—La Compania de Alumdrado (Lighting Company) is in the market for 3500 tons of gas coal. Prosepctive bidders should state the specific gravity, weight per cubic foot, and space occupied by one ton of gas coal. Give approximate analysis, including moisture, fixed carbon, sulphur and ash, and a commercial analysis showing the gas per ton of coal, gas per cubic foot of coal, illuminating power of the gas in standard sperm candles, value of one cubic foot in grains of sperm, sperm value per ton of coal, coke per ton of coal (good quality), coke per cent. of coal, ash in coke, sulphur eliminated with the volatile products, sulphur in the coke, tar per ton of coal. Quotations should be c.i.f. Guayaquil. Address The Manager, Compania de Alumdrado, Guayaquil, Ecuador, South America.

South America—Supplementing a previous notice, the Bureau of Foreign and Domestic Commerce at Washington states that details regarding a certain inquiry from South America have been forwarded to the department, and that complete information, including blank forms on which to submit bids for supplying coal under the conditions specified can be had on application. All inquiries should mention item No. 14,048, and be addressed to the Bureau of Foreign and Domestic Commerce, at Washington, D. C.

Santiago, Chile, S. A.—Bids are wanted on 300,000 tons of coal a year during the next three years, according to press reports. The coal is to be used on the Chilean Railway. All communications should be addressed to the Department of Materials, Santiago, Chile, S. A.

COAL AGE

Vol. 6 NEW YORK, NOVEMBER 28, 1914 No. 22

The Power of Encouragement

WOULD you fight for your Big Boss?—Sure you would. Do you brag about the smart things he does?—Sure you do.

Do you repeat to your wife and your kids what he tells you about his wife and his kids?—Of course you do.

And do you go off and smile to yourself every time he gives you a little pat on the back just to let you know that he appreciates the way you are running things?—Well, I should say yes.

Truth of the matter is (even if you haven't thought about it in quite that light) he's quite a hero in your eyes.

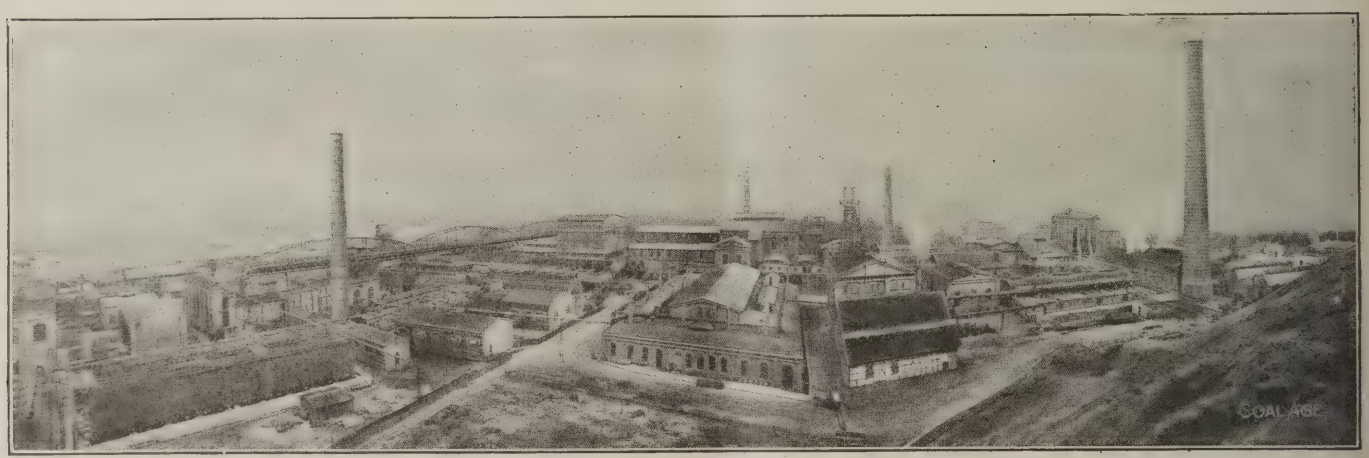
Isn't it strange then that you can't understand why it is that some of the men under you seem to lack enthusiasm.

If you didn't like your "boss" you'd nose about for a new job tomorrow; but the men under you can't throw up their places as easily as all that. They are living from hand to mouth, a good many of them, and they don't have much time to speculate about their likes and dislikes; nevertheless they are human like yourself, and their personal feelings drive them just as yours drive you.

If you, as boss, can't inspire your men to give you the best that is in them, it's a sure bet that your company, to a certain degree, is suffering from industrial paralysis, and the chances are you'll never discover the fact until it is too late.

Just put yourself in their shoes for a few minutes every day and try to picture your big boss dropped down a notch into your place.

It isn't necessary to do your thinking out loud while you're trying this—it wouldn't do, in fact—but you can feel reasonably certain that unless you are able to look back up the line and see why you really are a hero to the men under you, you don't belong where you are, and what's more you will not be there long.



On the other hand if you can succeed better in the business of inspiring men (the hero's business) than your big boss, it won't be long before you will be a big boss yourself and in time you may hope to be even a bigger boss.

A Visit to Coal Mines in Germany

By Samuel Dean*

SYNOPSIS—American coal operators might profit by studying the plans employed in developing the German coal industry. Their system of selling coal is the greatest on earth today. The mines are models of completeness and durability. Government lends aid at every turn. Wages are less than in America or Great Britain, and production per individual is less. Surroundings, however, are more pleasant.

When we are continually told about the wonderful things to be seen in a certain country or at a certain mine we are often disappointed when we go there to see for ourselves. But in spite of all the marvelous things we have heard about Germany in recent years it is a feeling of wonder and not disappointment that creeps over the visitor as he passes into the coalfields of Westphalia on his way from Rotterdam. As soon as the giant steel headframes and magnificent colliery buildings come into view between Wesel and Oberhausen, a scene opens up which holds the interest of the mining man every minute he is in that great industrial area which has its center at Essen.

Typical German Coal-Mining Plant with Byproduct Ovens

When in the colliery districts, it is not a case of having to travel miles and miles to see a modern mining plant; all the plants are modern. Germany may be called an "old country," but Westphalia is certainly the newest looking country I have ever seen. One views with astonishment the spick-and-span appearance of everything. Apparently there is not a telegraph pole out of the perpendicular. No weeds growing, no wooden shacks in sight. In fact I do not remember seeing a wooden building, and every inch of available ground was under cultivation.

Says the French Paid for It

As I left Dusseldorf and passed through a splendid agricultural country,[1] through Cologne and on to Liége in Belgium, I had a Frenchman for a companion, and I asked him if he could tell me how it was that everything appeared to be so new. Even the farmhouses, and farm buildings with their terra cotta tile roofs glistening in the sun, appeared to have been built only a few years. He turned to me with a sigh: "It was not so 40 years ago," he said; "France paid for all this." Whether that is true or not I do not know, but France, it will be remembered, had to hand over $1,000,000,000 after the Franco-Prussian war.

That looks like a tremendous sum of money and yet the collieries in the north of France are little behind those of Westphalia. There is a lighter touch about the architecture of the buildings at the mines in France, more sheet steel and fewer thick brick walls. Both are pretty to look at, but the buildings in Germany would doubtless stand a siege longer.

A Wonderful Arrangement

And what can I say about the interior of these buildings, to enable me to convey anything like an adequate idea of their magnificence? The polished machinery, the beautiful floors and tiled walls must be seen to be appreciated. In the power houses, the switchboards resemble giant pieces of drawing-room furniture. The entrance hall for the miners at the Hermann colliery near Dortmund would be quite suitable as a banqueting chamber. One would think the designer had copied it from a castle on the Rhine. Around the interior are the offices of the different officials, and the miners enter the hall and pass to the window of the official they wish to see between shifts.

Inside the entrance gates of the colliery you can step over to a small bar, where for a trifling coin an attendant allows you to select from his assortment of bottles of soft drinks, mineral waters and milk. Up in the screens I saw and sampled the contents of a similar bar. A very handy arrangement this—a thirsty official can get a drink without having to leave the works; it is also very convenient for the workmen. By the way, it might be mentioned that it is difficult to get a drink of plain water on the continent of Europe. Traveling Americans have introduced ice water, but the waiter always gives you the impression that he is disappointed when he places a pitcher on the table.

---

*Mine inspector, Victor-American Fuel Co., Delagua, Colo.

[1]The German farmer has mastered the science of plant nutrition; the yield per acre of every staple crop is greater in Germany than in any other part of the world.

I asked a German mining engineer why they erected such elaborate buildings about the mines, and he said that to a certain extent the laws demanded them, and that the owners felt that the workman took more interest in his work when everything was pleasing to the eye. I am sorry that I cannot show more pictures of the collieries in Germany. Photographs were being prepared for me, and were to have been sent on, but they have not arrived and the reader will probably know the reason why.

Extracting the Byproducts from Coal

I do not propose to go into what is being done in the way of extracting byproducts from coal; suffice it to say that soft seams which were considered valueless years ago are now being worked, and in addition to coke, they derive from them sulphuric acid, carbolic acid, chrysalic acid, benzol, sulphate of ammonia, tolule and various other products. Profits of as much as $1.25 per ton of coal from the byproducts alone are common.

German Discipline

The discipline in German works and offices is severe. There are many things which the public are forbidden to do. An observer is forced to the conclusion that many Germans do not think their great industrial success is worth the sacrifices made to obtain it. The middle course is perhaps the happiest existence. Too much discipline or too little are equally undesirable.

And yet they still have explosions in the mines in Germany, and try to palm them off as gas explosions when they travel from the face and up the shaft. On the question of dealing with the coal-dust danger, they are certainly not in front. Their explanations were amusing, and finally one of their inspectors blurted out that he did not think there was any cure for dust explosions. But hundreds will never agree with that statement. It is not difficult to make an advancing longwall mine, where tight steel cars are used, immune from dust explosions. And

Office Building of the Westphalian Coal Syndicate

Steel Headframe at a Modern German Colliery

In this branch of the industry Germany leads the world by a large margin. This is due to the superior education of the people, coupled with government assistance. For years the government of Germany has assisted the industries of the nation. Had this war not taken place, it is impossible to imagine what the country would have done. A London merchant told me that he could not understand why the Germans had rushed into the war because in his opinion they were beating the world commercially.

The bulk of their exports was shipped from Rotterdam, and a prominent official of the Westphalian Coal Syndicate repeated to me, what I had heard before, that Germany needed more seaboard; they were hemmed in too much. It is a fact, however, that the rank and file felt the oppression of militarism. The official quoted above stated to me that every summer he crossed the North Sea for his holidays, and immediately upon landing on the other side he felt like a bird let out of a cage.

in this connection it may be said that the difficulty of dealing with coal dust is far greater in America than it is in the mines on the other side of the Atlantic. In this country we have dilapidated open cars, with the coal loaded above the top, and the sides of our haulage roads are in coal.

Some German Methods Are Costly

They maintain clean haulage roads in Germany, and use tight steel cars. They employ the old-fashioned method of sprinkling, which is costly, being over 6c. a ton in certain places. This system is considered unsatisfactory by managers, but it is the law. They use troughs filled with water, along the sides of the roadways, and I am told have tried piles of wet peat in some places. Both methods are elementary.

The mines are well inspected, each mine being visited about twice a week by a government inspector. I was told that these inspectors worked in harmony with the man-

agement. Many of the managers were formerly government inspectors.

The Radbod Explosion

The explosion which recently occurred at Radbod colliery in Westphalia caused the death of 348 men including 6 officials. This was a new colliery and had only been in operation about two years. The shafts are about 3000 ft. deep. The seams gave off gas, but the workings being new the ventilation was exceptionally brisk. The gas given off was continuous, sudden blowers or outbursts being unknown. Benzine safety lamps were used in all parts of the workings except at the pit bottoms, where acetylene safety lamps were used. The benzine lamps were magnetically locked, and fitted with an internal frictional ignition device.

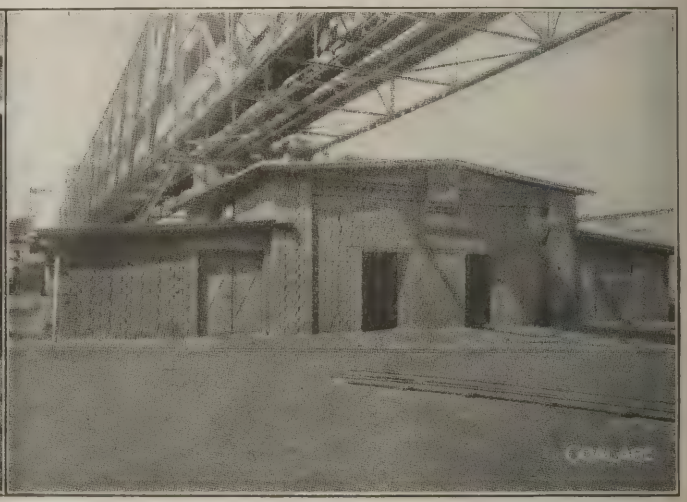
It is said that there was some coal dust present. An elaborate spraying and sprinkling system had been installed, and according to inspector Hollender, the rules relating to sprinkling had been enforced—the total quantity of water used for that purpose having exceeded 440,000 gal. per day. Special shotfirers were employed who fired their shots electrically and used permissible powders.

The explosion occurred at 4:20 a.m., a great cloud of black smoke issuing from the mouth of No. 1 shaft. Two more explosions occurred next day, and the mine exploded again twelve days later, after which the workings were flooded. Beads of coke were found marking the passage of the explosions, but no large masses or cakes of coke.

Gas vs. Dust

It is said that the cause of the explosion is unknown (another to that great list); that the effects of the flooding had put a detailed investigation out of the question, but that the explosion had visited all parts of the workings. Some of the inspectors seemed to think that a defective safety lamp caused the accident. I was told that this was a *gas explosion,* but when I inquired how a gas explosion could travel a main road against a strong fresh current of air there was some telephoning and eventually I was assured that gas started the explosion, and that *probably* coal dust carried it to the outside.

The Hermanite Barrier



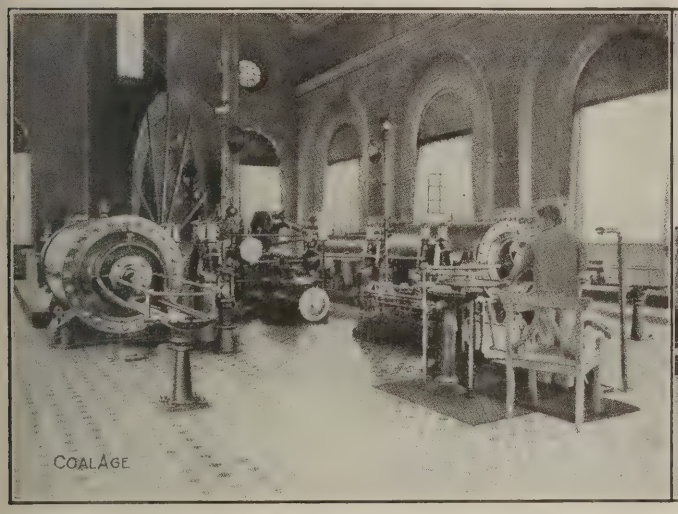
A curious barrier arrangement, inspired by Taffanel's experiments in France, has been tried at the Neunkirchen testing station in Germany. A framework is built in the roadway, fixed to roof, floor and sides. In the framework there is a swing, hung on hinges and holding light pans which are overturned on the opening of the swing. The swing is hung a little open and the shock preceding the flame of the explosion is supposed to cause the contents of the pans to be thrown into the atmosphere to extinguish the flame. Incombustible dust may be used, but the inventor, doubtless having a desire to be original, recommends a liquid which he calls hermanite; this does not evaporate, and has special extinguishing properties.

Amount of Water Necessary

Experiments at the Konig colliery showed that certain coal dusts were rendered noninflammable by the addition of a quarter their volume of water. When coal dust was only sprinkled, two-thirds of its volume of water was required. For the conditions of practice, 1½ parts of water to 1 of coal dust were considered necessary. And to combat the drying effects of the air currents 2 parts of water to 1 of coal dust might be needed. Nozzle spraying was not satisfactory, and in a report by an engineer named Hatzfeld, particulars were given of the successful experiments in France, where explosions were stopped by shale dust falling from overhead shelves, and collapsing box arrangements which were knocked down by the wave in front of the flame.

Storing Patent Fuel in a Steamer's Hold

A Shop Built of Patent-Fuel Bricks



The superintendents and inspectors in Germany are well paid, but the miner is doing well when he makes $1.75 a day; the average is about six marks, or $1.50 per day. Company men receive $1 to $1.25 a shift. The output is less than one ton per man per shift for all men employed underground. The miners are well housed; in this respect they are better provided than are some of the miners in England, but their earnings are lower. They have parks in the center of the mining villages for the children—the latter being, needless to say, numerous. The rent for miners houses is 50c. per month per room. Officials are provided with free house, coal and light.

Bathing Accommodations

Large bath houses are provided at the pits, with private baths for officials and visitors. It is not necessary to carry overalls or pit clothes when traveling on the continent of Europe, as complete changes are provided, including boots, socks, underclothing, etc. Men are in charge of

the private bath rooms in Germany, but women are employed for that purpose in France, and when the visitor ascends the shaft he finds his bath ready with clean towels and soap, and his clothes brushed and laid out on a table. They are exceedingly obliging in this respect in France. When continental mining engineers go back after a visit to this country they cause much amusement by telling their friends about having to carry dirty pit clothes all over the States, and not being able to get a bath when they come out of the mine.

At a large mine in Germany employing say, 1000 men underground, the mine is split into districts with about 100 men to the district. There is an overman for each district for each shift. There are 3 eight-hour shifts from 6 a.m. to 2 p.m., 2 p.m. to 10 p.m., and 10 p.m. to 6 a.m. Half an hour is allowed to hoist and lower men. The first shift starts going down at 5:30 a.m. Coal is hoisted during the morning and afternoon shifts; the night shift is for repairs.

INTERIOR OF A GERMAN ENGINE HOUSE, SHOWING HOISTING MACHINERY

LOADING DIRECTLY FROM MINE INTO BARGES AT THE DORTMUND-EMS CANAL

Austrians, Poles and Italians in large numbers were working in German mines, and there was a shortage of men.

The price of run-of-mine coal at the pit mouth, or the average price for all sizes of screened coal, was $2.75 to $3 per ton. Large quantities of briquettes were made and sold for $3.50 to $3.75 per ton at the mine. The cost of pitch, which is used as a binder, was $10 a ton delivered at the mines.

THE WESTPHALIAN COAL SYNDICATE

The coal corporations do not employ private sales agents, the coal being sold in a manner similar to the methods employed by the orange and lemon growers of California. With regard to the Westphalian Coal Syndicate, I was told that this selling agency did not sell in an arbitrary manner or abuse its position. Its object was to avoid violent fluctuations in prices. If prices of its competitor across the North Sea jumped a dollar a ton, it raised the prices of German coal 25c. a ton, and in the event of a fall of a dollar a ton on the other side, syndicate prices went down about 25c., so that manufacturers could rely upon steady prices at all times.

The syndicate on account of its considerate methods enjoyed the confidence and full approval of the state. The state would not wish to see it abolished. The miners of all classes, including the social-democrats, wanted to see it continued. And only a few short-sighted consumers criticized it, but the majority of consumers also wished to see it continued. In consequence of its existence the mines worked regularly, averaging about 300 days every year, the miners made steady wages, strikes were seldom heard of, and all round, the situation was highly satisfactory. The plants are magnificent, the status of the officials was high, the miners lived in pretty homes and were happy, and the owners made fair and reasonable profits.

The syndicate advertised, in different languages, in the following manner:

Annual capacity production of:
Coal .....about 110 million tons
Coke .....about 26 million tons
Patent fuel .....about 6.5 million tons

Suppliers to the German, French, Spanish, Danish, Russian, Swiss, Italian, Dutch, Portuguese, Greek and many other railway companies; also the German, Austrian and Greek navies; also to the most important steamship companies at home and abroad.

The coal district of the Ruhr producing all kinds of coal of the purest quality; that is to say, from anthracite coal to high-flaming coal, the syndicate is in a position to supply every consumer of coal with the material most suitable for his purposes, no matter whether his plant has been intended for Cardiff, Swansea, Newcastle, Yorkshire or any other coals. The supply can be made in every desirable composition; there are also available washed coals of the most varied sizes from pea to nut and lump, which, owing to their purity and absolute regularity of quality, are in particular favor with purchasers.

Coke, very hard and of great purity, may be advantageously used for foundries and all smelting purposes, equivalent to the best Durham coke.

Patent fuel in sizes of 3, 5, 7 or 10 kilos, is in quality perfectly equal to the best Cardiff brands.

Exports to all parts of the world.

The salesmen in charge of the export department of the syndicate were experts at their business, and knew the characteristics and prices of fuels the world over. Their branch offices in different parts of the world secured the orders, and these were turned over to another department which was familiar with the qualities of the coal from all the collieries, and arranged the distribution. They were shipping coke to San Francisco around the Horn.

No nation in the world was making such a bid for foreign trade as Germany. In the last 25 years this trade

increased 300 per cent. The German empire is little more than half the size of Texas. The actual value of total exports during 1913 was: Germany, $2,131,000.000; United States, $2,428,000,000.

A Lesson We Might Learn

The Germans have been ready to supply what the consumer wanted. They have not shipped unscreened mine-run into a market which has been previously supplied with clean screened coal. They have not allowed the status of the sales-agent to grow away beyond that of the superintendent of the factory or mine. Coal for export was shipped over the state-owned railroads of Germany, at a less rate than fuel for home consumption, and the rate per ton for large shipments was less than the rate for small shipments.

The German firms made their quotations in the decimal system, which is understood nearly everywhere, and they went to great pains to make the path of the purchaser easy by talking to him in his own tongue. In this respect, the English-speaking individual often fails lamentably by comparison; he usually speaks only his own language, and that often indifferently. The German method is the result of the admirable system of commercial education given at the state-aided schools.

The banks appeared to treat the manufacturer and operator liberally; he could often secure a loan on the strength of orders received. In fact, some of the strong firms complained that certain banks were becoming trading concerns. The inventor seemed to be able to secure financial backing without a great deal of trouble; note how Germany led in the production of some modern mining appliances—the breathing apparatus, electric safety lamps, the freezing process of shaft sinking, nearly all the successful freezing work in England being done by German engineers. The technical German was so exceptionally well trained that financiers had confidence in his plans and proposals.

The long-credit systems of German firms were often criticized, however, by their competitors. And it is well known in the steel trade that the German Steel Syndicate paid export bounties amounting to $3.75 per ton. Some are of the opinion that militarism had placed such a burden on Germany that she was at the breaking point before war was declared.

(To Be Continued)

Alberta's Coal Output

The annual report of the Mines Branch of the Department of Public Works of Alberta for 1913 shows that the output of the coal mines of the province for that year was 4,306,346 tons, as compared with 3,446,349 tons in 1912, an increase of 859,997 tons, or about 25 per cent. Of the production in 1913, 2,374,401 tons were bituminous, 1,763,225 lignite and 168,720 anthracite.

The total number of men employed was 8068, of whom 5837 were employed underground. The number of tons of coal mined per man was 533, as compared with 517 in 1912, the increase being due to the greater use of coal-cutting machinery in the lignite field. There were 45 new mines opened and 72 closed during the year, the abandoned mines having in many cases only been temporarily opened for prospecting purposes and closed down until railway connections could be made. At the close of the year there were 289 mines in operation.

The output of coke was 65,167 tons, and of briquettes 130,861 tons. There were 28 fatal accidents, of which 24 were underground and 4 above, 60 serious and 83 slight accidents. Eight of the fatal and 15 of the serious accidents occurred in connection with haulage, and only one fatality was due to the use of electricity. Much progress was made in connection with mine-rescue work, three rescue stations being in operation at which 201 persons underwent training, 51 of whom passed final examinations and were granted certificates for efficiency.

Don'ts for Miners

Don't enter your place of work without hearing from the fireboss.

Don't pass the fireboss' station, or allow your laborer to do so, until the fireboss returns and reports that it is safe to enter.

Don't enter your place without examining carefully for gas and other conditions, even though the fireboss has reported the same safe—they may have changed since his visit.

Don't fail to be careful when taking timber up in your breast for fear it might slide down and catch you or others.

Don't sit or work under a bad top; timber it or take it down immediately, always standing in a safe place to do so.

Don't allow your drill bits to be worn too small; be sure they are large enough to allow the cartridge to enter the hole freely.

Don't fail to keep detonators at all times separate and apart from other explosives until required for use.

Don't fail to keep gunpowder and other explosives in a wooden or metallic box, and a proper distance from the track.

Don't fail to examine your safety lamp and assure yourself that it is in good condition.

Don't attempt to open your safety lamp when the rules require it to be locked.

Don't carry matches where it is necessary to use locked safety lamps. It is dangerous and against the law.

Don't fail to extinguish and leave your naked lamp at the point beyond which the use of such lamps is prohibited.

Don't fail to obey the law in reference to lights when making charges of explosives.

Don't use a nail or spike to put a cap in a stick of dynamite, nor crimp the exploder by biting it with your teeth, or have a naked light near you while handling the charge.

Don't use two kinds of powder in the same hole; that is, black powder and dynamite.

Don't do tamping with an iron or steel bar; use a wooden tamping stick and tamp the hole to the mouth.

Don't shorten your fuse or squib to hasten the blast. It is prohibited by the Mine Law.

Don't use a blasting barrel instead of a fuse, inserting a cap in the barrel and exploding with a squib. This is a dangerous practice.

Don't connect your battery wires to those used by some other person. Connect your wires direct to the battery.

Don't connect your wires to the battery until ready to fire. If shot does not explode, be sure to disconnect at battery before seeking cause.

Don't fire a shot until you have given warning and received response from everyone in the vicinity.

Don't fire two holes at the same time under any condition.

Don't light fuse or squibs with matches where safey lamps are used; use a wire and always examine your place for gas or any other dangerous conditions before firing.

Don't go in a return air course or blind heading when firing a shot—the unexpected may happen.

Don't return to the face too soon after firing; take plenty of time and avoid accident. In case of misfire, go home for the day, place a warning for others in your place and notify the person in charge of your district.

Don't drill or pick out a misfire—drill a new hole.

Don't fail to examine the face thoroughly before commencing work, and after firing each blast, look for bad top or gas, and under no circumstances allow the laborer to enter before you do so and find it to be safe.

Don't fail to immediately extinguish a feeder of gas that you may ignite by a blast or otherwise; if unable to do so,

Note—From Susquehanna Coal Co.'s Book of Instructions to Employees.

notify at once the official in charge. Also examine your working place before leaving to see that no gas blowers are left burning.

Don't remove an accumulation of gas by brushing it, where it is practicable to be removed by bratticing.

Don't fail to remove any dangerous conditions at once by dressing down the face and repairing the broken brattice or blownout props.

Don't fail to keep the roof and sides of the working place in your charge properly secured by timber, or otherwise, and do not work or permit your laborer to work under loose or dangerous material, except for the purpose of securing same.

Don't fail to use props of safe and sufficient size for your manway, and don't use split props as they give a poor hand hold. Don't fail to sprag jugglers when necessary and also nail liners at both ends.

Don't remove any props until the relief props are placed, and always see that a good hitch and a large cap piece are used, and in no case remove props or timbers except by blasting or by some other safe method.

Don't fail to pay special attention to the top, and do not undermine top coal or top rock more than to the extent of one row of shots.

Don't neglect to order necessary props, etc., one day in advance. If you fail to receive same and your place becomes unsafe, you should vacate it.

Don't fail to observe all rules for the handling of explosives.

Don't fail to immediately report to the official in charge anything you may discover wrong that may lead you to suspect danger to yourself or others.

Don't be in a hurry to go home; take your time and work safe. A great many accidents are caused by hurrying through the day's work.

Don't go into abandoned workings or live workings when the miner is not present—there may be danger.

Don't attempt to drive a heading into a finished place before learning the condition of the place from the fireboss.

Don't let your manway become unsafe or hard to travel—your life may depend upon it.

Don't leave your place at quitting time without examining it and making it safe, and on pitch work always secure the top of your manway, placing tools where others cannot be injured by coming in contact with them. Remember the fireboss, as well as yourself, must visit your place the following morning.

Don't let your car stand in the face of a place on grade without blocking it securely.

Don't allow your laborer to remain at work without you.

Don't carry a drill on your shoulder when traveling near a trolley wire.

Don't ride on loaded trips when going home.

Don't ride between cars.

A Flexible Coupling

It became necessary, says C. F. Scribner, in *American Machinist* of Nov. 5, to design a flexible coupling where the amount of room for its construction was limited; high speed was required and the demands for service were intermittent. Such cases frequently occur, as in driving a generator from a motor, driving a fan for an exhaust system and many other applications.

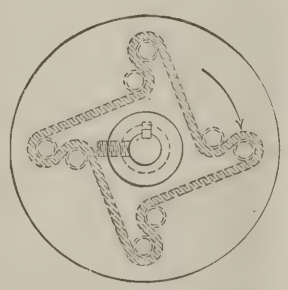


Diagram of Coupling

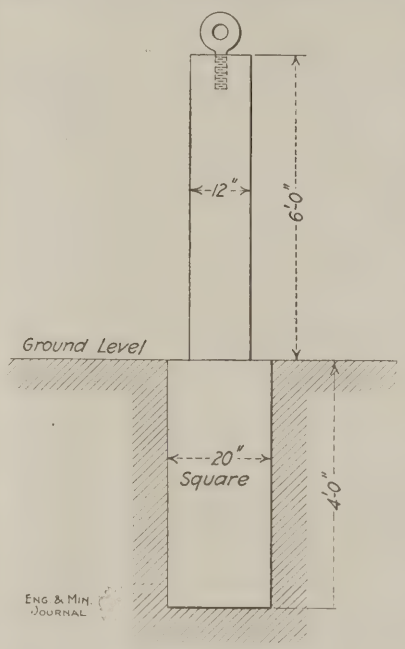

The sketch shows the design finally adopted for the foregoing requirements and which has now served successfully for a period of two years. The coupling consists of the two gray-iron flanges, having four driving studs in each, the studs being placed on the smaller radius in the driving flange and on the larger radius in the driven flange. Connection is made by the action of the driving studs of the smaller radius against the 1-in. endless leather belt, which encircles the studs spaced at the larger radius.

To break the connection, it is only necessary to loosen a setscrew, sliding one flange endwise until the studs are released from engagement with the belt, when the belt can be slipped over the flange not in motion, where it can remain until further service is required.

It was found that exceptional accuracy in the alignment of the two shafts was not required, as in the case where a slip-coupling was used and that there was a complete lack of vibration, and it was nearly noiseless, and easy in starting—factors which make its use desirable in many places.

Raising Guy Lines

Those who have had occasion to walk around the surface of mining properties at night have probably, once at least, stumbled across a guy line leading from a smokestack or similar object. L. E. Ives discusses this subject in the Nov. 7 issue of the *Engineering & Mining Journal* as follows:

Guy-Rope Support

The height at which these lines generally cross a path is just about that necessary to strike one in the neck. The sketch shows how this may be overcome, at the same time providing a perfectly strong anchor. A concrete post, reinforced with two 30-lb. rails, is made with a total length of 10 ft. The upper 6-ft. section of this post is circular in cross-section and 12 in. in diameter. The remainder is square, 20 in. on a side. The square section is placed in the ground, and the round portion extends above ground. An eye-bolt is embedded in the top, and the guy line is attached to this. In this way the line at its lowest point is 6 ft. above the ground, giving ample clearance.

Increased Coal Output of China

Prior to 1909 little attention was paid to coal exports from China, says the *Daily Consular and Trade Reports*, but during 1913, owing to the activity of the Kailan and Fushun mines, the increased valuation of coal exports was placed at $2,311,578, representing an increase of 808,670 tons.

The Kailan project is a British-Chinese enterprise, operating the Kaiping and Lanchow mines, with nearly $10,000,000 capital and an annual output of about 1,800,000 tons. The Fushun collieries are operated by the Japanese in connection with the South Manchurian Ry., the output being roughly estimated at 8000 tons per day. Some of the coal mines in China are operated by modern machinery, while others are utilizing native methods.

The Labor Situation

SYNOPSIS—The President is not intending to protect the miners continuously who are employed in the Bache-Denman mines in Arkansas, but only the U. S. marshals when executing the law. In Butte, kidnapping union men has been punished with 5 years' imprisonment, while in Colorado this crime, though frequently committed, has gone unpunished because only nonunion men have thus far suffered. The state authorities in Colorado want the U. S. troops withdrawn.

The receiver of the Bache-Denman Coal Co. in Arkansas when ordered by the U. S. Court to resume operations imported nonunion men from Clarksville and Jimtown. It was thought, of course, that as the men were employed on the order of the federal court, they would be protected by the U. S. troops brought into Arkansas to keep order.

Military Will Not Stand Guard at Mines

But to the present administration only those who obey and acknowledge the trades union are entitled to protection. So Major N. F. McClure in command of the federal troops was caused to make a proclamation that he would not act as a continual guard of the men at work but help the U. S. marshals should an emergency arise. The men working for the coal company must feel that such slackness may cause a repetition of the murder and arson which have already disgraced union labor and the state of Arkansas, and if it occurs again will dishonor the administration at Washington. There is a certainty that these marshals will be described as irresponsible gunmen of the operators and that public sympathy will be denied them. As a result the miners under their protection will take their lives in their hands.

Kidnapping Is Safe where Right Men Are Kidnapped

The reader should note how satisfactorily the rioters in Butte, Mont., have been squelched. But then, these sacrilegious men ventured to raise their hands against the Union. In Colorado far worse things have been done to nonunion men than were done in Butte by "Muckie" MacDonald to members of the American Federation of Labor. As yet no punishment has reached them while Muckie, victim of a peculiar misjudgment, has offended Mother Jones and her friends and so gets three years in the Deer Lodge Penitentiary. Joseph Bradley, vice-president of the new Union, receives five years, and Joseph Shannon, member of the executive board, is found not guilty. The crime was kidnapping miners—union miners. How shall such crimes be expiated! It will be remembered that the Ludlow affair in Colorado arose out of the forcible detention by union men of an Italian, Tutoilmando. Interference by the Colorado militia with the kidnappers of the Italian was the direct cause of that military action.

Ammons Wants U. S. Troops Removed

The governor of Colorado, E. M. Ammons, is in accord with his successor, G. A. Carlson, and believes that the time has come for the state to resume her sovereignty and call for the removal of the troops. The Burris Legislative Investigating Committee has so advised, saying to the governor:

> We recommend that you issue a proclamation that every person within the state is commanded to obey the law and to refrain from all incendiary utterances. Make it clear that each able-bodied man between the ages of 18 and 45 is, in fact, a member of the militia and that if it becomes necessary he will be called into active service.

This looks like impressment of citizens. This will not be popular if people from nonmining sections are impressed and if men are taken from the mining regions the result will be charges like those after the Ludlow affair where some men took part in the fray who were not members of the militia. With the threats of the union men such as they are, the removal of U. S. troops seems ominous. The authorities promise to deport a number of trouble makers who are citizens of other states. It would be well, however, for them to ascertain that they really have an adequate force before preparing for the execution of such a difficult program.

It is natural, however, for the citizens of Colorado to feel irritated with the presence of the U. S. troops. They have been used to set aside the laws of the Colorado legislature as also those of the United States. They have created an intolerable situation but if anarchy follows their removal, the conditions may conceivably become worse.

On Dec. 1 the Committee on Industrial Relations commences its inquiry into conditions in Colorado. The impression seems general that the militia will replace the army on that date but the change may be made sooner.

We are informed by Eli Jeffrys of the Jeffrys Coal & Mining Co. that after a short suspension of a week due to a misunderstanding, the Bloom mine at Starkville resumed operations. As soon as conditions were explained to Lindley M. Garrison, the Secretary of War, and to the colonel on the post, permission to reopen the mine was granted.

The Origin of the Possum-Hunting Movement

The following description of the uprising in western Kentucky is from the pen of Newell G. Alford, the engineer of the St. Bernard Mining Co. at Earlington, Ky.:

> Coal mining in western Kentucky for the past few months has been beset by dangers which call to mind the mysterious operations of the Ku-Klux Klan. Night riding by masked men was revived in Kentucky and Tennessee some eight years ago when the tobacco growers banded themselves together in a secret order for the purpose of exterminating the cultivation of the plant until a higher price might be secured for their crops. Farmers ignoring their warnings were visited at night by bands of masked men and whipped, the offender's buildings were often burned, while there were many instances here homes were riddled with bullets and men, women and children were shot to death. Former Governor Augustus E. Willson finally checked these outrages by putting state troops in charge of the situation.
>
> Depredations of a similar character were committed in Muhlenberg County in the early part of last April. This time the night riders operated under the name of "Possum Hunters." First a night fireman at the Gibraltar Mine near Central City was whipped by about 50 masked men under the shadow of night. Then an attempt was made to whip the store manager of the McHenry Coal Co. at Echols. This time the band was repulsed, four "Possum Hunters" being shot, while two were fatally wounded, their deaths being ascribed to quick pneumonia.

Movement Involves Five Counties

> The field of activities has since expanded into Ohio, Hopkins, McLean and Butler Counties. Rochester, Beech Creek, Drakesboro, Cleaton, Bevier, Dawson Springs, Ilsley, Carbondale, White City, Daniel Boone and Nortonville have been raided and notice served that negro miners must leave the camps. The reply of the operators to these threats has in every instance, excepting that of Carbondale, been the retention of the colored men and an increase of the vigilance guard on duty at the various operations. Carbondale has furnished the setting for two raids and a death, a miner being killed when a house was perforated with bullets.
>
> It is generally understood that the bond of secrecy among the "Possum Hunters" is extremely strong. They are initiated with a ceremony and the penalty for violation of their obligation is death.

Recent Acts of Violence

> On the morning of Nov. 13, the body of Henry Allen, 30 years old, was found dangling to a limb just back of the Advance Coal Co.'s mine near Hillside in Muhlenberg County. The body was clad in underclothes and the hands were tied behind it. Allen, an alleged leader of the Possum Hunters, was under indictment at the time for banding together with others for the purpose of intimidation. It is assumed that his threatened violation of secrecy brought upon him the extreme penalty.
>
> On the night of Nov. 14 a raid was made on the town of Island in McLean County and the tipple of the Consolidated Coal Co. was burned to the ground. This has been followed by a lull in night-riding activities.
>
> Earlington, the coal center of Hopkins County, has been strongly committed to law and order for many years and is always ready to lend its strength for its enforcement. It is not true, however, that a block house was built and provisioned in this town. This precaution was taken at Carbondale, a small camp in the same county, isolated from the neighboring settlements. The sheriff of the county, Thomas Logan, has expressed himself as being able to prevent any further lawlessness and claims to have control of the situation in Hopkins County.
>
> We have just received word that a coal tipple valued at $35,000, and owned by Shelby Gish, of Central City, Ky., was destroyed by fire by the "regulators" recently.

Operators' New Illinois Organization

The Illinois operators expect to form a new organization which will amalgamate them all into a common federation. There are now three separate bodies, the Illinois Coal Operators' Association, with headquarters in the Reisch Building at Springfield; the Central Illinois Coal Operators' Association, which comprises most of the Springfield district, and the Coal Operators' Association of the Fifth and Ninth Districts of Illinois, which is composed of the operators in the Belleville district.

The new plan provides for a parent association with four subsidiaries. One would cover the Danville and Springfield districts, another the northern coal field, a third the Belleville district and a fourth the southern coal field. Each subsidiary will act independently in its own district but conjoint action will be taken to prevent the passage of such legislation as appears injurious to the interests of the coal industry and ill-advised from the standpoint of the public.

West Virginia Coal Mining Institute

The winter meeting of the West Virginia Coal Mining Institute will be held at Huntington, W. Va., Dec. 10 and 11.

The morning of Dec. 10 will be devoted to the address of the president, Neil Robinson, on "A Plea for Posterity," after which the following papers will be read: "Cost Accounting," by Richard Smethurst, of Cincinnati, O., and "Coöperation," by the Hon. Z. T. Vinson, Huntington, W. Va.

At 2 p.m., two papers will be read, one on "Mine Gases," by Frank Haas, of Fairmont, W. Va., and the other on "The Pottsville Measures West of the Kanawha and New Rivers," by Ray V. Hennen, of Morgantown, W. Va., followed by election of officers and business session.

Introductory remarks by J. D. Van Scoten, of Washington, D. C., will open the evening session at 8 o'clock, after which Miss Mary K. Quick, of Moundsville, W. Va., will read a paper on "The Visiting Nurse," and Dr. Peter Roberts, of New York City, one on "Teaching English to Foreigners."

The entire morning of Dec. 11 will be devoted to a discussion of questions pertaining to mining. Some of the queries to be submitted at the question-box session are: What is the best roofing material for mine tenements? Assuming the force system of ventilation, is a door regulator preferable to a box regulator? Has the wisdom of the Compensation Law been proven by results so far obtained? Are oil safety lamps to be preferred to electric safety lamps in gaseous mines? Which is the best method of caring for the accumulation of dangerous gases in gob sections?

At 2 p.m., the following papers will be read: "The Benefit of Good Roads to a Mining Community," by the Hon. A. D. Williams, of Morgantown, W. Va.; "Storage-Battery Locomotives," by G. H. Shapter, Charleston, W. Va.; "Roof Supports," by Fred Keighley, Uniontown, Pennsylvania.

Extracts from a Superintendent's Diary

We have just passed through the excitement incident to the annual election of camp physician and as usual the best man didn't win.

During the past 18 months the man who was successful today has been living on the outskirts of our village and has been exerting himself worming into the good graces of all of our citizens. He had little difficulty in picking out families here and there who were dissatisfied with the efforts of the regular physician and after establishing friendly relations with them, he made use of their good will to his own advantage quite after the method so well understood by successful politicians.

The man whom he was undermining probably realized the danger but for reasons best known to himself, made no effort to block his enemy's campaign.

I foresaw the inevitable result months ago; it was history repeating itself to me as I had witnessed similar campaigns of quacking quacks at various times in the past, but my hands were tied. I was even more helpless than the chosen victim in that he might have struck back had he so desired, but I was absolutely helpless.

From the very beginning of my career as a mine superintendent this doctor question has persistently exhausted my patience and ridiculed my efforts to pass judgment.

The camp must support a physician and since he is to be everyone's physician, everyone ought to contribute toward his support. That's a self-evident, reasonable statement and everyone accepts it without argument, but any attempt to enlarge on that statement as a foundation is more than apt to inaugurate an earthquake.

If the officials of the operating company attempt to regulate the salary of the physician or the system of election or the educational requirements, they immediately run afoul not only the employees, but the company's legal department as well; these cautious lawyers know what it means to appear before a jury as defendant with medical testimony, when the plaintiff has a right to intimate that the physician is under obligations to the defendant.

If the salary of the physician is left to chance, it may become so small that no self-respecting physician will accept it, or so large that no self-respecting physician will enter the free-for-all fight necessary to win the appointment.

We have had physicians of all kinds. Some were strong on the pill treatment, while others ridiculed all pills. Some believed in prescribing for every ailment and others seldom prescribed at all. Since the doctors have to furnish the drugs as part of their contract, the ones who were free and easy with their drugs escaped the criticism of being stingy, but they were often grievously berated for unpleasant concoctions furnished. Because of the fact that the doctor's compensation is not dependent on the number of calls that he makes, it is easy to imagine that he will exhaust all reasonable means to discourage requested visits; at any rate every time one of them leaves an unpleasant dose, his motive is questioned.

And our physician's motives are subject to suspicion, not only at home but also in the world at large. The doctors' associations look with disfavor upon the control system and often accuse our physicians of violating the ethics of their profession.

Possibly some of these things have had an influence on our retiring physician; at any rate he does not seem to resent the outcome of the election as much as I do.

Final Figures on 1913 Coal Production

The U. S. Geological Survey has made its final report on coal production in 1913 in the United States.

The production of anthracite coal in Pennsylvania in 1913 was 81,718,680 long tons (91,524,922 short tons), valued at $195,181,127, an increase of 6,395,825 long tons, or 8.5%, and an increase in value of $17,558,501, or 9.9%. The gain is attributed to the light production in 1912 as a result of the fact that the mines were idle that year in April and May during the wage negotiations.

The production of bituminous coal and lignite was 478,523,203 short tons as compared with 450,104,982 tons in 1912, a gain of 28,418,221 tons, or 6.3%, and in value $47,324,213, or 9.14%. The total value of the bituminous coal produced was $565,307,658 in 1913 as compared with $517,983,445 in 1912. The average price of bituminous at the mines in 1913 was $1.18 per ton, the number of days worked was 232, and the average number of employees was 571,899.

Culm Recovery at Nanticoke

By Frank H. Kneeland

SYNOPSIS—Culm is conveyed to the washery by means of drag lines. The larger pieces are separated out and picked either mechanically or by hand after which all sizes above pea are crushed to that grade. All good coal above $\frac{1}{16}$ in. in diameter is loaded and shipped while that below this size is carefully stored on a separate dump heap.

The virtue of one age may be the sin of another; the economy of one generation, the extravagance of the next. So far as coal mining is concerned what small profits are made today are, generally speaking, secured through economies in production rather than through increases in the selling price. Many of us well remember the time when the beehive oven was considered the "last word" and most economical means of producing a satisfactory metallurgical fuel. Today, however, through the use of byproduct ovens enough material is conserved from the gases evolved to almost if not entirely pay for the whole coking operation, leaving the coke itself as practically a clear gain.

But the savings effected through modern methods and processes are by no means confined to the bituminous regions. Years ago during the earlier stages of anthracite development, there existed the firm belief that the small sizes such as chestnut and under could not be utilized to advantage. Certain it is that such sizes could not be sold, with the result that vast amounts of this material accumulated as dump or culm banks throughout the coal regions of eastern Pennsylvania. Today, all sizes of anthracite above $\frac{1}{16}$ in. possess a definite market value, and no inappreciable percentage of the revenue of many of the operating coal companies is derived from working over these culm banks and separating out and preparing for market the good coal contained therein.

Near the town of Nanticoke, in Luzerne County, Penn., the Susquehanna Coal Co. has in operation a culm-recovery and washing plant which is well worthy of notice. The washery proper, which may be seen in Fig. 1, draws its supply of culm from at least three separate and distinct banks by means of scraper lines entering the building from opposite sides.

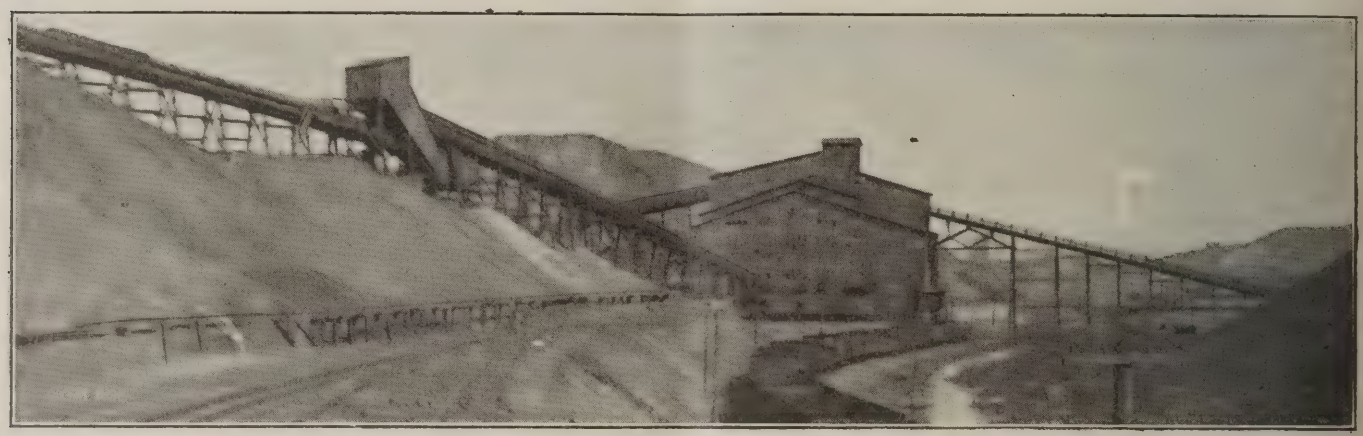

Fig. 1. General View of the Washery

To begin at the beginning, a single one of the culm banks being worked covers an area of about 440 acres to an average depth of approximately 100 ft. Assuming that this culm in place weighs only 50 lb. to the cubic foot, there is here alone 95,832,000,000 lb. of material, or 47,916,000 tons. It should be remembered, however, in considering these vast quantities that by no means all of this material is marketable fuel.

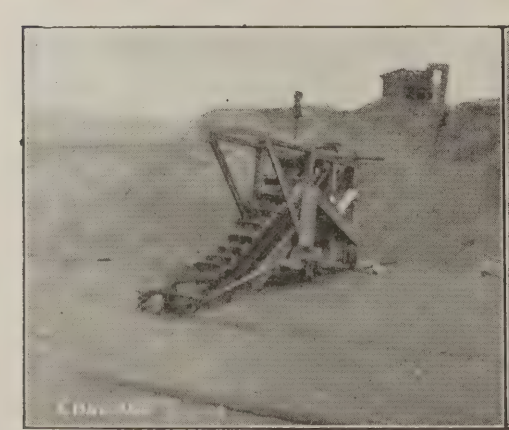

Fig. 2. Machine for Loading Culm into Conveyor

Fig. 3. Outer End of Conveyor

Fig. 4. Looking Down the Second Conveyor from the Driving End

This culm is transported to the washery by means of drag-line scraper conveyors into which it is washed by streams of water under considerable pressure, or by means of the device shown in Fig. 2, which is an electrically driven shovel or elevator to raise and spout the culm into the conveyor. In the figure this machine is shown standing upon ground which has been reclaimed from the culm bank.

Fig. 3 shows the outer or receiving end of the drag-line conveyor. This line is about 175 ft. long on a slope of approximately 25 ft. to the 100. It delivers to a second drag line 440 ft. long on a slope of approximately 21 ft. to the 100. Each conveyor is separately driven by an electric motor.

As may be clearly seen in Fig. 3, the outer end of the first drag line is in a considerable depression. In 1885, a cave occurred in the No. 1 Slope of the Susquehanna Coal Co., resulting in the loss of 29 lives. The men were caught in an old swamp under this culm bank. The recovery of the bodies was abandoned only after much effort and expense. The depression in the top of the culm bank due to the cave was about 150 ft. across and from 90 to 100 ft. deep. The low point where the end of the drag line is now located is very nearly at the exact spot where the cave occurred.

As culm banks were originally considered entirely a waste product, this one in many places has been covered with from 10 to 20 ft. of ashes from the boiler plant. These must now be removed before the culm is taken out. They are accordingly flushed off from the top of the pile by means of streams of water which convey them to a new ash heap. In Fig. 6 may be seen a workman controlling an ash-flushing stream as it travels down the hill.

From the discharge end of the second drag line, which like the first is a 9-in. pitch Simplex drop-forged chain carrying flights at suitable intervals, the culm is discharged to a flush chute. This is aproximately 400 ft. long on an inclination downwards of about 20 ft. to the 100. This chute discharges to the main drag line leading to the washery. This line is 468 ft. long and has a capacity of about 150 tons per hour. It is composed of two strands of Simplex chain, similar to that used in the first and second drag lines above mentioned, between which spaced every 36 in. are flights 8 in. deep and 26 in. wide. These, of course, operate in a properly formed trough. A general view of the flushing trough, the lower end of the main drag line, and the refuse disposal dump from the washery, may be seen in Fig. 5. Another single-strand drag-line conveyor, which is also visible in this figure, brings coal from another culm bank and discharges it to the main drag line a short distance from its lower terminus. A 100-hp. motor drives the main drag line.

On entering the washery, the coal is divided, one-half

Fig. 5. Looking Down Flush-Trough Delivering to Main Dragline; New Refuse Dump in the Middle Background

going to each side of the building. A second conveying line of the same capacity as the one above mentioned enters the washery from the opposite side, the material delivered by it going through the same processes as that from the side considered.

Nine sets of shaking screens are provided on each side of the building. There are also three other shaking screens, making 21 sets in all. Water is supplied from an overhead tank assuring an even supply at constant pressure. All shakers are fitted with Robinson bronze sprays, giving two jets to each segment of the screen, which is abundant for this purpose.

The coal as it comes from the conveyor is passed over a shaker consisting of four decks, the upper with 5-in. perforations, the second with 3¼-in.; the third with 2⅜-in. and the bottom deck being blank. This blank deck discharges to a second set of shakers. What coal comes over the largest perforations is hand-picked, while the discharge from the second and third deck is passed through anthracite spirals, the coal and slate being thus separated. All of these grades are then run through breaker rolls and crushed to pea size and smaller.

The second set of shapers separates the stove, nut and

pea coal which also is run through spirals. The nut and pea, after spiraling, are jigged to remove all impurities. after which all of these sizes above the pea are crushed to that size.

All sizes smaller than pea, from both sides of the building, are run over three banks of shakers of three screens each, separating the Nos. 1, 2 and 3 buckwheat. The material passing through the smallest perforations, or those $\frac{1}{16}$ in. in diameter, goes to a settling tank from whence it is conveyed onto the refuse dump by means of another drag line. The No. 1 buckwheat, after leaving the shaker, is jigged before going to the storage box. The silt or fine material carried in suspension by the water, as it leaves the settling tank, is deposited at the base of the refuse dump. From here the water filters through a railroad embankment to a small stream where it is impounded and again pumped up to wash the coal.

The No. 2 and No. 3 buckwheat are conveyed direct from the shaker to the storage pockets without washing or jigging. Each shaker is driven by 13-in. eccentrics giving a 5-in. throw. Parrish or flexible wooden eccentric rods are employed, while the shakers are suspended by elastic boards rigidly fastened at both top and bottom. All jigs are driven in pairs by a 10-in. belt from the main drive shaft. All other machinery is driven by

Fig. 6. Laborer Controlling Ash-Flushing Stream from Top of Culm Bank

Fig. 7. Flushing Ashes from Top of Culm Bank

1½-in. transmission ropes which are not spliced but are connected by Scott rope sockets. The main power belt for the entire building is of 8-ply rubber 24 in. wide.

The wastage or coal which is spilled when loading cars for market is brought to a tank below the track level from whence it is conveyed to the shakers for rescreening. The pump supplying the washery is a Jeansville simple duplex plunger machine with steam cylinders 30 in. in diameter, water cylinders 12 in. in diameter and having a 36-in. stroke. This machine runs at approximately 20 strokes per minute.

While means of successfully utilizing anthracite coal of $\frac{1}{16}$-in. diameter or less has not yet been devised, except through briquetting, it is believed that some such means may be developed in the future, and as has been stated above, the small coal from this washery is being carefully deposited by itself and not allowed to be contaminated with ashes or any other refuse. Future years may quite possibly see developed means of using such fuel as this to commercial advantage.

The early mining of anthracite was conducted in the best and cleanest coal measures. An appreciable quantity of what was even then marketable fuel was rejected by the slate pickers, together with considerable amounts of coal, to which slate adhered. The culm banks which today mar the landscape in many portions of eastern Pennsylvania represent in many instances as good a quality of fuel as it was possible to secure from any of the coal beds. As anthracite is made up mostly of fixed carbon, it weathers but little if any. The result is that the marketable coal secured from the culm banks when properly prepared and washed, as has been above described, represents as fine a grade of fuel of its kind, as it is possible to secure by direct mining at the present time. The cost of production on the other hand is comparatively small, since almost the entire process is carried on by the use of machinery.

West Virginia Mining Fatalities in October

The State Department of Mines has just issued the list of fatalities occurring in the coal mines of West Virginia during the month of October, showing that 34 deaths resulted from various accidents in that period. Twenty-six of these deaths were caused by falls of roof and coal, three by mine cars and locomotives, three were electrocuted, one crushed in mining machinery, and one killed by explosion.

Of the month's fatalities seven occurred in McDowell County, five in Fayette, five in Kanawha, four in Mingo, three in Raleigh, three in Logan, and one each in the counties of Marion, Ohio, Preston, Boone, Taylor, Tucker and Mercer. Of this number 17 were Americans and 17 foreigners.

The report just sent out by Chief Henry has a new feature, which shows where and under what conditions each man lost his life, in the hope that it may have its effect as a warning, and prevent workmen in the mines from taking similar risks without thoroughly acquainting themselves with the conditions. In the letter accompanying the report Mr. Henry says:

An effort has been made in making up this list to show just exactly how these persons have been killed, trusting that all who read the same may take warning and not permit themselves to take similar risks, which may also result fatally. The persons reading the list, occupied in similar positions, should profit by the mistakes of the unfortunates, and it is the duty of mine officials to eliminate, as far as possible, dangerous conditions and practices.

All are earnestly requested to carefully note how accidents occur, and then eliminate opportunities for repetition of same.

The Manierre Loader, known to coal men as an efficient box car loader for lump and small coal, has recently entered a new field. The Charles Warner Co. has installed one at their Cedar Hollow plant at De Vault, Penn., to load lime. As large lump lime breaks more easily than lump coal, and as this loader has been in successful operation for over six months, coal men are drawing an interesting lesson, which applies in their own field, from this recent departure.

Briquetting Plant of the Pacific Coast Coal Co.

By W. L. Kidston*

SYNOPSIS—A new plant using asphalt as a binder and having a capacity of approximately a million briquettes per 10-hr. shift is here described.

The Pacific Coast Coal Co., of Seattle, Wash., has been operating bituminous coal mines for a number of years at Black Diamond, Franklin, Burnett and Newcastle in Washington. These coal properties are comparatively short distances from Seattle and are at the terminus of branches of the Columbia & Puget Sound R.R., which is also operated by the coal company. The Black Diamond and Newcastle branches of the railroad converge at Renton on the southern shore of Lake Washington, where the coal bunkers of the company have been located for several years and where it owns suitable land for further development and for storage purposes. It is here that the company is now solving, by means of a modern briquette plant, some of its important fuel problems.

For some time it had been thought by the Pacific Coast Coal Co. that the most advantageous way to handle certain of its valuable coals would be to briquette them. Consequently, the late James Anderson, chief engineer, was commissioned to investigate the several plants operating in the United States and his studies led to the employment of the Malcolmson Briquette Engineering Co. to design, superintend the erection of, and turn over in working order a briquetting plant of a given capacity.

The original design of the plant called for coal-burning furnaces and the use of coal-tar pitch as a binder, but superior experimental results with asphalt led to its adoption for this purpose. The asphalt is eventually to be manufactured at the briquette plant, this change leading to the substitution of oil-burning furnaces which will ultimately use the distilling plant's byproducts.

Pacific Coast Coal Co.'s Briquetting Plant

As now constructed, the plant includes 10 buildings and 3 tanks. The buildings are: Raw coal bin 32x42 ft., drier building 36x105 ft., press building 32x64 ft., laboratory and office 18x28 ft., briquette-storage bin 20x 32 ft., demonstrating station 12x20 ft., watchman's cottage 22x28 ft. and a pump house.

The raw-coal bin is constructed entirely of fir timber bolted together. It stands 80 ft. high over all and contains two compartments of 400 tons capacity each.

The drier, press, transformer, and boiler and kettle

*No. 810 West 61st St., Seattle, Wash.

buildings are constructed of structural steel covered with corrugated galvanized-iron sides and roofs, with the exception of the drier and press buildings, where the roofs are of asbestos-covered corrugated iron. The demonstration station, briquette-storage bin, laboratory and office, cottage and pump house are all of the usual frame construction.

The raw coal comes from the mines at Black Diamond, Newcastle and South Prairie in standard hopper-bottom coal cars, which are discharged into an iron-lined concrete hopper. A Link-Belt reciprocating feeder draws the coal from the bottom of the hopper and discharges it into the buckets of a gravity-discharge elevator of 100 tons per hour capacity.

From the elevator the coal is delivered by a conveyor into one or the other of the two compartments of the raw-coal bin, each compartment of which has a capacity of 400 tons.

All Quantities Are Carefully Regulated

Regulation of the quantity of the coal in the manufacture of a compact and homogeneous product begins in this

Rear View of Plant

plant at the time the coal is drawn from the raw storage. To regulate, first, the amount of coal to be used in the briquette; second, to control the proportions of the various constituents, and third, to insure a uniform mix, a positive mechanical feed of the plunger type forces the discharge from each of the compartments of the raw-coal storage bin onto its respective horizontal flight conveyor.

A motor through a chain-belt and sprocket connections operates the feeders. Eccentrics control the stroke of the plunger and the sprockets regulate the speed. Each feeder is designed for a capacity of 50 tons per hour but is operating under present requirements at the rate of 30 tons.

Flight conveyors, inclosed by steel casings, deliver the raw coal either to a pulverizer made by the Williams Patent Crusher & Pulverizer Co., or to one or both of the two driers made by the Ruggles-Coles Engineering Co., of New York.

At this point in the plant means are provided for putting the raw coal through the driers and crusher in any order either desirable or necessary to put in proper condition for mixing and fluxing.

The Ruggles-Coles driers are of special design for handling raw and fine coal. They are 9 ft. in diameter and 65 ft. long. Heat is supplied by oil fuel in Billow burners and furnaces made by the National Supply Co., of Chicago. The driers are driven at 8 r.p.m. and the work of reducing the total moisture in the coal to one-half of one per cent. is assisted by the drier fans which direct the flow of heat through the driers and at the same time draw the moisture-laden air from them and exhaust it through Cyclone dust collectors which are located just to the right of the raw-coal storage bin and immediately over the end of the drier building.

The drier fans are 4 ft. in diameter, and are each driven by 15-hp. motors. A General Electric Co. centrifugal compressor running at 3600 r.p.m. supplies low-pressure air for the Billow burners.

After the coal has been reduced to a sufficient fineness with all the dust returned to it from an elaborate system of collectors, and is in a state of almost absolute dryness, it is delivered by bucket elevators to the regulating bin. It is necessary that the moisture be reduced to a negligible quantity that the mixing may be thorough and the fluxing uniform.

On the discharge platform of the regulating bin an employee, called the "mixer," is stationed. He receives his instructions as to the quantity of coal and binder to introduce from the pressman by means of bell signals. By gate control, he regulates the amount of coal carried by an apron conveyor, and, by a steam-jacketed valve, the flow of asphalt binder which is introduced just after the coal enters the mixing conveyor.

This mixing conveyor is a horizontal steel shell with a rectangular cross-section and extends 30 ft. from the discharge of the apron conveyor from the regulating bin to the feed box of the fluxer. Within the shell are mounted longitudinally two shafts upon which are set series of paddles of the propellor type, which churn the coal and binder and simultaneously push it toward the fluxer.

From the paddle mixer the coal and the binder are discharged into a feeder which supplies the fluxer. The final and most important stage in the process of preparation takes place in this latter machine. It is here that not only the binding qualities of the mix are perfected, but the future physical properties of the briquette are created.

This fluxer, with 30 tons capacity per hour, is the largest of its type now employed in briquetting coal. It consists of three superimposed horizontal cylinders in a single casting. Within each cylinder there is mounted a shaft upon which are set arms, or paddles, which agitate the mix while superheated steam is introduced through double horizontal rows of tuyeres on each side of the cylinder. The function of this dry steam is to maintain the asphalt in a sufficiently fluid condition to permit its being driven into and impregnating the interstices of the coal under the beating action of the fluxer paddles.

From the fluxer the material passes through two screw conveyors to the feed box of the press. These conveyors were built under the Schorr patent, which is controlled by the builders of the press. It is necessary, where asphalt is used for binder, to cool the fluxed material before it enters the press, and this is done by an air-exhaust system attached to the conveyor and also to the press-feed box.

The Press

The Rutledge briquetting press used in this plant takes its name from J. E. Rutledge, vice-president of the Malcolmson Briquette Engineering Co., although invented by G. Komarck, of St. Louis. It is the third press of its kind to be constructed and the first to take the name of Rutledge. It embodies several improvements over the others.

Essentially, the Rutledge press consists of three parts—two major shafts with punch-ram attachments and an endless bed with die-plate sections. The three are synchronized by proper gear connections. The machine is driven by a 75-hp. motor connected by friction clutch and silent-chain drive.

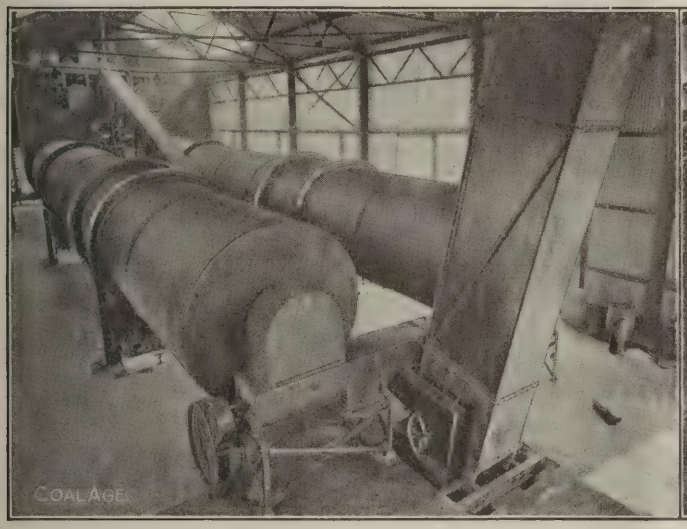
Each shaft is fitted with 12 punch rams, each ram having 14 punches. The rams are so arranged that they assume an exact vertical position before they engage the die plates. A vertical pressure is exerted upon the material within these die plates from both above and below. Each pulsation of the press produces 200 tons pressure, which is equivalent to about 30,000 lb. upon each briquette.

Attached to the upper group of rams are 12 arms, or pilot punches, one corresponding to each ram, which engage the corresponding die plates and time them for the punches. It is the pilot punches which furnish the motive power for the die-plate bed. So nicely is the work of the press timed that only $^1/_{64}$ in. is allowed for clearance. Turning over at the rate of 10 r.p.m., the press produces 30 tons per hr., or 1,000,000 briquettes per day.

The press punches are constructed with removable tips, which not only provides for quick adjustment and economical maintenance of the parts receiving the greatest wear, but also for the change of the brand or trade mark, which is impressed on every briquette. This brand designates the particular coal used and serves as a guarantee to the consumer that he is getting the quality for which he is paying. These tips are made from forged and hardened nickel-steel.

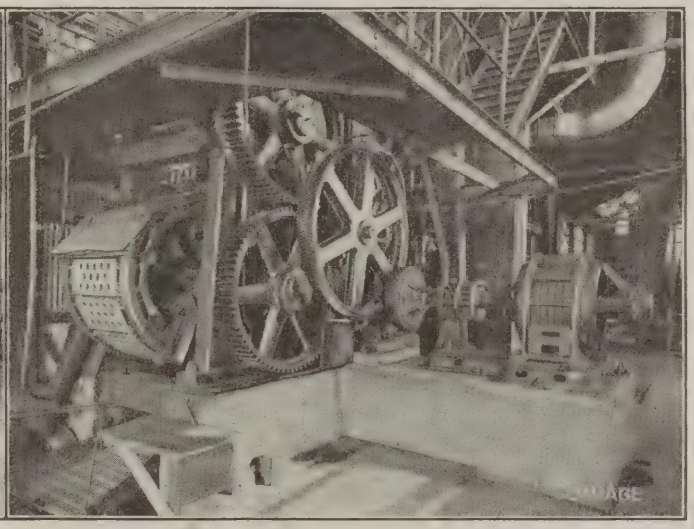
The press weighs 80,000 lb. and all the wearing parts are made from nickel-, manganese- or vanadium-steel. The rollers are of nickel-steel, the tracks of manganese-steel, the cams and springs of vanadium-steel. All bushings are of bronze alloy made especially to withstand high pressures.

The lubricating system is both unique and practical. The oil is driven through the main shafts to the interior of the press and from there works its way to the surface, properly lubricating all parts and preventing the entrance of any dust or grit. The press and its installation alone cost about $50,000.



As the briquettes leave the press they slide down over a perforated apron to the cooling belt, or conveyor. The belt is over 600 ft. long and is composed of 47,000 parts. It is made up of flat links giving a large area for the free circulation of air. As the briquettes are carried forward and up to the briquetting storage pocket, they are subjected to a fine spray of cool water which assists in reducing their temperature as well as hardening them before they are discharged into the bin.

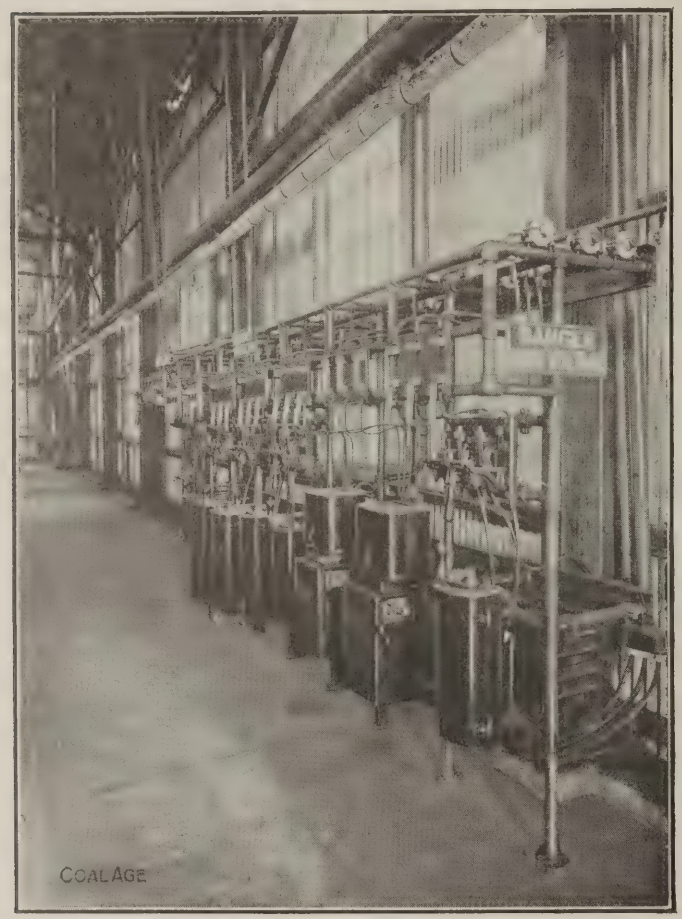
Hardness of Product Is Sought and Attained



By the proper pulverizing of the coal, the use of all the dust, the employment of asphalt as a binder, and the efficient fluxing of the mix, a briquette of remarkable hardness is produced. They are dumped from the cooling belt onto a cross-conveyor over the bin and in turn discharged on a vibrating baffle, thence to another baffle, from which they enter the bin. From here they are discharged direct to standard coal cars for shipment. The breakage is practically nil.

The briquettes now made weigh 10 oz. each. They are cylindrical in shape with a diameter of 2¼ in. and a maximum height of 2¾ in. and have ⅜-in. dished heads. Their hardness can best be stated in percentage of breakage under the standard tumbling test employed by the United States Government in its investigations at St. Louis. There the tumbling tests showed from 10 to 12 per cent. of breakage for the usual commercial briquettes, while similar tests on the Pacific Coast Coal Co.'s product show but 3 per cent. breakage, indicating a superior hardness.

Asphalts of the specified grades are received in barrels at the oil spur at the rear of the plant from whence they are carried by gravity in a barrel chute to the asphalt yard on a level with the charging floor of the boiler and kettle room.



Big Driers for the Coal

Close View of the Briquetting Press

There are two melting kettles of 40 barrels capacity each, placed in a specially designed setting. The single Wickes boiler employed in the operation of this plant is fired by oil through Jordan burners.

At present, oil is received in tank cars over the same route as the asphalt and is stored in steel tanks on the side hill. From these tanks it is drawn off by gravity through an insulated steam-heated pipe line to the boiler house. Future plans of the company, however, contemplate the purchasing of crude oil and its refining at the plant for the purpose of obtaining the exact grade of asphalt required in the briquetting process. Fuel oil will then be a byproduct to be used as required about the plant.

The Electric Control System

Fuel-oil circulation is maintained by a Billow pumping system installed by the National Supply Co., of Chicago. Asphalt circulation is secured through a rotary pump made by the Kinney Manufacturing Co., of Boston, and by steam-jacketed lines and valves.

Special attention is given to the asphalt-feeding equipment. It is the mixer attendant's duty to see that asphalt is maintained at a uniform temperature and head, and that there is a uniform flow through the steam-jacketed valve into the machine. Provisions are made for a flow through a steam-heated valve from the regulator to the kettles. Thus circulation of the asphalt is kept up continuously and a uniform static head maintained.

Temperature regulation of the binder is not only essential but that of the coal and steam as well. To this end automatic Bristol recorders giving 24-hr. graphic records are placed directly in front of the operator in charge of each movement dependent upon critical temperatures.

Water for the system is heated and filtered by a Warren-Webster feed-water heater under automatic thermostatic control. Superheated steam for fluxing is generated in a special oil-fired Foster superheater, which has a capacity for raising 2000 lb. of steam per hour at 150 lb. pressure to 556 deg. F.

Electricity is purchased from the Puget Sound Traction, Light & Power Co., and delivered at 2300 volts alternating current to the transformer station, where it is stepped down to 440 volts for the motors and 110 volts for the lighting circuit. It enters the plant through two main control boards and is distributed throughout the works entirely in conduit.

Plant operation is divided into two groups—the drier group and the press group. Each has a main control board which permits direct or automatic regulation, not only of each motor, but of each group as a unit. The drier group is automatically controlled by an electric tripping device which is thrown by an overflow from the regulating bin.

As the press is the final and perhaps the most important machine in the process of briquetting, the control of the whole plant or any group or unit thereof is directly under the pressman by means of complete bell-and-light-signal apparatus, as well as a speaking-tube system. Every machine has an individual motor drive, and, where not direct connected, is equipped with a silent-chain drive, of which there are 15 in the plant.

For a daily check on all materials used in the manufacture of briquettes the necessary laboratory equipment has been installed and a competent chemist employed. As this is the first plant to use asphalt on a large scale it has required some careful experimental work, and special attention has been given to the study of the physical properties of the binder, much importance being attached to the penetration test. Besides the investigations conducted with reference to the asphalt, complete analyses are made every day of the coal and the briquettes.

The plant above described was constructed under the direction of J. C. Ford, president of the Pacific Coast Coal Co., and by his departments of engineering, building and mechanics, represented respectively by N. D. Moore, D. C. Brown and D. O'Leary. Field construction was in direct charge of Ralph Galt, briquette engineer, who is now superintendent of operation.

Coming Meetings

The American Society of Mechanical Engineers will hold its annual meeting in New York City, Dec. 1, 2 3 and 4, 1914. Calvin W. Rice, secretary, New York City.

The American Mining Congress' seventeenth annual session will be held at Phœnix, Ariz., Dec. 7, 8, 9, 10 and 11, 1914. J. F. Callbreath, secretary, Denver, Colo.

The Coal Mining Institute of America will hold its winter meeting Dec. 8 and 9, 1914, at the Fort Pitt Hotel, Pittsburgh, Penn. Charles L. Fay, secretary-treasurer, Wilkes-Barre, Penn.

The West Virginia Coal Mining Institute's winter meeting will be held at Huntington, W. Va., Dec. 9, 10 and 11, 1914 Prof. E. N. Zern, secretary-treasurer, Morgantown, W. Va.

The American Institute of Mining Engineers will hold its annual meeting in New York City, beginning Feb. 16, 1915. Bradley Stoughton, secretary, New York City.

The Kentucky Mining Institute's winter meeting will be held Dec. 4 and 5, 1914, at the Seelbach Hotel, Louisville, Ky. Ivan P. Tashof, secretary-treasurer, Lexington, Ky.

Editorials

The Colorado Mine War

Under this title the Rev. A. A. Berle, of Cambridge, Mass., writes in the *Bibliotheca Sacra* with great sanity and conviction on the recent events in the mine regions of Colorado. A 24-page reprint lies on our desk which anyone may have on application. So much of what he has said we have endeavored to say, howbeit probably with less force, in our editorial columns and in other parts of the paper and consequently we do not wish to be unduly critical where our opinions differ. However, we do take issue with these remarks:

> The State of Colorado must settle, before it settles all else, the question whether it is to have a state administration which will uphold law and will maintain order, and will do this without the intervention of the President of the United States and the military forces of the Union. At the present time, men are being denied their fundamental constitutional rights by the presence of the armed forces of the United States. The right of private contract, the right to seek employment and continue therein unmolested, has been destroyed, and there can be no peace till these are restored. There is no genuine pending issue which is not provided for in the civil code and there is no wrong for which the laws and courts of Colorado do not provide adequate relief. It is to the law and the courts to which these issues must be brought for their settlement.

With his declaration that the laws and courts should dominate we have no contention, but we do not see any reason justifying the military forces of the United States in being just now a law-disregarding body. There is no reason why they should abridge the right of public contract in Colorado any more than that they should do so in the Philippines.

That they have violated the rights of the citizens is due to their perverted use by the bureaucracy at Washington, and not to any inherent defects in the U. S. military forces. The militia of Colorado would possibly be no better and even might be worse if the governor of that state was as subject as the Wilsons to the hypnotic suggestions of the exploiters of labor.

Before the U. S. Army was ordered to the mining camps of Colorado, we advocated its use in settling the difficulties there existing. But we do not know whether we should now continue such advocacy in view of the fact that Colorado, at last, seems almost as a unit in standing behind the militia in defense of order. A new governor, G. A. Carlson, who appears to be less pliable than his predecessor, E. M. Ammons, will soon come into office and the voters seem to have elected him because they thought he would act promptly and with decision. The present governor is now prepared to act at least a little less flinchingly than before.

Perhaps a sufficing militia properly backed by funds can be secured. Consequently despite the promises of trouble from labor leaders, the state troops of Colorado *may* be able to handle the situation. At this distance we cannot presume to make judgment, which must be hard even for those who are on the spot. Certainly we have no brief against the use of militia for promoting order if they are adequate in themselves and in their support for the work proposed.

But we have always been prepared to hope that the autocracy at Washington might learn that this is the United States and that there are laws, at least in time of peace, which even the most arrogantly righteous of persons must obey. The oath of office might yet rise to plague the President. He might yet realize that he was not called like Deborah to make rulings on the spur of the moment in order that happiness and peace might come to the poor bewildered American people. We do not want to be dogmatic. Perhaps the Massachusetts divine, however, is right. He may know that the President is beyond reason.

Railway Rates and Their Relation to National Prosperity

An interesting address on the regulation of railway rates was delivered recently by E. B. Leigh, a prominent industrial manager in Chicago. In commenting on the Interstate Commerce Commission's disavowal of all right or power to consider the case of the railroads in the light of its influence as a stimulator of business, Mr. Leigh says: "It is manifestly of the utmost importance that somewhere in our government, responsibility shall be for that specific promotion of the general welfare which consists of protecting the railways against influences, governmental and otherwise, which tend to impoverish the roads, and with them the whole people." Mr. Leigh rightly contends that the general railway problem has been committed by congress to the Interstate Commerce Commission, and that the latter body is clearly shouldered with the responsibility. The powers now delegated to the commission make it more of a legislative than a judicial body.

Much of the wonderful progress of our country has been due primarily to the railroads. In developing their territories, they become immense consumers of material and thereby doubly contribute to general business prosperity.

The Commission as now created is possessed of greater power for either good or evil than has ever before been conferred upon any governmental body. It can confiscate private property or it may be the greatest of all conservators of the public good. It can upset industries or it may establish normal business and carefully regulate commercial conditions.

It is about time the United States Government came to believe more in the principle or plan of industrial progress through encouraging business. Federal solicitude for the welfare of the individual might be exercised with no little profit to the nation as a whole.

The railways have nothing to sell but transportation, and yet they constitute our greatest industry next to agriculture. Nearly 50 per cent. of the total iron and steel production of the country is consumed by the railroads, so it is quite evident that any restriction of railway consumption must seriously affect the country's prosperity.

In conclusion, Mr. Leigh asserts that unless the rail-

roads are placed in a position to make purchases on a normal scale, a return of business prosperity will be seriously retarded. Coal Age is quite of the same opinion, and although the coal industry is by far the greatest freight producer in the United States, we suggest that the Interstate Commerce Commission meet the situation more squarely, and endeavor to apply such first-aid to the railroad business as will help lessen the present industrial paralysis.

The Closing of the Lake Trade

The Lake shipping season is over, and it is estimated that the bituminous movement will aggregate between 20 and 22 million tons. This is rather disappointing, as the growth of the Lake business has been rapid the last few years, and the high mark of 1913, 28 million tons, has been looked upon as a normal season.

However, when we consider the business conditions of the entire country during the past year, the Lake coal traffic of 1914 has been good. The decrease as compared with previous years is not so large as in the iron-ore trade where the loss is fully 40 per cent. as compared with 1913, and 30 per cent. over a period of three years. The coal traffic of 1914 will probably average 100 per cent. as compared with the average over the last five years, and this indicates a healthy situation.

The largest change in the bituminous business was in the tonnage coming from the West Virginia fields. The Ohio No. 8 field, which usually ships about five million tons in the Lake trade, has not moved a single pound of coal this season, the mines having been closed since Apr. 1. Cambridge operators began shipping in the middle of the season and have sent their last cargo up the Lakes. The Hocking district did not begin to move coal until late in the season and will fall substantially below its standard of 1,500,000 tons of lake coal. West Virginia fuels have made up the loss.

How much of the Northwestern trade will return to Ohio mines another year is the important question just now. The West Virginia operators have introduced their coals into many places that have never before been willing to consider them; it was an opportunity that they fully appreciated, and when the salesmen go out for 1915 business, a battle will be fought to hold a major portion of the new trade.

Considering the large stocks carried over on the Upper Lake docks, the 1914 business has been extremely good. The winter of 1913-1914 was open and the consumption of coal in the Northwest was comparatively light. Shipments the first two months of the Lake season were not so heavy as usual; in some instances, docks did not want any new coal until July 1, but when shipping was finally resumed, the traffic was steady.

There was no car shortage and vessels were always more plentiful than cargoes. However, so much coal was put on the Upper Lake docks during the summer months that when Nov. 1 came, there was practically a full supply. An open fall made it unnecessary to ship heavily in the last month of the season and extra freight for the last trip and storage in vessels were not required.

Anthracite shipments have been quite in proportion to the bituminous. The decrease in lake traffic was a little larger up to Nov. 1 than in bituminous, but the hard-coal companies continued to ship heavily in November and will have as much coal at the head of the Lakes by the close of navigation as usual.

Absurd Reports of Increased Coke Production

About once in so often the daily newspaper reporters become seized with an apparently irresistible impulse to make the wheels go round. Since the biennial election of Nov. 3, which perhaps furnished the psychological moment, the daily papers have been full of alleged news of plant resumptions. In many cases the reader might readily be deceived, although without being acquainted in detail with the industries involved, he should perceive that with general business in its present prostrated condition, no rapid resumption in activity, such as suggested by these reports, could possibly occur.

Among recent reports have been many purporting to give news of resumptions in the Connellsville coke region. The coke trade is so aligned that such statements appear particularly ludicrous. One report is to the effect that 21,000 ovens are going in blast in the coke regions. This is 55 per cent. of the total number in the region, and represents approximately the entire number idle. As a matter of fact, several thousand ovens are at plants where the coal has been so nearly worked out that the ovens could not operate unless they were to use coal that had been shipped to them.

Coke is not stocked to any extent. It suffers from rehandling and from the weather, and there is never any material excess of production over consumption. Substantially the entire output of the Connellsville region is consumed in the iron industry, and the production cannot and will not be increased until the iron industry revives. Up to the present moment the production of pig iron has been declining. There may be prospects of a slight increase in pig-iron production in the near future, but there has been none to date, consequently no increase in the demand for coke, and certainly no increase in the production. The reports of coke ovens resuming are pure fabrications.

The Ohio Situation

It has been said that the Ohio miners on strike are anxious for a settlement, and only desire that the officials of the Union will let them vote on the subject so that they can exhibit that sentiment to their leaders. But the news from Coshocton is, to say the least, disturbing.

The price offered by the operators was 54.6c. per ton for machine-mined run-of-mine coal, 4c. of which compensation was for the pushing of loaded cars from the working face. That is a much better price than 47c., the magic figure for which they have been loudly calling in eastern Ohio. The trimmings of the banquet were as good as the main *piéce de resistance,* for turn either to right or left the operator in the proposed contract was required to pay for extras.

Though the scale committee approved of the arrangement, the men in a referendum refused it. The patience of the public with the Ohio resistance is stretched almost to the breaking point. Those whom the gods would destroy, they first make mad.

Sociological Department

The Y. M. C. A. Building at Ramage, W. Va.

Ramage is a mining village in Boone Co., W. Va., 53 miles southwest of Charleston, on the Coal River R.R. and on the banks of Little Coal Creek. Recently, it dedicated a Young Men's Christian Association Building and this is fully expected to be a success because the sentiment back of the movement has already ripened.

The endeavors of the Y. M. C. A. in Ramage were *not,* however, a success at the very first. The Association had to meet at the start the conservatism and suspicion which everybody, miners and mountaineers especially, have for something new. This questioning or doubt is not really a fault. Far from it; if there were no disposition to turn over every new departure and weigh it carefully, the miner and mountaineer and the general public would doubtless often be misled and beguiled. However, the average generous-hearted benefactor wonders why it is that his purposes are questioned when he knows himself that his intentions are above scrutiny. He cannot understand that others have no speedier way of determining the integrity of his aims.

The Village of Ramage, Boone County, W. Va.

The Early Conditions at Ramage

There has been a large amount of dissatisfaction among the miners of West Virginia; a sentiment of resistance has been carefully fostered by agitators and the strikes along Cabin Creek and Paint Creek have continually borne fruit in other districts though without creating violence such as the villages on those streams experienced.

The money earned was quite generally spent in drunkenness, and conditions in Ramage were disgraceful every pay day. The violence during these debauches caused arrests and suits and then quarrels between families, and thus involved men who had personally no grievance and were guilty of no offense.

Whenever the mines were idle, time hung heavily on the hands of the men and they seemed to scent trouble when there was none. As a result when they went to work they were listless and discontented and disposed to exert themselves as little as possible. When any man was discharged because he was not industrious and neglected his manifest duty, the rest became affronted and in violation of their scale agreement went on strike.

The Need for Amusement

As F. F. Taggart, the secretary and treasurer of the Spruce River Coal Co., the company operating at Ramage, has stated he found the men were desirous of some mild form of excitement. One day the mine was rendered idle, all the men leaving for a town ten miles away. Investigation showed there was some kind of traveling circus billed for that day. At another time a quack doctor with an interesting tongue and some sort of an instrument drew the miners about three miles to enjoy his vaudeville acts and listen to his story. It was then that the Spruce River people realized that amusement was needed.

The company at first proposed to do what they have since done, erect a building. The important thing is not to build anything but to create a sentiment and they gradually realized this. After all it is often a harder task to mold sentiment than to erect a hall, and not a few may prepare the equipment and yet have no degree of success. Here, say the miners, is a new company development, earning perhaps a slight income, doubtless intended eventually to earn a big income, and every employee is ready to shun it, feeling that he is successfully thwarting an unholy purpose.

It was Ira D. Shaw, international secretary of the Y. M. C. A., who was asked to come to Ramage to see what could be done. Mr. Shaw was not successful in his project; he did not succeed in getting the men interested.

They had their suspicions and so the matter was temporarily abandoned. A second effort made by Mr. Shaw was more successful and the work was started.

The Sentiment of the Miners

But after the foundations were built and erection began, there was more curiosity than real interest evinced in the construction of the building. In fact, it seemed to concern the people very little whether the hall was ever completed or not. Looking over the problem, it was seen that the building was an unimportant matter after all in comparison with the man who would conduct the work. Weeks were spent trying to obtain the right man for the job, one who had a good character, experience in Y. M. C. A. work, and an ability to deal with such men as the company employed. At last, C. W. Ridenour was secured and he took charge on Apr. 1 of this year.

The first 60 days were wholly spent in the completing and arranging of the building and in getting acquainted with the employees. No attempt was made to organize a Y. M. C. A. The association secretary endeavored to study conditions and to find out the difficulties with which he would have to contend.

A Closer View of the Building

Ramage Colliery of Spruce River Coal Co.

Description of the Association Building

The building has two stories and a basement and measures 32x70 ft. A porch extends along one side and in front of the building and halfway down the opposite side. The width of this porch with its ample length makes it large enough to accommodate all the people of the village when the warmth of the summer enables them to congregate on it. In the basement are shower baths and locker rooms, a motor and a pump for a deep well which pumps water to a tank on the hill. This tank supplies the town with water.

On the first floor are the general reading room, poolrooms, and in one corner a barber's chair, writing and checker tables and a large fireplace. Soft drinks and ice cream are also served here at a standard soda-water fountain.

The second floor has a general assembly hall, equipped with a moving-picture machine, platform, comfortable chairs and a piano. The floor is used for Sunday school work, lectures, miners' meetings and any good public cause. The building with its equipment cost close to $6000.

The Building Is Opened with Free Entertainment

The first two weeks the building was open, the community at large was entertained every other night with free moving-picture shows and the auditorium was always crowded. On Sunday night illustrated lectures with Biblical subjects were delivered.

From that time on, the Y. M. C. A. work grew so rapidly as to astonish those who had instituted it. A Sunday school was organized with Bible classes. Literary organizations followed and in less than ninety days the employees were coming to the building and spending their evenings there every night in the week but Monday.

Desirable Citizens Move in and the Drunkards Leave

It was gratifying to the mine management to find that there was always a waiting list at the mines as the result of their efforts to make things pleasant for their employees. Previously the men were always leaving and going to other mines. Perhaps too many mine officials look for a verbal appreciation of their efforts, and desire their employees to say how much they are pleased with the efforts of the company. The best of men are not built in that way. They may say it to their families and friends but they will hesitate a long time before they will express it to those who have materially benefited them. The best evidence of success is in the retention of the employees, in their participation in the benefits and in the anxiety of those not employed to obtain jobs and to profit by the change in location.

Strange to say not only did Ramage retain its desirable men and obtain more but it concurrently got rid of the drunkards, who moved out for other towns as if the new habits of the citizens made the village uncongenial to them.

The Employees Have Full Charge

The association was not organized till work was well under way. The board of directors was composed of the men employed at the mine and none of the company and none of its officers have anything to do with the association or serve in any capacity.

The Y. M. C. A. organized a strong baseball team and six acres of the company's property were turned over to it for an amusement park. This park was inclosed by the men who worked in the mines. A fee of 10c. is now charged for admission to the moving-picture show, children being allowed to enter for half price. Five cents is charged for shower baths. This entitles each person to an individual cake of soap and a large towel. Admission to baseball games costs 10 and 15c.; pool tables 5c., while ice cream and soft drinks are sold for 5c. each. The whole

revenue goes to the treasury of the association and further development work.

Some Account of the Village

A hospital is now planned, open to any of the families of the employees and a nurse will be engaged to give her whole service to this work. The houses are all comfortable four-roomed cottages with porches in front and a large space for gardens and front yard. The company has planted hundreds of trees all through the town, laid out flower beds and given away flower and vegetable seeds. Next year contests with prizes for the best gardens and lawns will be given.

The town of Ramage has two good schools with excellent teachers. The best of water is secured from driven wells and as sanitation is diligently taught and the yards are kept clean, the town is a model from a hygienic standpoint. In fact the people seem pleased to have their homes inspected.

The Ramage Y. M. C. A. Headquarters

The social feeling in the town is one of the leading virtues of the new work. The men and their wives are interested in the newcomers and desire just as ardently as the company officials that good citizens shall enter the community. They have no use for lazy, good-for-nothing men or drunkards. It is hard to estimate how much this means in promoting efficiency.

The Y. M. C. A. is more than earning running expenses. It is gathering in money for improvements which will be made as time passes.

Dedication of Building

The dedication took place Oct. 10, 1914. I. M. Taggart, the president of the Spruce River Coal Co., made the address of welcome. The governor of West Virginia, H. D. Hatfield, and the former president of the United Mine Workers of America, Thomas L. Lewis, delivered the principal addresses.

The following words from the speech of the latter are well worthy of consideration outside of Ramage as well as in that village:

> There has always been more difficulty in getting employees and employer together for the purpose of discussing a difference that there ever was in finally settling it. Neither of the parties in a controversy can approach a problem in an intelligent manner if they have been denouncing or endeavoring to take an unfair advantage of one another.

The Spruce River Coal Co., of Massillon, Ohio, has realized this element in management and the officers are generously ready to express their indebtedness to the Y. M. C. A. for satisfactorily solving the problem for them. Mr. Taggart, the president, recently stated in a letter which we have seen:

> The result of the small amount of money which has been expended is almost beyond our belief. I am advised that the National Young Men's Christian Association is putting forth a special campaign throughout the mining districts for this particular welfare work and it should receive the endorsement of the public and the press, as it certainly brings results.

It is to be hoped that not only at Ramage and Decota but all through the State of West Virginia, the good work may spread.

Recent Legal Decisions

Duty to Warn Employee Against Danger—It was the duty of a company which operated an overhead coal conveyor to warn an inexperienced employee, who was directed to oil the shaft of the conveyor, against the danger of his clothing catching on a revolving setscrew projecting from a safety collar, which was covered by dust and could not be seen when the machinery was in motion, and, having failed to perform this duty, the company is liable to the employee for injury resulting. (Halpin vs. National Safe Deposit Co., 184 Illinois Appellate Court Reports 13.)

Discrimination in Freight Rates on Intrastate Shipments—A shipment of coal from one point to another within a single state is intrastate in its character, as affecting the shipper's right to recover on account of discrimination against him in the matter of freight rates, although he intends to later reship the freight from the state. The fact that a shipper pays a discriminatory rate, knowing that other shippers are being given unlawful rebates, does not preclude him from subsequently recovering damages on account of the discrimination. (Pennsylvania Supreme Court, Mitchell Coal & Coke Co. vs. Pennsylvania Railroad Co., 88 "Atlantic Reporter," 743.)

Seller's Liability for Increased Freight Charges—Duration of Coal Sales Contracts—Under a contract to sell coal f.o.b. the selling coal company's mines, the company is liable for increased freight charges arising from a shipment from a more distant mine owned by a third party. Where a contract bound a coal company to supply fuel required by a brick company during "the remainder of the brick-making season, say from this date to Apr. 1, 1910," at a given price, the brick company was not entitled to require delivery after Apr. 1. "In interpreting the contract, the real intention of the parties must be allowed to control; but, if the contract is unambiguous, such intention must be gathered from its language. . . . The giving of Apr. 1 as the date of the termination of the contract was not a mere approximation of the time it should end, but an absolute limit, beyond which it could not extend; so, in our opinion, the contract did not require appellant to furnish appellee any coal after that date, although the brick-making season may not, in fact, then have ended." (Kentucky Court of Appeals, Nelson Creek Coal Co. vs. West Point Brick & Lumber Co., 152 Southwestern Reporter, 929.)

Legal Aspects of Labor Organizations—The decisions of the United States Circuit Court of Appeals for the Fourth Circuit, which were handed down in the cases of Mitchell vs. Hitchman Coal & Coke Co., and Bittner vs. West Virginia-Pittsburgh Coal Co., 214 Federal Reporter, 685, 716, establish the following principles of law relative to mine unions: A union organized for the betterment of the interests of its members may order a strike, and induce other employees, by peaceable means, to join the strike; being subject to restraint by injunction only when unlawful means are resorted to. When a combination of employees amounts to a violation of the Sherman Anti-Trust law, a mining company injured thereby is not entitled to maintain suit to enjoin continuance of the combination; the company's only remedy is a suit for treble damages resulting from the unlawful combination. The federal government is the only party that can maintain an injunction suit of this kind. When a mining company employs nonunion men under an agreement that if they join a union, the contract of employment may be terminated by the company, efforts made by members of a miners' union to persuade such men to join the union, without coercion or intimidation, does not constitute an actionable interference with the contract of employment. Injunction lies, however, to restrain the members from coercing or intimidating employees who decline to join the union.

Discussion By Readers

Mining Laws, Legislation and Mine Regulations

Letter No. 6—There are two provisions that might well be included in the mine laws of coal-mining states and that would, I believe, result in a direct benefit to the industry as a whole. They are as follows:

First, a definite *educational training* should be required as a prerequisite to a candidate's taking the examination for mine foreman or fireboss. This requirement might be met in different ways. In many states, the law provides that no boy under 16 years of age can be employed in a mine. In that case, applicants for examination for certificates of competency should be required to produce evidence that they had attended school up to the age of sixteen.

Should, however, this early training have been neglected, in the case of any candidate who had been compelled to leave school before reaching that age, such a one might be permitted to offer, instead, a period of attendance at night school, or of study under a competent teacher, or the completion of a certain amount of correspondence-school work.

It seems self-evident that a requirement of this nature would result not only in the applicants being better prepared for the examination, but would provide or pave the way for the more efficient and intelligent operation of mines.

Second, there should be some recognition, in the mining laws, of *technical training* as a partial substitute for practical experience. This suggestion is made in behalf of the graduate mining engineer who has spent from four to six years in the study of mining engineering and, having secured his degree of Engineer of Mines, determines to work his way up and familiarize himself thoroughly with the practical operation of a mine. As evidence of his practical knowledge of mining, he desires to obtain a certificate of competency to act either as fireboss or mine foreman.

Under the bituminous mine law of Pennsylvania (1911), a candidate must serve five years before he is eligible to take the examination. During this time he must work for smaller wages than are commensurable with the time and money devoted to obtaining his education. It should be recognized, in the mine law, that such a candidate, by reason of his technical training, is undoubtedly better fitted after, say two or three years of service in the mines, than the man with less education but more practical experience.

Briefly, my suggestion is that a candidate for an examination, holding the degree of Engineer of Mines, should be credited with one year of service in the mines for each two years of college work. If he has had four years in college, he would then be required to serve three years in the mines; and if he has had six years in college, he would only be required to work two years in the mines, before being eligible for examination for a certificate of competency.

Compare, for instance, two young men at the age of 18, starting to prepare themselves for mining work. The one enters the mine at once and, after five years' work, becomes eligible for examination for a certificate of competency. During that time the other man has spent four years in college, obtained his degree of Engineer of Mines, and has had one year of practical work in the mines. Who will say that this man should work four years longer before he is eligible for examination? Should not his technical knowledge and training reduce this period of practical service in the mine and fit him earlier for the examination?

The five years of practical work required, by law in Pennsylvania, is a particular hardship to the college man. In many cases, he has been compelled to work his way through college and often graduates in debt for money that he has had to borrow in order to finish his education. For this reason, again, few of these men can afford to enter the mines as laborers or miners for five years of service, but must seek more remunerative employment that will enable them to pay off their indebtedness. While a three-year term of practical service in the mine would attract many, it goes without saying that a five-year term of such service practically debars from the examination all but those who have means and are independent.

As an illustration, permit me to cite a case that came under my observation. Ten years ago a young lad, after driving a mule for a year in one of the Pennsylvania collieries, decided that he could best improve himself by getting an education. He returned to school and worked his way through college, but found, after graduation, that it would be impossible for him to support himself and meet his indebtedness, while gaining the five years' practical experience in the mine, required to make him eligible for examination under the mining law. Thus debarred from the mines, he went West in the employ of a metal-mining company where his ultimate opportunities were no better, if as good, than those presented in coal mining. The period of service required, before he could secure a paying position, however, was much shorter and made it possible for him to meet his engagements.

In closing, permit me to say that coal mining is bound to be safer and more efficient if it attracts young men with technical training into the operating department. I believe the suggestion made of allowing *two years of college work to count for one year of practical service in the mine* would unquestionably result in gaining many desirable men who now feel that they cannot tide over the five years of practical work at relatively low pay.

M. D. Cooper, Mining Engineer,
Ellsworth Collieries Co.
Ellsworth, Penn.

Letter No. 7—I notice, in the inquiry of James T. Reynolds, fireboss, Coal Age, Oct. 3, p. 563, which appears under the title, "A Gaseous Mine," he raises the question of perspicuity in the statement of the Pennsylvania bituminous mine law, where the attempt is made to

define what constitutes a gaseous mine in Pennsylvania.

I have referred to the sections of the bituminous law to which Mr. Reynolds draws attention, and agree with him that the meaning of the law relating to a gaseous mine is vague and indefinite. The law does not give a clear and satisfactory definition of such a mine; but, to a certain extent, leaves the matter somewhat in doubt. In regard to Art. 28, Sec. 3, which reads: "The provisions of this act shall not apply to any mine employing less than 10 persons inside the mine, in any one period of 24 hr.," I fail to understand what the number of men working in a mine has to do with its being *gaseous* or *nongaseous*.

A mine generating explosive gas in such quantities that it can be detected by a modern safety lamp is, without question, a gaseous mine. This is true regardless of whether the number of men working on the inside is less or more than ten. The fact that the mine is liberating gas in such quantities that it is readily detected on the lamp *makes* the mine a gaseous mine, whether it be large or small and employing many or few men.

Like the bituminous statute of Pennsylvania, the mine laws of Tennessee do not clearly and satisfactorily define a gaseous mine; but leave this question in doubt. It is not stated anywhere in the Tennessee law what sort of a mine constitutes a gaseous mine. As a consequence, the duty of classifying such mines, in Tennessee, has devolved on the chief mine inspector, who has used his best judgment in so doing.

The Tennessee law, Sec. 9, Chap. 237, 1903, provides for four classes of coal mines, designated as A, B, C and D. The duty thus devolves on the chief mine inspector to list the mines of the state as belonging to one or another of these classes. In this classification, the greatest difficulty is experienced in respect to "Class A" mines, which by law "shall include every coal mine or other mine known to liberate firedamp (CH_4) at present or in the future, and all mines of this class shall be inspected . . . . at least once every 60 days." Besides this requirement of frequent inspection, Class A mines must be supplied with at least 150 cu.ft. of air per min., for each person, and 600 cu.ft. of air per min., for each animal employed in the mine at one time. In Class B mines there is required but 100 cu.ft. per min., and in Class C mines, 85 cu.ft. per min. for each person underground, while these mines require only 500 cu.ft. per min. for each animal employed.

It is easy to see, from the indefinite wording of the law, that it is an exceedingly difficult matter to draw the line of distinction, in respect to Class A mines, which are subject, by reason of such classification, to rigid restrictions. The law simply states that mines known to liberate firedamp (CH_4), at present or in the future, shall belong to this class. The question naturally arises, How much gas must a mine liberate before it can be claimed that it rightly belongs to Class A. This feature of the law throws an unnecessary burden on the mine inspector. In this regard, there is need for a clearer definition of the legal requirements. I will say, in closing, that all mining statutes should be so amended as to make their meaning clear and conclusive and leave no doubt as to the proper classification of the mines in the state.

JOHN ROSE,
District Mine Inspector.

Dayton, Tenn.

Problems in Rescue Apparatus

Letter No. 4—In reply to the criticism of W. H. Moore, COAL AGE, Sept. 19, p. 477, I beg you will permit me to present the following statement from the eminent physiologist in England, to whom I referred in my previous letter, COAL AGE, Aug. 22, p. 314.

In response to my request, this eminent authority sends me the following, in respect to the relative volumes of carbon dioxide exhaled and of oxygen inhaled, under different conditions of activity.

"On an ordinary mixed diet, for every four volumes of carbon dioxide breathed out, five volumes of oxygen are breathed in. In other words, one-fifth of the oxygen breathed is utilized in the oxidation of hydrogen to water; and four-fifths, in the oxidation of carbon to carbon dioxide.

"The water so formed may leave the body as sweat, urine or exhaled vapor. The water that is given off, to the breathing apparatus, from the exhaled air, is therefore almost entirely derived from water that has been drunk. Most of the oxygen inhaled at each breath is, of course, exhaled again into the breathing bag.

"Resting, a man requires about 250 c.c. of oxygen per minute, but when exercising hard, from eight to ten times this amount. He will thus use up the whole of his supply of 120 liters per hour when working hard, and be obliged to waste, through the escape valve, the larger part of it when resting."

The Ohio Situation

Letter No. 3—In my letter on the Ohio Situation, COAL AGE, Oct. 3, p. 561, I claimed that the eastern Ohio miners should receive the 47c. rate they were asking, because of the fact that the Hocking Valley miners sacrificed 2½c. per ton for the benefit of their brothers in the eastern part of the state. I made the assertion that "Equal labor demands equal compensation."

In the issue of COAL AGE, Oct. 17, p. 637, an editorial entitled "Small Potatoes," takes exception to what it styles my "moral maxim." Against this so called maxim, the writer of the editorial arrays "a stern economic truth," which he pronounces as follows:

> Wherever products are competitive and enter the market on equal terms, equal labor can demand equal compensation only when the products of equal labor are themselves equal.

This dictum is then illustrated by a supposed colloquy between a miner's wife and a farmer, whom I shall call "Brown." Brown is trying to sell potatoes to the miner's wife, who refuses to buy on the ground that Brown's potatoes are not as large as Thompson's, while the price asked is the same. To this Brown replies that he has worked as hard as Thompson, in growing the potatoes. "But," said the miner's wife, "it's taters I'm buying and not your labor."

In my opinion, this is not a parallel case with that existing between the two Ohio districts. The Ohio miners are selling labor and not potatoes, or coal, or any other commodity. Suppose, for a moment, that Brown and Thompson find that they cannot do their farm work without help; and each hires a man to work on the farm.

Brown cannot say to his hired man, later, "These potatoes are smaller than Thompson's and I cannot afford to pay you as much as Thompson pays *his* man." To such reasoning, the man would reply, "It's my labor you are buying and not potatoes. I work as hard as Thompson's man. He is not overpaid and I am entitled to the same wage. Last year, when you had the best of Thompson, you paid no more for labor than he did; and, this year, it's up to you to pay as much. If you cannot raise potatoes equal to Thompson's, the only thing to do is to leave the potato market to him and raise corn."

The reasoning is economically sound. It is only another way of saying that *the economic law tends to prevent the production of an inferior article.* In other words, *the article produced must be of sufficient value to pay for the labor of production, at a living wage.* This is the same conclusion reached in the editorial, where it says, "There is every need that the economic law shall arrest the hand of the man who chooses to produce an inferior article at an excessive cost."

I must not be understood as saying that eastern Ohio mines must shut down. Instead, let them improve their methods. In this connection, permit me to quote from Letter No. 6 of Supt. J. D. Jones, writing on the Foreigner in Mining, COAL AGE, Oct. 17, p. 643. Mr. Jones asserts, "Competition in the coal industry will soon cause efficient engineering to replace obsolete methods. . . . . While trained men and improved methods are generally forging ahead, I know mining properties in eastern Ohio and elsewhere that have made no progress during the last 15 years. On these properties one cannot find a labor-saving device or a machine designed later than 1900. . . . . Many coal-mine operators have been so engrossed in their sales department and other matters, that they have given no attention to the introduction of mining machines and other improvements."

Again, the editorial states:

> The wage scale of Ohio has made the state backward in conservation, negligent of first-aid, indifferent as to housing, and largely unprogressive.

While this argument has merit, it is not as convincing in behalf of conservation, first-aid measures, good housing, etc., as the argument generally used, "It pays." Ohio's labor rate has always, I believe, compared favorably with that of other states in the same competitive district. Illinois, also, is admittedly progressive.

I believe that the writer of the editorial to which I have referred is sincere, and I have not written in the spirit of opposition, but with equal sincerity, being convinced of the justice of my claim that *equal labor demands equal compensation.*

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

A Centrifugal or Turbine Pump is a water turbine operated, by power, in a reverse direction. In a water turbine, the water imparts motion to the turbine wheel and power is developed; but, in a turbine pump, power is applied to turn the wheel or propeller, which imparts its motion to the water. The difference is the same as that between a windmill and a ventilating fan. The moving air turns the mill, while the fan operated by power moves the air.

A **piston pump** is one in which the cylinder is fitted with a piston, the area of the piston being equal to that of the cylinder.

A **plunger pump** is one in which the piston is replaced by a plunger that is moved in and out of the cylinder or pump barrel displacing the water therefrom each alternate stroke. A plunger, unlike a piston, is of necessity single-acting; except where the plunger is inside-packed, or the same plunger operates between two water cylinders. A piston pump may be either single- or double-acting, according to the arrangement of the valves that control the inflow and discharge of the water.

The terms **outside-packed** and **inside-packed** in reference to pumps refer to the manner of packing the plunger. A piston pump is necessarily always inside-packed. A plunger, however, may be either outside- or inside-packed. (See figure on the following page.)

An **air pump** is a pump used to exhaust air from a receiver or other chamber or vessel. A machine used to compress air is called an air compressor.

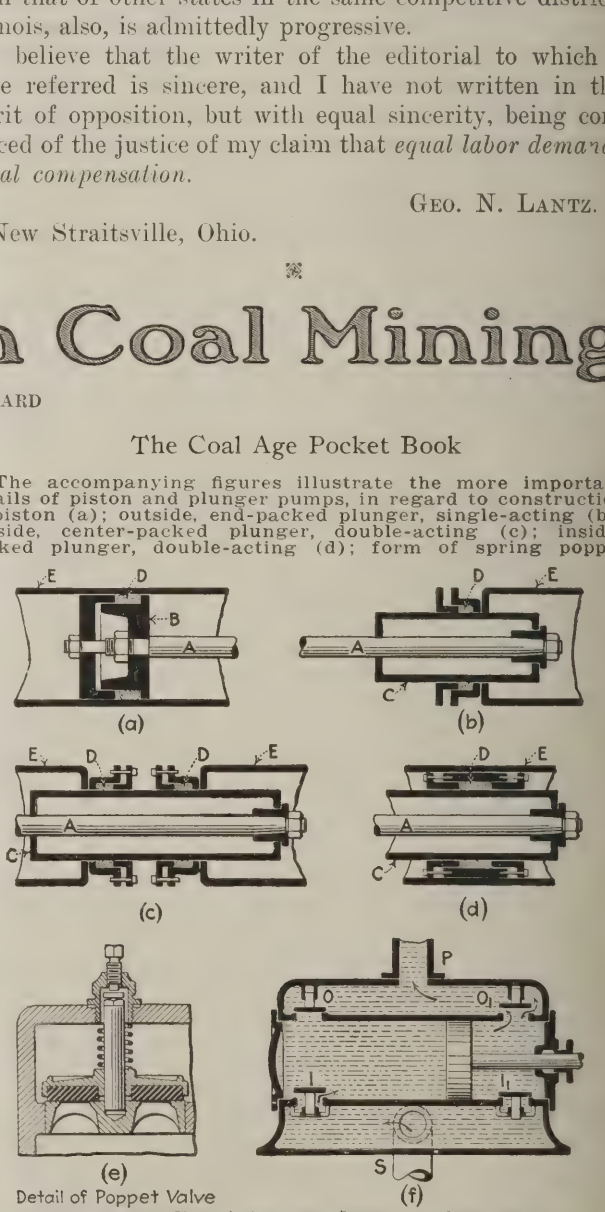
A **boiler-feed pump** or simply **feed-pump** is a small pump used to force the feed-water into a boiler.

A **sinking pump** is a pump used in sinking shafts. A special design of this class of pumps is adapted to hang in a shaft, so that it can be readily raised or lowered as occasion may require.

RECIPROCATING PUMPS

The essential parts of all reciprocating pumps are the pump **cylinder** or **barrel, piston** or **follower, plunger, piston rod, valves, packing rings** and **packing,** to which may properly be added the **air chamber,** which is an important adjunct of all high-duty pumps.

The **cylinder** of a piston pump is similar to that of the steam engine; but the **pump barrel** of a plunger pump may be of any reasonable size and shape.



The **piston** or **"follower"** is a more or less solid disk attached firmly to the piston rod. Its circumference is grooved deeply to receive the packing or packing rings, as shown at (a) on the following page.

The **plunger** may be outside-packed, single-acting, as shown at (b); outside, center-packed double-acting (c); or inside-packed, which is also double-acting (d).

The **piston rod** of a direct-acting pump connects the steam piston of the pump with the water piston or plunger, so as to form a single, compact system. In some cases, the steam and water-ends have separate piston rods, which are connected, by siderods, into a rigid system.

The Coal Age Pocket Book

The accompanying figures illustrate the more important details of piston and plunger pumps, in regard to construction of piston (a); outside, end-packed plunger, single-acting (b); outside, center-packed plunger, double-acting (c); inside-packed plunger, double-acting (d); form of spring poppet

Detail of Poppet Valve

A = Piston Rod, B = Piston in two parts; C = Plunger; D = Packing, E = Cylinder or Pump Barrel, I, I_1 = Intake or Suction Valves; O, O_1 = Outlet or Discharge Valves; P = Discharge Pipe; S = Suction Pipe

COAL AGE

valve (e); diagrammatic arrangement of the suction (I, I_1) and discharge (O, O_1) valves in a piston pump (f). The outside, center-packed plunger is here shown as operated by the piston rod A, which will require to be end-packed in one cylinder.

Inquiries of General Interest

Resistance Required to Reduce Speed of Electric Motor

I want to ask if you will kindly answer the following question in COAL AGE:

How can I calculate the size and length of wire required to build a wall resistance sufficient to reduce the speed one-half, in operating a 15-hp., 250-volt, General Electric motor, using a current of 54.7 amp. when running at a speed of 600 r.p.m.?

An answer to this question will greatly oblige one of your subscribers and an interested reader.

Every day electric motors are becoming of increased importance in coal mining. The use of such motors underground possesses many advantages that appeal to mine superintendents and foremen, owing to the ease with which they can be installed and moved from place to place as occasion may demand. The installation of an electric motor will, of course, depend on the absence of gas in the mine.

MECHANIC.

Red Jacket, W. Va.

In order to obtain the best possible answer to this question, it was submitted to an engineer of one of the large electric companies, who is familiar with the installation and operation of this class of motors. His reply is as follows:

"With the same field strength as at 600 r.p.m. and with full-load torque on the shaft; that is to say, with the same current input of 54.7 amp. delivered to the armature, it will require about 52 per cent. normal volts impressed on the armature to give a speed of 300 r.p.m. This will leave 100 — 52 = 48 per cent. of the voltage to be absorbed by the external resistance, which gives 0.48 × 250 = 120 volts. Then for a current of 54.7 amp., the required resistance, according to Ohm's law, will be

$$R = \frac{volts}{amp.} = \frac{120}{54.7} = 2.2\ ohms$$

"Reference must now be made to the wire tables given in any standard handbook for electrical engineers. From these tables it will be found cumbersome to use most any form of resistor wire alone for this external resistance of 2.2 ohms. With either german silver or iron wire, which are the most readily obtainable, there would be required for this resistance at least 500 ft. of wire of the proper current-carrying capacity, with the maximum allowable temperature rise.

"There is, however, an alternative if rapidly flowing water is available. By submerging the resistance coil in a stream of water, the heat developed by the resistance in the wire is carried off and the overheating of the coil prevented. Adopting this method, it is found that 30 ft. of No. 18 B. & S. iron wire wound in the form of a coil and submerged in running water, as described, will carry a full-load current without overheating. I would suggest that iron grids, built especially for this purpose, be purchased from the company that supplied the motor. This would, without doubt, be the most satisfactory solution of the problem."

ELECTRICAL ENGINEER.

New York City.

Drying Washed Coal

I would like to ask of COAL AGE and its many practical readers any information they can give in regard to the drying of washed coal. What I desire particularly to know is whether a soft bituminous coal can be successfully washed and then dried so that it will contain only 3 per cent. of moisture. Information in regard to the successful installation and operation of such a drying process, together with data relating to the additional cost in the production of the coal, will be greatly appreciated.

JOHN HAMMOND, Mine Foreman,
Wharton Coal & Coke Co.

Coral, Penn.

The question of drying coal as it comes from the washery is not a new one. It was suggested, some time ago, in connection with the work of washing the coal. Such a drying process has been tried in a number of instances; but with what results, we cannot state.

The drying of the coal, in respect to the advantages to be derived thereby, can be viewed in two aspects. First, the extraction of the surplus water from the washed coal reduces, to that extent, the cost of transportation of the coal to market. Though the percentage of reduction is comparatively slight, the saving in freight charges on, say 1000 tons of coal per day, may prove an item not to be disregarded.

Second, the shipment of comparatively dry coal may and often does result in a shrinkage in the weight paid for mining, and cause a difference between the mine sheets and the railroad weights that would be serious. Again, the drying process would probably start an early disintegration of the coal, which would greatly increase the loss by breakage, in handling. It has been suggested that the drying of the wet coal may greatly assist the oxidation of the sulphur contained in the coal and, in this respect, prove a decided advantage by improving the quality of the fuel. These comparative advantages and disadvantages must be considered when estimating the additional cost.

A reference was made, some time since, COAL AGE, Vol. 3, p. 880, to a centrifugal drier, which was designed and placed on the market by the American Concentrator Co. (Ohio). It was claimed, at that time, that this machine could handle 50 tons of washed coal per hour, containing 13 per cent. of water and, by its operation, reduce this content to 5 per cent. The principle of the machine depended on the surplus water of the coal being thrown out by the centrifugal force developed by the rapid revolution of the coal in the machine.

We hope that further information in regard to this interesting subject will be forthcoming.

Examination Questions

Miscellaneous Questions

(Answered by Request)

Ques.—If 30,000 cu.ft. of air is passing in a square airway with a velocity of 500 ft. per min., what is the length of each side of the airway?

Ans.—Assuming this is an average velocity of the air current, the sectional area of the airway is

$$a = \frac{q}{v} = \frac{30{,}000}{500} = 60 \text{ sq.ft.}$$

The length of any side of a square airway of this section is $\sqrt{60} = 7.75$ ft., or 7 ft. 9 in.

Ques.—If the weight of a cubic foot of air is 0.0766 lb., and the water gage is 1.5 in., what is the height of the motive column?

Ans.—The pressure corresponding to a 1.5-in. water gage is $1.5 \times 5.2 = 7.8$ lb. per sq.ft. The corresponding motive column basing the calculation on the given weight of air is then $7.8 \div 0.0766 = 101.8$ ft.

Ques.—Explain the symbols, CH_4, CO_2, SH_2. What are their comparative weights?

Ans.—The symbol CH_4 is the chemical symbol representing a molecule of methane or marsh gas, whose molecular weight is $12 + 4 \times 1 = 16$. The symbol CO_2 is the chemical symbol for carbon dioxide, and its molecular weight is $12 + 2 \times 16 = 44$. The symbol SH_2, which is more commonly written H_2S, is the chemical symbol for hydrogen sulphide, and its molecular weight is $2 \times 1 + 32 = 34$. The densities of these gases referred to hydrogen as unity are 8, 22 and 17, respectively; the density of a gas referred to hydrogen being one-half its molecular weight.

Ques.—The portal to one of our mines is a concrete arch, at which the air is measured. The arch is 10 ft. high, 8 ft. to the springing line and 8 ft. wide; what are the perimeter and area of this intake?

Ans.—The perimeter of the intake is made up of the width of the floor, 8 ft.; the two vertical sides, to the springing line of the arch, each 8 ft.; and the circumference of the arch. The distance from the floor to the springing line of the arch being 8 ft., and the height of the arch 10 ft., the arch is an ellipse whose major axis is the width of the arch, 8 ft., and the minor axis, $2\ (10 - 8) = 4$ ft. The perimeter of a semiellipse is 3.1416 times one-fourth the sum of the two axes; or, in this case, $3.1416\ (4 + 8) \div 4 = 9.42$ ft. The total perimeter of the arched airway is, therefore, $9.42 + 3 \times 8 = 33.42$ ft.

The sectional area of the intake is made up of the area of the semiellipse, plus the area of the square below the arch. The area of the semiellipse is 0.7854 times one-half the product of the two diameters; or, in this case, $0.7854\ (4 \times 8) \div 2 = 12.57$ sq.ft. The total area of the cross-section of this intake is therefore $12.57 + 8 \times 8 = 76.57$ sq.ft.

Ques.—If there are 10,000 cu.ft. of air passing through a mine, in one current, and the resistance of the two shafts at that time is equal to the resistance of the mine; what quantity of air will pass through the mine if another airway be added of the same size and length as the first airway, the power on the air remaining the same? Assume that each shaft is 6x6 ft. in section, and 500 ft. deep, and that they are connected at the bottom by an entry 6x6 ft. in section, and 1000 ft. in length?

Ans.—First, find the reciprocal of the cube of the relative power potentials of the shafts and entries, which are calculated as follows:

Two shafts, $\frac{1}{X^3_u} = \frac{lo}{a^3} = \frac{1000 \times 24}{36^3} = 0.5144$

One entry, $\frac{1}{X^3_u} = \frac{1000 \times 24}{36^3} = 0.5144$

Two entries, $\frac{1}{X^3_u} = \frac{1000 \times 48}{72^3} = 0.1286$

In tandem circulations where the air passes through consecutive sections, the sum of these values for each section in the circuit, will give the corresponding value for the entire circuit, from which the relative potential value for the circulation can then be found. In the present case, the calculation is as follows:

Present circulation, $\frac{1}{X^3_{u_1}} = 2 \times 0.5144 = 1.0288$

(General potential), $X_{u_1} = \frac{1}{\sqrt[3]{1.0288}} = 0.9906$

Proposed circulation, $\frac{1}{X^3_{u_2}} = 0.5144 + 0.1286 = 0.643$

(General potential), $X_{u_2} = \frac{1}{\sqrt[3]{0.643}} = 1.159$

Having found the general potentials of the original and the proposed arrangements, the quantity of air circulated by the same power in each case is proportional to the potential ratio, which gives

$$\frac{Q_2}{Q_1} = \frac{Q_2}{10{,}000} = \frac{1.159}{0.9906}$$

$$Q_2 = \frac{10{,}000 \times 1.159}{0.9906} = 11{,}700 \text{ cu.ft. per min.}$$

This is a difficult question for examination; but the work could be greatly shortened by canceling the common factors in the first potential values, which would give the following relative values:

Two shafts, $1/X^3 = 1$

One entry, $1/X^3 = 1$

Two entries, $1/X^3 = \frac{1}{4}$

Present circulation, $1/X^3 = 1 + 1 = 2$; and $X_1 = \sqrt[3]{\frac{1}{2}}$

Proposed circulation, $1/X^3 = 1 + \frac{1}{4} = \frac{5}{4}$; and $X_2 = \sqrt[3]{\frac{4}{5}}$

Potential ratio, $\frac{X_2}{X_1} = \sqrt[3]{\frac{4 \times 2}{5}} = \frac{2}{\sqrt[3]{5}}$

Finally, $Q_2 = \frac{10{,}000 \times 2}{\sqrt[3]{5}} = 11{,}700 \text{ cu.ft. per min.}$

Book Review Department

COAL FIELD DIRECTORY AND MINING CATALOG OF COAL MINING EQUIPMENT FOR THE YEAR, 1914. 564 pp. 9½x12½ in. Keystone Consolidated Publishing Co., Inc., House Building, Pittsburgh, Penn. Cloth Boards.

"As uptodate as a telephone book and as concise as an encyclopedia" is the proud boast of the publishers and we must admit the claim has much merit. The early part of the book is full of advertisements of an extremely readable character with occasional technical matter which seems well chosen. The field has certainly been well canvassed and to a cursory examination the book seems remarkably complete.

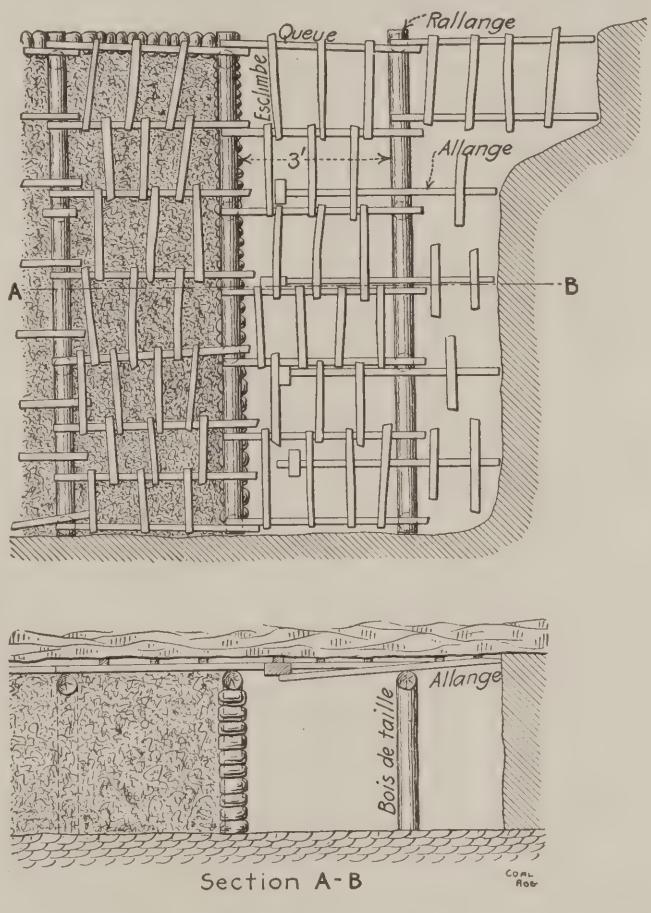
The corporation has for several years been publishing a directory and therefore is well equipped for effective work. The ordinary directory of coal mines in fine type at the end of the book occupies 140 pages. To it is added an exceptionally valuable addition of 17 pages, cataloging mines by counties so that traveling-men and managers who wish to district their work will receive no little assistance in so doing.

The book reflects much credit on E. B. Day, whose ideas, we believe we are right in saying, it represents. There are many exceptionally good tables bound within its covers and we believe that many engineers and managers will find it serves as a text-book.

EXAMINATION OF LUBRICATING OILS. By Thomas B. Stillman, late professor of engineering chemistry, Stevens Institute of Technology. 120 pp., with 5-page index. 6x9 in. The Chemical Publishing Co., Easton, Penn. Cloth boards. Price, $1.25.

The study of oils is hedged about by much secrecy. The greater part of the literature published tells us how particular we should be to get the right kind of oil, what will happen to our machinery if we are indifferent as to the quality, how important it is that we should employ an expert to select our oils, but on the subject itself there is a silence more profound if not as ominous as that regarding the military status of nations. It is a study in which everyone who uses oils is interested, but when he would post himself he finds a conspiracy of silence, or rather, much noise, with but little valuable fact.

The text book above mentioned supplies much needed information and gives several specifications for lubricating oils, also the results of many tests made by the author. It seems possible that eventually the public will realize that there are oils of various qualities—specific gravity, composition, viscosity and the like—which will serve certain purposes equally or almost equally well.



Consequently, the test that will be imposed will not be exclusively an examination of the oils as oils, but a trial of their lubricating qualities. The resistance of a journal revolving at a certain speed for a definite time will determine largely the excellence or the undesirability of oil. Chemists may demur at this test, but oil should be tested, like cement, by its performance. The Thurston, Henderson-Westhoven and Riehlé machines make such determinations. Of course, where the service of the oil is discontinuous, and the fluid is exposed to alternate high and low temperatures, a steady test with such a machine would be an unfair criterion taken alone. Furthermore, no machine appears to have been manufactured to measure the lubricating qualities of oil when fed to steam and applied thereby to surfaces.

However, the author is not sponsor for these remarks. His description of all of the various tests seems rather favorable to the use of everyone of them, and probably all of them have their value; some because oil has not only to lubricate, but has also to be fed to the surface; others because oil has to be stored for long periods, and still others because it has to be used at different temperatures and is liable to explode and may, moreover, have a chemical action on surfaces which are exposed to its influence.

MODERN PRACTICE IN MINING, VOL. III, METHODS OF WORKING COAL. By R. A. S. Redmayne, chief inspector of mines of Great Britain. XII + 204 pp. with 6-page index. 5¾ x 8¾ in. 167 illus. and one folding plan. Longmans, Green & Co., 4th Ave. and 30th St., New York City. Cloth Boards. Price, $2.

This book written by the chief inspector of mines of Great Britain fully sustains the reputation of the series. The numerous illustrations are not photographs of nothing in particular such as we find in so many books of mining but almost all are drawings made for the text. Most of them are small but all of them are of value.

We have taken one of these to illustrate a French method of timbering in a mine now no longer in the possession of the French people—Courrières. What the French call "bois de taille" we would term a "prop." "Rallange" should be translated "collar." We have nothing corresponding to "allange" in America, but "steel forepole" would best serve as a description. The "queues" are crossbars timbering from collar to collar and the "esclimbes" are shorter crossbars set on the "queues." On these the roof rests immediately. The "allanges" or steel bars rest on the "rallanges" or collars and are pushed forward to the face of the coal, their forward ends being pressed against the roof at the face by a chock of

THE STEEL FOREPOLING METHODS OF FRENCH MINES

wood bearing down lever-wise at the other end. The collars are kept within 3 ft. of the face and as the steel bars or allanges are only 20 in. apart there is little risk of death from falling roof.

The book deals with the opening out of a mine, the size of shaft pillars, the support of underground engine houses and stables, the protection of roadways and the actual workings in the coal. The room-and-pillar system has two chapters and longwall two more. The last chapter discusses the relative value of various methods of support at the face.

The treatise contains much regarding English, French, Belgian and German methods. It overlooks American systems almost entirely. The one illustration given of room-and-pillar working in the United States is almost unknown here and would be most uneconomical if adopted. It would not be fair to judge the book on its value as a reflection of our methods. Hardly a single volume written abroad and treating of America would successfully meet the searching light of such criticism.

Coal and Coke News

Harrisburg, Penn.

Much information was obtained from the Pennsylvania welfare and efficiency conference held in the capitol building during the past week. In a short time the legislature will be in session and a flood of bills will be offered looking to every sort of regulation of employment and the welfare of the employed. Many of these measures will be helplessly utopian, some will be so radical as to fall of their own weight, and some will be much more reasonable. This is the situation which confronts every legislature. Much has been accomplished in the last 20 years, most of it beneficial and some of it open to criticism in that it has failed to accomplish the good expected.

State Commissioner Jackson made an address which contains much food for reflection. An investigation made by him involving thousands of employees in various capacities in all parts of the state resulted in the surprising fact that one-fourth of these had changed their employment within a year. Some of this is due to the depression of late and much must be set down to adverse circumstances, but in any event it is not a good showing. Workmen who are constantly changing employment cannot be expected to have the high efficiency of those who work steadily at the same task for years. Operators cannot expect to get the best results with a shifting body of employees.

It was the opinion of many of the delegates that the legislature should establish a bureau of employment with offices in the chief cities, so as to bring employer and employee together. The system has worked fairly successfully abroad and might do some good here, but Commissioner Jackson stated that too much cannot be expected from such a system, because the man out of work in this city, for instance, might find it impossible to take a job in the Pittsburgh district or the anthracite region. But at least the plan is worth trying. If we have a revival of industry, as some believe confidently we shall, the problem of the unemployed will settle itself. If not, much scientific work will be necessary to adjust conditions.

Governor Tener, in addressing the conference, expressed regret that during his administration no workman's compensation and employers' liability act had been passed. The governor, in his first message, declared in favor of such an act, and the fact that the Senate of 1913 defeated such a bill, his friends always contended, has been the one sore spot of his administration with the governor.

PENNSYLVANIA

Anthracite

Hazelton—The discovery of a 6-ft. extension of the Lykens Valley vein at the Truseckow No. 16 coal mine of the Lehigh & Wilkes-Barre Coal Co. forebodes the continuation of operations at this plant for 25 years or more. The coal bed in question was discovered at a point where geological experts declared that there could be no coal. It will be developed at once.

Wilkes-Barre—Four men were seriously burned recently in a premature explosion in the Stanton Colliery of the Lehigh & Wilkes-Barre Coal Co. A first-aid crew went to their assistance, and it was necessary to dig some of the men from under a fall of coal and rock.

Nanticoke—The biggest production record for one month in the history of anthracite mining is said to have been attained in the month of October by the Truesdale colliery of the Delaware, Lackawanna & Western R.R. Co., when over 118,726 tons of coal were shipped from the big electrically operated breaker. This record considerably outdistances the figures of the Woodward and Pettebone collieries combined, the latter two producing a total of 115,395 tons for the same period of time.

Bituminous

Indiana—L. F. Sutter and A. P. Sutter recently bought the coal tract of the Plotzer heirs on Yellow Creek, containing 204 acres, the price being $125 per acre. This tract contains two workable coal beds, while 70 acres are in good timber. The purchasers will open mines and market coal.

Roscoe—Claiming that a stage of water too low to permit shipments of coal down the Ohio, and that the European war have had a damaging effect upon the coal industry, members of the local miners union No. 854, District No. 5, have sent out a general appeal for financial aid. In preference to accepting charity, however, the miners say that they will gladly work at any occupation that offers, and have applied to the Government for jobs on roads and public institutions.

Somerset—Mine Inspector F. W. Cunningham has instituted a suit in the criminal courts that is decidedly unique. He charges an assistant mine foreman of the Consolidation Coal Co. at Jenner No. 2 with neglect of duty for failing to have props set at the working face of the coal to protect the roof. It is alleged that failure to have the props in place resulted in the death of a foreign miner some weeks ago. The subforeman claims that he directed this man to set the props, as the roof appeared to be unsafe. He then proceeded to perform other duties, and when he returned in about an hour the foreigner was buried under a pile of coal, having failed to carry out his instructions.

Connellsville—The coke production of the Connellsville region remains about 200,000 tons weekly. There have been, however, in the recent past, a slight increase in the number of shipments and a decided interest is manifested in 1915 contracts.

Pittsburgh—The coal business of Pittsburgh and vicinity has undergone a slight beterment in the recent past, more inquiries being received, with slightly greater sales. It is believed, however, that the most hopeful feature of the business is the fact that there is practically no reserve stock. It is believed that with the slightest encouragement the coal companies will increase their production, thereby giving many of the idle miners employment.

Evans Station—The mines of the Evans Coal & Coke Co. at this place recently resumed operation after being closed or on half time for a considerable time past.

Trotter—Supt. B. B. Boyd, of the Trotter plant of the H. C. Frick Coke Co., has established a court of his own. Under orders that have just been issued, any employee who brings a prosecution before a justice of the peace or alderman without first consulting the superintendent is to be discharged. The superintendent hears the quarrels that arise and decides whether they are of sufficient importance to warrant going to law. Mr. Boyd says that hundreds of dollars a year are collected from Trotter foreigners because they are so easily led into bringing actions against their fellow countrymen.

WEST VIRGINIA

Fayetteville—The Minden mines of the New River & Pocahontas Co. are now using power for operation purchased from the Virginian Power Co. These are the first mines in this section to employ the Virginian company's power.

Elkhorn—The U. S. Bureau of Mines rescue car No. 8 is now engaged in the work of training the miners here in the use of the oxygen breathing apparatus and first aid to the injured. Great enthusiasm is being shown among both miners and operators and 25 men have already completed the full course of training.

Clarksburg—A coal deal of considerable magnitude was recently made public by the filing in the County Clerk's office of a deed from J. V. Thompson, of Uniontown, Penn., to Harry Ainsworth, of Moline, Ill., conveying to the latter a $\frac{1}{8}$ interest in the P. M. Jackson coal land of this county. The consideration involved was not announced. The tract consisted of 4008 acres lying on Jones' Run and Isaac's Creek.

Fairmont—In order that work may be given to its employees during the present temporary shortage of orders, the Consolidated Coal Co. has begun the concentration of men at the mines which are easiest to operate. Until orders are more prevalent and the car supply better, some of the plants of the company will remain idle.

Morgantown—The United Mine Workers of America are trying to organize the Fairmont field, Morgantown, Grafton, Clarksburg, Buckhannon and all intermediate towns being considered in the district. Meetings have already been held in Taylor and Preston Counties. A recent meeting held at Flemington resulted in a light attendance and but little interest was exhibited by those present.

ALABAMA

Birmingham—The U. S. Bureau of Mines has appointed a committee to arrange for first-aid instruction in all of the mining camps of the Birmingham district, and to plan for a big field demonstration to be held in Birmingham soon. Chief Mine Inspector Nesbitt is in charge of preparations.

KENTUCKY

Cannel City—The Bureau of Mines has requested the Kentucky Black Cannel Coal Co. to send samples of cannel coal to the federal laboratories in Pittsburgh for experimental purposes. The results of the experiments will be compiled in book form and will contain analyses not only of the cannel coals, but of many others.

Winchester—The mines of the Consolidation Coal Co. and the Elkhorn Mining Corporation are reported here to be resuming operations and to be giving work to several thousand miners who have been idle for some time. Business has shown decided improvement in the last week or so.

Henderson—Two long trains of tank cars leave here each day to supply Madisonville and the coal-mining operations in that part of the state with water for operating purposes. A year ago Madisonville constructed a municipal reservoir which it was expected would hold enough water for all purposes, but it has never been filled, the drouth of the past summer having kept it dry. This is the third successive year that trains of tank cars have hauled water from the Ohio River to the Madisonville consumers.

OHIO

Bridgeport—Additional reports of destitution among the families of striking coal miners in this district indicate that there will be great distress among them during the winter, as they do not possess any fuel, as a rule, and are without funds to provide themselves with food and clothing.

Columbus—No change has taken place recently in the labor situation in Ohio. Miners and operators in the eastern Ohio district have not yet arranged for the resumption of scale conferences and the entire district is idle. In the Coshocton district the situation is also unchanged. Since the rejection of the conference committee's report by the referendum vote of the miners, no steps have been taken to bring about another conference.

INDIANA

Indianapolis—About 75 retailers attended the meeting of the Indianapolis Retail Coal Men's Credit Association. It was decided that the limit of credit should not be more than 30 days. Figuring on profits, it was agreed that $1.40 should be added to the mine price and the freight charges before any profit could be shown to the retailer. This amount included loss in transit, breakage into slack by handling, cost of driver, upkeep of horses and equipment, cost of unloading at yards and overhead expense. It was shown that some coal sold at $4.50 a ton had actually cost the dealer $4.60.

Brazil—A fire recently destroyed the engine house of the Hamlin & Heck mine near here and was making toward the tipple. The miners were warned to make their escape by way of the narrow airshaft which opened near the burning building. All escaped promptly except six, one of whom was unusually large. This man stuck in the shaft, blocking the escape for the other five. It took desperate efforts to dislodge him, which, however, was finally accomplished. Fred Heck, one of the owners, was severely burned while holding the shaft door open for the escaping miners.

ILLINOIS

Chicago—An idea to reduce the production of surplus coals by returning to the 1¼-in. lump screen, as suggested by H. C. Adams, of the Jones & Adams Coal Co., is meeting with the general approval of operators in Indiana and Illinois, and it is likely that a meeting will be held shortly in Chicago to take definite action with respect to this suggestion.

Belleville—One of the most interesting mining propositions in Illinois today is the new National mine, southwest of here, producing between 200 and 300 tons per day. This mine was sunk and is owned entirely by miners. In July, 1911, 17 miners and three outsiders put in $1000 each and leased 135 acres on a 3½c. royalty. They did their own work, and when the mine was ready to produce hired a mine manager, who has no interest in the mine at all. It is one of the few mines in Illinois that has worked continuously six days a week, week in and week out. The coal is sold through a St. Louis jobber on a percentage basis, bringing the market price.

Pocahontas—The miners at the Pocahontas mine are out on a strike that threatens to last through the winter. For repeatedly breaking the rules of the mine, a miner was discharged. He happened to be the president of the miners' local, and failure on the part of the operator to reinstate him brought the men out. Arrangements have been made to keep the mine closed indefinitely, rather than make the reinstatement.

Grayson—A fire at the mine near here of the Big Creek Colliery Co. severely damaged the operation. It is expected that it will be a month or more before the mine will resume work.

Herrin—Of the three mines taken over last spring by the Taylor Coal Co. from the Southern Illinois Coal & Coke Co., namely, Possum Ridge, Oak Ridge and Walnut Ridge, only one is now worked. The Oak Ridge mine has been abandoned; the Walnut Ridge mine has not worked since last summer, with no prospects of working for several months to come, and the Possum Ridge mine is getting out a tonnage of about 800 or 900 tons per day. Lack of a sufficient market, and the low price of coal, are the only reasons given.

Marion—An unusually large tonnage of Illinois coal has recently moved to Ohio River points, coming from the mines adjacent to this place, and going to Brookport and Golconda, where it is loaded onto barges for points on the Ohio River. Low water has prevented coal coming down from the Pittsburgh field.

Taylorville—Two large suits for damages were recently filed in the Circuit Court, one against the Stonington Coal Co. for $5000 by Bert Duisy, injured in the mine on March 28 last, and the other for $10,000 damages filed by Chester Davison against the same company for injuries received in May.

Springfield—Francis Peabody, of Chicago, the closing of whose coal mines at Witt, Montgomery County, has resulted in acute suffering to 600 miners and their families, has taken steps toward relieving the situation and it is probable that some of the mines will work upon short time for a limited period.

Lovington—About 150 miners employed at the Lovington Coal Co. shaft recently walked out. The trouble, it is alleged, occurred over the employment of a nonunion driver.

MISSOURI

Chilhowie—The coal mines at Chilhowie were recently purchased for $200,000 by the Chilhowie Coal & Coke Co. These mines have been closed for a couple of years, but will resume operations immediately.

ARKANSAS

Heber Springs—The first real coal mine ever opened in Cleburne County is now being developed one mile west of Heber Springs. This operation is owned by Mortimer Frauenthal and the product is said to be a fine grade of soft coal equal to that shipped in from Alabama or western Arkansas. The coal measure now being worked is about 3 ft. thick, and it is believed that another and thicker measure lies below this.

Prairie Creek—Under the protection of Government troops operations at the Bache-Denman mining interests were resumed Nov. 20 in the Hartford Valley by nonunion labor. It is the intention to gradually extend operations until several of the mines will be running.

Fort Smith—Twenty-six persons, including former officials of the United Mine Workers of America, were indicted by the special United States grand jury investigating the troubles in the Hartford mining district. Among those indicted are Peter R. Stewart, former president of the mine workers for district No. 21, comprising Arkansas, Oklahoma and Texas; Fred W. Holt, former secretary; James S. Slankard, a constable at Hartford, and James McNamara, an ex-councilman of Hartford. They are charged with conspiring against the government to interrupt justice in connection with the troubles of the Bache-Denman Coal Co. at Prairie Creek, and also of sending threatening letters to U. S. Judge Frank A. Youmans and taking prisoners away from a deputy U. S. marshal and participating in riots.

COLORADO

Denver—It is announced that Governor Ammons will shortly request President Wilson to withdraw the federal troops from the Colorado strike zone, and it is expected that the regulars will begin their exodus about Dec. 1. Adjutant-General Chase has issued orders to the Colorado National Guard to hold itself in readiness for field service probably about that date. Although strike leaders have declared that reëntry of the state troops into the field would mean a resumption of warfare, the military authorities declare they are capable of handling the situation.

PERSONALS

R. C. Cofer has been appointed general inspector of mines for the Pocahontas Consolidated Coal Co., in place of Robert Wallace, promoted to general superintendent. Both promotions were well earned.

Howard I. Smith has been transferred from Pittsburgh to Urbana, Ill., as district mining engineer for the U. S. Bureau of Mines. This is the position made vacant by the resignation of J. T. Ryan, who has entered private business.

Judge Allie Young, formerly on the state Circuit bench, retained as counsel by the Consolidated Coal & Coke Co. at a salary said to be $15,000 a year, has opened offices at Whitesburg, Ky. He will give all his time to the company.

Thomas Hammond, of Vandegrift, Penn., for the past four and a half years chief mine foreman for the Pine Run Coal & Coke Co., has resigned his position, effective Dec. 1, and will accept a similar position with the West Penn Mining Co., near Apollo, Penn.

Jacob Yoch, for several years in charge of the North Breese Coal Mining Co.'s property at Breese, Ill., has been transferred to St. Louis as general manager for the International Coal Co. Edward Yoch comes from that position to take charge of the properties at Breese.

J. M. Roan, mine inspector of Ohio, has been called to the Poston mines, near Nelsonville, to settle the question of the percentage of fine coal allowable. The operators have complained that the miners are loading an excessive amount of small sizes which they desire stopped.

S. L. Sherer, secretary of the Big Muddy Coal & Iron Co., is on an extended trip through the Eastern coal fields. Mr. Sherer is also vice-president of the St. Louis Art Museum, and is expected to look up some masterpieces in the Boston and New York galleries for the St. Louis institution.

William McKinley, general superintendent of the Central Coal & Coke Co., has resigned. Mr. McKinley will probably do nothing this winter, but will reënter the business next spring for himself. William Harkes, formerly with the Northern Central Coal Co. at Moberly, Mo., will take his place as general superintendent.

John S. Jones, of Chicago, who recently purchased the holdings of the Sunday Creek Coal Co. from the receiver, expects to assume control of the property about Dec. 1. This property comprises 25 or 30 mines and large acreages in the Hocking and Sunday Creek Valleys in Ohio and along the Kanawha River in West Virginia.

Philip Carson, president of the Cresson Coal & Ice Co., of Philadelphia, Penn., was recently held under $500 bail for court by Magistrate Macleary on a charge of personally obstructing City Inspectors Sinclair and Mayer from weighing his loaded coal wagons. The prosecution is the first brought by the bureau since its inception in July of last year.

Eugene C. Roberts, Jr., who has for some time been the superintendent of the Fairmount mines in the Allegheny Valley at New Bethlehem, Penn., has been made temporary manager of the Copper Reef copper mines at San Carlos, Ariz., and has gone to assume his new duties. If the work does not suit him, he has the option of returning to his old position.

OBITUARY

Jeremiah B. Jones, 80 years of age, and for many years a coal operator and contractor, died recently at his home, 5240 Schuyler St., Germantown, Penn. Mr. Jones was a member of the Society of Friends and is survived by a wife and one daughter.

Samuel Dunkerly, aged 69 years, for 40 years general superintendent of the G. B. Markle Coal Co., died on Nov. 19, in the State Hospital, following an operation for stomach trouble. He was a veteran of the Civil War and for many years was assistant to the late G. B. Markle.

CONSTRUCTION NEWS

Ebensburg, Penn.—Surveys are being made by the Monroe Coal Co., it is said, for a railroad from the Pennsylvania line at Beulah, some distance west of Ebensburg, to the line of the Cambria & Indiana R.R., 14 miles distant.

Columbus, Ohio—The contract for the railroad bridge across the Ohio River at Sciotoville for the Chesapeake & Ohio Northern R.R. has been awarded to the Dravo Construction Co. of Pittsburgh. Work is to start at once.

Baskett, Ky.—Work was suspended at the Pittsburgh Coal Co.'s mine here last week while repairs were made to the hoisting apparatus. Cables broke and let two cages fall to the bottom of the shaft, a distance of 135 ft. Fortunately, no one was injured.

Claysville, Penn.—Word has been received that Owen Murphy, who was sinking a shaft at Coon Island, expects to resume operations in the near future. He was compelled to close down the work some weeks ago on account of the Baltimore & Ohio R.R. refusing to put in a switch. This matter has, however, been adjusted. Forty miners' houses will also be built during the coming winter.

Chattanooga, Tenn.—Contracts for the concrete and iron work of the new $1,000,000 coke plant for the Chattanooga Gas & Coal Products Co. have been let by the engineers, and actual construction work upon the plant at Alton Park will begin shortly. Approximately $200,000 will be expended on the concrete and iron work alone. Installation of the ovens and coal-handling devices will begin about Dec. 15.

Pottsville, Penn.—Work was recently started at the lower end of the St. Clair yards of the Reading Co. to install two large pumps for the purpose of bringing water from the Tumbling Run Dam to Wadesville. A large gang of men was also put at work at the Tumbling Run Dam preparing that end of the pipe line. The purpose of the company is to augment the water now coming from the Silver Creek Dam.

NEW INCORPORATIONS

Novinger, Mo.—The Novinger Coal Co. has been incorporated, with a capital of $6000, by John Appleby, Frank Beck and Charles W. Kelly.

Franklin, Ky.—The Franklin Coal Co. has been organized with a capital of $5000. The incorporators are Bailey Franklin, Lena Franklin and W. J. Franklin.

Seattle, Wash.—The Issaquah Coal Sales Co. has been organized with a capital of $50,000. The incorporators are W. J. Taylor and J. Oakwood. R. D. Ogden is attorney.

Yukon, W. Va.—The Hyper-Pocahontas Coal Co., of Yukon, W. Va., has been organized by D. D. Hatfield, J. W. Strickler and others, of Yukon, with a capital stock of $25,000.

Oklahoma City, Okla.—The Superior Smokeless Coal Mining Co. has been organized with a capital stock of $30,000. The incorporators are H. F. Wheeler, Charles T. Gibson and H. M. Sinclair, of Oklahoma City.

Jenkins, Ky.—The Elkhorn & Shelby Creek Coal Co. has been organized and will develop 400 acres of coal land near Penny, Ky. All machinery has been purchased and installed except the mining machines.

Massillon, Ohio—The Spruce River Coal Co. has been incorporated with a capital of $100,000, to mine coal. The incorporators are I. M. Taggart, F. F. Taggart, L. P. Schunke, E. R. Allricht and C. P. McLain.

St. Louis, Mo.—The Williamson County Coal Co., of Illinois, with a capital of $50,000, has been licensed to do business in Missouri, with an office in St. Louis. This is a subsidiary company of the Lumaghi Coal Co.

Parkersburg, W. Va.—The Mingo Block Coal Corporation, of Parkersburg, W. Va., incorporated at $2,000,000, has been organized by George S. Sarver, E. A. Ferrin, C. C. Brown and Edwin S. Nely, of Greensburg, Penn., and C. J. Pitgen, of Pittsburgh, to operate coal mines.

Glenville, W. Va.—The Frick Coal & Coke Co., of Glenville, W. Va., has been incorporated with a capital stock of $1,500,000, by Charles N. Lindley, Charles Edsall and H. J. Von Hemert, of New York, and David J. Carter and Harry W. Sheet, of Clarksburg, W. Va. It will engage in mining.

INDUSTRIAL NEWS

Philadelphia, Penn.—The Lennox Coal Co., with mines at Hastings, Penn., has established a Philadelphia office in the Stephen Girard Building, in charge of A. K. Cosgrove as Eastern manager.

Birmingham, Ala.—According to statistics compiled by Chief Mine Inspector Nesbitt, there have been within the last two years only eight fatalities in the coal mines of Alabama among mine workers under 21 years of age.

Kansas City, Mo.—In the past month three of the leading railroads out of here have changed from coal to oil as a fuel. The low price of oil and the uncertainty of the labor problem in the coal fields of the Southwest were chiefly responsible for the change.

Birmingham, Ala.—The Pierce Coal Co. has just opened a new mine in Jackson County, Ala., which is said to be one of the best equipped in the state. A railroad 20 miles in length has just been completed to connect it with the main line of the Southern Ry.

Columbus, Ohio—The officials of the Hocking Valley Ry. Co. have notified the Ohio Utilities Commission that the $4,000,000 6 per cent., one-year notes recently authorized by the commission have been sold for 98¼. The proceeds will be used to better the equipment of the road.

Toledo, Ohio—The general offices of the Royal Collieries Co. have been removed from Jackson to Toledo, Ohio, and are located in the Ohio Building. Eben Jones, of Jackson, is president, and E. W. Ervin is general and sales manager. The company operates in the Jackson district, and also in Kentucky.

Cincinnati, Ohio—At the regular meeting of the Ohio Valley Improvement Association, held in Cincinnati recently, resolutions were adopted calling on Congress to make adequate provisions for carrying on the work of improving the Ohio River. The object of the association is to secure a 9-ft. stage in the Ohio at all times.

San Francisco, Calif.—The first cargo of coal that has ever been brought to San Francisco from the United Kingdom arrived here from Glasgow recently aboard the British steamship "Crown," of Toledo. The coal was consigned to Balfour, Guthrie & Co., but it is rumored that the cargo of 6499 tons was really meant for a British warship.

Ringling, Okla.—The gradual return of the railroads of the Southwest to the use of fuel oil, together with the contracts made with numerous other industries to use oil for fuel, is increasing the number of independent refineries in the oil districts of Kansas, Oklahoma and Texas. The Southern Pacific, the International & Great Northern, and the Santa Fé have each placed large orders for this fuel.

Scranton, Penn.—A jury recently awarded Samuel M. Reese, of Scranton, damages to the extent of $1500 against the Peoples Coal Co. It was the first case of its kind ever recorded in this vicinity, that is, damages awarded against a mining company as a result of damage to property. The deed gave the Peoples company the right to mine the underlying coal, but did not waive surface support. Mr. Reese sued for $3000.

Washington, Penn.—Charged with having refused to pay his employees semi-monthly and being unable to get bail for $1200, John Greek, of Pittsburgh, president of the Greek Coal Co. and owner of mines near Washington, was placed in the county jail to await a preliminary hearing on Nov. 18. The action against Greek was brought by four of the 65 employees who were thrown out of work when he closed down his workings on Sept. 12, last.

Lynchburg, Va.—The Lynchburg board of trade is preparing to send a representative to the Interstate Commerce Commission to make application for a rate of $1 per ton on coal from West Virginia mines, the present rate being $1.50. The rate from West Virginia mines to Bluefield is only 65c. a ton, while to Norfolk it is $1.40 for export coal, and the Lynchburg board feels that something between these two rates would be a fair charge to that city.

Winchester, Ky.—When the projected tunnel is constructed by the Louisville & Nashville R.R. at Willow Shoals, Lee County, the line to the coal fields along the Winchester-Irvine extension will be shortened five miles. All indications point to an enormous traffic over this line. Construction work is still in progress on the terminals. Preparations are being made at this point to handle daily 1000 cars of outgoing and 500 cars of incoming freight.

St. Louis, Mo.—Under normal conditions, the Missouri Pacific-Iron Mountain system uses 11,000 tons of coal per day on the locomotives of the system. At the present time the daily consumption is 8000 tons per day. The curtailment of 3000 tons per day hits the Illinois field harder, perhaps, than any other field on the system. It is believed that 2000 tons per day of this coal formerly came from Illinois and the other 1000 tons from Kansas and Arkansas fields.

Philadelphia, Penn.—Coal dealers attempting to prevent the weighing of their wagons by inspectors of the Department of Weights and Measures, will in future be prosecuted. According to Chief Virdin, the inspectors have thus far found 80 per cent. of the coal scales defective, most of them to the disadvantage of the purchaser. One dealer refused to permit the inspector to weigh a load of coal leaving his yard, and after a preliminary hearing was held in $500 bail.

Philadelphia, Penn.—The American Federation of Labor in Annual Convention on Nov. 18, unanimously adopted a resolution calling on President Wilson to insist that the coal operators of Colorado immediately comply with the Federal plan of settlement of the strike existing in that state. In the event that they refuse, the President was urged to operate the mines in the interest of the people under Federal supervision until such time as the civil and political rights of the people are established.

Little Rock, Ark.—The greatest fight that the business houses of Arkansas ever put up is the protest against the proposed increase in the rates on coal. The increase to Little Rock consumers alone would amount to $50,000 per year and the state would be affected to the extent of over $100,000. The proposed increase is only on Arkansas coal and would throw the state open to an invasion of Kentucky and Illinois coals. The new rates are an increase on slack of 15c. per ton and 25c. on domestic sizes.

Prince Rupert, B. C.—The first carload of coal has been received at Prince Rupert from west-central Alberta and distributed among consumers for testing purposes. Its use for domestic consumption as well as for steam production is stated to have proved entirely satisfactory. As the charge for haulage is less than the freight between Nanaimo and Prince Rupert, a considerable trade is expected to be opened up between the Alberta mines on the eastern slope of the Rockies and points on the North Pacific coast.

Cincinnati, Ohio—Receivers Harmon and Smith, of the Cincinnati, Hamilton & Dayton Ry. Co., have filed in the United States District Court their report of the receipts and disbursements of the road for the month of September, showing a balance on hand on Sept. 30 of $546,606.43. The income account for the month shows a total operating revenue of $939,902, and operating expenses of $697,334, leaving a net operating revenue of $242,568. Various deductions leave the net income at $107,458.38 for the month.

Washington, D. C.—Solicitor-General Davis on Nov. 19 filed in the Supreme Court the government's brief in the suit against the Delaware, Lackawanna & Western R.R. and the Delaware, Lackawanna & Western Coal Co., seeking to destroy an alleged connection between the two concerns. The defendants were charged in the bill with violation of the commodities clause of the Hepburn bill. The suit was designed also to have a contract between the two companies, held to be in contravention of the Sherman anti-trust act.

St. Louis, Mo.—Of vital importance to several of the coal firms with offices in St. Louis is the suit filed on Nov. 14, in the Supreme Court of New York County, New York, by Robert Holmes, a director of the St. Joseph Lead Co., against said company and eight directors thereof, to compel said directors to enter suit against several coal-shipping companies, with offices in St. Louis and mines in Illinois, to recover damages to the extent of approximately $50,000 for losses sustained by the Lead company, caused by its directors and purchasing agents permitting the coal contracting companies to substitute inferior coal from the Standard field in place of high-grade coal from the Carterville field.

Toledo, Ohio—At a dinner given at the County Club in Toledo recently, attended by the officers and directors of the Hocking Valley Ry. Co. and the Chesapeake & Ohio R.R. Co., the full extent of the improvements to be made by both companies was discussed. Among the things contemplated is the double-tracking of the Hocking Valley from Columbus to Toledo, the enlargement of the terminal and dock facilities of the road at Toledo, the building of the line of the Chesapeake & Ohio from Portsmouth to Columbus and other steps to increase the efficiency of the roads. These improvements have been under consideration for two years, but have been held up. Now it is proposed to carry them out.

Columbus, Ohio—A bulletin compiled by J. M. Roan, chief deputy and safety commissioner of mines, has been issued by the Ohio Industrial Commission, showing that there were 22 fatal accidents in the mines of the state during the six months ending June 30, 1914. Significance attaches to the fact that the victims were young men, the oldest being only 45. This leads to the comment that the younger miners have faith in their agility and take risks in violation of rules. The need of greater discipline is urged. A second document issued by the same authority is addressed to operators, general managers, superintendents, mine bosses and mine foremen, which calls attention to the increasing dangers incident to cold weather. It points out that cold air entering the mine absorbs the moisture from the workings, leaving a dry dust which is a menace. Mine men are asked to heat the air wherever possible to at least 40 deg. F. and to see that the dust is wet down and kept moist.

Coal Trade Reviews

General Review

Cold snap fails to precipitate the expected activity in anthracite. Some favorable developments in bituminous but still much pressure to move tonnage. High ocean freights restrict foreign shipping.

The recent cold snap has failed to give the expected impetus to the hard-coal business. Considerable activity is noted among dealers, due to a rush of orders from domestic consumers, but the increase was not reflected back to the mines where occasional instances of curtailed production are still noted. Conservative observers are of the opinion that the winter's consumption will fall substantially below normal because of the destitution in most manufacturing districts, which will compel a rigid economy among the poorer classes. But in spite of these discouraging features, the current wholesale business continues on a satisfactory basis, with production and consumption generally well balanced, though the demand is at times intermittent, and salesmen are compelled to push hard for orders.

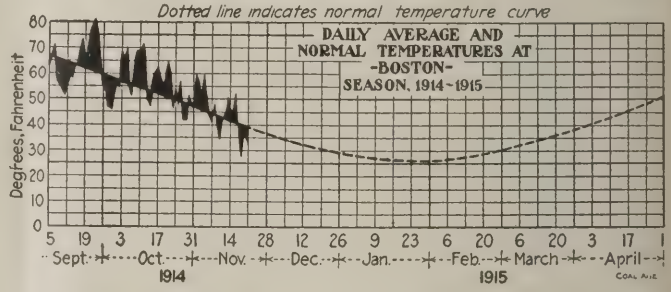
Bituminous reports continue uniformly optimistic as to the future, even from those districts suffering most acutely from the depression; but so many premature reports of an upturn have occurred in the past, that careful observers will be wary about accepting such in the future. There are undoubtedly favorable developments in the current market, but there is pressure in every direction to move coal, and prices continue weak.

Sacrifice sales are almost a daily occurrence, while the large accumulations at many of the distributing centers seem to indicate a lack of coöperation among the producers. Cheap fuel is the rule, and there is little encouraging in the situation. A number of foreign points are reported as hard pressed for coal, but the heavy demand for steamers in other lines has advanced rates entirely beyond any possibility of taking up this business.

Manufacturing demand in the Pittsburgh district has fallen off a trifle further,and though the movement in the retail trade is somewhat improved, negotiations on new contracts are so rare that there is scarcely any definite circular. Mine operations are at 40% capacity. Domestic trade in Ohio is notably more active, the cold snap having released many orders that were being held back; stocks have begun moving out of the dealer's bins and more orders are coming into the mines. The cold weather has been of such proportions that it was all the coal dealers could have desired, but the effects on the trade have not been so impressive as anticipated. The closing of the Lake trade has thrown considerable coal back on the market, which has not been easy to absorb in every case.

Middle Western operators see definite indications of an improvement as a result of the lower temperatures, and some increased industrial activity. The improvement has not attained to large proportions as yet, but prices are somewhat stiffer, and mine outputs are more closely regulated to market requirements. Indications point to a profitable season.

ATLANTIC SEABOARD



BOSTON

Improved mill business lends some encouragement, although stocks are too large to forecast any spot demand. Uneven production in West Virginia and Tidewater accumulations still large. Export trade off again. Anthracite dull.

Bituminous—There are a few favorable sides to the present market, but only a few. The demand on contracts is a shade better, due partly to the colder weather and partly to an improved mill situation. The latter, however, is hardly general enough to affect the spot market in any way, for stocks throughout New England are too large to permit any buying. Pocahontas and New River continue to show heavy accumulations at Hampton Roads and there is apparently a lack of coöperation among many of the mining interests. Some operators are holding down to a small output consistent with market needs, but others are not. The result is that sacrifices are made almost daily and the net return to the mines must be disappointing.

Inquiry for export has sagged off again, due probably to the lack of suitable carriers and the consequent inability of American shippers to name delivered prices. Several foreign ports are said to be in a bad way for fuel and it is unfortunate that some way cannot be found to ship the coal.

Prices are unchanged, ranging at the Virginia terminals from $2.50@2.75, depending on the degree of distress in which the shipper finds himself. Sales are not at all frequent, for most of the trade in New England is tied up on yearly contracts; many of these have had to be modified in view of the general softness of the market, but rumors of such adjustments are naturally hard to confirm.

Georges Creek is beginning now to show a larger volume of shipments than was the prospect a week or two ago. A few steamer cargoes have made up the arrears in this market and now conditions on this grade are restored to about the status that prevailed in October. No concession is heard from the season price of $2.85@2.95 f.o.b. Baltimore.

Many mines in the Pennsylvania districts are on a two-day per week basis and the outlook is anything but encouraging. There is pressure on all sides to make sales, and prices are still weak. All-rail there is only a scattering demand.

Water Freights are perhaps in better position than a fortnight ago. At least three coastwise colliers that have been in regular service between Hampton Roads and New England have been chartered to load grain for Copenhagen. Rates, however, are still not far from the minimum, 60@65c. being the utmost that would have to be paid for ordinary tonnage.

Anthracite—The trade is almost as dull as in bituminous. There is only a hand-to-mouth demand and the producers are slowing up operations in most parts of the field. All kinds and sizes are in more than adequate supply and salesmen are making strenuous efforts to place coal. The winter has not taken hold in this territory, although a moderate fall of snow last week will probably give some impetus to the retail demand.

Quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.45	$1.15@1.50	$1.67@1.77	
Philadelphia*	2.10@2.70	2.35@2.70	2.92@3.02	
New York*	2.40@3.10	2.65@3.05	3.22@3.32	
Baltimore*	.....	.....	2.85@2.95	
Hampton Roads*	.....	.....	.....	$2.50@2.75
Boston†	.....	.....	.....	3.40@3.73
Providence†	.....	.....	.....	3.25@3.58

* F.o.b. †On cars.

NEW YORK

Recent embargoes have reduced the excess of bituminous and a slightly better tone is noted. Anthracite steady but rather quiet. All sizes in easy supply.

Bituminous—There are conservative members of the trade who believe they see definite indications of a change for the better, though conceding that the improvement must inevitably be slow. The foreign trade is undoubtedly helping out to quite an appreciable extent among the operators specializing on this business, even though the effect on the market as a whole must be negligible. The recent embargoes at the New York piers have also had a beneficial effect in that they have served to clean up the surplus stocks. In addition to this the new contracts are now beginning to come up for

consideration and a discussion of these is stimulating some interest. A moderate activity still prevails in the bunkering trade which is absorbing considerable coal, and in fact has been the principal mainstay of some companies.

On the other hand, the improvement is progressing so slowly that it obviously cannot assume important proportions before the close of the year, which means that two months' activity is the most that can be expected under the best conditions. It is further noted that there has been a further sharp contraction in operations at the gas coal mines, though this may in a measure be due to an attempt of the labor unions to organize that district. The bituminous market cannot be quotedly changed from the recent level, which we continue to quote as follows: West Virginia steam, $2.35 @2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@ 3.15; Georges Creek, $3.15@3.25.

Anthracite—With shoal water points facing the possibility of an early closing of navigation, there has been a mild rush for anthracite, although it has not at any time attained to abnormal proportions. Curtailment of operations is still necessary in a few isolated instances, and with considerably more than the average tonnage in storage it is not generally thought that the anthracite trade will experience any unusually profitable season, even though the weather be more than ordinarily severe.

A stronger demand is noted for nut coal, but egg is still off, and difficult to move except at low prices. Plenty of stove coal is now available to meet all demands and can be had in full and unrestricted cargoes. Pea coal is moving along in excellent form and is closely held at the full circular as a rule.

In the steam sizes, low-grade rice coal is exceedingly difficult to move. A few odd lots of buckwheat, No. 1, are being offered at $2.15 at Port Reading, but most of the business is being done at $2.35 or better. The high-grade steam coals are in active demand, especially barley and rice, though concessions are to be obtained on No. 1 buckwheat where it is necessary to move the coal promptly. The New York market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	5.10@5.35	5.30	4.85@5.30
Stove	5.35	5.35	5.30	5.20@5.30
Chestnut	5.60	5.50@5.60	5.55	5.35@5.55
Pea	3.55	3.45@3.55	3.50	3.40@3.50
Buckwheat	2.80	2.70@2.80	2.50@2.75	2.15@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.45@2.25
Barley	1.80	1.70@1.80	1.75	1.25@1.75

PHILADELPHIA

Seasonable weather creates better attitude in anthracite. Domestic in good demand, but steam sizes inclined to be apathetic. Bituminous on about parity with week previous. Demand and prices the same.

Anthracite—There was a much better tone to the market during the past week. The cold weather has created a demand from those who have been putting off purchases from time to time, in the hope that the high temperatures would continue. As a matter of fact, there are indications that considerably less coal will be consumed during the winter than has been the case in the past. No such widespread industrial depression in the mill districts has existed for many years, and it is understood that families are doubling up with the intention of reducing expenses to the lowest possible basis. This means many tons of coal that otherwise would have been consumed, will not find a market, and it is fair to assume that before the winter is over, this will be felt by the anthracite operators and dealers.

Egg size is in a little better demand, due to the change in the weather, and stove and nut are keeping well up in front, with pea a close second. Buckwheat and rice have also felt the impetus, due to increased consumption by hotels and apartment houses, and for the present the outlook is good, although the market still lacks the activity that should prevail at this season of the year.

Prices at Tidewater rule about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	4.80 @ 4.90
Stove	5.00	5.10
Chestnut	5.25	5.10 @ 5.15

Bituminous—The bituminous market has not shown any improvement. Quotations are unchanged, and the demand in no way increased. Some operators, however, are inclined to think that two weeks of good weather will create a better call, but this is not the general feeling in the trade, and the wish is probably father to the thought.

BALTIMORE

Anthracite is the strongest feature of the trade. Bituminous conditions adverse but a gradual building up is now looked for. Exports continue to hold up well.

Cold weather, considerably ahead of the schedule as set by last year, has proven a boon to the trade. Anthracite dealers are quite busy delivering coal to belated customers; there are apparently a much larger number than usual this year who have failed to lay in full supplies and a very good early winter business is expected. Most of the coal men are now pushing deliveries as fast as possible.

In bituminous many large mining sections of West Virginia, Pennsylvania and western Maryland are working not more than one-third time; some mines are on a one day per week basis. Cheap coal is offering everywhere. Pennsylvania low grades are quoted at 90c., and then being taken only in small lots. West Virginia gas three-quarter is to be had around 85c., with run-of-mine at 75c. Some western Maryland low-grade fuels were offered at 80c. There is a strong feeling that the trade has now reached its lowest level.

Exports continue to hold up fairly well. From one to two loadings, comprising shipments of from 2000 to 3000 tons, are being made daily. Were it not for the cutting off of the usual big shipments to Tampico and Vera Cruz by reason of unsettled political conditions in Mexico, the export trade would probably be considerably above normal.

HAMPTON ROADS

Colder weather causes some increase in demand for local consumption. Export and coastwise shipments are holding up fair considering existing conditions.

Dumpings over the piers at Tidewater, while not as heavy as anticipated, are at the same time showing up as well as could be expected. The coastwise movement has been principally to New England ports, with some small shipments going South.

Circular prices are still being asked for New River and Pocahontas run-of-mine, and even with somewhat of an accumulation at Tide no cut, so far as can be ascertained, is being made. The retail price on Pocahontas and New River run-of-mine is $4 per short ton, with lump at $5.50. Some of the suppliers are introducing a New River and Pocahontas nut coal into this market, which, although a quicker burning fuel, is much cheaper in price than anthracite, it is meeting with much favor and retails for $5 per ton against $7.50 for anthracite nut.

Authoritative announcement of destination of vessels is no longer made, but the following have cleared, presumably for the ports noted:

Vessel	Destination	Vessel	Destination
Vulcano	Genoa or Naples	Sava	Trapani, Sicily
Joseph Di Giorgio	Jamaica	Wegadesk	Cristobal, C. Z.
Talisman	Havana	Eibergen	Para, Brazil
Gladstone	Chilian Ports		

OCEAN FREIGHTS

South American rates entirely prohibitive. Some offerings to Italy. General cargo requirements heavy.

There are a few steamers available for coals to the West Coast of Italy, that can be obtained from about $5.76 to $6; these boats carry from 3500 to 6000 tons each. Also a few small boats that will entertain Cuban coal, say at $2 to $2.10 for Cardenas; $2.10 to $2.25 for Santiago; also Bermuda at about $2.10.

There are a number of orders in the market for steamers to take coal to Brazil and River Plate ports, but owners' ideas are so much in excess of those of the shippers' that it is useless to quote the figures they are asking. The demand for steamers for grain, horses, general cargo, etc., still continues and owing to the great absorption of tonnage for these trades a scarcity of steamers is now very apparent.—W. W. Battie & Co.

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
William P. Palmer		Baltimore	Mayport	1609	
Spiral	Norwegian	Philadelphia	Sagua	860	
Iona Tunnell		Philadelphia	Mayport	1118	
Theoline		Philadelphia	Jacksonville	850	$1.00
Wawenock		Philadelphia	Boston	258	
Yallaroi (ship)	Italian	Norfolk	West coast Italy	1363	
Tibagy	Brazilian	Virginia	Rio Janeiro	1552	
Zilia (bark)	Italian	Virginia	West coast Italy	1095

		Boca Grande	Baltimore		
Henry J. Smith		Philadelphia	Boston	998	0.70
Governor Powers		Philadelphia	Bangor	1578	

Note—Steamers are indicated by **bold face** type, all others being schooners

LAKE MARKETS

PITTSBURGH

No regular asking prices on contract. Prompt market much cut up. Lake shipments ended. Operations reduced to about 40%.

There have been no negotiations for contract coal and it can hardly be said that there are any circular prices. While the majority of operators still regard the circular of a year ago, based on $1.30 for mine-run, as nominally in force, others, as recently reported, have announced circular prices on a basis of $1.20. With no transactions in contracts, and not even a similarity in asking prices, circular quotations may be disregarded entirely. For prompt coal the market is much cut up and no very close prices can be given, but the following quotations represent about as much as any seller could hope to secure: Slack, 60@70c.; nut and slack, $1; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district.

Shipments have practically ceased in the Lake trade, manufacturing demand has fallen off a trifle more and the retail demand, while somewhat better with the cold weather is still unsatisfactory, as dealers are carrying very limited stocks. The cessation of Lake shipments has not stiffened the slack market as much as is usually the case, because the demand for slack is particularly light and there remains considerable production on account of coal demand running so largely, in proportion, 1¼-in. for the domestic trade. Mine operations in the district are averaging about 40% of capacity.

BUFFALO

Heavy steel orders may help the bituminous situation. Some coal losing money on demurrage. General feeling more hopeful. Anthracite doing well.

Bituminous—There is some improvement in bituminous here and there, due mostly to the foreign orders for steel manufactures and textiles. People in other trades are agreed that business is improving and some say that it will soon return with a rush and before we are ready for it. There are undoubtedly many European buyers here and elsewhere, looking for manufactured articles that they can no longer find at home, and this is helping to restore confidence. The general feeling is much better than it was a month ago, though some shippers say the coal business will lag along a matter of six months after most other things are booming.

There is some coal still on track, paying demurrage, but it usually belongs to some inexperienced shipper. Prices are not much changed, being on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny Valley sizes about 25c. lower, slack as a rule selling on a par with Pittsburgh.

Anthracite—There is a good movement of all anthracite sizes except egg, and shippers are disposing of it without much difficulty. The urgent demand for stove and chestnut is not in evidence and it may not be at all what it has been in former seasons, as there was more than the usual tonnage of these sizes sold early in the season and the weather has been unusually mild until the present time.

It was supposed that there was an excess of anthracite on the upper Lake docks, but some shippers who have lately visited that district deny this and it appears that the Lake season is going to end as briskly as the fleet and the weather will permit. Shipments are heavy, the amount cleared for the week being 148,000 tons, which is the largest since the middle of August. Practically everything is going to shippers' docks at the heads of the Lakes, which shows that the smaller points have all the coal they require.

TORONTO, CAN.

Situation much improved by the cooler weather but this was partially discounted by the heavy stocking in August and September.

Trade has been considerably improved since the cooler weather began, but much of this has been already discounted by the laying in of large supplies in August and September in anticipation of a possible shortage. The navigation season has practically closed and only a few more consignments by water will be received. The yards are well stocked for the winter's trade. Prices are as follows: Retail, anthracite, egg, stove and nut, $8; grate, $7.75; pea, $6.75; bituminous steam, $5.25; screenings, $4.35; domestic lump, $6; cannel, $7.50. Wholesale f.o.b. cars, three-quarter lump $3.78; screenings, $2.64.

TOLEDO

Domestic trade greatly stimulated by colder weather. Steam business also shows some improvement owing to better factory operations.

Winter has arrived at last and has caused a remarkable revival in the coal trade here. The biting winds sweeping off the Lake are just what is needed to tone up the coal situation here and the effect has been fully as great as was expected. Orders have been coming in about as fast as they can be taken care of and the comparatively light stocks of the retail dealers are being reduced quite rapidly.

There has also been a noticeable improvement in the steam market; a number of idle factories are starting up. The Lake movement is light but still continues despite the rough weather. There is no congestion in the railroad yards and dealers are not anticipating any shortage. Prices remain unchanged.

COLUMBUS

The lower temperatures have stimulated the trade. Buying more active and prices better maintained. Lake trade now over.

Quite a little boost was given the trade in Ohio by the mild cold wave. The effects are noted in the increased orders received from dealers, who have been able to move stocks. Orders which had been held up because of mild weather were permitted to come forward and there was a general strengthening of the market. Stocks are being reduced to a point where a general buying movement will soon be started. In the rural sections there is also a better movement as farmers are now taking time to haul their winter's supply of fuel.

The steam business is still slow and there is no immediate indication of a change for the better. Manufacturing does not improve very rapidly but larger war orders may have an effect soon. Fuel requirements are not large as yet and much of the buying is being done on the open market rather than on contracts. Contract prices are about the same as the previous year. One of the best features is the strength shown in the small sizes, because of the curtailed production of lump. Nut, pea and slack and coarse slack are selling at higher levels.

The Lake trade is now over and on the whole it was as satisfactory as could be expected under the conditions. Because of the suspension early in the season the tonnage was not, of course, as large as in previous years. Some coal will be loaded yet for storage but it will be only a small amount. Congestion on the docks of the upper Lake ports is reported.

In the Hocking Valley the production was about 45% normal. In the Jackson and Crooksville fields it is estimated at 40% and in Massillon about the same. Pomeroy Bend field reports a large production, about 80% of the average.

The retail market is stronger and prices have been advanced slightly. There is still a marked preference for the fancy grades such as Pocahontas and West Virginia splints.

Anthracite is in good demand and prices remain strong on all grades.

Prices in the Ohio field are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.55	$1.65	.....
Inch and a quarter	1.50	1.55	$1.40
Three-quarter inch	1.35	1.40	1.35
Nut	1.15	1.25	1.15
Mine-run	1.10	1.15	1.10
Nut, pea and slack	0.35	0.45	0.35
Coarse slack	0.25	0.35	0.25

CLEVELAND

Fine coal prices continue to advance as the demand increases and the supply becomes smaller. The domestic trade is good. Some new business is being booked.

One large jobbing company has purchased a considerable amount of fine coal for shipment over the next two weeks, at $1.70, Cleveland. Fairmount operators are quoting slack at 65c. and 70c. at the mines. Ten operators named the lower price to local brokers at the opening of the week and three the higher price. Spot quotations are from 5 to 10c. lower than shipment prices, but when the stocks on track are cleaned up spot prices will probably go higher than shipment prices as there is no more of the cheap coal of a week ago to be had.

With the exception of Bergholz, Hocking, Youghiogheny and Panhandle there is no coal being quoted that can be brought into this market at a profit. Fairmount would cost the jobbers at least $1.80, while West Virginia No. 8, Cambridge, Goshen and other Ohio coals not quoted are either not to be had except on old contracts or at prices ranging from $1.75 to $1.80 on track here.

Considerable new business is being booked by operators and jobbers. The improvement continues in the market for fine coal. The three-quarter market is dead because of the

close of the Lake season on Monday next and there is so little going forward that only a neglible amount of this size is being made.

Many of the mines in Ohio are working only part time, some as low as two days a week, but a few operators with mines in the Bergholz field are working up to 90% of capacity. A number of operations in West Virginia and Pennsylvania are being closed down with the shipment of the last Lake order.

There is a fair demand for domestic coals, such as Bergholz, Hocking and Youghiogheny 1¼-in., but it is not large enough to keep the mines supplied with all the fine coal they can sell. It is generally the opinion now that slack will go no lower this winter.

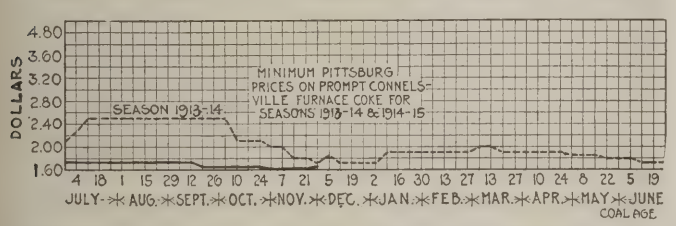
Quotations for shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmount	W. Va. No. 8
Lump	$3.60	.....	.....	.....	.....
Lump, 6 in.	.....	.....	$2.45	.....	.....
Egg	3.60	.....	.....	.....	.....
Egg, 6 in.	.....	.....	2.10	.....	.....
Lump, 1¼ in.	.....	$2.40	2.25	.....	.....
Lump, ¾ in.	.....	2.30	2.10	$1.95@2.00	$1.95@2.00
Mine run	2.60	2.25	1.95	1.85@1.90	1.90
Slack	2.40	1.70@1.75	1.65@1.70	1.70@1.75	1.70@1.75

CINCINNATI

Colder weather has stimulated both the domestic and steam markets. Indications point to continued improvement.

The long expected cold spell materialized last week in fine style, freezing temperatures being a nightly occurrence. The resulting business was exceedingly good, as compared with that prevailing for a long time past. The steam trade also seemed to benefit by the change, contract deliveries being nearer a normal mark than at any time so far this season. A satisfactory amount of domestic business has been handled during the week by dealers and operators alike, with every indication that this will continue at the usual winter volume for the rest of the season.



All that can now be asked is a better tone in the iron and steel trades, which would mean a good consumption of steam coal for the winter.

COKE

CONNELLSVILLE

No demand for prompt coke and negotiations on contracts proceeding very slowly. Prices soft. Production and shipments approximately stationary.

Negotiations continue on a few furnace-coke contracts for next year, either the first-half or the whole year, but the possible buyers are not pushing matters at all. It is understood that $1.75 has been quoted for the first-half of the year without arousing any interest. There is scarcely any demand for prompt coke, the few furnaces operating being well supplied on contract. There have been occasional sales of small lots at $1.60, but this price could possibly be shaded.

Prompt foundry coke is weaker, there being offerings at $2.15 to consumers, equivalent to $2 to dealers. The four large operators that made contracts at $2.35 to dealers and $2.50 to consumers for the twelvemonth ending June 30 are adhering to the figure for prompt shipment, in order to protect their contracts, in which there is usually an expressed or implied price guarantee. There is no demand for contract foundry coke at this time. Reports that many ovens are being freshly fired in the Connellsville region are purely fabrications, for with pig-iron production still tending to decline, the requirements are lessening and coke ovens are more likely to go out than to go in. The market is quotable as follows: Prompt furnace, $1.60; contract furnace, $1.65@1.75; prompt foundry, $2@2.25; contract foundry (nominal), $2.35@2.50, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Nov. 14 at 206,314 tons, a decrease of 5240 tons, and shipments at 210,387 tons, an increase of 6644 tons.

BUFFALO

There is no stir in coke yet. As a rule the members of the trade are hopeful, as the pig iron stored at the furnaces is selling better than it was. Coke prices remain on the basis of $4.25 for best 72-hr. Connellsville foundry, with stock coke $3.30.

CHICAGO

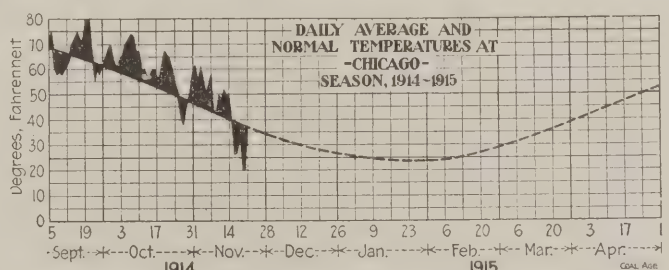
The coke market lags along about the same, although it may be said that during the last few days inquiries for prices have been received in larger volume. Quotations are: By-product, $4.95; Connellsville, $4.75@4.90; Wise County 72-hr. (select), $4.75; gas coke, $4.25; furnace coke, $4.40@4.65.

THE STEEL INDUSTRY

Pig-iron buying increases. Turn for the better anticipated after the first of the year.

Pig-iron buying has increased; as to that there is no doubt. In finished-steel markets the expectation of better buying just ahead is stronger, for inquiry has grown and in some lines the decline in orders has stopped. Many manufacturing consumers seem to be waiting for the reductions in labor cost which it is widely believed will become effective Jan. 1. Whether prices meantime will discount them is the question close buyers are trying to answer.

Reported Russian and Norwegian inquiries for rails and the figuring of Russian and French commissioners now in New York on various lots of freight cars are still without tangible results.



The inquiry of the New York Central for 25,000 tons of rails is likely to result in winter rollings for one mill, at least. Otherwise the rail makers have little to relieve the prospect of a very lean winter. The Pennsylvania Steel Co. has booked a 3500-ton order and the Ensley mill has a week's double-turn operation ahead.—"The Iron Age."

MIDDLE WESTERN

CHICAGO

Arrival of winter weather has a good effect. All Indiana and Illinois coals stronger. Further improvement noted in the screenings situation. Anthracite trade quiet.

Market conditions in Chicago and the Middle West have shown a distinct improvement during the past week owing to the freezing winter weather. A continuance of the low temperatures will be necessary to reduce the large stocks but at this season of the year it is not probable that anything like warm weather will continue for long. Operators are much encouraged over the results of the recent cold snap; while the volume of business has not increased sufficiently to insure full operation of the mines, improvement of any kind is exceedingly welcome to all connected with the trade. It is felt that the period of depression is over and that better conditions will prevail during the balance of this season at least.

There seems to be a more careful regulation of output at the mines than in a number of years past.

Indiana coals have a stronger tendency, especially in screenings. There is a good demand for Sullivan and Clinton County domestic sizes, and Fourth Vein screenings are strong, being held at around 80c. per ton.

The demand for Franklin County domestic sizes has improved particularly screenings which are higher in price.

The anthracite trade continues generally dull, although there has been a perceptible improvement in spots.

Smokeless lump and egg such as Pocahontas and New River, have been in good demand, but mine-run is still weak.

But little improvement is noticed in the demand for splint coals, although colder weather has cleaned up all that accumulating demurrage.

The demand for Hocking and Kentucky coals is still far below the supply, and with little or no improvement due to colder weather.

Youghiogheny gas and smithing coals are quiet. Prevailing quotations are as follows:

	Franklin Co.	Springfield	Harrisburg	Sullivan	Clinton
Lump	$1.55@1.75	$1.50@1.60	$1.50@1.75	.....	$1.65@1.75
4-in. lump.	.....	.....	.....	$1.60@1.75	.....
Steam lump	.....	.....	.....	.....	1.15@1.20
2½-in. lump.	.....	.....	.....	1.50	.....
1¼-in. lump.	.....	.....	.....	1.20@1.35	.....
Mine-run	.....	.....	1.10	.....	1.10
Egg	1.40@1.75	.....	1.50@1.75	.....	.....
6x3-in. egg.	.....	1.50	.....	.....	.....
Nut	.....	1.35	1.30@1.75	.....	.....
No. 1 nut.	1.35@1.75	.....	.....	.....	.....
Screenings	0.60@0.75	0.50@0.60	0.55@0.75	0.60@0.80	0.60@0.80

Hocking Valley 1¼-in. lump, $1.40@1.60; mine-run, $1.25.

New River and Pocahontas lump and egg, $2.25; mine-run, $1.25@1.40.

Somerset Smokeless lump and egg $2@2.25; mine-run, $1.25@1.40.

Carterville lump, $1.60@1.75; 6x3 in. egg, $1.60@1.75; No. 1 washed egg, $1.60@1.75; No. 2 washed egg, $1.50@1.60.

Green County 5-in. lump $1.60@1.75; 2½-in. lump, $1.30@1.60; 1¼-in. lump, $1.35@1.50; screenings, 75@90c.

INDIANAPOLIS

Spurt of buying all around due to cold weather. Steam grades advanced in price but retail quotations are unchanged. Slack selling at better prices.

A fall in the temperature has naturally stimulated the movement of domestic coal and increased the running time at the mines at least one day a week. Some operators have even sold their output for a week or two ahead. The suddenness of the severe weather stirred up the buyers, and prices at the mines were advanced 10 to 15c. a ton for steam coal. Slack demand was good and as high as 75c. was obtained in the open market, as against 50c. the previous week. For domestic the price is $1.50 to $1.75, according to size and quality; No. 4 mine-run, $1.10 to $1.20; other sizes $1 to $1.05. The increased activity caused a slight shortage in gondola cars, chiefly because of their larger use for loading domestic coal. Up to the time of the change of weather the working schedules had not been much increased by the reported general industrial improvement, though something from that is expected later on. The steel mills of the state and some other industries have increased operations and their demand for coal. Retail prices show no change.

There is a "trade-at-home" movement throughout the state at which the coal interests have taken the opportunity to point out that the public institutions of the state should buy Indiana coal.

ST. LOUIS

Situation somewhat improved by the cold weather. Indications point to a steady market for the balance of the season.

A slight improvement in local conditions has been noticeable during the past week. This is due entirely to the cold weather and it has not been long enough nor severe enough to materially affect the market yet. The demand for domestic coal from the South has helped conditions wonderfully, but this call has been confined mostly to egg size. There seems to be a plentiful supply of lump in the Williamson and Franklin County fields but there is apparently no demand this year which is something out of the ordinary. Everything indicates a steady coal market from now until the first of the year.

There has been a slight increase in the price of screenings and steam sizes from higher grade fields, but with the increased output of domestic sizes, this will fall back again. In the Standard field, 2-in. lump is sold as low as $1 in some instances, while the top of the screenings market is 25c.; 6-in. Standard lump has gone as low as $1.15, but with a few more days of cold weather, it will be on the upward trend.

There is very little anthracite moving in, and the retailers report no demand. The same applies, in a general way, to smokeless.

The prevailing wholesale prices are:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	....	$1.25	$1.05@1.15	$1.20
3-in. lump	.....	....	1.40	.....	.....
6-in. lump	$1.35@1.60	....	1.50	1.25@1.30	1.40
Lump and egg	1.85@2.15	$2.25	.....	.....	1.35
No. 1 nut	1.25@1.35	....	.....	0.75@0.80	.....
Screenings	0.50@0.55	....	0.80@0.85	0.20@0.25	0.20

No. 5 washed nut	0.20@0.25	....	.....	....	.....

PORTLAND

Cooler weather causes increase in demand, but prices show no advance.

Cool weather has set in here and coal dealers are beginning to realize that consumers have been buying largely from hand to mouth. Coal briquettes have made considerable of an inroad on the market for coal, but as these are handled by the dealers, this does not make any particular difference in the amount of business they do. The briquettes are sold at $9 per ton delivered, while hard coal is quoted at $9.50 and $10. Soft coals are selling all the way from $6 to $8 per ton but the demand for these is rather limited at present.

There are no reports of any coal coming here from Australia this winter and it is not believed there will be any.

A small cargo of Wellington, B. C., coal was received here this week and is selling at $10 delivered within the first zone limits of the city. This was the first importation from that section for a long time.

Utah coal has not been coming in as freely as last season, but this is due largely to the fact that consumers have been buying sparingly, because of the mild weather.

KANSAS CITY

Three days of cold weather last week moved the excessive stocks. No increase of prices.

Kansas City has had a touch of real winter and the first strong domestic movement of the season resulted. The stocks accumulated during the previous warm weeks were generally reduced to normal. The cold snap did not last long enough to effect any increase in prices. Another period of warm weather succeeded the temporary winter. There has not been enough cold weather to cause much consumption by the larger users, and contracts seem slow making their appearance.

SAN FRANCISCO

The past week has shown practically no change in the local situation. Weather continues warm and coal for domestic purposes is in light demand. Bituminous coals are going to the dealers at $7.50 to $8 per ton, which is a normal figure for this season of the year.

PRODUCTION AND TRANSPORTATION STATISTICS

CHESAPEAKE & OHIO RY.

The following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for September and the three months of the fiscal years 1913 and 1914, in short tons:

	September				Three Months			
Destination	1914	%	1913	%	1914	%	1913	%
Tidewater	384,246	19	261,012	16	985,701	17	819,266	18
East	227,959	11	188,570	12	608,893	10	552,610	12
West	1,241,932	62	1,010,987	64	3,898,894	66	2,946,659	63
Total	1,854,137		1,460,569		5,493,488		4,318,535	
From Connections								
Bituminous	149,628	8	120,468	8	414,845	7	318,730	7
Anthracite	2,526		1,606		5,270		4,819	
Total	2,006,291	100	1,582,643	100	5,913,603	100	4,642,084	100
Coke	13,439		29,680		59,653		86,348	

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for May and the three months of the years 1913 and 1914:

	March		April		May	
State	1913	1914	1913	1914	1913	1914
Missouri	259,270	263,593	204,255	179,723	186,366	165,395
Kansas	492,304	501,841	444,142	378,192	407,124	370,097
Arkansas	113,354	165,037	136,153	87,002	130,020	95,749
Oklahoma	257,162	296,484	246,155	239,443	252,901	241,180
Totals	1,122,090	1,226,955	1,030,705	884,360	976,411	872,421

This statement only covers the tonnage of members of the association, which is estimated to be at least 95% of the entire production.

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for October and ten months of 1913 and 1914, in short tons:

	October		Ten Months	
	1914	1913	1914	1913
Anthracite	1,055,344	1,046,703	9,205,279	8,711,723
Bituminous	4,233,393	4,887,840	40,346,167	42,662,163
Coke	720,070	1,152,950	8,324,007	12,012,363
Total	6,008,807	7,087,493	57,875,453	63.386.249

SAULT STE. MARIE CANALS

Coal shipments through the Sault Ste. Marie Canals for September and October were as follows:

	September			October		
	Canal			Canal		
	U. S.	Cana.	Total	U. S.	Cana.	Total
Anthracite	142,063	20,847	162,910	211,810	25,900	237,710
Bituminous	1,427,127	296,475	1,723,602	1,313,170	295,941	1,609,111

IMPORTS AND EXPORTS

The following is a comparative statement of imports and exports of the United States for September, 1913-14, and for the nine months ending September, 1912-13-14, in long tons:

	9 Months			September	
Imports from:	1912	1913	1914	1913	1914
United Kingdom	4,062	4,597	8,410	904	102
Canada	1,050,394	828,013	771,158	81,984	101,646

Coke				
Tidewater, foreign	3,292	.....	30,491	339
Domestic	111,020	63,625	1,264,781	870,729
Total	2,209,261	2,061,464	21,325,120	22,849,014

FOREIGN MARKETS

GREAT BRITAIN

Market heavy and prices maintained with difficulty. Ocean freights high. Exports show a large falling off.

The London coal trade continues depressed. Both household qualities and manufacturing coals are moving slowly, and the demand is lifeless. Supplies are coming forward in abundance, and the principal metropolitan centers are congested. Prices are maintained with increasing difficulty.

High rates of freightage are the dominating feature. On the Tyne business is very restricted, and only most pressing orders are undertaken. The Lancashire coal market is still very moderate, and those in Yorkshire have also suffered a falling off in business. Matters at Cardiff have taken a change for the worse, and prospects appear exceedingly dull. The position of the Scottish trade remains unchanged.

Further regulations have now been issued relating to trade with the enemy, which require certificates of origin or declarations of destination to be presented of goods imported into or exported from the United Kingdom.

The quantity of coal, coke, and manufactured fuel sent out of the United Kingdom during October is considerably below that of the corresponding month of last year. The total was 4,151,381 tons. During October 1913 and 1912 the totals were respectively 7,059,928 tons, and 7,058,442 tons. During the first 10 months of the present year the exports amounted to 54,523,993 tons, as compared with 63,958,136 tons, and 54,605,209 tons, in the corresponding periods respectively of 1913 and 1912.—"The Colliery Guardian."

Nov. 13—Tonnage arrivals are unsatisfactory, and so far as Second Admiralty List and Monmouthshire coals are concerned, substantial concessions from quoted prices can be secured by those in a position to take immediate deliveries. For forward shipment sellers generally are inclined to adopt a waiting policy rather than sell at under the quoted figures, being of the opinion that the high rates of freight current will attract tonnage. Quotations are approximately as follows:

Best Welsh steam	$5.04@5.28	Best Monmouthshires	$4.02@4.08
Best seconds	4.56@4.68	Seconds	3.84@3.96
Seconds	4.32@4.44	Best Cardiff smalls	1.92@2.04
Best dry coals	4.68@4.92	Cargo smalls	1.20@1.56

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, exclusive of wharfage, and for cash payment.

Freights—Chartering orders are numerous but there is a great scarcity of tonnage and rates practically all round are much improved. Rates are approximately as follows:

Gibraltar	$2.52	Venice, Ancona	$4.80	Singapore	$4.32
Malta	2.76	Alexandria	3.84	Las Palmas	2.40
Marseille	2.60	Port Said	3.84	St. Vincent	2.64
Algiers	2.52	Aden	4.08	Rio Janeiro	3.84
Genoa, Savona	3.48	Colombo	4.20	Monte Video	3.24
Naples	3.48	Sabang	4.08	Buenos Ayres	3.48

FINANCIAL DEPARTMENT

HOCKING VALLEY PRODUCTS CO.

President Daniel E. Reagan reports for the year ended Dec. 31, 1914, as follows:

Results—Notwithstanding general conditions, the damaging effects of the spring flood and suits of certain bond and stockholders to set aside oil lease, there is a decided improvement in the condition and prospects of the company.

Coal—During 1913 the production of coal from the mines and sales thereof show a decrease, and will continue to gradually diminish from year to year, since with very few exceptions the operations consist of working or drawing the pillars left during past operations for the support of roof of mines, and, as the pillars are withdrawn, the mines are abandoned.

Oil and Gas Properties—The maximum production of oil was for March, 1912, when 30 wells produced 52,470 bbl., while 69 wells for December, 1913, produced only 14,408 bbl. Total production for year 1912 was 419,312 bbl.; for 1913 was 192,300 bbl. If the development of the oil properties had not been aggressively pushed, the production and earnings would have shown a much greater decline.

Sinking Funds—Attention is called to the improved condition of surplus account, through increased business of the brick plant and the purchase and retiring of bonds by the sinking fund of 5c. a ton on coal, 25c. a thousand on brick and 15c. a barrel on oil.

INCOME ACCOUNT FOR YEAR ENDING DEC. 31

	1913	1912		1913	1912
Clay products sales (billed)	$201,213	$115,395	Selling expense	$34,569	$26,332

Coal Contracts Pending

Contract No. 9—Fort Wayne, Ind.—The Municipal Light, Heat & Power Co., of Fort Wayne, is in the market for 20,000 tons of screenings. Deliveries are to be made in hopper bottom cars during the next year. Address the Municipal Light, Heat & Power Co., Fort Wayne, Indiana.

Contract No. 10—Chicago, Ill.—The Chicago Coated Board Co. is in the market for 300 tons of screenings per day. Deliveries are to extend over a period of one year, and to be made at Chicago, Ill. Address the Chicago Coated Board Co., 420 E. North St., Chicago, Illinois.

Contract No. 11—Portland, Maine—The Portland Gas Light Co. is in the market for 30,000 tons of Penn Gas, Westmoreland, or any good grade, three-quarter screened, gas producing coal for delivery between Mar. 1, 1915 and Mar. 1, 1916. Shipments are to be as required, about in equal monthly proportions, to wharf through one bridge, Portland, Maine, ample water alongside. All communications should be addressed to C. H. Tenney & Co., Managers, 201 Devonshire St., Boston, Massachusetts.

Contract No. 13—New York—The more important bids received on this contract were as follows, delivered:

14,000 TONS NO. 1 BUCKWHEAT—Charles D. Norton & Co., $3.48; Smith, Lineaweaver & Co., $3.19; John W. Peale & Co., $3.53; Meeker & Co., $3.42.

3700 TONS NO. 1 BUCKWHEAT—Charles D. Norton & Co., $3.67; A. J. & J. J. McCollum, $4.24; Smith, Lineaweaver & Co., $3.69; Bacon Coal Co., $3.69; John W. Peale & Co., $3.67; Meeker & Co, $3.74

4000 TONS NO. 1 BUCKWHEAT—Charles D. Norton & Co., $3.43; Smith, Lineaweaver & Co., $3.48; John W. Peale & Co., $3.70; Meeker & Co., $3.67; Gavin Rowe, $3.54; Joseph Johnson's Sons, $3.30; John E. Donovan, $3.55.

15,000 TONS SEMIBITUMINOUS RUN-OF-MINE—Charles D. Norton & Co., $3.36; Smith, Lineaweaver & Co., $3.34; John W. Peale & Co., $3.35.

4000 TONS SEMIBITUMINOUS RUN-OF-MINE—Smith, Lineaweaver & Co., $3.78; John W. Peale & Co., $3.78.

3800 TONS NO. 3 BUCKWHEAT—Charles D. Norton & Co., $1.97; Smith, Lineaweaver & Co., $2.07; Meeker & Co., $3.01; Pattison & Bowns, $1.97.

2400 TONS SEMIBITUMINOUS RUN-OF-MINE—Charles D. Norton & Co., $3.93; Smith, Lineaweaver & Co., $3.96; Meeker & Co., $3.46; Pattison & Bowns, $4.03.

4800 TONS NO. 3 BUCKWHEAT—Charles D. Norton & Co., $2.89; Smith, Lineaweaver & Co., $2.89; Meeker & Co., $3.46; Pattison & Bowns, $2.93.

Contract No. 14—Panama, C. Z.—The following are the bids received by the Panama R.R. Co. for furnishing all or any part of the company's requirements, estimated at 500,000 tons of coal:

500,000 TONS—F. R. Long & Co., $2.70 (contingent on increase in freight rate) for Rockhill Smokeless and Georges Creek, delivery at Philadelphia; C. F. Blake Co., $2.80 (subject to change in freight rate and supply not to exceed 45,000 tons per month) for New River coal, delivery at Newport News and Sewalls Point; C. P. Burton Coal Co., $2.50 (not guaranteeing analysis as per specifications), delivery at Baltimore; White Oak Coal Co., $2.85 for White Oak and New River, delivery at Newport News and Sewalls Point; Pocahontas Fuel Co., $2.75 for Pocahontas and New River, delivery at Hampton Roads.

350,000 TONS—William C. Atwater & Co., Inc., $2.70 for Pocahontas semibituminous steam, delivery at Lamberts Point.

250,000 TONS—A. McNeil & Sons, Inc., $2.60 (under different specifications) for Toms River, delivery at Lamberts Point.

200,000 TONS—A. McNeil & Sons, Inc., $2.48 for Jamison, delivery at Baltimore, and $2.55 for delivery at Philadelphia; J. H. Weaver & Co., $2.68 (subject to change in freight rates, but not to exceed 5c. per ton) for Colver, delivery at Philadelphia; Delaware Carbo Coal & Coke Co., $2.65 (under different specifications) for Eagle, delivery at Newport News; B. Nicholl & Co., $2.47 (under different specifications) for Davis Big Vein, delivery at Baltimore; Flat Top Fuel Co., Inc., $2.85 for Pocahontas, delivery at Norfolk; Castner, Curran & Bullit, Inc., $2.83 (at the option of bidder as to the kind to be supplied) for Pocahontas and New River, delivery at Norfolk.

150,000 TONS—West Virginia Coal Co., $2.38 for New River, delivery at Newport News and Sewalls Point.

100,000 TONS—New River Coal Co., $2.85 for New River, delivery at Sewalls Point; Pennsylvania Coal & Coke Corporation, $2.85 for Webster, delivery at Philadelphia; Crozier Pocahontas Coal Co., $2.85 for Crozier Pocahontas, delivery at Lamberts Point; Chesapeake & Ohio Coal & Coke Co., $2.80 for Admiralty New River Smokeless; Maryland Coal & Coke Co., $2.80 for M. C. & C. New River.

70,000 TONS—New England Coal & Coke Co., $2.70 (subject to increase in freight rates) for Beacon, delivery at Boston.

50,000 TONS—Chesapeake & Ohio Coal Agency, $2.85 for New River, delivery at Newport News and Sewalls Point; A. McNeil & Sons, Inc., $2.58 and $2.63 for South Fork, delivery at Baltimore; $2.65 for delivery at Philadelphia, and $2.73 for Miller, delivery at Baltimore.

Contract No. 19—New York—Sealed bids are requested by the Department of Public Works for furnishing, delivering, storing and trimming coal for use in the various public buildings, courts, etc., in Manhattan, as follows: About 3,000,000 lb. buckwheat No. 1, 26,000,000 lb. buckwheat No. 2, 13,000,000 lb. buckwheat No. 3, 1,300,000 lb. broken coal, 4,000,000 lb. bituminous coal, run-of-mine. The security required on each bid will be $20,000, and a deposit of 5% of the security must accompany each bid. Bids will be opened at 2 p.m., Dec. 3, Room 2034, Municipal Building, Borough of Manhattan. Time for completion of this contract will not be later than Dec. 31. Blank forms and further information can be obtained on application to the auditor, Room 2141, Municipal Building.

Contract No. 20—New York—Bids will be received by the Board of Trustees, Bellevue Hospital, until 3 p.m., Dec. 4, for furnishing and delivering 300 gross tons buckwheat coal No. 1. The security required will be 30% of the total amount of the bid and a deposit of 1½% shall accompany each bid. The time for completion of this contract shall not be later than Dec. 31. Blank forms and further information can be obtained on application to the auditor, 400 East 29th St., Borough of Manhattan.

Contract No. 21—Cleveland, Ohio—Sealed proposals for furnishing and delivering 2000 tons of Pittsburgh nut coal, 100 tons of the best grade soft lump coal and 50 tons of the best grade Lackawanna egg coal will be received by the County Commissioner until 10 a.m., Dec. 12, each bid to be accompanied by samples of not less than 25 lb. A certified check for $500 must accompany each bid. Address E. G. Krause, Clerk of the Board of County Commissioners, Cuyahoga County, Cleveland, Ohio.

CONTRACTS LET

Contract No. 12—New York—This contract, which provides for furnishing 2600 tons of anthracite buckwheat and chestnut, was awarded to John S. Conabeer, whose bid was $3.95 on buckwheat and $7.44 on nut, the gross consideration being $10,793.50. For a complete list of the bids made on this contract, see the last issue of "Coal Age." Address C. B. Rhinehart, Secretary, Armory Board, Hall of Records, New York City.

Contract No. 15—New York Harbor—This contract, which provides for furnishing 20,000 tons of steam coal, has been awarded to the J. H. Weaver Co., whose bid, delivered f.o.b. suitable lighters or barges alongside at Navy Yard, Brooklyn, was $3.25, with a guarauteed heat value of 14,567 B.t.u. Complete list of all bids submitted appeared in last week's issue of "Coal Age." Address Navy Department, Bureau of Supplies and Accounts, Washington, D. C.

Contract No. 16—New York Harbor—It has been recommended that the bid of Hite & Rafetto be accepted on this contract, which provides for furnishing and trimming approximately 17,000 tons of bituminous coal to be used by the United States dredges in New York Harbor. This bid was $3.43 per ton for Bird Quemahoning coal with a guaranteed heat value of 14,400 B.t.u. Maj. G. J. Dent, Corps of Engineers, Army Building, New York.

COAL AGE

Vol. 6 NEW YORK, DECEMBER 5, 1914 No. 23

Did You Ever Think of Pausing to Size Yourself Up?

Many a man never thinks of pausing to size himself up, to formulate a definite plan for his life, or to consider his mental equipment. Yet the same fellow would heartily condemn a mine where no plans were made for the future and no thought was paid to the condition of the equipment.

ABOUT A YEAR AGO A FIREBOSS IN a mining institute arose to object to the study of English grammar in mining classes, on the ground that he could see no need of it for a practical workingman. He showed clearly enough by that statement that he was unwilling to advance—to grow in the most effective direction, namely, to develop his ability to think and to express his thoughts intelligently.

Had he stopped to reflect, he would have remembered that in order to advance above the grade of fireboss, he must pass the state examinations for mine foreman or assistant. Even with a good practical knowledge of mining, men fail year after year to pass the examinations because they are unable to express their thoughts accurately, due to lack of training in the application of the simple principles of English grammar. If we are to make a success of life, we must willingly grasp the opportunities to learn to develop brain-power.

Just as a man must exercise his body to develop it, so he must study to develop his brain. And when a man makes up his mind to study, he can best spend his first efforts in trying to find out what real study means.

Study is not the mere memorizing of facts, however valuable these facts may be. A certain fireboss in Pennsylvania has spent many earnest hours, yes years, in committing facts to memory in the belief that he was studying. Yet the piecemeal knowledge that he has acquired by those efforts corresponds to the parts of a great engine spread out on the manufacturer's assembling-room floor. No matter how excellent they are in themselves, the parts are of no real use until they are fitted together in their proper relation to each other to make up a single workable unit. It is this ability then to acquire facts and place them in their proper relation to each other that constitutes real study and useful mental effort.

It is remarkable that those men who have studied most seem to realize so much more than other men the decided advantages of study. Not long ago, a patient in a doctor's office remarked upon the amount of studying that doctor was doing; the patient being aware that the doctor had spent over seven years in this country and abroad on the professional part of his education before he began to practice. The doctor promptly replied: "The minute I stop studying I shall begin to fall behind my fellows." Recently, a superintendent remarked: "I've studied some from time to time, but now I am so busy I do not even take the covers off the mining papers I get." He has lost his sense of proportion, and he is standing still.

One reason why the educated man has always recognized the benefits of continued study has been the training he has received in how to study. But today, with the great number of schools and institutes open to every class of mining men, there is coming to be less reason for any one's failing to secure the advantages of their guidance.

Study

is more important today than ever before. The opportunities for study are far greater. When any man thinks he has reached the point where study is no longer necessary, he has ceased to progress; either he is stagnating or else he is going backward.

Electricity in Coal Mining

By Eric A. Lof*

This article is the longest ever published in one issue of Coal Age; however, it is complete as it stands, and is of such great interest and technical value, we especially recommend it to the attention of all coal men from miner to president.—Editor.

SYNOPSIS—Enormous advances have been made in the use of electricity in mining operations in the past few years. The principal applications of electric power in coal-producing work are here described, together with the advantages and disadvantages of the different types of motors available for the given service.

While electricity has been used in mining work for nearly 30 years, or almost since the practical introduction of the electric motor, it is especially during the past decade that the enormous advance of this system has taken place. In no other field than the coal-mining industry has electricity been of greater benefit to mankind, and only through its medium has it been possible to meet the ever-growing demand for fuel.

On the other hand, it has prevented or at least greatly reduced the use of animal power in mines, the cruelty of which could almost be considered as a crime, and this also to a great extent spurred the engineers to devise a means whereby this abuse could be abolished.

The advantages of using electric power for mining operations are now so fully realized that no other system whatever is being considered when a new installation is planned, while hundreds of old mines are changing over to this modern method of power application.

The nature of mining operations necessitates that the machinery must be located at many different places, while on the other hand a large number of small units may have to be used, resulting in a low efficiency. Electric power can be cheaply produced in a single generating station and transmitted to any distance within the mining district without excessive increase in the cost, provided that a suitable pressure is used for the transmission. The power consumed in each district or by any individual machine can be measured by suitable meters or instruments, and in this manner any excess consumption can at once be detected and the defect remedied, while an accurate record can be kept on the different operations.

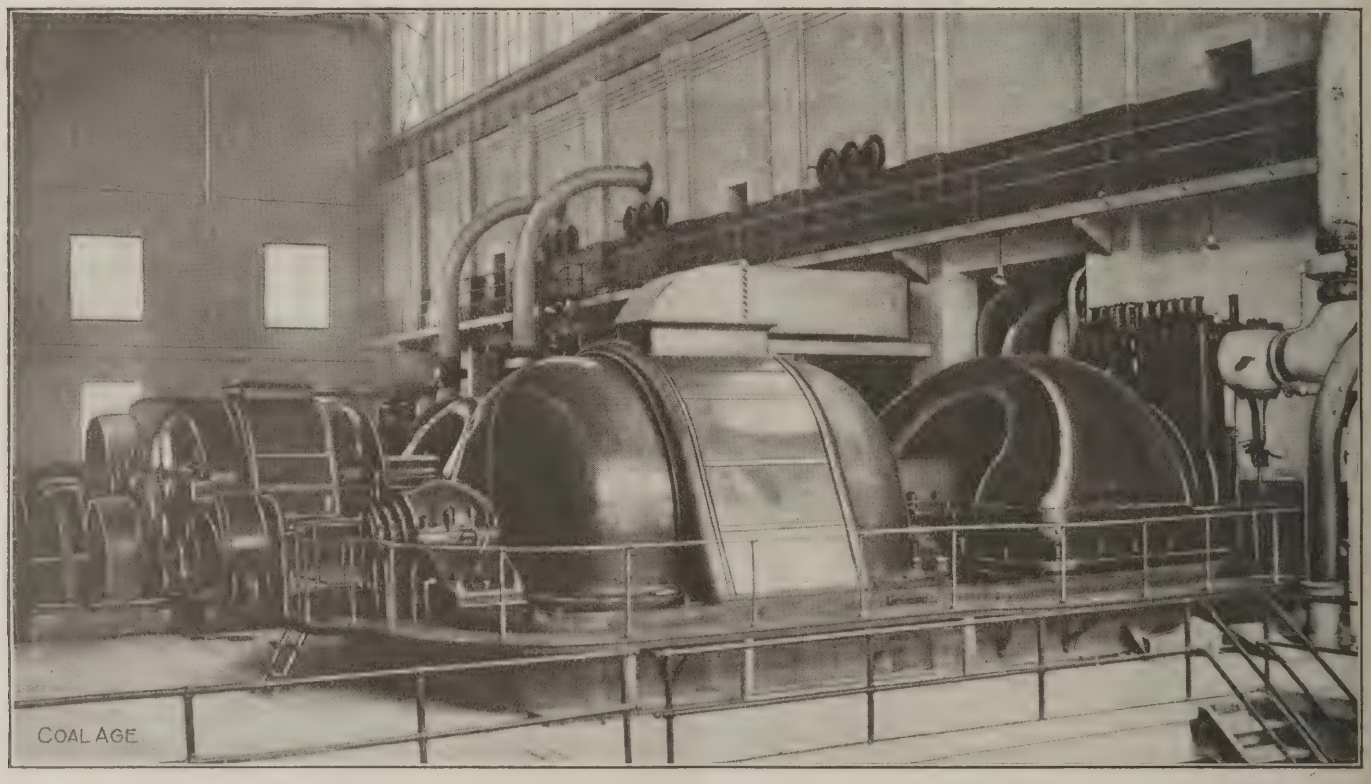

Fig. 1. Interior of Lehigh Navigation Electric Co.'s Plant, at Hauto, Penn. A Steam-Electric Plant at the Mines for High Tension, Long-Distance Transmission

There is no restriction as to the location of the machinery, as the distributing lines can be carried to any part of the mine and occupy but little space. They eliminate long and expensive steam and air lines, with which the danger of breakdown and the difficulty encountered in keeping up the necessary working pressure increase for every extension to the service. With the flexible electric system, on the other hand, additions and alterations can always be made without any difficulty whatsoever.

Electric motors are highly efficient, even down to the smallest sizes. They take but little space and are readily

*Power and Mining Engineering Department, General Electric Co., Schenectady, N. Y.

adapted to the machines which they are to drive. Perfect control is also possible at all times, and simple automatic safety devices can readily be installed.

Power Supply

The power supply for a coal operation can be obtained in many different ways. Steam power can be generated directly at the mine, and the stations may either be of a capacity just sufficient to supply the need of that mine alone, or they may be of a considerably greater capacity, in which case the surplus power may be transmitted electrically to profitable market centers. On the other hand, power may be purchased from hydro-electric or other public-service companies.

As a rule, it is generated directly at the mine, and steam turbines having an exceedingly high efficiency are used as prime movers. Their steam consumption is low, being for condensing units sometimes more than 50 per cent. better than for the single slide-valve engines formerly quite generally used in mining districts, and from 10 to 15 per cent. better than for modern compound condensing engines. The space they occupy is small, which in turn reduces the cost of the station.

The new and immense power plant of the Lehigh Navigation Electric Co., Fig. 1, represents the beginning of a most important step toward the economic use of coal directly at the mines. By transforming the heat energy of the fuel at the point of origin into electrical energy and transmitting this to the consumers at profitable market centers, one of the biggest factors that enters into the cost of coal—the transportation thereof—will be eliminated.

Still another economic saving is, however, realized, in that the enormous waste product, consisting of coal particles and dust which pass through the screens and are entirely unmarketable, can be successfully burned under the boilers by providing specially designed furnaces therefor. The cost of transportation for low-grade coal is approximately the same as for the higher grades, and consequently the demand for low-grade coal is limited. The Lehigh mines produce enough refuse coal to maintain the continuous generation of 100,000 kw., and this is the ultimate capacity for which the new station at Hauto, Penn., has been designed, the present capacity being 37,500 kw. The electric energy is being transmitted at a pressure of 100,000 volts.

The Appalachian Power Co.'s plant, on the New River, in Virginia, Figs. 2 and 3, is, on the other hand, an example of the advantages which may be derived from using hydro-electric power for coal-mine operation, this company furnishing power to the Pocahontas coal fields.

In the supplanting of steam power, produced at the mouth of the pit, with hydro-electric energy generated 50 to 70 miles distant, the question of power cost is not entirely the ruling factor, although in many cases the purchase of central-station energy is cheaper than individual production. Central-station energy relieves the coal operators from the power-plant investment, which can be used for other profitable improvements. The service is of a much higher quality than is, as a rule, obtained in an ordinary individual plant. This is a factor of importance in that it greatly improves the operating conditions of the mine.

Fig. 2. One of Appalachian Power Co.'s Stations Transmitting Electric Power to the Pocahontas Coal Fields

Often formerly it was necessary for the coal operator to establish his own power plant in inaccessible locations, to which water had to be pumped against considerable heads. Not infrequently also this water was of poor quality for boiler use, resulting in excessive maintenance costs. It was difficult to retain skilled engineers and station operators, owing to the remoteness of many of the mines from community advantages. A definite contract for central-station energy insures the operator against these unfavorable conditions.

Choice of Systems

Two systems are available for the distribution of electric power in mines; i.e., the alternating-current and the direct-current, the choice depending upon the particular

conditions of the project. For smaller installations, with short distributing lines, the direct-current system can be used, the motor of this type being well adapted for the operation of hoists, mining locomotives, blowers, etc.

When, on the other hand, power has to be distributed over greater distances, as in larger mining districts with scattered shafts, the alternating-current system will generally be found more advantageous. Due to the possibility of using a higher voltage, a more economical distribution can be obtained, and the simplicity of the induction motor makes this system especially suitable for the severe service encountered in mining work. For the operation of mining locomotives or other machinery requiring it, direct current can readily be obtained by motor generators or rotary converters, so that in general it can be said that the alternating-current system offers many advantages for mining operations.

The selection of the proper voltage at which the power should be generated depends to a great extent on local conditions. Mining motors are, as a rule, operated at from 220 to 550 volts, but occasionally 2300 volts is used for pump motors, etc. The restrictions imposed by the commutators of direct-current motors for mining work limit the potential of such a system to a maximum of 550 volts. Furthermore, the electrical pressure which is in use in one part of the mine generally determines that for the entire installation when the direct-current system is used.

A working potential of 550 volts, however, is only economically feasible for mines whose workings above and below ground have a maximum extent of a few hundred yards, while on the other hand it is as high as is advisable for small motors working underground, considering the safety of the operators.

When the extent of the mines is such that the above

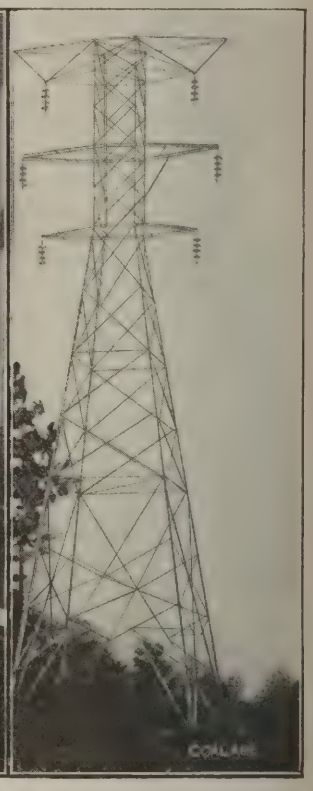

FIG. 4. STEEL TOWER FOR HIGH-TENSION TRANSMISSION

The two standard frequencies in this country are 60 and 25 cycles per second. Where purely alternating current is used, the former is preferable. The speeds of 25-cycle induction motors for general application are practically limited to 750, 500 and 375 r.p.m., while the corresponding speeds for 60-cycle motors would be 1200, 900, 720, 600, 514, 450 and 400 r.p.m. Twenty-five-cycle motors could, of course, be wound with two poles, giving a speed of 1500 revolutions, but this is rarely done, except in the very small sizes. The 60-cycle frequency also permits its use for lighting. If, on the other hand, the distribution is done wholly or partly with direct current, 25 cycles may prove the best, the lighting in such a case being obtained from the direct-current circuits.

voltage is not sufficiently high, the alternating-current system of transmission or distribution must be resorted to. With this system the voltage can be transformed up or down as may be desired in static transformers, operating at a very high efficiency. It is, therefore, possible on the one hand to transform up to such values that the transmission can be carried out economically for any practicable distance, while, on the other hand, the pressure can be reduced to any extent necessary for its safe use in small motors, for lighting, etc.

TRANSMISSION AND DISTRIBUTION

For transmitting the energy over long distances, bare overhead wires of either copper or aluminum are used. They should preferably be supported by means of insula-

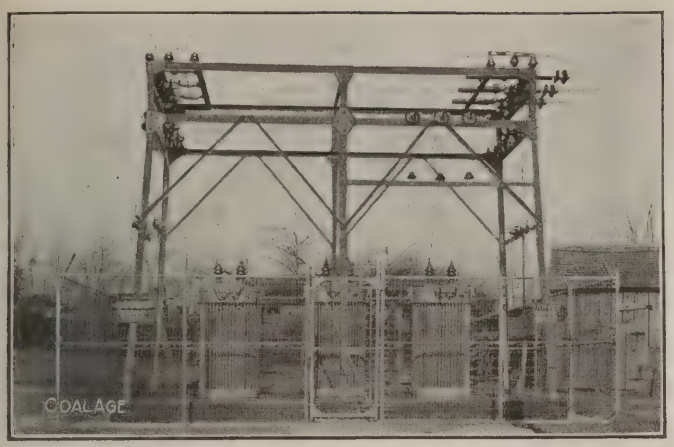

Fig. 5. Typical Outdoor Substation for Tapping Power from High-Tension Transmission Lines

tors on substantial steel towers, Fig. 4, if the transmission is to be of a permanent character. Such towers may be of considerable height, allowing greater spans, and thus a smaller number of supports, while the life and reliability of the system are greatly increased.

Double-circuit lines are preferable to single circuits. The same weight of copper divided into two conductors and supported by slightly modified towers would considerably reduce the chance of a shutdown, with only a small additional cost for towers, a second set of insulators and the labor of stringing the second circuit.

One or more substations, depending on the number and location of the different mines, will be required for housing the step-down transformers, the converting apparatus, and the control equipment. The design of the substation building and the contained apparatus should be made with a view to economy and simplicity of operation, so as to minimize the number of necessary attendants.

The design is fixed by the kind of service to be given, whether the distribution is purely either alternating or direct current, or a combination of both. The first system necessitates naturally the simplest design, as it only involves the installation of step-down transformers, and such stations are nowadays often of the outdoor type, i.e., the apparatus is installed as shown in Fig. 5 without any protecting building. If a conversion to direct current is to be made, rotary converters with transformers, or motor-generator sets with or without transformers, must be provided and a building is necessary for their protection.

The secondary distribution should be laid out in the best possible manner, both from an economical and operating standpoint, and the construction should be most substantial, so as to prevent any possible shutdown due to poor workmanship. For the overhead distributing circuits, the conductors are either bare or insulated with weatherproof braid. They are supported on insulators mounted on regular wooden poles with crossarms.

For the underground construction in the mines, it is highly desirable that the wires be erected out of easy reach. Frequently, however, the headroom available is such that this cannot be done. Owing to the excessively damp and acidulous atmosphere in many mines, it is quite difficult to maintain a high degree of insulation on the wires, and hence in many cases the low-pressure wiring is run bare, supported on glass or porcelain insulators.

Where the danger of coming in contact with the wires is great, especially in the case of high-voltage conductors, they should be thoroughly insulated and metal covered, the armoring not only protecting the insulation from deterioration, but also from mechanical injury. It seems also advisable that even with lead-covered cables, the insulation should be nonhygroscopic and as nearly as possible proof against the action of mine acids, because there is always the possibility of a defect appearing in the lead sheath, either through a faulty joint, through electrolytic action, or otherwise. If paper insulation is used, even a small opening of this sort may admit enough moisture to destroy the insulation at that point and cause a breakdown.

Haulage

The first electric locomotive for mine haulage was put into operation in 1887. From that time up to 1900, the progress of utilizing electric power for mine haulage was rather slow, but after that year it increased at a rapid rate, so that now many thousands of electric locomotives are in operation in this country alone.

Steam locomotives for underground coal mining are out of the question, on account of the smoke and steam produced by them and the danger of fire. The use of locomotives driven by internal-combustion engines is increasing, but these are also accompanied by the danger of fire, and their operation is not as reliable as that of electric machines. Compressed-air locomotives are less economical, and only occasionally come into consideration where explosive gases may be present on haulage roads.

As a fact, however, the sparks that may be caused by the setting of the brakes does not make them any more safe for such a service than the electric locomotive. Even the mule, which has been one of the chief competitors of the electric haulage, is now being displaced by gathering locomotives, and actual experience has shown that the cost of hauling by the electric method is from 50 to 75 per cent. cheaper than by mules. A consideration of the cost of feeding, the large percentage of killed or injured, the additional amount of air necessary in underground work, and finally the large number of mules and drivers required to perform the same amount of work as a locomotive, makes this evident.

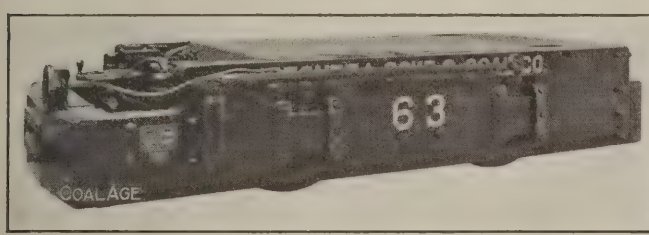

Fig. 6. A Modern Electric Mine Locomotive

Fig. 7. Storage-Battery Locomotive with Loaded Trip

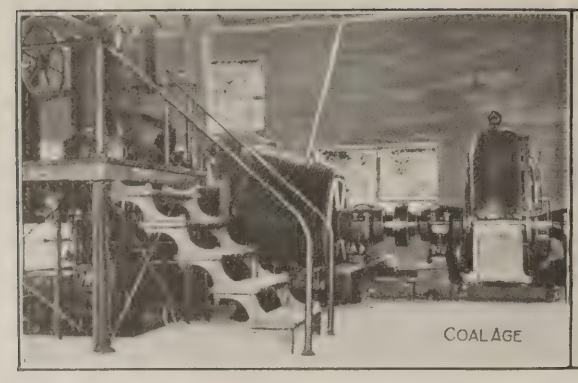

Fig. 8. Direct-Current 250-Hp. Motor Driving Double Conical-Drum Hoist

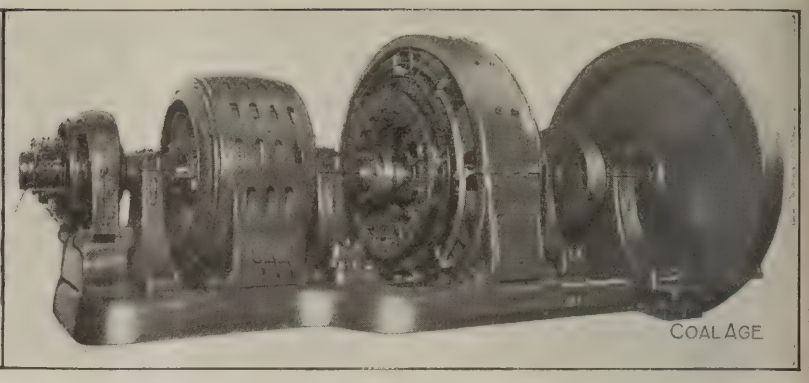

Fig. 9. Flywheel Motor-Generator Equalizing Set with Direct-Connected Exciter

Direct-current locomotives are generally recognized as standard, although in rare instances single-phase locomotives are used, due to the fact that the supply system is alternating current, and the magnitude of the work does not warrant the installation of converters. The use of three-phase locomotives is not to be recommended, as in such a case each track would require two separate trolley wires, with the rails comprising the third leg of the three-phase circuit.

The two-motor locomotive, Fig. 6, has come to be generally recognized as the standard type for mine work, and actual tests have demonstrated that this equipment will pull from 10 to 20 per cent. more than a single motor mechanically connected to the two axles. On the other hand, a higher efficiency is also realized due to the series-parallel control. So, for example, when a slow speed is required, this is efficiently attained by running the two motors in series.

With the single-motor drive, slow speed can only be secured by inserting a large resistance in series with the motor, and the current consumption would be twice that taken by the two-motor equipment under series operation. Furthermore, should one motor for some reason or other be damaged, it would entirely cripple the single-unit machine while that supplied with two motors would still be capable of performing a large part of the work.

Inside and Outside Frames

From the constructional viewpoint, there are two general forms of this type of locomotive, one in which the side frames are placed outside of the wheels, and the other in which they are placed inside of the wheels. For a given track gage, the outside-frame type allows the maximum space between the wheels for the motors and other parts of the equipment, renders the journal boxes more accessible and gives somewhat greater space at the operating end for the motorman.

The inside-frame type restricts to a certain extent the space available for motors and other equipment, but secures a minimum overall width—a construction that is necessary in those mines where the props are set close to the track or the space outside the rails is otherwise limited. The wheels being outside the frame, this type, in case of derailment, is somewhat more readily replaced.

There are two standard methods of mounting the motors: "In tandem," i.e., one motor placed between the axles and the other between the forward axle and the front end frame, and "central," or where both motors are placed between the axles. The "tandem" arrangement permits of a short wheel base and is adopted for the light- and medium-weight locomotives, as these are usually required to operate over sections of the track having short-radius curves.

On the heavier locomotives the motors are mounted "central." The longer wheel base is permissible in this case for the reason that the heavy machine operates on the main haulage roads which, as a rule, are comparatively straight and have easier curves. With either arrangement the locomotive frame is proportioned to give an equal distribution of the weight between both pairs of driving wheels.

Motors may also be "end" mounted by placing them in the spaces between the axle and the forward and rear end frames respectively. This permits the minimum wheel base, but is very seldom used and is adopted to meet exceptional conditions only.

From the viewpoint of operation, there are also two kinds of locomotives employed in coal mining; i.e., those used for main haulage and those used for gathering. This is particularly the case in mines where the headings have attained considerable length and where the output can be handled most economically by concentrating the trips over the main haulage road into trains of a capacity sufficient for a 20- or 25-ton locomotive.

On well laid tracks having 50-lb. or 60-lb. rails, four-wheel, two-motor locomotives of this weight operate successfully. Where, however, light rails exist, it is inadvisable to concentrate this weight on four drivers. Instead, therefore, of a single 20-ton locomotive, two 10-ton machines are coupled together and operated as a single unit, which, while developing the same tractive effort, has its weight distributed on eight drivers.

The tandem locomotive is also adapted for those cases where conditions of operation require trains of a certain definite tonnage and the gage is so narrow that two motors of sufficient capacity cannot be used.

The method of coupling locomotives in tandem is extremely simple and permits the complete control of motors, brakes and sand valves of both units from the operating end of one.

In order to avoid the necessity for installing overhead lines on side tracks which are only used temporarily, the gathering locomotives intended for this service are equipped with a cable drum. Before the machine leaves the overhead trolley line, the flexible cable is hooked on behind one of the line clamps. The locomotive is now able to travel for a further distance of about 500 ft. A small electric motor, which is coupled to the cable drum,

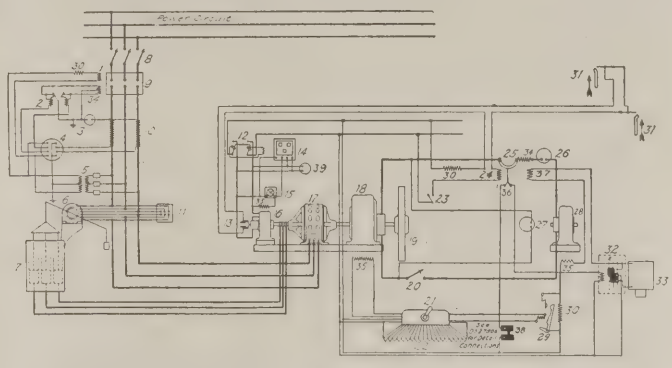
is constantly under current. This holds the cable tight as it runs out, and winds it up again at the necessary speed on the return journey.

If the gradients of the side tracks are so steep that it is no longer economical for the locomotive to traverse them, a winding drum may be provided, which enables the driver to draw in trucks from a distance of about 300 ft.

For gathering service and in other instances where for any reason it is not permissible or advisable to install an overhead trolley wire, the storage-battery locomotive, Fig. 7, may be advantageously employed. Such a locomotive possesses all the well known advantages appertaining to the ordinary electric machine, as compared to other varieties and animal haulage, among which are the following:

It consumes power only when in actual operation, and can be handled by any man of ordinary intelligence. It is ready for use at all times of the day, providing it has been given its full charge during the preceding night or idle period. It has large momentary overload capacity, and possesses an easy and perfect system of control. It can be run underground and in other localities where the smoke and fire risks of the steam locomotive would forbid its use or where the fire hazard of the trolley type is dangerous. It can be charged from a relatively small generator, as the charging period is distributed over several hours and the dynamo consequently is relieved of heavy overloads which would otherwise be incidentally demanded by trolley locomotives. The mechanical and electrical parts are few and simple, resulting in low maintenance cost. It requires minimum head room in tunnels and mines. It can be installed on track systems where animal haulage is now in use without the necessity of stringing wires, erecting poles or bonding rails.

Hoisting



Of equal importance with the electric locomotive in the successful operation of a mine is the electric hoist. This was, however, not extensively introduced for mining work until about 1900, or not until long after the locomotive. Its importance is evident when it is considered that the main shaft represents to a certain extent the principal artery of the entire mine. It is the connecting link between the coal-handling systems above and below ground. The whole of the material mined must pass through the shaft on its way from the various points of production to the loading station. Any interruption or breakdown in the hoisting machinery is equivalent to a stoppage in the whole coal-getting work of the mine. In fact, its efficiency determines the maximum output of the development.

It is possible to arrange both the underground haulage system and the surface-railway network according to the requirements, and thus increase the efficiency as desired, and at the same time provide working reserves. This is, however, not always the case with the hoisting system.

A second or third hoisting plant would require the sinking of a second or third shaft, which would entail large extra construction costs, which, in most cases, would be economically impossible. The technical problem is, therefore, to cover the greatest possible area of a mine with one main shaft, and to install a hoist therein which combines maximum efficiency with high economy and thorough reliability. Endeavors to solve this problem have led, during the course of a century, from hoists driven by flowing water to steam engines, and from the latter to electric motors.

The successful introduction and the surprisingly rapid growth of electric hoisting are therefore primarily attributable to the fact that the electric motor is excellently adapted to hoisting work. There is scarcely another form of service which is more intermittent or in which the power required varies so greatly.

The two principal classes of electric mine-hoist equipments are: The direct-current motor operated from its own motor-generator set by generator field control, and the induction motor. The direct-current motor lends itself well to direct connection, as the characteristics of

Fig. 10. Diagram of Connections for Direct-Current Mine Hoist with Flywheel Motor-Generator Set

slow-speed motors of this type are excellent. The cost of a direct-connected motor will, in practically all cases, be higher than that of a geared motor, but in some instances this is largely offset by the saving in gearing, etc. Where, however, a considerable saving can be made by using a geared motor and where the mechanical advantages of a direct-connected hoist are not an important consideration, a geared direct-current motor should be employed.

Such a motor, Fig. 8, should be separately excited and shunt-wound and the current for the same obtained from a separately excited generator of similar type, both machines being driven by a direct-coupled induction motor, Fig. 9, where the source of supply is alternating current, as is almost invariably the case.

The Control of the Hoist Motor

The control of the hoist motor is effected by regulating and reversing the exciting current of the direct-current generator, thus varying the voltage impressed upon the motor terminals, Fig. 10. The current for the motor and dynamo fields is supplied from the direct-connected

exciter, and in the case of the motor it is maintained constant. As the rapidity of hoisting is practically proportional to the voltage impressed upon the motor armature, the controlling gear is arranged so that the speed will be directly proportional to the distance by which the controlling lever is moved away from the neutral position. This system of hoisting has the great advantage that the rheostatic losses are reduced to a minimum and that the operator has perfect control over the motor.

In many cases it is highly desirable to reduce the instantaneous peak loads and equalize the current input to the hoist. This is especially true where the power charge is based wholly or partly on the maximum demand, and any practicable method, therefore, by which energy may be taken from the line and stored during periods of light load and discharged when the hoist load is heavy, makes it possible to greatly reduce the maximum input and consequently the charge for power.

The simplest method of effecting this is by adding a flywheel to the motor-generator set, previously described. In order to permit the flywheel to take care of the peaks, and equalize the load, the speed of the set must be varied according to the demand for power. This is accomplished by an automatic slip regulator connected in the secondary circuit of the induction motor, which, in this case, must be of the phase-wound type.

In its most common form this regulator consists of a liquid rheostat. The resistance is varied by means of movable electrodes suspended from an arm mounted on the shaft of a small induction motor which is set on the top of the rheostat tank. The regulator motor is connected in series, either directly or through series transformers, with the induction motor of the flywheel set. It is adjusted so that its torque opposes the weight of the electrodes, which are counterbalanced to reduce the size of the regulator motor to a minimum and to permit adjustment for different values of the line current. When this exceeds the amount for which the regulator is adjusted, the torque of the motor overbalances the weight of the electrodes, lifting them, and thus inserting resistance in the rotor circuit of the induction motor of the set. This causes it to slow down and allows the flywheel to assist in driving the generator during the peak load.

The Induction-Motor Hoist

The second important class of electric hoisting systems is, as previously stated, driven by induction motors. Excessively low-speed motors of this type and of moderate capacities do not show particularly good electrical characteristics. For large-capacity hoists at high rope speeds, using as small a drum diameter as is consistent with good practice, a direct-connected induction motor is, in some instances, entirely feasible, and a number of such equipments are in actual operation abroad. However, the great majority of induction-motor-driven hoists now in use and which will be installed in the future are and will continue to be of the geared type.

The induction motor must be of the phase-wound type, and the speed control is accomplished by cutting in or out resistance in the secondary circuit. Drum controllers with grid resistances are used up to about 200 hp., while between this and 400 hp., it is customary to provide a complete magnetic-contactor control. Above 400 hp., the liquid rheostat is usually employed as a secondary resistance and control.

This rheostat has stationary electrodes, and the area of immersion and therefore the resistance is varied by raising or lowering the level of the liquid. By means of a small centrifugal pump, mounted on the rheostat, the liquid is pumped continuously into the electrode chamber and overflows a movable weir into the cooling chamber. With the weir in its lowest position the electrodes are only slightly submerged and the resistance is high. As the control lever is moved over toward the running position in either direction it raises the weir, which causes the electrode chamber gradually to fill to a level corresponding to its height. This submerges the electrodes, thereby decreasing the resistance and accelerating the motor.

By moving the control lever to any desired intermediate position, thereby lifting the weir part way, the liquid may be raised to an intermediate level. By this means an infinite number of partial-speed running points can be obtained. The time required for the pump to fill the electrode chamber serves to limit the maximum rate at which the acceleration can take place.

When the weir is swung down to the lowest position, it opens one entire side of the electrode chamber so that the liquid falls out, instead of being required to flow out through a restricted orifice. The rapid emptying thus obtained is particularly advantageous in cases where it is necessary to reverse the motor in order to retard the hoist.

For equalizing the load taken by an induction-motor-driven hoist, a flywheel motor balancer may be used. This consists of a shunt- or compound-wound direct-current motor, connected to a heavy flywheel and carrying a direct-connected exciter. The motor balancer is floated indirectly across the incoming line circuit, being tied in by means of a rotary converter or motor-generator set. A regulator actuated by the line current controls the direct-current motor field, so that when the power taken by the hoist drops below the average, the field is automatically reduced, causing the flywheel set to speed up and absorb power from the supply system and store it in the flywheel. When the load on the hoist motor exceeds the average, the operation is reversed, the flywheel set slows down and power is returned to the system through the rotary converter.

Pumping

Due to the severe service conditions ordinarily encountered in the operation of pumps in mines, the superiority of electric-motor drive has been more thoroughly demonstrated in this particular industry than in any other. The motors occupy a small amount of space, operate with high efficiency, are easily controlled, and their location in the mine may be limited solely by the work to be done.

Where conditions of extreme dampness prevail, the motors may be so constructed as to be absolutely waterproof. For temporary or intermittent service, portable pumping sets may be used either mounted on trucks or skids, and provided with cables for connection to the feeder or trolley circuit. The use of the electric motor is the only method by which a portable pumping set can be easily and economically operated in mines.

The main pumps are mostly of a large capacity and are used for emptying the sumps where the water from various parts of the mine is collected, either by gravity or by small auxiliary portable pumps. If these reservoirs are of a sufficient size for storing the water during the

day, the large pumps may be operated at night and the load factor greatly improved.

The question whether reciprocating or centrifugal pumps are to be used is difficult to determine offhand. If the amount of water to be handled is small and the head high, the reciprocating pump, Fig. 11, has generally been selected, although modern installations indicate that the centrifugal pump may be successfully used for heads up to 2000 ft. When a large amount of water has to be pumped against a small head, centrifugal pumps, Fig. 12, are always preferable.

Reciprocating pumps are less affected by gritty water, which may cause serious damage to the guide vanes and impellers of centrifugal pumps. The efficiency of reciprocating pumps is also higher than that of centrifugal pumps, but this is partly counterbalanced by the higher efficiency and power factor of high-speed motors employed to drive the latter as compared to the low-speed motors employed for driving the reciprocating machines.

The volume of water delivered by a reciprocating pump can be varied either by changing the speed or through a bypass valve. The latter method is, of course, less economical on account of the waste of water, and speed variation is therefore preferable. In starting large pumps the water may, however, be delivered through a bypass until the motor is up to speed, when the valve in this passage is gradually closed and the water delivered into the pipe system. The load at starting, therefore, only consists of the friction losses, and usually does not exceed 25 per cent. of the full-load torque.

Either Type of Motors May Be Employed

Either direct- or alternating-current motors may be used for driving reciprocating pumps. When of the former class, the compound-wound type is generally selected for single-acting pumps on account of their rather pulsating load, while for duplex and triplex pumps, having steadier characteristics of power demand, the shunt-wound motor is used to advantage. Both squirrel-cage and phase-wound induction motors are suitable, the latter as a rule being selected where it is desirable to reduce the starting current to a minimum or where a somewhat variable speed is required.

Synchronous motors may also be used for driving large pumps of moderate speed, and are admirably adapted for such service, while, on the other hand, their characteristics are such that by over-exciting their fields they may be made to considerably improve the power factor of the system. Bypass valves should preferably be provided on the pumps, when this type of motor is employed, so as to reduce the starting current as much as possible.

In selecting the motor equipment for a centrifugal pump, its characteristics as affected by the service conditions must be carefully predetermined, and in some respects the operating features of this type of water lift are entirely opposite to those of reciprocating pumps.

With constant speed an increase of the resistance against which the reciprocating pump operates, increases the water pressure and, therefore the load on the motor, while with the centrifugal pump an increase of the resistance reduces the load. The volume of water delivered by a reciprocating pump is not affected by the reduction of the head, but the required power is lessened. A reduction of the head with a centrifugal pump, however, increases the volume of water, and as the efficiency at the same time goes down rapily, the load increases. It is, therefore, of importance to know what this overload, caused by a reduction of the head, amounts to and the duration of the same; and the capacity of the motor should, as a rule, be governed by the low and not the high-head conditions.

The starting condition must be given careful consideration in selecting the motors. In starting a centrifugal pump the discharge valve may be entirely closed until the motor comes up to speed, so that the latter may start as nearly light as possible. As the machine accelerates, the water is churned around in the casing, causing the motor to load up as it approaches full speed, when, with pumps of the usual design, it takes from 40 to 50 per cent. of full-load torque to drive it even though pumping no water.

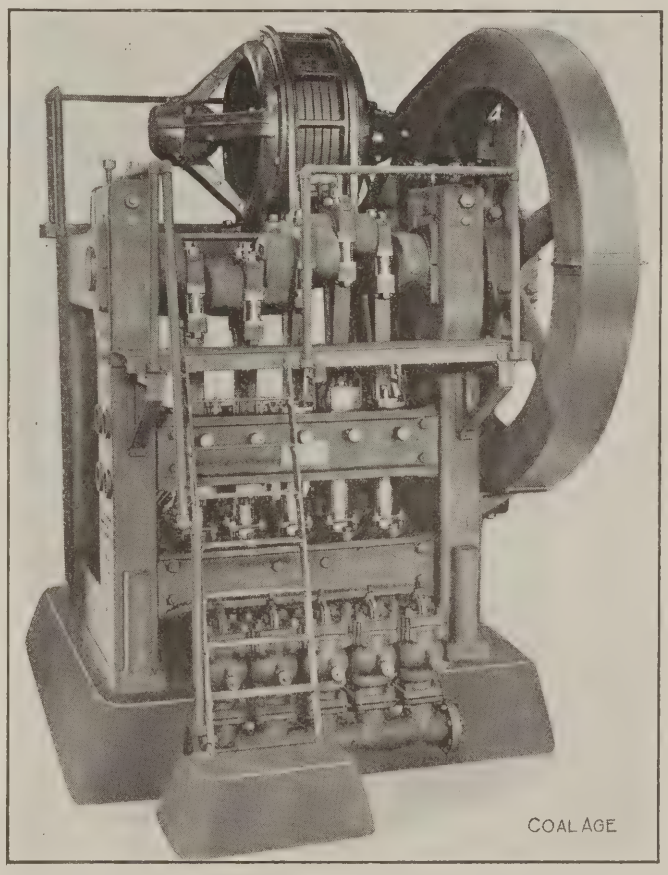

Fig. 11. Motor-Driven Reciprocating Mine Pump

Shunt-wound, direct-current motors and either squirrel-cage or phase-wound induction motors are well adapted for this type of pump and will readily meet the above conditions. A synchronous motor, however, may lead to difficulties unless precautions are taken in designing the squirrel-cage starting winding with a sufficiently low resistance so that it will develop enough torque to pull the motor into synchronism. When this is done, however, the starting current is increased and a compromise must usually be made.

The advantages of electricity for mine pumping are especially evident in the case of sinking pumps. These are intended for being lowered in a vertical shaft when flooded mines are to be drained. They are either mounted on a float or suspended from a cable so as to always operate at the surface of the water. The motors for driving these pumps can be either of the direct- or alternating-

current type, but as they are often liable to be entirely submerged the inclosed induction motor is preferable on account of its simple construction and the absence of moving contacts. In the operation of these pumps the load increases inversely as the head and the motors should be so designed that their efficiency increases with the increasing water pressure.

Ventilation

The ventilation of mines differs somewhat from other ventilation problems, in that a variable air supply is essential, while, on the other hand, an uninterrupted service is the primary requisite. For the latter reason, mine fans should, if possible, be direct-connected to the driving motor, thus avoiding the use of belts. This is entirely feasible and economical with high-speed fans, while with large slow-moving units, changed over from steam to electric drive, the retention of belting is often necessary, due to the difference between the speed of the fan and that which would prove most satisfactory for the motor.

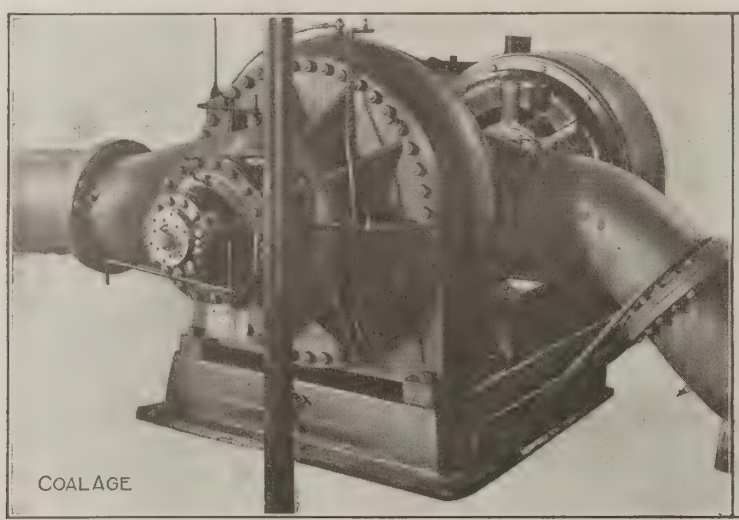

Fig. 12. Motor-Driven Centrifugal Mine Pump

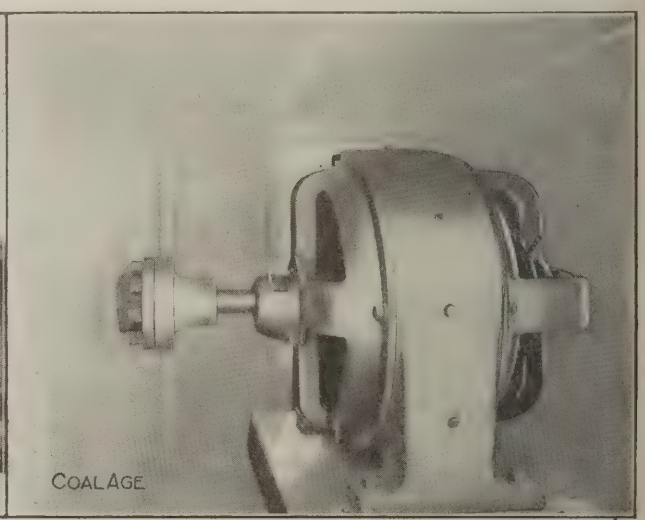

Fig. 13. Direct-Current Motor Driving a Mine Fan

For driving centrifugal mine fans either direct- or alternating-current motors may be used, the choice depending upon the nature of the power supply. The application does not differ materially from centrifugal pumps, the load increasing as the speed rises, and unless some sort of shuttering is provided, the motor will be fully loaded when it comes up to speed.

With a direct-current supply, shunt motors, Fig. 13, are generally used, the speed regulation being accomplished by field control. With alternating current, the phase-wound induction motor should be employed, and in this case the speed control is accomplished by inserting resistance in the secondary winding.

The condition of starting should be considered in selecting the control equipment for mine-fan motors. With large fans, having a high inertia, the time required for acceleration is comparatively long, and the starting resistances for such cases should, as a rule, be of a larger size than that ordinarily required.

Drills

While numerous purely electric drills have been invented and many are in actual operation, their use is, as yet, limited as compared to that of the machine known as the "electric-air drill." The latter is exactly what its name implies—an air drill distinctly, the operating power of which is electricity. It is not, however, merely an air drill driven by an individual electrical compressor, but a complete device—pulsator, hose lines and drill—making a closed circuit in which the same air is repeatedly compressed and expanded, utilizing instead of wasting its expansive power and eliminating all compression losses.

The pulsator is a motor-driven air compressor of unique design—a vertical, duplex, single-acting, self-oiling machine—without inlet or discharge valves, and, therefore, not limited by these parts in either speed or endurance. Motors are used for either direct or alternating current, motor and pulsator being connected by reduction gears. The whole equipment is mounted on a steel truck with wheels which may run on a standard mine track, or may simply roll on the floor in room, tunnel or heading. When used in connection with a track, it may be easily moved on or off the rails or held on an incline by a rope.

Two short lengths of hose form the only connection between pulsator and drill, giving a flexibility to the unit in striking contrast to the usual electrical type, involving a mechanical connection between these two elements. The air in the hose, which is simply a transmitter of power, forms an unbreakable cushion protecting the more vulnerable parts of the mechanism from shock, wear and breakage.

The drill proper is simply an air drill of the utmost simplicity, devoid of all the minor but essential accessories of the usual rock drill, and using the familiar shell and feedscrew. It is the simplest machine of its kind ever built—a plain cylinder containing a piston, mounted on a standard column, shaft bar, quarry bar or tripod.

Coal Cutters

Of the various coal cutters, the chain type is considered the most satisfactory and is in quite general use. The chain is driven by an electric motor and the whole mechanism is mounted on a truck. Through the electric drive it has been possible to make the machine entirely self-propelling, securing a movement from one side of the room to the other, thus completing the cutting in one operation. The cutter is also so arranged that the electric

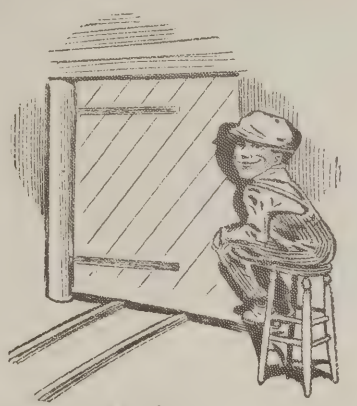
power can be used for unloading, moving to position at the face, loading upon the truck and moving about the mine, making a large saving in time and labor over other designs.

While direct-current motors are generally used for driving coal cutters, alternating-current machines may also be successfully employed. Many important improvements have been made of late in the construction of coal-cutter motors, one of the most important being the gas-proof design which has been sanctioned with the Government's approval.

Auxiliaries

Besides the previously mentioned applications, there are numerous others about a coal mine, in which electricity has played a most important part in improving the working conditions and increasing the output. Among these may be mentioned the various machines used in breakers and tipples, such as crushers, picking tables, screens, conveyors, etc. These are preferably driven by induction motors, either connected to driving shafts or to individual machines. The absence of commutator troubles, which may be aggravated by the severe vibrations frequently encountered in this service, makes such motors preferable to those employing direct current.

The use of electricity for lighting, particularly its employment in the miner's cap lamp, and for signaling and telephone communication, is too well known to need any comment.



Since a trolley wire serves the double purpose of a conductor and a feeder to the moving current collector, it must be of high conductivity, also strong and durable. Trolley wire is generally made of hard drawn copper in three shapes, round, grooved and figure 8. The latter form is not extensively used for two principal reasons. Owing to its unsymmetrical section, it is difficult to handle and to place in position. The nonuniformity in the sections as made by different manufacturers has rendered it impossible to make a uniform style of mechanical clamp for supporting the trolley wire. Trolley wires are seldom made larger than $^1/_0$ or smaller than $^1/_0$, B. & S. gage. They may, however, be made either larger or smaller than these sizes.

The Trapper

Written Expressly for COAL AGE *By* BERTON BRALEY

HE'S only a kid with a grimy face
Who sits by a door all day,
His job's not much of a fancy place,
He'll never get rich that way;
He's deep, deep down from the light and sun,
But he whistles with careless glee,
For the heart of a boy is full of fun
Wherever that boy may be.

So here's to the happy trapper
Whose grin is a full yard wide;
He comes in a small sized wrapper,
But there's pretty good stuff inside!

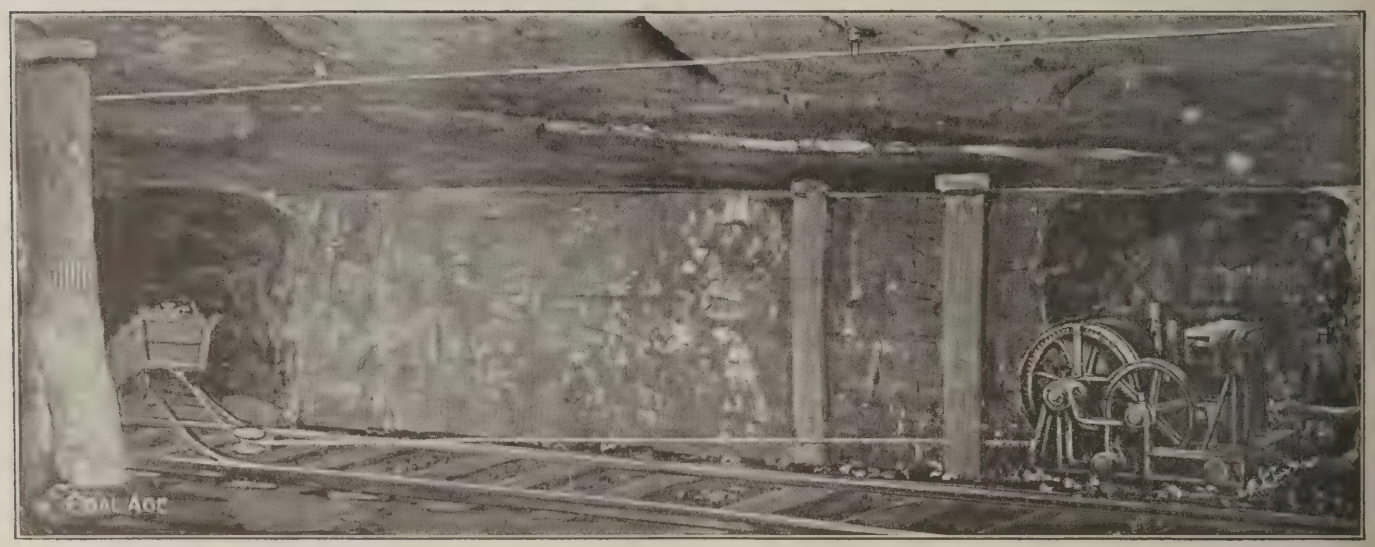
HIS *Grin is a Full Yard Wide.*

His cheek quite often contains a quid,
His language is not refined,
He isn't the Sunday School sort of kid
Not being that way inclined;
He can give and take in the miner's slang
And his wit is far from flat,
And though he runs with a roughhouse gang,
He's a pretty good boy, at that!

So here's to the snappy trapper
Whose impudent ways we know;
He comes in a small sized wrapper,
But give him a chance—he'll grow!

HE *can Give and Take in the Miner's Slang.*

He must "swing her wide" when he hears the roar
Of a mule train coming on,
Or the train may crash on the heavy door
And a first-class mule be gone;
He must watch his work with a careful eye
Lest the air in the rooms grow stale,
And firedamp gather and good men die,
And mothers and children wail.



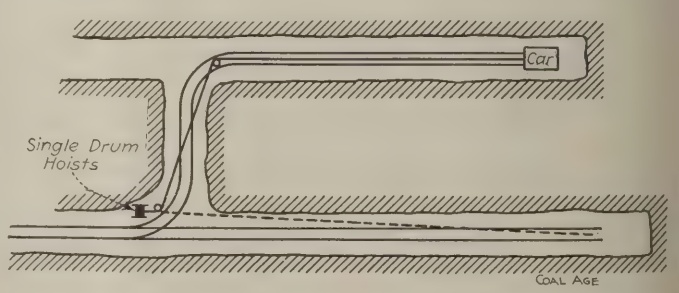
So here's to the humble trapper
And all of his youthful band;
He comes in a small sized wrapper,
But holds men's lives in his hand!

The Development of the Ebensburg Coal Co. Mines

By H. V. Brown

SYNOPSIS—In order to hasten the advance of the mine entries, the headingmen at the Ebensburg mine both cut and load the coal in the haulageways and air courses, placing the cars for loading with the aid of a hoist whenever the grades would otherwise be prohibitive.

Modern progress in coal mining tends toward larger capacities, which must be obtained under conditions that are becoming more and more difficult. To produce large tonnages, especially in the thinner beds, it is vitally necessary that careful attention be given to the development of the headings. No. 1 mine, of the Ebensburg Coal Co., at Colver, Penn., is a good example of a large capacity mine working a thin seam, and the methods employed in its heading development are worthy of note.



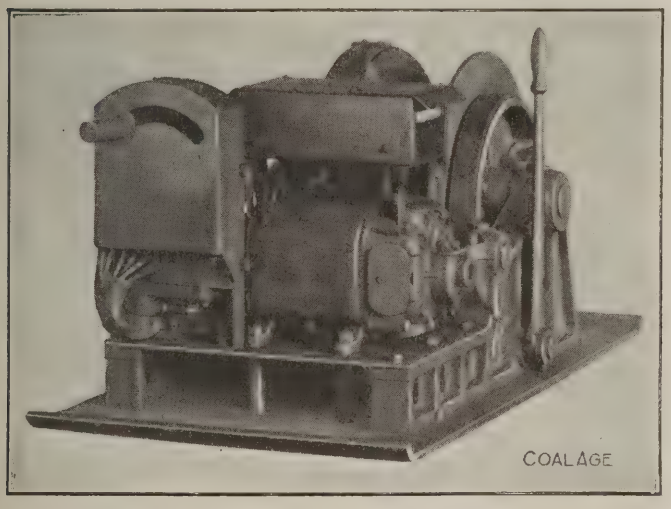
Room Hoist Pulling a Loaded Car Out of a Dipping Back Heading

Development of the Ebensburg No. 1 mine was started in the early part of 1911, this work consisting of the general preliminaries, and the starting of the rock tunnel. About Apr. 1, 1911, coal was reached in the air shaft, also in a slope which was used for the initial development of the mine. Some of the first heading work was done by means of compressed air, which was furnished from a temporary plant. When the permanent power plant was completed in the early part of 1912, careful consideration was given to the problem of obtaining an electrically operated machine, especially suited for heading development work. The Pneumelectric electrically operated coal puncher was adopted for this purpose. The first unit was installed in April, 1912, and more were added from time to time, so that now 42 of these machines are used, practically all on development work. In this time the output of the mine has increased to an average capacity of four thousand tons per day.

Transferring Cars at Entry Face

As the mine progressed, local grades which were encountered on some of the headings made it necessary to consider some reliable method of handling cars at the entry faces. Mules could not be considered, as the mine was electrically operated, and the management felt that it could not use gathering motors without materially retarding the advancement of the headings. It was apparent that a small electric hoist which was readily portable and could be made to serve a pair of headings and so simple that a miner could operate it would best meet the conditions, and the Pneumelectric room hoist was therefore adopted for use in all headings having a grade of over 3 per cent.

The main headings are driven 18 ft. wide, all other headings 10 to 15 ft. and other narrow work, such as crosscuts, etc., being driven 10 ft. wide. Four men are usually employed to drive a heading, its accompanying air course and the necessary crosscuts, and one electric puncher working on the cutting-and-loading system does the undercutting in these places. The machine is, of course, not in use continually, but is always instantly available when there is a place to be undercut. This system of driving headings is much superior to that in which the same machine undercuts in both rooms and headings.



Method of Pulling Cars from Dipping Faces of both Haulageway and Aircourse by a Single Hoist

With such a plan there is almost always a considerable delay in undercutting the heading after it is "cleaned up," because the machine has many other places to serve, also because of blocked roadways and other causes of delay. Too often the result is that the headingmen leave their places, and thus the entry stands idle for that shift. No such delays are possible when the cutting-and-loading system is adopted. The accompanying illustration gives a good idea of the way the electric puncher does its work; one feature which is especially noteworthy being the character of undercut, which assures greatest safety in "shooting," uniform ribs and the best condition of roof, since the charges of explosive are light.

Hoists Operated by Headingmen

The method of using the room hoist is illustrated by the accompanying sketch. The hoist is placed just outside the crosscut and, by means of spool sheaves set on the ties, the rope can be taken to the face in either the heading or air course. When necessary, the empty cars can, of course, be drawn to the face by means of a suitable sheave and jack set near the face. The miners operate these hoists and are thus enabled to take the trip of five or six empty cars, which the locomotive may leave, load them all, and have them back on the heading outside the crosscut ready for the next trip of the motor. Since the rope drum on these hoists holds over 500 ft. of rope, it is only necessary to move the machine and extend the trolley wire when the heading has advanced that distance.

Electric Room Hoist or Car Puller

The advantages of this system of driving headings can be summed up briefly in the statement that the headingmen are never delayed by waiting, either for their places to be undercut or for their loaded cars to be shifted. The time of making the undercut is less, when all things are considered, than in the case of undercutting by pick or by any other type of machine. The net result therefore is that the miner is enabled to spend practically all his working time in shooting and loading the coal, and thus advancing the heading.

That this system works out well is best illustrated by the fact that the Pneumelectric coal punchers and hoists produced, last month, over 17,000 ft. of narrow work, this figure including headings, air courses and crosscuts, but making no allowance for room necks. Stating the figure in another manner, these machines have produced an

The Conversion of Electric Energy into Energy of Compression, and Then into the Translative Energy of the Pick Plunger Is Performed without the Introduction of Any Elaborate or Weighty Machinery

equivalent of over 6700 ft. of heading progress with accompanying air course, crosscuts, etc.

The writer of this article is indebted to T. R. Johns, general superintendent of the Ebensburg Coal Co., for the information forming the basis of this article.

Extracts from a Superintendent's Diary

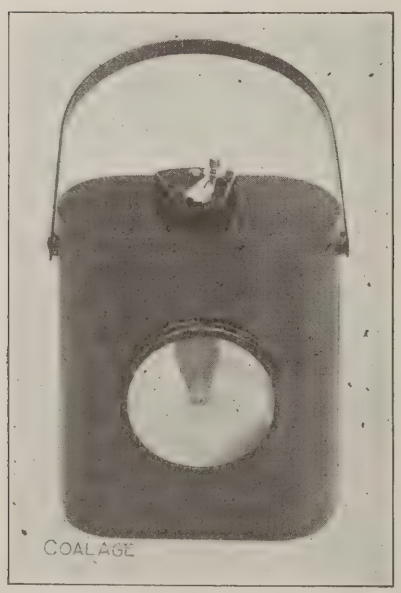
I have never found it possible to lay down a rigid rule of conduct for my own guidance covering the acceptance of gifts. I do not enjoy receiving presents of any kind from any source and never have. They all seem to belong to one of two classes; those given with affection and those given for affection. The givers of gifts that come under the first class can generally ill afford the gifts they make and often inconvenience themselves to a point of embarrassment as a consequence. The ones that come under the second class embarrass both the giver and the receiver eventually.

If it were possible to always determine positively before accepting a present to which class it belongs, it would at least be possible to avoid wounding sensitive hearts, and yet administer telling rebukes occasionally when circumstances demanded; but it is very often not possible to draw the line with any degree of certainty.

Some of our foreign-born citizens are among the worst offenders in the matter of trying to curry favor by means of gifts.

We have one such family in our camp in particular (they are Italians) that has persistently exhausted my patience. So long as their tactics were confined to the men folks of the family, I managed to make the proper allowances, but when the wife and the mother began to work on my wife, I became disgusted. Even at that they have the laugh on me for right now the father is working every day in our blacksmith shop, while two men who are more competent and really worthier are working two days a week, because of the slackness in business.

They began by sending over fruits for my younger children. They are related to an Italian in town who conducts a wholesale tropical fruit business and in conse-



quence they are always well supplied with rather choice fruits. My wife was at a loss to know just how to meet their advances. She did not want to offend them and ended up by doing nothing at all, hoping they would not repeat the occurrence, but they did repeat the incident time and again and gradually varied the gifts to include wines, cheese, etc.

Then followed an exchange of confidences between the women folks and my wife learned that the family were living from hand to mouth, and they should never have thought of making presents out of their meager store. For three months now my wife has been drumming into my ears this family's affairs and when it became necessary to put some of the men on short time last week, fear of what my wife would surely say influenced my decision and I spared the Italian and swallowed my disgust.

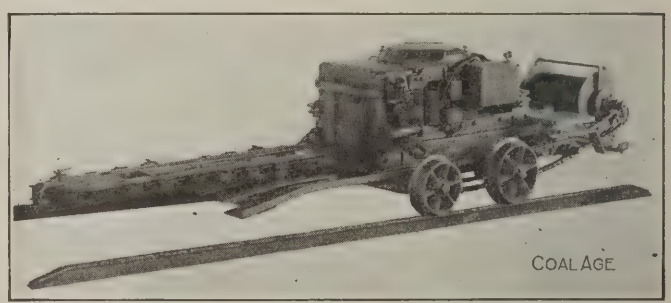
Years ago, when I was a young fellow getting my first experience around mining camps, nearly every man in authority had some kind of a perquisite that went along with his regular salary, and as a matter of course the underbosses who were not so fortunate managed to tack on a few perquisites and did so without any stretching of their consciences. Back in those days my Italian and his family would have been general favorites, and a few fat years would have been sufficient to have enabled them to return to their native land. But now with the word perquisite almost an obsolete term, their future cannot be very rosy. Eventually I will be compelled to get rid of them and each move means for them the entire undoing of all of their carefully prepared plan of campaign, and a reduced fund with which to begin the new assault.

A New Portable Electric Lamp

A novel form of portable electric lamp has recently been placed on the market by H. W. Johns-Manville Co., New York City. The particular feature of this lamp that appeals to the user is the fact that two ordinary dry batteries are used to maintain the light. The advantage of this is apparent, since these dry cells can be procured quickly and readily at almost any point, when it is necessary to replenish the battery of the lamp.

A Portable Electric Lamp

The lamp consists, as shown in the accompanying illustration, of a light tin case, which holds the batteries. A small one-fifth ampere, 2½-volt, tungsten bulb is set in the center of a 3-in., silver-plated reflector. A switch shown at the top of the lamp turns the current on or off, as desired. It is claimed that, with this reflector, the lamp projects a beam of light that renders objects clearly visible at a distance of 100 ft. The two dry cells, it is stated, are sufficient to maintain the light for at least 100 hr.



The lamp is furnished with a handle by which it can be carried or swung on the arm. The weight of the lamp is chiefly the weight of the two dry cells, and is about 5 lb. This lamp is a convenient one for many purposes. It was originally designed for the farm; but has been found useful in coal mines in the pumproom, toolhouse and other shanties, as well as on the shaft bottom. For these purposes it is a very convenient form of portable electric lamp. The price of the lamp complete is $3.50.

A New Tack in Undercutting Coal

By Ralph E. Noble*

SYNOPSIS—The possibilities involved in decreasing the width of the kerf made by coal undercutters of the chain type are here set forth.

Ever since the introduction of successful chain mining machines, the standard kerfs cut have ranged from about 4½ to 6 in. in height.

Narrow-Kerf Shortwall Machine on Reversible Self-Propelling Truck

In the design of the machines in order to use the class of material available at that time for the chains, and frames carrying the same, it was felt that this amount of space was needed. Furthermore, this large kerf was in every way acceptable, since it was a material reduction compared with the undercuts made by punchers or by hand. In some mines the fine coal produced was not objectionable, for the cuttings were used, together with the balance of the output, in making coke or sold as run-of-mine.

However, in certain beds, where the whole profit depended on lump coal, strong objections were raised and efforts were made to cut in the clay or rock underneath the coal measure. Where this was free from grit and fairly soft, good results were obtained, but if hard and gritty, the small amount of undercutting done and the excessive wear on certain parts of the machine made the operation impracticable.

As the use of chain cutters became more general and spread to various fields, much attention had to be given to their development in order to meet the cutting conditions found and much larger and stronger machines were brought out to do the work required. In the anthracite fields, large motor equipments and stronger parts were considered necessary to cut the coal without excessive maintenance cost, and a number of such machines were

*Works manager, Morgan-Gardner Electric Co., Chicago, Ill.

produced and put into operation. These, however, still adhered to the large kerfs.

In certain beds there would be found several inches of free-cutting coal at the bottom of the measure, then a band of rock or sulphur, and then the principal coal stratum. If the kerf was put above the rock, too much bottom was left to take up by hand, while if it was cut in the bottom coal, the bits would hit the band and make the cutting difficult.

Since there has now been put upon the market strong alloy steels, better electrical and insulating materials, bearings, etc., the necessity for making large frames and chains no longer exists. Realizing this, a machine to cut a smaller kerf was developed.

Tests have shown that, at the same rate of feed, the power required is practically proportional to the height of kerf cut; i.e., a 5-in. kerf requires about one-fifth more power than a 4-in. kerf. This is a waste of power which should be avoided, not only for itself, but because the economy is accompanied by a reduced investment in copper for transmission lines.

After studying the problem, it was decided that the kerf could be reduced to 3¼ in., and machines were built for this size of cut. The benefits resulting are manifold, such as lessening the duty and strains on the machine, which increases their life and reduces the upkeep cost; a direct saving in power, copper and bits; being able to cut in the bottom coal and avoid rock bands, sulphur balls, and places that would otherwise be troublesome, and a direct saving in coal, which amounts to a surprising sum in many localities.

NARROW-KERF CUTTER ARM, SHOWING SINGLE-REDUCTION GEAR DRIVE FOR CUTTING CHAIN

For example, a Morgan-Gardner 6-ft., type SA, short-wall mining machine, cutting 200 ft. of face in a day with a 3¼-in. kerf, produces 13 tons of cuttings. If a 6-in. kerf is cut, 24 tons of cuttings would be made, showing a saving of 11 tons in large coal in favor of the 3¼-in. kerf.

Meeting of Illinois Mining Institute

SPECIAL CORRESPONDENCE

SYNOPSIS—Discussions on the relative safety of continuous and alternating current, on the sealing off as against the ventilating of idle workings and on the value of panels for the prevention or the control of squeezes marked the successful winter meeting of the Illinois Mining Institute.

The second annual meeting of the Illinois Mining Institute was held in Springfield, Ill., on Nov. 19, 1914. Two sessions were held in the Council Chamber of the City Hall, one opening at 9:30 a.m. and the other at 2 p.m. In the evening a banquet was provided at the St. Nicholas Hotel.

The Illinois Mining Institute is open to "any person engaged or interested in any branch of mining," and it "has for its object the advancement of the mining industry in Illinois, by encouraging and promoting the study and investigation of mining problems, by encouraging education in practical and scientific mining, and by diffusing information in regard to mining that would be of a benefit to its members." Meetings are held twice each year, this being the fourth semiannual meeting.

About 50 per Cent. of Membership Present

While the attendance was small, less than one hundred members being present out of a total membership of about 180, yet it was a thoroughly representative body of interested men, comprising operators, mine inspectors, representatives of mining-machine companies, educators, practical miners, etc. The keynote of the session was strict attention to business and a desire to make the day profitable to all present.

The meeting was called to order promptly at 9:30 by President Thomas Moses, superintendent of the Bunsen Coal Co., who introduced the mayor of Springfield, John S. Schnepp. He delivered a cordial and brief address of welcome to the visitors.

In the absence of ex-President John P. Reese, general superintendent of the Superior Coal Co., who was to respond to the address of welcome, President Moses called upon W. C. Adams, electrical engineer of the Allen & Garcia Co., Chicago, to deliver his paper, entitled "Electrification of Coal Mines."

Electrification of Coal Mines

Mr. Adams' paper covered the many lines to which electric power can be applied in and about coal mines, paying special attention to electric haulage.

A warm discussion followed the presentation of his paper. It was pointed out that the storage-battery locomotive does not require as large a plant for its operation as a trolley locomotive, there being a light load factor due to the charging on night shifts. In fact, owing to the great demand for power where storage-battery locomotives are being used at night, public-service power is well suited for such locomotives.

Relative Danger of Direct and Alternating Current

The question of the relative danger to men of alternating current and direct current was opened by Patrick Hogan, who stated that danger must be considered as well as efficiency, in deciding whether to use direct or alternating current. Two men were killed in his inspection district by the latter.

John Dunlop, ex-state mine inspector, referred to the deaths of two men from alternating current at the Brewster & Evans mine. These men were killed by the cur-

rent from a supposedly insulated wire. In case of an accident of this kind where alternating current is used, it is necessary to cut the wire or shut off the power before the victim can be freed, so strong is its grip on hands placed upon the conductor.

The discussion was finally closed by a motion that the chair appoint a committee of three to prepare a paper for presentation at the next meeting, on the relative danger of direct and alternating current in mines. It is hoped that by obtaining the joint opinion of three separate authorities, no one point of view will be given undue importance. The committee was not named before the meeting closed.

Panel System of Mining

Mr. Reese, having come in during the discussion of Mr. Adams' paper, was called upon for a short speech, and when the paper of Patrick Hogan, state mine inspector, Third District, Canton, Ill., on the "Panel System of Mining" was read, Mr. Hogan brought out the following points as advantages of the panel over the usual room-and-pillar system:

1. The panel system offers the best facilities for ventilation, next to longwall.

2. Old and abandoned sections of a mine should be sealed and this is easier to accomplish where the panel system is in operation.

3. Gob fires should be closed off. Abandoned room-and-pillar workings, where the panel system was not used, cannot be sealed up, for there is too much to seal.

4. Squeezes cause trouble and expense. The panel system is not proof against them, but if panels are laid off carefully, a squeeze within a panel will not close the haulage road.

5. The haulage system has the main roads in solid coal. There is a concentration of work that gives big trips and a large output from a small territory.

6. Close supervision results from concentration in panels, also a saving in materials and a reduction in accidents.

How to Handle Gas in Gobs

In the discussion following this paper, objection was raised to sealing up large bodies of gas within a panel because of the risk of holing through when working the next set of rooms on the following panel. Of course, the new workings can be kept from approaching the old, but this entails leaving large bodies of coal as barriers between panels. Mr. Hogan thought that such pillars must be left intact indefinitely.

He stated that ventilating the old works would be best were that possible, but a large territory will have many holes due to falls of roof, and that large bodies of gas may accumulate in such places, as the air cannot enter them. Such bodies of gas are a menace to a mine. It may rush out when a roof fall occurs or a fall of the barometer may allow it to flow out or a windy shot may drive it to a point where it may be ignited. A sealed body of gas is not explosive because there is not enough oxygen present to provide combustion.

A Gob Which Defied Ventilation

J. W. Starks instanced a case at No. 11 West Frankfort where the room-and-pillar system was in use. A bad top caused a squeeze that left some 10 to 15 acres in such a condition that it could not be ventilated and became filled with gas. Concrete walls were built to close it in and stood for five or six years. A pipe leading from this area showed that the gas had finally been rendered harmless by blackdamp. The walls were blasted out and the workings laid out in panels. Mr. Starks recommends the sealing of such areas, seeing that it is impossible to ventilate them.

President Moses explained that he had to deal with some 30 to 40 ft. of soft shale above a coal, with a solid stratum above the shale. Large cavities were formed and these became filled with gas. A disaster would have resulted if the gas had been allowed to enter the working portions of the mine. Such gas, in any event, should be carried away from the men by a gas entry, regardless of whether the panel or room-and-pillar system is used. This is the practice in western Pennsylvania.

Panels Limit but Do Not Prevent Squeezes

Mr. Reese stated that his company is operating large mines on the panel system. It does not prevent squeezes and his mines have had many which were the occasion of much expense. A total of at least twenty have occurred in two mines. None of these squeezes ever came over the haulageway. The squeezed panels are sealed off by two or four stoppings.

In his mines he finds that an extraction of 60 per cent. of the coal brings on squeezes, so only half of the whole seam is taken now in hope that this trouble can be avoided. Mr. Reese claims that at least as much coal can be extracted by the panel as by the room-and-pillar method, while the panel system has a great advantage in ventilation. But the haulage is more expensive in panel than in room-and-pillar workings, this being due to the long distance, nearly 1500 ft., over which a mule must haul coal while developing up to the first room in the panel.

New Officials Elected

The afternoon session was opened at 2 p.m. as a business meeting. Officers were elected for the coming year as follows:

President, J. W. Starks, state mine inspector, Fifth district, Georgetown, Ill.

First vice-president, W. M. Burton, Herrin, Ill.

Second vice-president, F. S. Phaller, Belleville, Ill.

Secretary and treasurer, Martin Bolt, chief clerk of the State Mining Board, Springfield, Ill. Mr. Bolt has held this position ever since the Institute was organized.

Executive Committee—John Dunlop, Peoria, Ill.; Patrick Hogan, Canton, Ill.; John Bohlander, Pekin, Ill.; John P. Reese, Gillespie, Ill.; J. S. Reid, Cartersville, Ill.

John Bohlander is president of the State Mining Board and Mr. Reid is state mine inspector of the 12th district.

It was decided to hold the next meeting at Danville, Ill., at the time fixed by the constitution, which is May, 1915.

Following the business meeting, a paper was read by R. M. Gambol, of the Hirsch Electric Mine Lamp Co., Philadelphia, Penn., on "The Advantage of the Electric Cap Lamp for Coal Miners." A number of questions were asked and answered concerning the details of the Hirsch cap lamp, and the session adjourned for the afternoon.

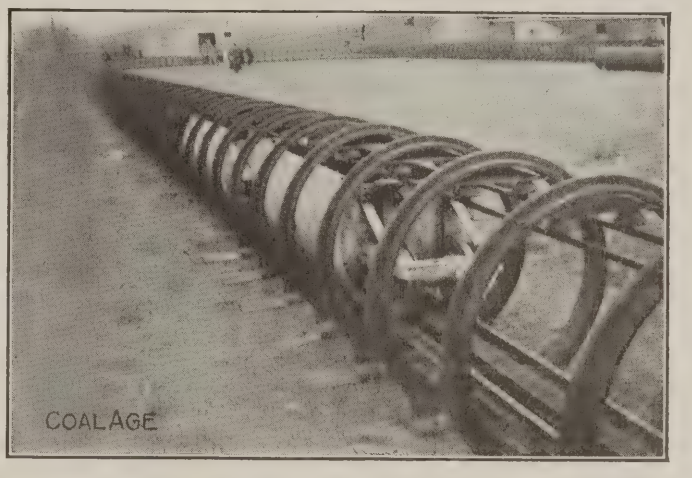
Banquet

The banquet was held at the St. Nicholas Hotel at 8 p.m., with Thomas Moses as toastmaster and 49 members present. Patrick Hogan favored the party with a few songs. Short talks were made by John Bohlander, Prof. H. H. Stock, of the University of Illinois, F. W. De Wolf, state geologist, Charley Kane, Martin Bolt, David Ross, and others.

A New Type of Electric Locomotive

By Frank H. Kneeland

SYNOPSIS—The basic principle of the induction motor applied to a locomotive produces a machine which is independent of grades and the adhesion of wheels to rails.

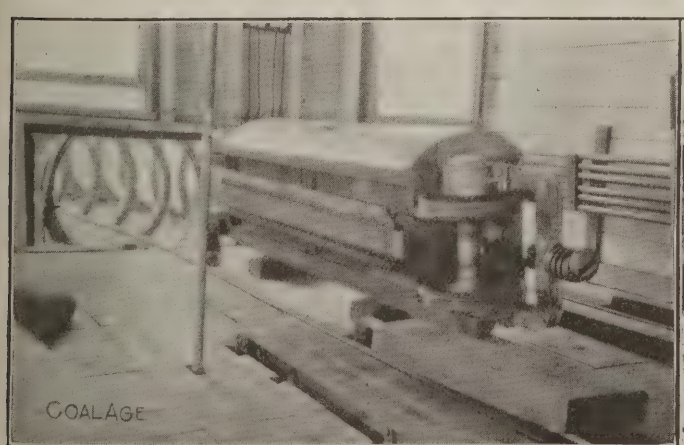


We are all accustomed to think of the electric motor as a machine for revolving a shaft. In this construction the elements of the rotor receive electrical energy and moving through space and time transform it into mechanical power. The construction is such that the parts travel in circular paths around the shaft of the motor. It is perfectly possible, however, to so construct and arrange the stationary and moving units of the ordinary motor as to get a motion in a straight line.

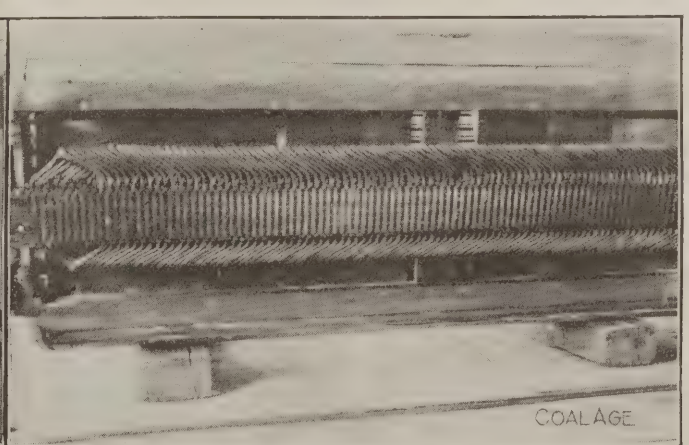
Take as an example the common induction motor with which all coal-mining men are familiar. Suppose that we cut the rotor and stator in two and straighten each element out, supporting them in proximity to each other, leaving the customary air gap between them but in such a manner that one is held stationary while the other is free to move in a straight line. Now should we pass the electric current for which the machine is wound through the device in the ordinary manner, a motion would be induced in the movable part relative to the stationary one. The speed of travel in this case would be exactly the same as the circumferential speed of the rotor in the ordinary motor.

Now to carry this idea a step further toward practical application, let us support the stationary element of the device between the rails of a track, and carry the moving element beneath the truck of a car traveling thereon, maintaining a suitable air gap at all times between these two elements. Now when both elements are suitably energized from a source of current supply we have an electric locomotive which is absolutely independent of grades and the friction between wheel and rail. This machine will travel along the track at a practically uniform and predetermined speed, regardless of grades, curves or other obstructions.

This is the fundamental idea which is embodied in the apparatus, the patents for which are controlled by the Electric Carrier Co., of No. 220 Broadway, New York City. This firm has constructed a demonstration plant at Paterson, N. J. This plant was built, however, with the primary idea of demonstrating the possibilities of this method of transportation in the handling of mail or express matter underground in large cities, and consequently differs radically in detail from that which would be employed in coal mining.



Two phases of the 100-volt, 55-cycle, 3-phase current are carried by overhead conductors which make contact



Locomotive and Trailer on Demonstration Track at Paterson, N. J.

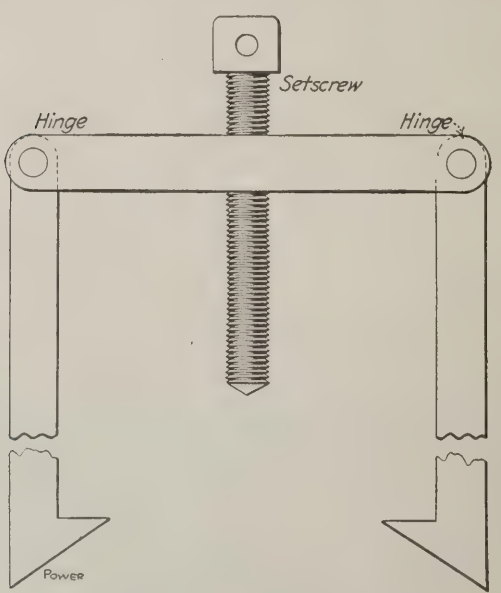
with suitable shoes upon one end of the locomotive. The third phase is taken by the rails and the stationary element in the center of the track, which in this case correspond in general construction to the rotor of the induction motor. The moving element which is carried on the bottom of the car is equivalent to the field of the ordinary induction motor, and in this plant is composed of 12 poles. The wheels of the truck are, of course, practically independent of all electrical connections.

The lineal speed of the machine is uniform, or as nearly so as the revolutions per minute of the induction motor under load. This speed is determined by the pitch of the poles on the moving element and the frequency of alternations of the current. A reversal of one phase of the current reverses the direction of travel of the locomotive.

Bottom View of Locomotive

Nearer View of Locomotive Windings

The air gaps maintained between the stationary and moving elements of the device may be varied between say ⅛ and ½ in., the only difference in operation being a difference in the power factor on the system.



It will be at once evident that a system of this kind presents a wide range of possibility. On adverse grades or heavy curves the stationary, or track, element may be constructed with heavier copper, and the impressed voltage increased, thus augmenting the pull where such an increase is necessary. On favoring grades, where the speed of the locomotive and trip tends to increase, when a velocity 5 to 10 per cent. above synchronism is reached, current is generated and returned to the line. This on down grades offers a braking effect to the movement of the trip, which is practically ideal.

This system may be built to be operated either in the ordinary way with a motorman upon each locomotive, or each car may be run entirely automatically. The former would probably be the more preferable method in coal or metal mines, while the latter lends itself readily to the transportation of mail matter and express in cities.

As stated above, the operation of this device is independent absolutely of the friction between wheels and rails. As a result, loads may be successfully handled upon either favoring or adverse grades which would be utterly impossible for the ordinary mine locomotive. Inclinations of 20 to 30 per cent., or even higher, may be negotiated without the slightest difficulty, while on systems which have a general down grade favoring the load, a considerable amount of power may be generated and returned to the system, balancing that required to haul the empties back up the hill.

Clamp for Safety Valve

A clamp for a safety valve to prevent its opening when applying a hydrostatic test to a boiler is described by Wrightson in *Power* for Nov. 3 and shown in the accompanying illustration. The clamp is placed over the valve, the arms hooked under the valve body and the setscrew set down on the spindle, preventing the disk from lifting. This saves the trouble of increasing the tension on the spring and resetting to the right pressure after the test.

Adjustable Valve Clamp

COMING MEETINGS

The American Mining Congress' seventeenth annual session will be held at Phœnix, Ariz., Dec. 7, 8, 9, 10 and 11, 1914. J. F. Callbreath, secretary, Denver, Colo.

The Coal Mining Institute of America will hold its winter meeting Dec. 8 and 9, 1914, at the Fort Pitt Hotel, Pittsburgh, Penn. Charles L. Fay, secretary-treasurer, Wilkes-Barre, Penn.

The West Virginia Coal Mining Institute's winter meeting will be held at Huntington, W. Va., Dec. 9, 10 and 11, 1914. Prof. E. N. Zern, secretary-treasurer, Morgantown, W. Va.

The American Institute of Mining Engineers will hold its annual meeting in New York City, beginning Feb. 16, 1915. Bradley Stoughton, secretary, New York City.

Who Are "Brokers" under the War Tax Bill?

The provision of the War Tax Bill of Oct. 22, 1914, for levy of a $20 tax on "commercial brokers," promises to raise controversies as to just who fall within that term, since the same question arose frequently under a similar provision in the War Tax Bill of 1898. Under the latter measure it was decided by the Commissioner of Internal Revenue that persons who were employed by a coal company to negotiate sales for it on a commission basis were not subject to tax as "brokers"; it appearing that they were regular employees. The ruling in this case conformed to other decisions of the Commissioner to the effect that a "commercial broker" was one who, without being an exclusive agent, made a business of negotiating sales or purchases for others on commission, without taking title or possession of the goods. Since there does not appear to be any good ground for reaching different conclusions under the present bill, it is a fair assumption that the same rulings will be made under it.

Luzerne, Penn. (mail, Homer City, Penn.)—Nov. 30, 1914. to Jan. 23, 1915.

Erratum

The account of the Royalton Explosion published in our issue of Nov. 7, 1914, should have stated that the disaster occurred on Oct. 27 and not on Oct. 29.

If heat be developed in an electrical conductor faster than it can be dissipated from its surface by radiation and convection, the temperature will rise. The allowable rise in temperature is one of the limiting features of the current-carrying capacity of any conductor, since the rate at which heat will be dissipated will depend upon many conditions, such as the size and structure of the conductor, the kind and amount of insulation, if any, and the location with respect to other bodies. It is not possible to give any general definite rule for carrying capacity that will be true for all conditions.

Who's Who in Coal Mining

Everett Drennen

There is a young fellow down in Virginia who has accomplished quite a lot since he first became engaged in coal mining—about seven years ago. His name is Everett Drennen, and he first saw the light of day out in Minneapolis, about the year 1881. He's quite a bashful, backward sort of chap; so it is hard to understand just how he came to inject himself so violently and so deeply into the coal industry. However, he's there with both feet, and that's about all that counts in these days of dealing in actualities. Furthermore, we can't complain about

Everett Drennen

Everett's presence among us, for we are obliged to admit that the coal-mining business is all the better because of his activities.

After finishing the usual course of study in the public schools, Everett somehow or other managed to register himself as a student in the engineering department of the University of Michigan. Two years of study at the Ann Arbor institution satisfied him and he showed up next at Cornell—that far-famed knowledge factory situated midst the quiet scholastic atmosphere of lake and mountains in the central part of New York State. Just three years later he emerged from the classic halls of Cornell with a sheepskin credential tucked snugly under his arm.

Everett's first work was out in Ohio, where he spent a few months building roads for the Commissioners of Belmont County. However, this line of engineering did not hold attraction for him, so when an opportunity presented itself in the coal fields of West Virginia, he was quick to accept the chance, and in October, 1907, we find him serving the Fairmont Coal Co. as superintendent of their power and mechanical departments. In this position he was in charge of all the electrical and mechanical equipment of 47 operating mines. It isn't necessary to dilate on the value of the experience he gained while holding this position; suffice it to say there can be no doubt concerning the quality of the service he rendered, for in 1909 he was advanced to the position of superintendent of the entire power and mechanical departments of the Consolidation Coal Co., having charge of this class of work in all the company's mines in Maryland, Pennsylvania, West Virginia and Kentucky.

While filling this last mentioned position, he also served as general manager of the Fairmont Mining Machinery Co., consulting engineer of the Monongahela Valley Traction Co. and managing director of the Black Diamond Products Co., all of Fairmont, W. Va.

From March, 1913, to June, 1914, Everett was actively engaged in managing the 14 mines of the Consolidation Coal Co. in the Elkhorn division, Jenkins, Ky. Other duties which he assumed at this time were vice-president and director of the First National Bank at Jenkins, director in the Bank of McRoberts, Fleming, Ky., president Sandy Valley Light & Power Co., director of the Prestonburg Light Co., director of the Paintsville Water & Light Co., and director of the Standard Tie & Mfg. Co.

In June of the present year, Mr. Drennen was appointed vice-president and general manager of the Stonega Coal & Coke Co. at Big Stone Gap, Va. This corporation is one of the largest producers of coal in this Virginia-Kentucky territory.

One of his most notable achievements was the construction of a 10,000-kw. steam-electric turbo-generator central power plant for the Consolidation Coal Co. at Jenkins, Ky. Other large central plants that were built under his supervision are at Hutchinson, W. Va., Van Lear, Ky., and Fairmont, W. Va. He also accomplished some notable results in the construction of two three-phase, 40,000-volt transmission circuits for the Consolidation Co. One of these lines was in Kentucky and is 40 miles long; the other line is in West Virginia and is 25 miles in length.

In 1911, while connected with the Consolidation Coal Co. at Fairmont, Everett conceived and developed the idea of the Jeffrey-Drennen turret mining machine. It was about this same time that he organized the Standard Tie & Mfg. Co., at Fairmont, which developed the well known Fairmont steel tie.

Mr. Drennen is a member of the American Institute of Mining Engineers; he is also a member of the West Virginia Coal Mining Institute and the Kentucky State Mining Institute. Few young men connected with the American coal industry have accomplished more, or advanced so rapidly to a position of such high trust, as Everett Drennen.

Editorials

The New Haven's Purchase of Canadian Coal

Announcement has been made that the New Haven R.R. has contracted one-half its annual requirements at Boston, or approximately 200,000 tons, with the interests that ship Provincial coal, and there is now a well defined rumor that the Boston & Maine has closed a similar contract for about 75,000 tons for delivery at the same point. These two items have occasioned a great deal of comment unfavorable to the new officials of the two railroads in question.

The New Haven deal is especially significant, and in the view of many is bound to be heard from in months to come. A great American railroad dependent for its earnings on the general prosperity of the country has placed a large contract with a foreign corporation operating mines in a foreign country. This would be bad enough by itself under ordinary conditions, but to do it at a time when the American coal trade is almost stagnant, when mines in West Virginia and Pennsylvania are shut down for lack of business, and American shippers are resorting to every known expedient to carry them over one of the softest markets they have experienced in years, is exasperating in the extreme.

Particularly is this so when it is remembered that the coal from Cape Breton Island cannot compare in heating value with any of our recognized grades; it is well known that the steadily increasing discrimination against fuels that are too high in ash or low in fusing temperature has resulted in a consistent restriction in the markets for these particular coals.

Portland and Boston are the only centers where Cape Breton coal is imported in any quantity, and in 1913 the entire tonnage received at Boston was only slightly over 265,000 tons, 40,000 tons less than in 1912, and less than 5½ per cent. of the total tonnage of bituminous received by water. In other words, the New Haven R.R. buys for half its Boston requirements a coal that practically no other steam-user feels he can afford; in addition to this it is buying foreign coal, which inevitably deprives the American mine worker, operator, railroad and vessel owner of their fair share of participation in an American contract. In fact, it affects even the market for supplies at the mines where the coal might originate.

There are some very pertinent questions that might be asked in this connection. For instance, the Cape Breton coal entered at Boston has been exclusively for one of the large gas-producing companies, under an old, and what has been understood to be, a long-term contract, and the gradual reduction in the shipments from Louisburg and Sidney was due to the larger tonnages received each year from West Virginia and apparently the same holding company controls both the mines and the gas company. This particular holding company is not only engaged in the mining of coal, but in the shipping, the transportation, and the sale of it.

The New England Coal & Coke Co., which sold the Cape Breton coal to the New Haven, is controlled by the same interests that dominate the gas company, which has been practically the exclusive customer for Cape Breton coal in the Boston market. The president of both of these is a prominent and conspicuous member of the executive committee of the board of directors of the New Haven R.R. This savors strongly of "interlocking arrangements"; it certainly looks as if the New Haven director had been transacting business with himself in the person of the coal company and gas company president; and ordinary citizens are wondering if antitrust acts apply. This, we remember, is the *"reform management"* of the New Haven R.R.!

Careful consideration of the subject leads one to the inevitable conclusion that the New Haven's poor orphan, the Boston & Maine, is making up the difference between the 200,000 tons the New Haven bought and the 275,000 tons or so the gas company has usually taken. Did the gas company want to be relieved of an undesirable obligation? Is the New Haven once more to be the goat?

Presidential Conciliation Boards

On Sept. 5 the President sent, unsigned, to the operators of Colorado, a paper entitled "Draft of a Tentative Basis for the Adjustment of the Colorado Strike." With it was forwarded a letter signed by the President containing the following enigmatical statement.

> Two representatives of the Government of the United States have been actively engaged in investigating the whole situation. . . . The result of their investigations and of their very thoughtful consideration has been the drafting of the inclosed "tentative basis for the adjustment" of the strike.

It seemed to us then that this paper while outwardly appearing to be approved by the conciliators, Davies and Fairley, was really written by the President. We wrote to Hywell Davies to ascertain the facts on Oct. 2, and up to the present no answer has been made except in the morning papers of Nov. 30, where we read under the President's signature, the following clearer statement of the events as they actually happened.

> After long waiting, therefore, and the disappointment of many hopes, I ventured, after taking counsel with representatives of the government who had been on the field and made themselves thoroughly familiar with all the circumstances of the case, to propose a plan of temporary settlement.

So it is clear that the proposals, declared from end to end of the United States to be those of the conciliators were not theirs at all but were written and should have been signed by our absentee President. Apparently Davies and Fairley never reached an agreement or if they did, the President did not like it and prepared an independent paper.

But now another board of conciliation is proposed with three members. One is Seth Low, a man who will give the decisions of the commission some weight. He was mayor of Brooklyn, 1881-85, president of Columbia University, 1890-1901, mayor of Greater New York, 1902-03,

and delegate to the Hague Peace Conference, 1899. He is now trustee of the Carnegie Institute at Washington and president of the National Civic Federation. Moreover, he helped to settle the Anthracite Strike, being one of the conciliators named by President Roosevelt.

With him on the committee are two lesser lights, one of whom is Patrick Gilday, president of the second district of the United Mine Workers of America and resident of Morrisdale Mines, Clearfield Co., Penn. He is an agitator who has some merits. It is true he has been unable to make his followers in the second district keep their contracts but he has been in favor of a fining system which he trusted would make the miners keep their engagements.

The third man, Charles W. Mills, is being widely heralded as an operator and he is, in some measure, entitled to that distinction. We cannot say we know much about him, but we learn he is general superintendent of mines at Somerset, Penn., of which he is in part owner. These mines are small; one produced 45,757 tons and the other 2752 tons in 1912.

The larger mine is ventilated by a 7-ft. fan, the smaller by a furnace. No machines were used in the mine in the year 1912 and the power was all furnished by horses or mules. No permissible powder was used, and in the larger mine, the ventilation was not satisfactory to the inspector on the occasion of his last visit in 1912. In the smaller mine the ventilation was fair. While No. 1 mine had defective drainage in some headings, the drainage was good in No. 2 Mine.

One man was killed in 1912, which is equivalent to a loss of about 12 men per thousand or a fatal accident for less than 50,000 tons. The rate for the inspection district is about 2.8 men per thousand or a fatal accident for 334,089 tons. Of course, as only one accident occurred, no far-reaching conclusions should be drawn from the one fatality as has too often been done by the Pennsylvania Department of Mines.

This is all the information we can find about the operating appointee of the president except that he is a partner of the firm of Swayne & Mills, and that the mines in which he has interest and which we have just described are operated by the Climax Coal Co. He was appointed a conciliator in the Westinghouse strike last June and in the Kanawha, W. Va., strike.

By looking back to our files of July 4, 1914, the reader may see that both Gilday and Mills reported in favor of the checkoff, if they can be said to have come to any conclusion at all because they offered the miners a choice between alternatives, one of which proposed the formation of another commission to do what Gilday and Mills had avoided doing, though appointed for that purpose. They sidestepped the issue apparently as gracefully as that other partnership, Davies and Fairley, which has now been removed to make place for Low, Gilday and Mills.

We have not chosen to point to the report of the Climax Coal Co. out of any malice. The important matter to the public and Colorado is that a man has been chosen whose mines have, perhaps by chance, been shown not to be uptodate or leaders in safety. Charles W. Mills may be a most estimable and capable man, but we think it would have been well in view of the clamor which has willfully dubbed the operations of Colorado as being unsafe and inefficient, to have put an operator in the conciliation board who would have been able to point to his own mines as an evidence of what might be done by wise counsels and due care. That judge is indeed in an unfortunate predicament when the man who appears before his bar has a clearer record than his own.

A Welfare Association

Some time ago, May 23 of this year, we wrote an editorial entitled, "A Trust in Virtue." Such a trust we see has been started in Colorado. We hope it will be found in every coal-mining state of America and will be imitated by the unions.

The United Mine Workers of America make much sport of this new movement in the editorial columns of their journal. They say it shows that the laws have been violated. It does truly show that some of the operators, like some of the miners, are crooked. If the miners would spend the same time, energy and money in rooting out these people as the new association purposes to do, it would throw a bright halo over unionism. Then violence, dishonesty, violation of contracts and needless agitation would pass as a dream.

The miners can do it, and if we thought the United Mine Workers of America or any other body had half the virtuous determination of this new body known as "The Coal Mines Welfare Association," we would herald the renovated union as a new ray of hope in a sadly perverse world.

Here are the words showing the purposes of the organization. It is intended to "promote the welfare and safety of the employees of the members, to assist in the enforcement of all laws pertaining to coal mining, and to promote the accurate weighing of coal on the basis of which the miners are paid."

Let us quote what we said before on this matter because we believe it shows what the new association can and will do.

> It is necessary, therefore, that there should be a strong attempt among all right-thinking, right-acting corporations to bear on all those who use their men wrongfully and who do not seek safety in operation.
>
> There are several ways in which a union of operators, a trust of virtue, could be formed, which would make everyone, operator, miner and public, better satisfied. The agreement of the operators is made as a result of their combined effort; but never do those same coal-mine operators join hand in hand to force all the members of the organization to keep the agreement to the letter.
>
> We would urge that all the associations of operators use their coercion not only on their employees, but on themselves, to the end that the agreements made shall be kept to the letter, and to so modify those agreements that unsanitary and unsafe conditions in camps and mines may not be possible.

Let us request the United Mine Workers of America to formulate a similar program and hold meetings for the purpose. It is time that that organization also spent some energy in house-cleaning instead of devoting its time and efforts wholly in correcting the faults of others. Like many people with much work undone and needing doing, it persists in reading the Golden Rule to others and neglecting its observance itself.

The men in control of the new operators' organization are as follows:

> Incorporators—John M. Osgood, president of the Victor-American Fuel Co.; S. M. Perry and C. L. Baum. Directors—George C. Manly, C. L. Baum, S. M. Perry, G. F. Bartlett, D. W. Brown, president of the Rocky Mountain Fuel Co.; J. F. Welborn, president of the Colorado Fuel & Iron Co.; S. S. Murphy, George D. Kimball and D. M. Harrington.

Sociological Department

A Plea for the West Virginia Miner

By Margaret Walker Jordan*

SYNOPSIS—The writer, a settlement worker who has had experience in various lines of work, pays a visit to the "Winding Gulf" section in West Virginia and gives a description of her trip, explaining the needs of the mountaineer miners.

In the course of my studies at Columbia University, I heard much of Ellis Island, that door of hope to the yearly increasing multitude of immigrants, and much concerning the obligations which we owe to these our foreign brothers.

Ellis Island, however, is not the only place that challenges our sense of duty to our fellowman. Being a native of the Southern Alleghany mountains, where the purest Anglo-Saxon blood of the world is found, and where in recent years, with the opening of vast coal operations, communities have suddenly sprung up with their attendant chain of serious problems, both social and economic, I am naturally strikingly impressed with a sense of duty to our brother in that section, and I have been wondering what we are doing to uplift him.

Boys of the King Arthur Club

These boys cleaned up that part of "Winding Gulf" which flows through the mining village of Tams

Bright Little Foreign Youngsters

The girl with the child speaks five distinct languages, and with all the others should make the best type of a citizen

The Mountaineer's New Environment

The man who makes up the mining population of the West Virginia camps is of a type which for generations had been isolated in the mountains, where hunting wild game and chopping timber "offen his patch" were the only sources of livelihood. But today his patch is no more. An absentee owner cut the timber from the whole range and sent the mountaineer with pick and shovel under the surface to dig coal.

Literally buried from sight of sun and progress, no one seems to know him. Little thought had been given to his welfare and uplift, until a strike followed by bloodshed brought him prominently to attention. Then the declaration of martial law in West Virginia, followed later by the memorable occurrence in Colorado, which now occupies so much of our attention, made the miner, his life, conditions and surroundings the topic of the hour. The world generally does not know of these people, and what is more, few people have seemed to care to investigate.

I was particularly fortunate in getting my information first hand in the field itself. My sense of fair play was aroused by the false opinions and unjust criticisms of people who know nothing of the actual situation in these mining communities. I realized that the only way to learn and know conditions is to *live* in them. Therefore, with the twofold object of both learning and improving their methods of life, I went into several of the typical mining towns. I took with me two special teachers in home-making with a view of securing the confidence and interest of parents through effective work with the children.

The coal operators were favorably inclined toward the experiment. Owing to my inexperience, I could outline the work only vaguely in the beginning. But from the day of our arrival, we aimed to bring something of happiness, contentment and economy into the homes of the community. We saw at once that the situation would demand tact, patience and, above all else, no outward affiliation with the company itself, for the operator as an operator is sincerely hated.

Social Experiment on "Winding Gulf"

The place we chose for the beginning of our work was on a branch of the Virginian R.R. known as the "Winding Gulf." Four years ago it was virgin forest, but now little mining towns have sprung up like mushrooms all along the steep, denuded mountain sides. We were to work in a series of three of these towns, strung along the "Gulf" about two miles apart.

*No. 4406 Walnut St., Philadelphia, Penn.

Thus it was that on a hot August day, three university girls found themselves in a dirty little street of a dirty little town, surrounded by dirty little children and grunting pigs. The question of at least temporary accommodation was soon solved. We approached the one building which was somewhat more pretentious in size than its neighbors. We assumed the role of teachers and began to organize sewing and kindergarten classes. In this way we finally got started, though at first we had considerable trouble.

The Men More Approachable Than the Women

Our calls on the neighbors began immediately. Most of the faces were unsmiling and stern, but they showed us the hospitality of "have a toter stranger." One dear woman wished us "succession;" another showed us her photographs. One man proudly brought out the gun and hound which he had received in exchange for his last wife. We became acquainted and our room on the third floor of the boarding house became a classroom. Boys up to 30 years old came to that "kindergard" school.

With their help we cleared the space for a playground. Their fathers moved the heavy timber left by the lumbermen and built swings. Later, this cleared space was used not only by the children, but as an assembly room for evening socials and outdoor classes. This work in the other two towns was carried on along similar lines and always with patience and with almost immediate interest and enthusiasm on the part of the children.

With the women we were not so successful. A coal town is of necessity dirty. Water must be carried and housework is not systematized. Payday was announced every two weeks by the drinking of whisky, playing of cards and the flourishing of pistols. On these occasions, we kept a nightly watch, sitting on the edge of our wire cots very close to our thin, lockless door. The hours never dragged at such times, for our men folks liked a good time. These little amusements made our lives interesting, and at times exciting. Besides, the condition of the food and the wretchedness of the sanitation offered little to make living pleasant. Accordingly, we were glad to find in the next town a fairly comfortable four-room house.

The valley consists of a creek with a railroad on both sides. The mountains rise almost perpendicularly; the sun beats fiercely down at noon and in the evening drops quickly behind the mountains. Often while walking home from work along the lonely stretches of the valley in the somber dusk we, with faces blanched with fear, would pass negroes or Italians. At such times we would bolster up courage by humming a tune, the favorite being "I've been working on the railroad." But no matter whom we met, the "howdy" was always passed and the hats would invariably come off. In time, we became known by such names as "Mrs. Teachers Nice" or "Quality Ladies." The distances we had to cover took much of our time and energy. This gave us much concern, for we saw an ever increasing number of things to do, but we realized our time and strength were limited.

Even Providence itself seemed at times to be allied with other forces in trying our mettle, for we continually worked under great difficulties, and it was only our ability to see the amusing side that often saved the situation.

Difficulties in Overcoming Conservatism

In one town the building which we expected to use was not completed; an available schoolhouse was too small; another school was closed on account of diphtheria. In that same town, a well equipped building which was offered to us burned. Drizzling fall rains and the earliest snows for "well nigh forty years" made walking bad and a playground impossible. In addition to these handicaps, there was marked opposition from local mountain teachers and school boards who had never heard of manual training, domestic art or science.

Naturally, then, we were forced, on account of this opposition, to confine ourselves to evening club work. We taught something, of course, and sowed the seed for effective future work, but we learned much more than we ever taught, and undoubtedly received more than we gave.

One of the Many Seventeen-Year-Old Mothers

Schoolhouse "Steps" in West Virginia

We were forced to admire the conservatism and shrewd native ability of the mountaineer. We saw at once that knowledge for him must be simple, definite and shorn of all artificialities. The domestic science of a white marble kitchen left me somewhat at sea when I found myself equipped with nothing but a "two-eyed coal stove" and a frying pan. I didn't give up, for I realized that much is spent unwisely in equipment and that the problem of more wholesome and attractive food and greater efficiency and economy in cooking were to play a vitally important part in the ultimate success of the work which I had undertaken.

At this stage I realized that I was fortunate in having the coöperation of Mrs. Hanna B. Scott, of Philadelphia, whose 40 years of experience in teaching the wage-earner better and more economical cooking and homemaking, have made her recognized as an expert authority in this

important work. The interest which her remarkable demonstrations aroused in the community among men as well as women, employers as well as employees, gave me a new light and inspiration on the great ultimate possibilities of such work in a field like this.

The Lack of Ambitions and Desires

Before anything can be taught, even to children, the desire to *want* must first be instilled. We want because our neighbors *have,* but in this community, lacking the education of environment, even that of the newspapers and department store windows, there is little to want. Your neighbor lives as you do. Life down there is a very simple, very elemental process. The people talk little, and they have gradually become like the mountains that surround them, reserved, conservative, showing neither pain nor pleasure, suspicious of all strangers and anything or anybody connected with the company.

Socialism there becomes violent anarchy. No demands are made by union leaders for better schools, hygiene or sanitation, but always for an increase in wage. Neither the man nor his wife knows how to make a dollar do

Looking from the Schoolhouse up the Gulf. Some of the Citizens of Tams

a dollar's work. The wage increase goes for gambling and cheap whisky. One even sees a native driving mules on Monday morning in six-dollar patent-leather shoes which were purchased Saturday evening. The best grade of foodstuffs is demanded, and much of it ruined in the preparation or thrown out the back door. This extravagance is responsible for a large part of the discontent. It is the old, old story of "the high cost of ignorance."

The only hope for the situation is education. These people must be brought back to the simple, sensible way of living and be shown that work is a blessing, not a curse. We must teach mothers how to prepare wholesome, economical food. The task is a difficult one, requiring money, ability, skill and patience. But it can and will be started and accomplished when Capital realizes its importance and possibility.

The Labor Problem at Mines Similar to That Elsewhere

The coal operator, as any other business man, must see a profit for his investment. He is neither a philanthropist nor a missionary. His position differs from that of the New England mill owner in that he does not create the present conditions under which he works. When people in the city talk of those terrible mines, I wonder if they know of their own department stores, which are supposedly model, and the factory and child-labor laws, which should be enforced. Maids in their own kitchens may be finishing 10- or 12-hr. days. The whole thing seems to resolve itself to this, that we are often conscious of the evils of the labor question in the distance, but not in our own home and environment.

When the ambition of the mountaineer is aroused, he seldom goes back. It is true that we were never quite sure just how our work was received, and because there was no outspoken appreciation we could not tell what lasting impression we had made. Some time after leaving, however, I wrote the girls' club about some work I was doing in one of the paper-box factories in the North, and in a few days I received a large, soft package, which contained hundreds of short-stemmed mountain violets, tied into small bunches with calico strings. The note accompanying them read: "You showed us as how they were pretty, and we reckon the girls up there don't have none."

The whole problem, after all, is teaching the laborer how to live. Simple, wholesome food makes a man better physically and mentally. A warped mind and soul may be the direct result of food and home surroundings, and corporations today are beginning to realize that the efficiency of a plant depends not only upon the latest improved mechanical inventions, but upon the food and care of the man who works in that plant.

To summarize what I have said, my object has been to outline conditions as they exist in the West Virginia and other mining towns, to tell what we tried to do to help the people there, and to make an appeal, as far as it is expedient, for improving conditions in the future.

The Gillespie Meet

An open meet for all teams in the state of Illinois will be held at Gillespie, Ill., on Dec. 8, under the united auspices of the American Mine Safety Association, Local Union No. 730 of Mine No. 1 and the Superior Coal Co. Headquarters will be at the Colonial Theater, Gillespie, Ill.

At 9 a.m. the mayor of Gillespie will make his address of welcome and James Boston will respond. At 9:30, the one-man events will be held. Two-man contests commence at 1 p.m. At 2 p.m. the schoolboys exhibit their proficiency and at 2:15 the team events are contested. At 7 p.m. prizes are awarded and following this event prominent men in the community will address the assembled crowd.

In the evening at 8:30, moving pictures will be exhibited showing safe methods of mining coal, these exhibits being made by the Federal Bureau of Mines. The list of prizes seems as if chosen by the Society for the Prevention of Useless Giving for most of the awards are useful articles and money.

The Golden Rule of First Aid Work consists of attending to accidents on the spot; stopping all bleeding by pressure; covering all wounds at once; preventing all unnecessary movement; keeping the patient warm; providing easy methods of removal; avoiding unnecessary interference and being yourself gentle, quick and cool.

Discussion By Readers

An Electric Mine-Haulage Problem

Letter No. 1—In the issue of Coal Age, Oct. 24, p. 686, Fred Vinton asks the following question:

Why will an electric mine locomotive pull more on series than on parallel? For example, should a motor stall on account of defective bonding when running on parallel, it will at once start and haul the trip if thrown over on series.

The answer given takes up in detail many interesting questions concerning motor losses, but, I believe, misses the point that Mr. Vinton intended to bring out. The reasons given in the last paragraph of this answer are hardly sufficient to produce the result noted by Mr. Vinton. It will be noticed that the question asked ascribes the trouble that caused the motor to "stall" to "defective bonding."

I want to suggest that the proper answer to this question is that the high resistance in the circuit, due to the defective bonding, causes practically the same current to flow through the locomotive whether the motors are in series or in parallel. When the motors are in parallel, this current is equally divided between the two motors and each exerts a torque corresponding to one-half of the total current taken by the locomotive; but when the motors are in series, the total current flows through each motor, causing a corresponding torque very much greater than was obtained when the motors were in parallel.

The following example will bring out the facts a little more clearly. Assume that we have a 10-ton locomotive equipped with two 50-hp. motors, hauling a load of 20 cars up a 1-per-cent. grade, each car weighing 3 tons when loaded. Now, taking the frictional resistance of the cars as 30 lb. per ton, the tractive effort necessary to haul this trip up a 1-per-cent. grade at a constant speed, will be 3000 lb. The locomotive has a frictional resistance of, say, 20 lb. per ton, which makes the tractive effort necessary to operate the locomotive on this grade 400 lb. The total tractive effort required to operate the entire trip, including locomotive and cars, will be therefore 3400 lb.

Assume that the defective bonding makes the total resistance of trolley and track 1 ohm; the total resistance of a 50-hp., series motor will be about 0.16 ohm. The resistance of the two motors in parallel will be one-half of this amount, or 0.08 ohm, and in series 0.32 ohm. With the motors in parallel, the total resistance in circuit would be 1.08 ohms, which, at 250 volts, would produce a current of 231 amp.; and the motors being in parallel, each motor will then take one-half the current, or 115 amp. From the tractive effort curve of the motor, it will probably be found that this current will produce a tractive effort of 1300 lb., so that the total tractive effort for both motors will be 2600 lb., under the assumed conditions.

On the other hand, with the motors in series, the total resistance of the circuit will be 1.32 ohms, which at 250 volts, would produce a current of 190 amp. This current passes through both motors and, from the tractive-effort curve of the motor, will give a tractive effort of 2600 lb., which makes the total tractive effort, for both motors, 5200 lb.

Now, the total tractive effort necessary to operate the trip is 3400 lb. With the motors in parallel, the locomotive can exert only a 2600-lb. pull, which is insufficient to start the trip. But, in series, the total tractive effort, which is then 5200 lb., gives an ample margin to start the trip.

Graham Bright, Engineer,
Westinghouse Electric & Mfg. Co.
East Pittsburgh, Penn.

Letter No. 2—Referring to the inquiry of Fred Vinton, of the Penn-Mary Coal Co., asking why an electric mine locomotive will pull more on series than on parallel, Coal Age, Oct. 24, p. 686, I desire to add a few comments.

In your explanation of the circumstance mentioned by Mr. Vinton, you endeavor to show how the motors in the locomotive operate when in series and in parallel, and make the statement that "the tractive force or drawbar pull of the locomotive depends as much on the adhesion of the wheels to the rails as on the power exerted by the motor itself." This would indicate that you regard the *tractive force* and *drawbar pull* as one and the same thing. Is it not true that the tractive force may exceed the drawbar pull of the locomotive?

Your statement is equivalent to saying that a mine locomotive will exert a drawbar pull that is limited by the adhesion of the wheels to the rails, and is not measured by the power exerted by the motor itself.

[It is proper to make a distinction between the **tractive effort** of a locomotive, which depends on the power of the motors; and the "tractive force," which, as stated, is limited by the adhesion of the wheels to the rails, as determined by the weight of the locomotive and the coefficient of friction. It is always possible that the "effort" to exert force is less than the force exerted.—Editor.]

After explaining that, in a direct-connected motor, the torque varies practically with the speed, except for certain losses to which reference was previously made; and, further, that the torque is practically independent of the voltage, the statement is made that "by reason of this condition, motors operated in series present a slight advantage in respect to torque, which measures the *tractive effort* of the locomotive." From this statement, it would appear that the case is viewed entirely from the efficiency of the motors, neglecting the *weight* of the locomotive.

[Again, permit us to say, the "tractive effort" that the motors can exert should not be confused with the "tractive force," which is limited by the adhesion of the wheels to the rails as well as by the possible torque of the motors; while the drawbar pull must be determined by the load hauled.—Editor.]

In this connection, permit me to state that, ten years ago, the Baldwin-Westinghouse Co. frequently equipped a locomotive with a series-parallel controller. It worked with fair success, because the horsepower, per ton of weight on the driving wheels, was so small that a loco-

motive of six or seven horsepower per ton when operating in series would hardly slip its wheels. Today, when electric locomotives, made by the Baldwin-Westinghouse companies, are sold to mines, they are equipped with motors ranging from 12 to 14 hp. per ton and are seldom, if ever, constructed with a series-parallel controller (rheostatic, with commutating switch).

The reason for this is that if you attempt to start a full-load trip, in series, the locomotive will stand still and slip its front wheels continuously, while the rear wheels will not move at all. If, then, the commutating switch be thrown into parallel position, the locomotive will start off with a jerk and frequently break a coupling. The result is that series-parallel controllers are not used on uptodate mine locomotives; and the only reason why the one in operation at Penn-Mary mine will start and haul its trip over the defective bonding, is because the horsepower of the motors, per ton of weight on the driving wheels, is low; and because when operating at about 120 volts, the rails and defective bonds can carry away the current from the return. In addition to this, a well made series-parallel controller of the General Electric or Westinghouse companies is usually too high for mine service if used on a powerful locomotive. In mine work, while theory is useful, it is of small value as compared with practical experience in securing the output required under all conditions.

Chicago, Ill.

Merging the Interests of Coal Exporters

Letter No. 1—I have read with much interest the suggestions in regard to merging the interests of exporters of coal, which appeared in Coal Age, Nov. 21, p. 820. At your request, though I must acknowledge it is with some diffidence, I will offer a brief criticism of the paper. I submit these comments for what they may be worth.

The suggestion appears to be that coal operators, instead of employing individual representatives, should jointly engage one or more representatives to act for the common weal.

Bearing in mind, then, that the constituent members of such an association are, when at home, in active competition with each other, it would seem that the success of such an arrangement will depend, *prima facie,* upon the assurance to each member that he would receive fair and equal treatment, and that no one else would get the "thick end of the stick." In other words, competition should be eliminated, as far as regards exports. This, however, would have a tendency to prevent the more important operators from joining the association, as they are unaccustomed and unwilling to be placed on the same footing with smaller operations. But, assuming that the association is formed, I am afraid it would fail in its purpose, for a reason similar to that given for the failure of the New River scheme; namely, "*internal disagreements.*"

I have seen ideas of this nature attempted at various times, but they have never come to anything; and I think you may take it for granted that each seller will consider it more satisfactory to retain his individual agent, and conduct his business without reference to or interference by anyone else, than to enter any joint agreement with his competitors.

As to the 12 advantages claimed, I am not very clear whether these claims are most on behalf of the suggestion offered or of the coal-export trade. If the latter, most of the claims would apply; except only if No. 11 is read in conjunction with No. 4 the effect would be to the contrary. Increased exports and the consequent increased demand for ships, *unless accompanied by an increase of imports from the same locality,* would, of course, have a tendency to *raise* ocean freight rates. Claims Nos. 2 and 6 I expect are made solely on behalf of the suggestion, as possessing advantages over the usual method of selling coal. Claim No. 12 I do not quite understand. I would ask, "more easily handled" than what?

In closing, the correspondent says he "will not go into details of such a plan." In this he is right, as it would be for the members to determine these; but it is on the details that the whole proposition will depend, and no operator could give an opinion on its merits until a *pro forma* proposal is laid before him.

New York City. George Breffit.

The Ohio Situation

Letter No. 4—George N. Lantz, Coal Age, Nov. 28, p. 877, has made a clever reply to the editorial of Oct. 17, p. 637, entitled "Small Potatoes." He has declared that when men come into the market to buy labor they must pay the price regardless of the value of the products that the laborer is able to produce in a given amount of time.

As a matter of fact, this is not true: (1) Because no employer enters the labor market without some idea of what profit he can make by the purchase of labor. He may make an erroneous estimate, but if he cannot make a profit, he either ceases to employ labor or makes a new contract. (2) Because the laborer is often wedded to a certain locality, job or mine; or bound to a certain spot by his investments; or too poor to move; or too ill-acquainted with conditions elsewhere to pack up and leave; or too lacking in enterprise. Labor is by no means a mobile commodity, even in mining and in America, and it is notorious that wages vary considerably in different districts. Consequently wages are largely determined by the value of the product of labor as the editorial writer stated. Mr. Lantz, in urging that eastern Ohio operators could pay better wages if they would use better mining methods, quotes Supt. J. D. Jones, writing on "The Foreigner in Mining," Coal Age, Oct. 17, p. 643, where he states that "Many coal-mine operators have been so engrossed in their sales department and other matters that they have given no attention to the introduction of mining machines and other improvements."

Now, it is not true that Ohio is backward in the use of mining machines, though possibly the type in use may not be the most modern. For years, Ohio has led in the percentage of coal mined mechanically. In 1913, the U. S. Geological Survey placed the percentage of machine-mined coal of Ohio as *first* among the American states, no less than 90.2 per cent. of the coal being dug by machines. The retrogressiveness does not lie so much in that direction, and the editorial does not so state, though it is true that improvements in equipment other than undermining are needed, as also doubtless some better machines than those now in use. But not even that was

asserted in the editorial. Let me quote the words as they appeared: "The wage scale of Ohio has made the state backward in conservation, negligent of first-aid, indifferent as to housing and largely unprogressive." There is not a word written there as to mechanical equipment.

Mr. Lantz seems to think that the Ohio operators should risk their money in experiments in welfare work, and so escape the desperate straits thrust upon them by those whom the welfare work would benefit. Welfare work may "pay," it is true, but who will be willing to risk it when each year now sees a deficit?

The eastern Ohio operators evidently did not believe, in 1913, that conservation, first-aid and good housing would enable them to make a profit, or they would have embarked with much energy in these projects. Why increase their difficulties now by higher wages and ask them to make "a venture of faith" by adding welfare-work burdens to their other enhanced expenditures, at a time when the condition of the coal market is more seriously demoralized than it has been for a decade?

Mr. Lantz declares that Illinois, like Ohio, is "admittedly progressive." He apparently thinks the Ohio operators should blame themselves and not their wage scale for their lack of progress. In reply, I would say that equal scales may have unequal results in unequal markets. Moreover, it must be remembered that Illinois is, by no means, uniformly progressive, and some of the newer and finer plants of Illinois owe their existence to the superior quality of their coal and to a difference of wage scale. Thus their erection would witness rather in favor of the writer of the editorial than against him when he urged that fair wage scales result in bettered conditions, had he asserted that the Ohio mines were poorly equipped. But he did not. Let me repeat that he spoke only of *"conservation, first aid* and *housing."*

Conservation limps in all parts of Illinois except in the longwall districts. Work there was started long ago, and if the Ohio scale were applied in those mines, mining would not pay. And as to housing, many of the men in the newer and better mining sections of Illinois live in their own homes. There is in such parts, of course, no welfare or housing work whatever, though there is a large amount of first-aid and mine-rescue work, fostered largely by the profits made from thicker and better coal and from wage differentials that are the outcome of such favorable mining conditions. As a whole, Illinois is not a mining state in which adequate profits are made, and as a result the operators are not leaders in welfare work, though they have shown a most enlightened interest in backing the activities of state institutions.

R. Dawson Hall.

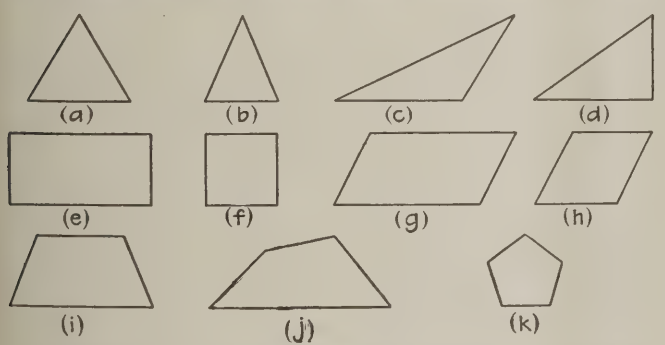
Study Course in Coal Mining



By J. T. Beard

The Coal Age Pocket Book

Polygons—A polygon is a plane figure bounded by any number of straight lines, which are the **sides of the polygon,** and which taken together form its **perimeter.**

Polygons are named, according to the number of their sides and their shape, as follows:

A **triangle** is a plane figure having three sides. A triangle

is **equilateral** (a) when its sides are equal. An equilateral triangle is always **equiangular.**

An **isosceles** triangle (b) is one having two equal sides. The angles lying opposite the equal sides are likewise equal each to each. Hence, a triangle having two equal angles is always isosceles.

A **scalene** triangle (c) is one having no two of its sides equal. Likewise, the angles are all unequal.

A triangle is **acute** when all of its angles are acute or **oblique** if one of its angles is **oblique.**

A **right triangle** (d) is one in which one of the angles is a right angle or 90 deg.

A **quadrilateral** is a plane figure having four sides. If the opposite sides of a quadrilateral are parallel, each to each, the figure is a **parallelogram.**

A **rectangle** (e) is a parallelogram whose angles are all right angles.

A **square** (f) is an equilateral rectangle.

A **rhomboid** (g) is an oblique parallelogram.

A **rhomb** or **rhombus** (h) is an equilateral rhomboid.

A **trapezoid** (i) is a quadrilateral having two of its sides parallel.

A **trapezium** (j) is a quadrilateral having no two of its sides parallel.

A **regular polygon** (k) is one that is equilateral.

An equilateral polygon of any number of sides is always equiangular; but, except in the case of a triangle, an equiangular polygon is not necessarily equilateral.

The Coal Age Pocket Book

QUALITIES OF POLYGONS

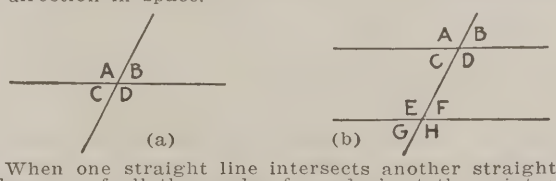
1. The sum of the interior angles of any polygon is equal to twice as many right angles as the polygon has sides, less four right angles.

2. The interior angles of a regular polygon are all equal, each to each; and each of these angles is therefore equal to their sum divided by the number of sides.

Or, to calculate an interior angle of any regular polygon, divide 360° by the number of sides and subtract the result from 180°.

3. A regular polygon can always be inscribed in a circle whose radius is equal to a side divided by twice the sine of one-half the subtended angle, which is equal to 180° divided by the number of sides.

The radius of the circumscribing circle of a regular hexagon is equal to one of its sides.



4. A regular polygon is divisible into as many equal isosceles triangles as it has sides.

LINES AND ANGLES

1. The straight line joining two points is the shortest distance between them.

2. Two straight lines can intersect in but one point, which is common to both. Two intersecting straight lines always lie in the same plane.

3. Two straight lines are parallel when they lie in the same plane and can be produced or extended indefinitely, in either direction, without meeting. Parallel lines have the same direction in space.

4. When one straight line intersects another straight line (a) the sum of all the angles formed about the point of intersection is equal to four right angles or 360 deg. Any two angles lying on the same side of one of these lines and on opposite sides of the other are **"adjacent"** angles, as A, B; A, C; B, D; or C, D; while any two angles lying on opposite sides of both lines are **"opposite"** or **"vertical"** angles; as A, D; or B, C.

The sum of any two adjacent angles formed by two intersecting straight lines is always 180 deg.; as A + B = 180°; A + C = 180°; etc. If the adjacent angles are equal, the intersecting lines are **perpendicular** to each other.

Opposite or vertical angles are always equal; as A = D; and B = C.

When a straight line cuts two parallels (b) the angles formed are as follows: **Adjacent exterior,** A, G; or B, H; **adjacent interior,** C, D; or E, F; **alternate exterior,** A, H; or B, G; **alternate interior,** C, F; or D, E.

Inquiries of General Interest

Loading Coal by Machinery at the Face

I am working a thin seam of bituminous coal, which is only 2 ft. 8 in. in thickness and overlaid with a hard sandrock roof, while the floor is an almost equally hard limestone. From my own practical experience, in the working of coal, I would prefer to give each man a place by himself; but this is impossible here, under the present conditions. Moreover, the cars we are using are too large and heavy for one man to handle.

I would very much appreciate any information you can give me in regard to the use of a chain machine for loading out the coal at the face. I have been much interested in the many subjects discussed in COAL AGE, but have seen nothing in regard to this matter.

JOHN HARVEY,
Grazier Coal Mining Co.

Foustwell, Penn.

We are somewhat in doubt as to whether correspondent refers to a loading machine, as, for example, the Jeffrey-Hamilton loading machine, which is designed to follow any coal-cutting machine and to gather up the coal and load it into the mine cars after it has been shot down. This machine is operated by two men; and it is claimed will load 1000 lb. of coal per min. into the mine cars at the face. The machine can only be used, of course, where the conditions of roof and floor will permit. It is equipped with a 12-hp. electric motor.

The time saved in the loading of coal by the use of this machine is said to reduce the number of working places required for a given output fully one-half. If this result is realized, in actual practice, there can be no doubt of the advantage gained thereby wherever the conditions will permit of its employment. A greater concentration of the work means less length of entries, air courses and track to maintain; a quicker advance of the working face, whereby the danger incident to bad roof is reduced, less timber destroyed and the coal mined in better condition. The concentration of work at the face also reduces the cost of underground haulage; and this, together with the other advantages named, greatly reduces the cost of production per ton of coal mined.

It is possible that this inquiry refers to the use of a chain conveyor at the working face. Such conveyors are frequently used on a longwall face, in the working of thin seams of coal or where bad roof conditions will not permit the car to be taken along the face.

If any readers have had experience in the loading of coal by machinery at the working face, we should be glad to hear from them and to know the comparative results obtained by the employment of such method. We would also be glad to receive and publish any data of interest in reference to the use of chain conveyors on a longwall face, giving the results obtained thereby, as compared with the use of a track laid along the face of the coal. Any device that will reduce the cost of handling the coal along the face reduces, to the same extent, the cost of production per ton of coal mined, and should receive the most careful consideration by every coal operator and mine superintendent.

Size of Intake and Return Airways

Assuming that the main intake airways in a large gaseous mine are used as haulage roads and traveling ways and that the mine is in full operation, requiring a ventilating current of 300,000 cu.ft. per min.; which should have the larger sectional area, the intake or the return airways? In answering this question, kindly explain fully, stating the practical conditions that determine the choice.

MINE FOREMAN.

Southwest, Penn.

It is generally stated that the return airways of a mine should have a larger sectional area than the intake airways. The reasons given for this statement are mainly two; namely, the expansion of the return air by reason of its higher temperature due to the heat absorbed in its passage through the mine workings, as well as the increased volume of the return current due to the presence of the gases generated in the mine.

As a matter of fact, however, the cold intake air current, even in the winter season when the outside temperature is much below that of the mine, very quickly partakes of the higher mine temperature, so that there is very little difference observed, in passing from an intake airway to the return, at almost any point in the mine, except in close proximity to the downcast shaft or main intake airways. At the most, this difference will rarely exceed 10 or 15 deg. F.

Since the expansion of the air is proportional to its absolute temperature, it is readily seen that an increase of, say 15 deg. in the mine, for an outside temperature of 32 deg., would only call for an increase of sectional area barely exceeding 3 per cent., which would only mean an increase of 3 per cent. in the velocity of the return air current.

The increase in volume, due to the gases generated in a mine, rarely exceeds 3 per cent. and is generally much less. Taking both of these effects into consideration, it is safe to say that, in general mining practice, the increase in the volume of the return air current will seldom exceed 5 per cent.

There is, however, in a gaseous mine where men enter the main return airway, the danger of the lamps being exposed to a velocity above what is safe in a gas-charged current. For this reason, under such conditions it is often necessary that the area of the return airways shall be such that the velocity will not exceed, say 200 or 300 ft. per minute.

Examination Questions

Hoisting Engineers' Examination, Held at Albia, Sept. 23 and 24, 1914

(*Selected Questions*)

Ques.—(a) How much will pure water expand? (b) What is the weight of one gallon of pure water?

Ans.—(a) The coefficient of expansion of pure water, referred to its volume at maximum density (39.2° F.) as unity, is expressed by the following formula:

$$coef.\ of\ expansion\ (water) = \frac{(T - 500)^2}{1000\ T}$$

In this formula, T represents the absolute temperature of the water, using 460 as the absolute zero of the Fahrenheit scale. Since water attains its maximum density at, practically, 40 deg. F., it is observed in the formula that the coefficient of expansion becomes zero, at this temperature (460 + 40 = 500° F., abs.)

Applying this formula to find the volume of 1 cu.ft. of water at 200 deg. F., we have

$$volume = 1 + \frac{(460 + 200 - 500)^2}{1000\ (460 + 200)} = 1.03878 + cu.ft.$$

From this it appears that 1000 cu.ft. of water at 40 deg. F. will increase in volume 38.78 cu.ft., at a temperature of 200 deg. F.

(b) The weight of 1 gal. of pure water, at a maximum density of 39.2° F., taking the weight of 1 cu.ft. of water, at this temperature, as 62.4283 lb., is

$$w = \frac{62.4283 \times 231}{1728} = 8.345\ lb.\ per\ gal.$$

To find the weight of water at any other temperature, this weight must be multiplied by the density of the water as calculated by the formula

$$D = \frac{1000\ T}{500^2 + T^2}$$

in which T equals the absolute temperature of the water, in the Fahrenheit scale, using 460 as the absolute zero.

Ques.—(a) How can the accuracy of a steam gage be tested? (b) What kind of pressure does a steam gage indicate?

Ans.—(a) The accuracy of a steam gage is determined by a steam-gage tester, which consists of a handpump, to which is attached an accurate gage. The steam gage to be tested is connected with this apparatus, and its indications are compared with those of the standard gage.

(b) The pressure indicated by a steam gage is the pressure above that of the atmosphere, expressed in pounds per square inch.

Ques.—(a) Define the different kinds of steam. (b) Has steam weight; and, if so, is it lighter or heavier than air?

Ans.—(a) Steam is described as "saturated," "superheated," or "gaseous," "dry" or "wet." When water is heated, it passes into steam, at a temperature corresponding to the pressure supported by the liquid. At normal atmospheric pressure, sea level (14.696 lb. per sq.in.), water is converted into steam at a temperature of 212 deg. F. At a pressure greater or less than this amount, the temperature of evaporation is above or below 212 deg. F. *Saturated steam* is steam having a temperature corresponding to its pressure.

When saturated steam, not in contact with water, is heated, it follows the law of gases and becomes an unsaturated vapor, which is often spoken of as "gaseous steam." The steam is then said to be "superheated." In other words, *superheated* or *gaseous steam* is steam having a temperature higher than that corresponding to its pressure as a vapor.

Steam is "dry" when it contains no entrained moisture. *Dry steam* may be either saturated or superheated. *Wet steam,* on the contrary, is steam containing some entrained moisture. If wet steam, not in contact with water, is heated, it will first become dry and saturated, the entrained moisture being converted into steam by the added heat. A further application of heat would convert this dry saturated steam into superheated steam, which would then follow, more or less closely, the law of gases known as Boyle's law.

(b) Steam has weight; but its weight is less than that of air, volume for volume. The density of saturated steam is approximately that of water vapor or, say 0.6235, as referred to air of the same temperature and pressure. The density of superheated steam varies directly as its pressure and inversely as its absolute temperature.

Ques.—Describe fully the theory of draft; and explain what causes draft.

Ans.—"Draft," in this connection, is a current of air passing through the furnace. When this current is the result of the heating of the air by the furnace, before the air passes up the chimney, the current is described as "natural draft." On the other hand, a "forced draft" is a current of air that is *forced* through the furnace, by the action of a fan or blower.

Natural draft is caused by the difference in weight between the heated air column in the chimney and a similar column of outside air. The weight of the heated column of air in the chimney is always less than that of the outside air column, for the same cross-section or unit area. These two air columns are in dynamic equilibrium, and the heavier outside column forces the lighter chimney column to rise. *Forced draft,* on the other hand, is caused by the pressure due to the centrifugal force developed in a fan or blower, which pressure drives the air through the furnace and up the chimney, assisted by the natural draft of the chimney column.

Ques.—(a) Is it possible to build and maintain a fire without air? (b) What is the mechanical equivalent of heat?

Ans.—(a) Fire will not burn in the absence of a sufficient quantity of air or oxygen to support the combustion. Draft, by increasing the air supply, increases the rapidity of the combustion.

(b) The mechanical equivalent of heat is 778 ft.-lb., which is the theoretical work performed by 1 B.t.u.

Book Review Department

OUR MINERAL RESERVES. HOW TO MAKE AMERICA INDUSTRIALLY INDEPENDENT. By George Otis Smith, director, U. S. Geological Survey, Washington, D. C. 6x9 in. No illus. Paper cover. Sent free on application.

In this bulletin, under the two headings, "Opportunity for Export" and "Coal," the director of the U. S. Geological Survey discusses the possibilities of our exporting coal, the coals available, etc. The appearance of the statements contained under the second heading, "Coal," in your Sept. 26 issue, prompts me to make some comments and criticisms. The reader will find the quotation, to which I refer, under the caption "The U. S. Geological Survey on the Export Question," on pages 504 and 505 of the present volume of "Coal Age."

In criticism, I would say that, in the first place, it should always be borne in mind, when speaking of our coal exports, that about 50 per cent. of these go to Canada, a market where we have no competition. Furthermore, about half a million tons of the so called exports go to Panama and Porto Rico, our own possessions and places where we have no competition. Deducting these quantities from the 1913 exports, leaves only 4,600,000 net tons exported to the foreign markets where other countries compete with us.

The monograph makes this pronouncement:

"At present, however, while the six European nations that rank next to the United States as coal-mining countries are at war, the demand for export coal from neutral countries is inevitable." Does this mean that the six European nations at war, England, Germany, France, Russia, Austria and Belgium, demand "export" coal from neutral countries, or that the neutral countries demand "export" coal? If the first is meant, the statement is not true, as none of these countries have demanded any coal from the neutral nations. I presume that the meaning the Survey desires to convey is that neutral countries which do not produce sufficient coal for their own use will inevitably demand coal from other neutral countries.

EUROPE AND SOUTH AMERICA TOOK COAL FROM US BEFORE THE WAR

"Already shipments to European and South American countries have begun," says the Survey, and that is, indeed, true, but the beginning was about 16 years ago. Then the text continues: "There is a demand for authoritative information regarding the quality of coal from the different fields accessible to the seaboard." To get such data, we are then referred to the Bureau of Mines Bulletin No. 22 for analyses of coal.

Now, in the first place, these analyses are nearly all of mine samples, which do not represent the coal as it is shipped, and may be very misleading to buyers. Take a concrete case. An English company wishes to buy coal from the best New River mines, to take the place of the best Welsh Admiralty. They go through Bulletin No. 22 and look up the mines showing the best analysis, which gives 15,442 B.t.u. for the dry coal, and 2.40 per cent. ash. They then find out, if they can, who sells this coal, and make their contract for a supply of coal from this mine. Will they get any coal of such quality, even if they do get all the coal from the mine named, which is unlikely? They will not. Nor is the coal from this particular mine one whit better, as put on the market, than the coal from another New River mine, which Bulletin No. 22 gives, for a composite sample, as containing 14,897 B.t.u. and 5.26 per cent. ash. In fact, a large shipment of coal delivered to the government from the latter mine yielded, on analysis by government chemists, 15,314 B.t.u. and 4.28 per cent. ash.

POSITION OF GREAT BRITAIN

"Until the present war broke out," says the Survey, "Great Britain was the only country that exported coal in considerable quantity." What about Germany, with exports last year of 38,722,000 short tons, or 12 per cent. of her total output of 312,062,796 tons?

"But," the Survey adds, complacently, "Great Britain is already beginning to feel the pinch of poverty in her coal supplies." The "pinch" has not yet become apparent to the outsider.

The Oct. 3 issue of the "Iron and Coal Trades Review," one of the two leading British coal papers, says, speaking of collieries supplying Admiralty coals: "In the majority of cases, stocks (of coal) are excessive." "Secondary and lower qualities are plentiful." "All the cheaper classes of coking and bunker coals are plentiful and easy."

The "Weekly Coal Review" of the "Liverpool Journal of Commerce" says of South Wales coals, under date of Oct. 2, "Buyers are holding off, with supplies of large coal plentiful." "Secondary descriptions and inferiors were plentiful." "Stocks of free coal have accumulated to such an extent that it was difficult to keep collieries going 'owing to shortage of empties.'" "Inferior coals were very plentiful, collieries extending good reduction (in price) for immediate shipment." "Monmouthshires were weak owing to the heavy stocks." These quotations do not seem to the outsiders to indicate a shortage in coal supplies in Great Britain.

During the week ending Oct. 1, there were 81 ships actually chartered to take coal to foreign ports from that island. Of this total, 11 ships were for South America, with a total cargo tonnage of 58,300 tons, and there were 15 ships chartered for Italy to carry 69,600 tons. This looks as if Great Britain was still in the export business, notwithstanding the war and the bad financial conditions in other countries.

THE FUTURE EMBARGO ON COAL

The Survey then ventures on a prediction:

"It is highly probable that when peace is once more established, she (Great Britain) will place restrictions upon her exports of coal." To an outsider, this supposition looks highly improbable.

England's consumption of coal in normal times is only about 66 per cent. of her production; if, after the war is over, her colliery output is decreased, her home consumption will also be less, and the balance between exports and home consumption remain about the same.

But a further quotation must be made from the bulletin of the Survey:

"The total foreign bunker trade at the principal ports, New York, Philadelphia, Baltimore and Hampton Roads, was only about 7,500,000 tons, indicating that most of the transatlantic liners, the majority of which are English, have been carrying from the other side a sufficient quantity of coal for the round trip."

Now, in the first place, the foreign bunkers at the ports mentioned supplied only 6,352,000 tons, and not 7,500,000, the latter being the foreign bunker tonnage for the whole United States.

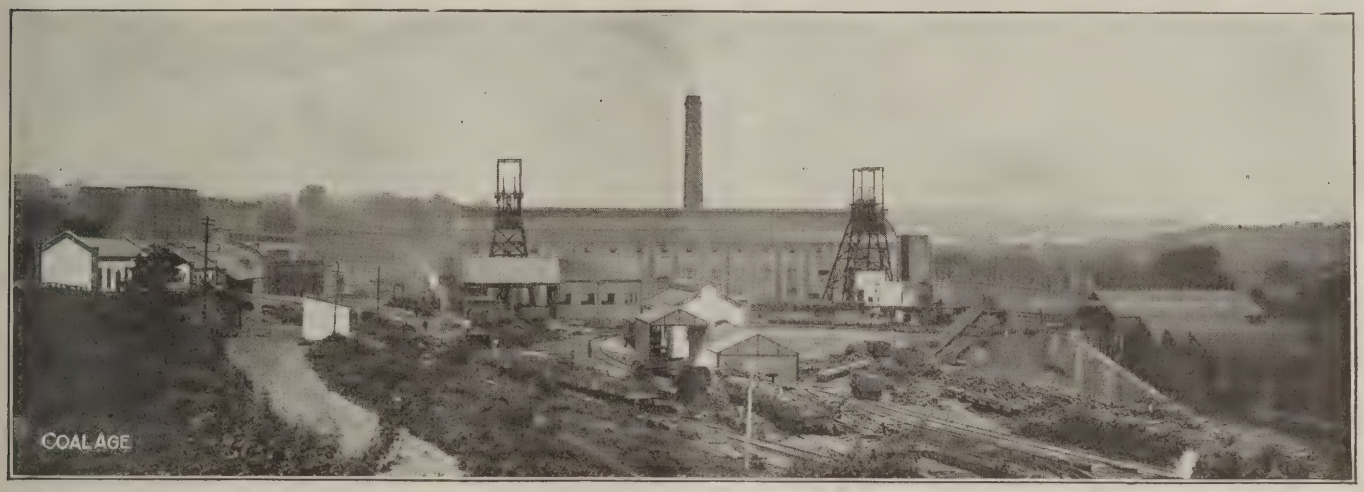
Of this amount, 4,192,000 tons were supplied at New York alone, which indicates that the transatlantic liners actually did get large supplies of coal on this side, and that is indeed a fact. The large liners have not sufficient bunker space to hold enough coal for the round trip. Take the Lusitania; her bunkers hold 6000 tons, and she uses 840 tons per day. It is a common sight at New York to see coal barges alongside the big liners, from which coal is put in the latter's bunkers.

THE COALS SUITABLE FOR EXPORT

"The high-grade steaming coals of the United States which would be the coals in chief demand for export trade," are given in the bulletin as follows:

Pennsylvania: Clearfield, Allegheny, Somerset; Maryland: Cumberland; West Virginia: Elk Garden, Fairmont, New River, Pocahontas; Virginia: Southwest counties: Tennessee and Kentucky: Eastern counties; Alabama: Birmingham and other districts of Alabama on the south.

The Pittsburgh field of Pennsylvania should be included. Large amounts of Pittsburgh coals are used at New Orleans in foreign trade; also the Kanawha field of West Virginia, while there is no demand for east Kentucky and Tennessee coals for export, and probably never will be, with present freight rates.



In speaking of the coals "available in highest quality," Clearfield is the only Pennsylvania coal mentioned. Why leave out Somerset and Cambria County coals? There is more fuel and of better quality in those counties than in that of Clearfield; their production is also greater. In 1913, Cambria County produced 19,265,000 tons and Somerset 9,454,000, while Clearfield produced only 8,097,000 tons.

It would be of more help to our coal interests if they were given information on the foreign markets and on the coals

with which they must compete. Any well informed coal man in the tidewater business would know the main facts given in the Survey's article, and would not fall into the errors of assumption by which they are accompanied.—**F. R. Wadleigh.***

THE POWELL DUFFRYN STEAM COAL CO., LTD., 1864-1914. 95 pp. 6¾x9¾ in., 1 map and 51 illustrations. Cloth boards.

This book is published by a Welsh coal company, the name of which it bears as title. Ordinarily we do not publish any comment on such books which are rather regarded as pretentious circulars than volumes of public interest. However seeing the present interest in the Welsh coals, this somewhat comprehensive circular beautifully illustrated and extremely interesting, deserves some notice.

THE PENALTTA COLLIERY OF THE POWELL DUFFRYN STEAM COAL CO., LTD.

The colliery is located 15 miles from Cardiff, Wales, and has an annual output of a half million long tons. The two shafts are 21 ft. in diameter and about 2300 ft. deep. The mine is ventilated by a 154-in. Sirocco fan, driven both by steam and electric units. The power is generated by two 3000-kw. Westinghouse Rateau turbines.

We are assured that the company holds up as its motto "Per ardua ad alta" which roughly means "No matter how hard the going we aspire to reach the top." On page 16, we learn how truly that motto has been followed. Since and including 1910 the company has paid a 20 per cent. dividend, free of tax. In 1907 and 1908 a similar dividend was paid, that in 1907, however, not being tax free. It is clear that some companies in Great Britain are not running on a hand-to-mouth basis. Most of our corporations would conceive that they were top notchers if they paid year by year a 20-per-cent. dividend.

Possibly, however, the acquirement of the property in 1864 when the Welsh coal did not have its present standing may have been a cause for the excellent financial position of the corporation. Such a few analyses of Welsh coal are at hand that we feel justified in repeating those of the Bargoed colliery quoted in this book. There is no statement as to the manner in which the samples were collected.

Coal Seam	Fixed Carbon	Ash	Volatile Matter	Moisture
Ras Las	80.22	2.88	16.24	0.66
Brithdir	67.51	5.90	25.76	0.83

The plants are uptodate both in equipment and in rescue work. The Aberaman and Rhymney Valley rescue plants are remarkably well fitted having automobile rescue cars which were purchased long before the U. S. Bureau of Mines ordered one for the Pittsburgh station. These rescue stations are owned in common with some other firms operating in the same neighborhood.

FACTS CONCERNING THE STRUGGLE IN COLORADO FOR INDUSTRIAL FREEDOM. Series I, issued by the Coal Mine Managers of Colorado. 72 pp., 6x9 in.; no illustrations or tables. Paper cover.

This book comes to us without even the imprint of the publisher, but we surmise it can be obtained on request by writing to any of the larger operating concerns in Colorado. The preface is signed by the Committee of Coal Mine Managers, J. F. Welborn, John C. Osgood and D. W. Brown. It consists of 15 bulletins entitled "The Struggle in Colorado for Industrial Freedom," issued between June 22 and Sept. 4, 1914, with an introduction entitled "What Has Happened." If the public, including our well-meaning but absentee President, would only read it, we are sure its message would sink home. Just casually we pick out a striking passage.

"Instead of the managers hiring miners, the Union is hiring 'strikers.'"

"That the union men of the country who are contributing to maintain this appearance of an effective strike are being misled is indicated by the following statement by Captain Hildreth Frost, of Company A, Second Infantry, National Guard of Colorado, who was also judge advocate in one of the districts of Colorado during the military occupation of the strike zone:

My district included the producing mines of Wootton, Morley, Starkville, Piedmont, Sopris, Cokedale and McLaughlin and the coke ovens of Sopris and Cokedale, the population of the district being between six and eight thousand. There was one tent colony in my district and a large number of strikers and their supporters. I took a careful census of the entire district and either myself or one of my lieutenants personally examined the union cards of practically every union man in the district. We found approximately 700 men holding such cards. They all bore a stamp showing the date when the men to whom they respectively belonged had joined the union.

I found only one resident who carried a card showing that he was a member of the United Mine Workers of America prior to or at the time the strike was ordered a year ago this July, and only four or five who were members of the union prior to the time the strike was actually commenced on Sept. 23, 1913.

I found that less than 300 of the approximately 700 union card holders in my district were actually in any coal mine in southern Colorado at the time the strike was called. The balance of the 700 had simply joined the union to swell its apparent strength and to draw the stipend of $3 a week.

PROCEEDINGS OF THE KENTUCKY MINING INSTITUTE FOR THE THIRD ANNUAL MEETING AND MIDWINTER SESSION PRECEDING. Edited by Ivan P. Tashof, secretary-treasurer, Kentucky Mining Institute, Lexington, Ky. 5⅞x9 in. One illustration. 134 pp. Paper cover. Free to members.

When proceedings of the smaller mining institutes, which have only a localized membership fall into the hands of the reviewer he does well to deal with them charitably and to remember the difficulties the editor has to meet and that the work is a labor of love and not of compensation. We use the word "love," of course, in its tennis significance for no one becomes so "enthused" in his work of editing proceedings that he becomes seriously enamored of his task.

When, therefore, we receive proceedings adequately edited and without flaws, so far as we can discover from cover to cover, and know that the editor is also grand factotum of the institute and has to perform all the duties of secretary and treasurer, where only too many members forebear to pay unless dunned, we feel like expressing ourselves in the highest of praise.

The papers in this work are of excellent quality, for the Kentucky Institute is a lively body. No one appears before it to rehash material taken from some time-honored textbook. On the whole too there is little space taken up with the usual regrets that the price of coal is no higher than it is. As much of the material is in 6-point type for purposes of condensation, the book contains more information than most books of similar size. A photograph of H. L. Viers, the Institute president, appears on the front page.

---

*Consulting engineer, 426 Real Estate Bldg., Philadelphia, Penn.

Coal and Coke News

Washington, D. C.

President Wilson has seemingly taken a step toward the settlement of the Colorado mining troubles by appointing a committee to take the matter in hand, investigate the circumstances, and if possible, dispose of it.

The strike of the miners in Colorado, which has now lasted for 12 months, has attracted the attention of the whole country, and has been accompanied by many distressing and tragic circumstances. The mediation of the government of the United States was offered early in the struggle, but the operators of the mines were unwilling to avail themselves of it, or to act upon the suggestions made by representatives of the Department of Labor. It became necessary to send Federal troops to the district affected by the strike in order to preserve the peace; but their presence could of itself accomplish nothing affirmative.

On a statement issued, the President says:

I do not feel that I am at liberty to do nothing in the presence of circumstances so serious and distressing. Merely to withdraw the Federal troops and leave the situation to clear and settle itself would seem to me to be doing something less than my duty after all that has occurred.

I have, therefore, determined to appoint the commission contemplated in the plan of temporary settlement, notwithstanding the rejection of that plan by the mine operators, and thus at least to create the instrumentality by which like troubles and disputes may be amicably and honorably settled in the future, in the hope that both parties may see it to be not merely to their own best interest, but also a duty which they owe to the communities they serve, and to the nation itself to make use of this instrumentality of peace, and render strife of the kind which has threatened the order and prosperity of the great State of Colorado a thing of the past.

The Hon. Seth Low, of New York, Charles W. Mills, of Philadelphia, and Patrick Gilday, of Clearfield, Penn., have most generously and unselfishly consented, at my request, to serve as members of the commission. I owe to these gentlemen my own warm thanks not only, but also, I believe, the thanks of their fellow citizens throughout the country. They will place themselves at the service alike of the miners and the operators of the mines in Colorado in case controversy between them should in the future develop circumstances which would render mediation the obvious way of peace and just settlement.

That the strike in Colorado is now entirely over, insofar as it affects the ability of the Colorado Fuel & Iron Co. to supply the market requirements of coal, is set forth in the annual report to the stockholders of that company by President J. F. Wellborn, which states:

Our former employees have been very anxious to secure work again at our mines, and we have quite willingly taken back such as we had reason to believe were not connected with past violence. The result is now a working force that is producing sufficient coal to more than supply the somewhat reduced market requirements. At no time during this struggle would we have been unable to produce sufficient coal to meet all demands, had order been maintained and the men desiring to work been free from violence.

The charge has often been made that the state troops were under the control of the coal companies. There is no foundation in fact for this charge. The relations between ourselves and the state soldiers were the same in every essential particular as those that have existed between us and the Federal troops. We have looked upon both as the proper peace officers of the district. Our employment of camp marshals in normal times has been heralded broadcast by the so-called labor leaders as a "notorious and criminal guard system." Our practice, in fact, has been to employ the smallest possible number of such men, and for a long time before the strike was called we had but seven camp marshals at our 22 working properties. They also acted as sanitary and truant officers, as well as being charged with the care of miners' houses.

PENNSYLVANIA

Anthracite

Harrisburg—The blank forms for returns of industrial incomes under the income tax are now ready. They will be mailed by the collector of the district about Jan. 1, and must be returned before Mar. 1. It is specifically stated that royalties on coal will be subject to taxation.

Wilkes-Barre—Members of the Tri-District Executive Board, which includes districts Nos. 1, 7 and 9 of the anthracite region, United Mine Workers of America met here on Nov. 28, to prepare a legislative program. The officers of District No. 1 named David Fowler, of Scranton, a board member, to fill the vacancy caused by the death of M. J. Healey.

West Mahanoy—The Board of City Trusts of Philadelphia has applied to the Schuylkill county court for permission to make the public roads in the township. This is one of the wealthiest townships in the state, the coal lands owned by the Girard estate being worth many millions of dollars. As the estate is the largest taxpayer in the district, the right to make the roads is claimed under the Losch act. The Philadelphia & Reading Coal & Iron Co. and the Lehigh Coal & Navigation Co. also asked to be permitted to make contracts with a score of townships.

Hazleton—Between 3000 and 4000 Italians employed in the anthracite coal fields in this immediate district were notified by mail on Nov. 25, that they must report for military service to the nearest Italian consul for enrollment before Dec. 31, or be adjudged deserters. The notice is construed to denote the speedy entrance of Italy into the European conflict.

Drifton—Thousands of miners' families in the Lehigh region sent congratulations on Nov. 26, her 73d birthday, to Mrs. Eckley B. Coxe, widow of the Drifton coal operator and called the "angel of the coal fields" because of her many years of benefactions. Mrs. Coxe is now actively engaged in preparation of Christmas presents for 3500 children of the towns on the Coxe lands.

Shenandoah—A serious fire broke out on South Mountain on Nov. 26, and destroyed much valuable timberland. The McTurk breaker and washery, employing hundreds of men and boys, were on fire a number of times, but each time the fire companies extinguished the blaze and did heroic work in diverting and checking the flames. The breaker and washery were only slightly damaged.

Hazleton—So many quarrels developed over the hostilities in Europe among the English, Irish, German, Slavish, Russian and Balkan mine employees that the output at the Cranberry mine of A. Pardee & Co. was reduced. An order has accordingly been issued to the effect that anyone of the 1500 employees who discusses European conflicts will be promptly discharged. The management is evidently attempting to enforce its neutrality.

Wilkes-Barre—A recent explosion of gas in the No. 20 Maxwell colliery of the Lehigh & Wilkes-Barre Coal Co., caused the serious injury of a miner and his laborer. Both were seriously burned, and were taken to the city hospital, where the condition of one of the men was pronounced serious.

Shenandoah—The Mill Creek Coal Co. which a short time ago opened up the old workings of the Wolf Creek Coal Co. near St. Clair, recently made its first shipment. The coal is being sent to the new Boston colliery for preparation.

Bituminous

Jerome—The big tipple of the No. 3 mine of the Jenner-Quemahoning Coal Co. was badly damaged by fire recently and would probably have been totally destroyed, but for the heroic efforts of miners. The mine is now running without the use of the tipple, which will be repaired immediately. The mine has plenty of orders and is working steadily, in contrast with many other of the coal operations of this place.

Connellsville—The production of the Connellsville region is still above 200,000 tons per week. This will be reduced slightly for a short time, due to the fact that some of the furnaces of the U. S. Steel Corporation have been overstocked with fuel and are cleaning up their stock piles to a certain extent. Many of the Frick ovens are now banked, but have not been put out of blast.

Bellefonte—Two new coal deposits were recently found in the Snow Shoe region, one being a 4-ft. measure belonging to the Lehigh Valley Coal Co., and the other a 5-ft. bed at the mouth at Beauty Run, belonging to the Kelly Bros. Both owners recently completed a thorough test by drills in the territory underlaid, and each will develop the property by opening extensive operations. Modern machinery will be employed, and a large number of miners will be put to work.

Pittsburgh—The John B. Shannon Co. has recently sold for James B. Manning, of New York, to the National Coal & Fuel Supply Co., of Columbus, Ohio, 5000 acres of coal property near Grundy in Buchanan County, Va., for $150,000. The

sale includes not only the mineral rights, but the timber and surface as well. The new owners expect to operate the property, the Norfolk & Western R.R. passing through the tract.

Pittsburgh—In an opinion handed down Nov. 7, Judge Charles B. Orr in the United States District Court, refused the petition of the Girard Trust Co. to join the receiver of the Pittsburgh-Westmoreland Coal Co. in the foreclosure of a mortgage given by that company to secure payment of 6 per cent. two-year gold notes in denominations of $1000 each to the aggregate sum of $900,000. Leave was granted to the receivers of the coal company to issue certificates in the sum of $350,000 to carry on the business.

WEST VIRGINIA

Welch—All the mines owned by the U. S. Steel Corporation in the Pocahontas and Thacker fields will resume operations at once. This means the employment of many men who have been idle or working only part time. The demand for the output of these mines has not been sufficient during the last few months to justify their full operation, and consequently a large reduction in working forces was made.

Herberton—The property of the Herberton Collieries Co. has been purchased by the Willis Branch Coal Co., of Beckley, W. Va. It is understood that the new owners will not open the mines formerly operated by the other concern, but will start new operations.

ALABAMA

Sayreton—The Republic Iron & Steel Co., of Birmingham, is making extensive improvements at Sayreton, the banner coal mines of the state. Automatic doors are being installed and the mine is being electrified.

Charles M. Barnett, formerly president of the Chesapeake & Ohio Coal & Coke Co., has been elected president of the Atlantic States Coal & Coke Co., of Richmond, Va., to succeed C. E. Bockus. The policy of the company has broadened considerably in the export business, and it expects also to participate largely in the coal trade of the Middle West.

Birmingham—J. P. Pearson and R. A. Monagham have been named by E. M. Dryer, referee in bankruptcy, as receivers for the Central Coal Co., which concern recently filed a voluntary petition in bankruptcy. The liabilities of the Central Coal Co. are listed at $292,697.97, and the assets at $190,300.

Approximately 16,000,000 tons of coal were mined in the State of Alabama last year. The value of this output was $21,000,000. During the time there were 125 fatal accidents, according to the report of J. T. Gorman, examiner of public accounts. There are 302 coal mines, in which 25,000 men are employed.

A voluntary petition in bankruptcy was filed in court by the Mountain Valley Coal & Coke Co. of Jefferson County. Liabilities were placed at $52,596, and assets at $30,203.21. John W. Cook was appointed receiver.

D. J. Parker, of Birmingham, has gone to Pittsburgh to assume the duties of mining engineer in the government service. The appointment was the result of an examination in which he took third place out of a thousand competitors.

KENTUCKY

Berea—Coal companies in this part of the state are preparing to take advantage of the Workmen's Compensation Act which is to become effective on the first of the year. The cost of going in with the state is little more than that of liability insurance and it is said that numbers of the companies in this section have been refused liability insurance because of the frequency of accidents.

Greenville—Activities of the "'Possum Hunters" are declared to have practically ceased in this part of western Kentucky where there was considerable violence in the last several weeks. It is reported that there is much apprehension as to recurrence of the troubles but no particularly notorious cases have been reported. Judge J. J. Rice has added another $200 to the reward offered for apprehension and conviction of the persons who hanged Henry Allen and for those who later whipped Frank Lee and I. E. Covington.

Pineville—Although the coal-mining operations in this part of the state have been on a reduced scale for several weeks, conditions are showing steady improvement. Many mines which have been running on short time are working longer hours and prospects are considered to be favorable to more extended operations in the near future. The fact that the Harlan Coal Mining Co. has recently opened up a second operation at Kayu, near Coxton, its original operation, is considered a special indication of better times. The Harlan company has just completed 100 new houses for its employees and is making other improvements in its settlement.

Whitesburg—Since the advent of rough, snowy weather, with extreme cold there has been considerable improvement in the eastern Kentucky coal fields, especially in the Jenkins-McRoberts-Fleming fields, and a number of mines have resumed operations after being closed down for several days. In fact all over the coal fields there has been a notable improvement, and a better market now exists generally. As a result a large number of miners are now working.

Hazard—All the mines around Hazard, especially those of the Ashless Coal Co., the Hazard Coal Co., the Hazard-Dean Coal Co., the Kentucky Jewel Coal Co., the East Tennessee Coal Co., and the Wolf Creek Coal Co., are all running full time, and a general improvement of market conditions is noted. There is especially great activity in and around the Hazard field.

OHIO

Pomeroy—The two mines of the Essex Coal Co., located in the Pomeroy Bend field, have been opened and each is shipping about 500 tons daily. Both are electrically equipped and the capacity will be increased to about 1500 tons each by spring.

Cleveland—Operators and miners of No. 8 field held a joint conference in Cleveland, Wednesday morning. National President John P. White and National Secretary William Green, of the United Mine Workers of America, President John Moore, of the Ohio district, President Charles Albasin, of the eastern Ohio sub-district union, and delegates from the unions attended. This was the largest gathering of miners since the Wheeling conferences. No preliminary arrangements had been made and the whole situation was gone over as if nothing had previously been done.

Martins Ferry—It was reported recently that the Gaylord mine, which has been idle since Apr. 1, when the miners went on strike, will probably never again be opened. It is certain that this mine in filling up with water and several falls of rock have already occurred. No men have been employed to keep the mine clean, and it is said that it is in a bad condition from the long idleness. It is believed that many mines in this vicinity are in the same condition.

Cincinnati—The city has brought suit against the Paint Creek Collieries Co. for $7000, which is claimed to be due for the use of the water front for the past three or four years. The suit was filed in Scranton, Penn. It is alleged that the company, which has been using a certain space along the water front for a number of years, paid the city $500 every three months for the privilege, up to three and a half years ago, when payments ceased, and the suit has been brought to compel the payment of dues, and to adjust the rights of all parties.

INDIANA

Paxton—A strike at the J. Wooley Coal Co.'s mine has been settled by the state board of miners and operators. The company has been charging $3.25 for 25 lb. of permissible powder and the miners held that black powder, costing $2.72 would do the same amount of blasting. The company agreed to sell the former powder at the price of the latter, the miners to furnish their own detonating caps.

ILLINOIS

Sesser—Plans are under way for another mine near here, which will be sunk by A. Watts, Sr., and his son, in connection with Jesse Diamond, who is already interested in other Franklin County mines.

Royalton—The report made during the past week to the Governor of Illinois, by United Mine Workers officials, that the widows and orphans of the 52 miners, who lost their lives in the Royalton explosion, were destitute, is entirely without foundation. The operators claim that this malicious report has been spread to create an ill feeling against the unfortunate operators. J. L. Mitchell, principal owner of the Royalton property, is taking care of every one of the defendants of the deceased miners who might be in need, and there is absolutely no suffering or destitution of any kind.

East St. Louis—The Interstate Commerce Commisison is holding a hearing, in an effort to determine whether some of the coal roads entering East St. Louis should be classified as industrial roads or as common carriers. At the present time they enjoy the privileges of common carriers, and if they are classified as industrial lines, they will be allowed a switching charge on coal from the mines to East St. Louis, and will not participate in the through coal rates.

Cantine—Mine No. 3 of the Lumaghi Coal Co. has been shut down permanently, on account of lack of business. This mine had an output of 1000 tons a day, and up until a month ago, worked steadily.

Percy—Finding the mining business in anything but a flourishing condition, the Willis Coal & Mining Co. has decided to go into the dairy business, and several hundred acres of land, which has been undermined, has been laid out by the Willis people in a $75,000 dairy farm, $25,000 being paid for the milk cows alone.

Staunton—A short time ago the DeCamp coal mine was sold for $5000. Recently the president of the company applied to the Circuit Court of Madison County, asking that approval of the sale be withheld, as the figure named is far below the value of the property, which is estimated to be $51,000.

ARKANSAS

Fort Smith—Practically every miner who was arrested last week on indictment returned by the Federal Grand Jury, investigating the Hartford Valley mining troubles, has been released on bond. Latest reports from Prairie Creek are to the effect that everything is quiet and work has been resumed, although not on a large scale.

Heber Springs—Plans are almost completed for the development of coal mines near here, by Mortimer Frauenthal.

OKLAHOMA

McAlester—Sixty-seven tracts, including about 10,000 acres of segregated coal lands, were withdrawn from the market when the government sale was opened Nov. 25, because of protests by coal operators. Nearly 100,000 acres of leased land has already been withheld.

FOREIGN NEWS

Sydney, Nova Scotia—The Dominion Coal Co. has completed its shipments from Sydney to the St. Lawrence market for the season. In consequence, work at the various mines has run slack, and will probably continue so until banking operations are resumed about the middle of December. After the beginning of the new year, operations will be good, it being said that the collieries will work about three-quarter time.

PERSONALS

J. H. Tidmore, superintendent of the Banner mines of the Pratt Consolidated Coal Co., Birmingham, Ala., recently resigned.

James S. Thompson, formerly of Colorado, has accepted the position of general superintendent for the Utah Fuel Co., with offices at Castle Gate, Utah.

Robert M. Irving, of Terre Haute, Ind., has resigned his position as general superintendent of the Monon Coal Co. His successor has not yet been appointed.

James M. Page, who recently resigned as superintendent of Rex No. 1 Mine, at LaFollette, Tenn., is now superintendent for Gaviano & Co., coal operators, at Ludlow, Colorado.

J. F. Webb, assistant state mine inspector of Alabama, in charge of the Third District, recently resigned his position, to take charge of the Banner mines of the Pratt Consolidated Coal Co. as superintendent.

Julius Bierach, manager of the Louisville office of the St. Bernard Coal Mining Co., is confined to his bed at the Deaconess Hospital in Louisville, where he recently underwent an operation. He is reported progressing favorably and is expected to be able to return to his desk by the middle of December.

E. T. Stotesbury, president of the Piney, Crab Orchard and White Stick coal companies, announces their dissolution, having surrendered to the State of West Virginia their charters and corporate franchises. After the sale of said properties and all debts and obligations are discharged, the balance will be divided pro-rata among the stockholders.

T. R. Ragland, formerly superintendent of the Fort Defiance Coal & Coke Co.'s operation at Gauley Bridge, W. Va., has taken charge of the new mines of the West Virginia Coal Mining Co. at Skeleton. This operation is on land leased from the Beaver Coal Co., and over 2000 tons were shipped last month.

In the accident on a Burlington suburban train recently, in which several cars caught fire, P. C. Richards, of Richards & Ambler Co., was severely burned about the head and hands. He is now in St. Anthony's Hospital, Chicago, and it is reported that he will not be able to be out for at least 10 days. A number of other coal men were on the train, but Mr. Richards was the only one injured.

Colonel R. J. Stegall, for the past 10 years purchasing agent for the New River Co. at Macdonald, W. Va., recently severed his connection with that company preparatory to assuming his new duties as clerk of the County Court, to which office he was recently elected. M. C. Moore, who has been in the purchasing department for the past two years, succeeds Colonel Stegall.

W. L. Moke, of Adena, Ohio, head of the Roby Coal Co., the Roby-Somers Coal Co. and the A. G. Blair Mining Co., was recently made general manager of the Lehigh Valley Coal Co.'s properties. The latter firm has had a million tons annual output, but will open another mine and develop a new property which will mean a considerable increase in the tonnage under Mr. Moke's supervision.

CONSTRUCTION NEWS

Martins Ferry, Ohio—A new coal mine has been recently opened on the narrows south of Shadyside.

Shenandoah, Penn.—Work on the new steel and concrete breaker of the Lehigh Valley Coal Co. at Packer No. 5, is being pushed with all possible speed.

Scranton, Penn.—The Lehigh Valley Co. recently placed a force of men at work repairing the Yorktown Washery of the Spring Brook Colliery which has long been idle. Operations at this development will be resumed at once.

Johnstown, Penn.—The W. H. Hughes Coal Co. has begun the installation of an electric haulage system at its mine at Bens Creek. It will also make other improvements that will increase the capacity of the plant from 400 tons to 1200 tons per day.

Wheeling, W. Va.—A force of men was recently put to work making repairs on the Semet-Solvay coke plant at Wheeling. It is understood that two large smoke stacks will be rebuilt and other repairs requiring several weeks will be effected.

Birmingham, Ala.—The Tennessee Coal, Iron & R.R. Co. has commenced work on the construction of a building, 80x200 ft., for the manufacture of fertilizer from slag. The cost of the plant will be $250,000 and a large number of men will be employed.

Rockwood, Penn.—The coal tract northwest of Rockwood in Milford Township is again being investigated by promoters. It is proposed to build a standard gage track connecting the proposed mines with the Somerset & Cambria line. The plant, if built, will be modern in every way.

Piedmont, W. Va.—The Maryland Coal Co. has announced that improvements costing many thousands of dollars will be made at its plant. The plant will be modernized for the mining of thin coal, and more than 300 men will be employed. It is estimated that the company will ship over 1000 tons of coal daily. An electric haulage system will be installed.

Wilkes-Barre, Penn.—A large concrete shaft is being sunk by the Delaware, Lackawanna & Western R.R. Coal Dept., at Nanticoke. The caisson method, which has not been employed to any great extent in the anthracite field, is being followed. The new shaft will have two hoistways, a pipeway and an airway, while its greatest dimension will be 52 ft. 3 in.

Cincinnati, Ohio—The Reliance Coal & Coke Co., which recently made arrangements for the purchase of the property and business of the White Oak Coal Co., is building at a point 10 miles below the city a coal-handling and storage plant with a capacity of 100,000 tons, at which it will take care of coal from up the river as well as from its mines.

NEW INCORPORATIONS

Bristol, Va.—An amendment has been filed to the charter of the Blacok Coal Land Co., reducing the capital stock from $1,500,000 to $15,000.

Duquoin, Ill.—The Granger Coal Co. has been organized with a capital of $30,000. The incorporators are A. G. Graham, C. F. Quick, O. M. Roberts.

Middlesboro, Ky.—The Low Ash Mining Co. has been organized with a capital of $5000. The incorporators are E. B. Nicholson, F. D. Hart, Jr., M. H. Rohrer, and J. D. Simpson.

Switzer, W. Va.—A charter of incorporation was recently issued to the Alemma Coal Co., of Switzer, Logan County. This company has an authorized capital of $25,000 and the

incorporators are Fred C. Prichard, Rufus Switzer, Thomas A. Wiatt, R. H. Williams, and J. M. Vest.

Mullens, W. Va.—Organization has been effected by the Hardy Coal Co. with officers as follows: President, J. A. Wood; vice-president, Frank A. Prince; secretary, D. H. Mead; treasurer and manager, J. C. Sullivan. This firm plans a daily output of about 1500 tons which will be secured through electrical equipment, the machinery to be purchased during the next 30 days.

INDUSTRIAL NEWS

Cambridge, Ohio—Two mills of the American Sheet and Tin Plate Co. have posted notices that they will be closed until Jan. 1, 1915; 800 men will be idle from these plants.

Birmingham, Ala.—The Mountain Valley Coal & Coke Co. recently filed a voluntary petition in bankruptcy. The liabilities were given as $52,596 with assets of $30,203.21. John W. Cook was appointed receiver.

New Lexington, Ohio—The property of the former Lilly-Hocking Coal Co., located one mile east of New Lexington, was sold at public sale Nov. 28, by John F. Nugent, receiver for the Weaver & Dufraine Coal Co.

Washington, D. C.—Sixty vessels of the United States Navy, six of which are battleships, are now burning oil instead of coal. It has been found that the oil occupies less space, weighs less, and gives a larger steaming radius.

Viper, Ky.—The Viper Coal Co. recently organized to make developments announces that it will be ready to begin shipping coal within the next 30 or 40 days. It will have a daily capacity of about 1500 tons when fully under way.

Put-In Bay, Ohio—The "Isabella J. Boyce," a steam barge belonging to the Pringle Barge Line Co., of Cleveland, caught fire while bound from Cleveland to the upper Lakes with a load of coal, and had to be abandoned. She and her cargo are believed to be virtually a total loss.

Knoxville, Tenn.—A twenty-five per cent. improvement in the domestic coal market has resulted from the recent cold snap, according to the leading coal merchants of this section who also report that the steam market also has taken a brace.

Charlestown, W. Va.—The industrial conditions in West Virginia continue to show a slight improvement. New industries continue to announce their plans for opening business in the state. Among these the Pursglove-Maher Coal Co., of Cleveland, Ohio, is reported to have taken an option on coal land in the Island Creek district of West Virginia.

Columbus, Ohio—The Alma-Thacker Coal Co., of Columbus, of which Charles Cohenour is president, is opening four mines near Williamson, W. Va., on property recently acquired. The property consists of 2000 acres and the capacity of the mines will be 2000 tons daily. Shipping will start as soon as the spur of the Norfolk & Western Ry. to the property is completed.

Wheeling, W. Va.—Suitable mine timber is becoming an expensive problem in many of the older coal-producing districts of this state. It is believed that the steel mine prop, which has been for some time in successful use in Ohio and other states, will grow in favor as it becomes more generally understood that this prop can be removed and used oftener than wood.

Lexington, Ky.—Suspension by the Interstate Commerce Commission of the "long and short haul clause" will stimulate the coal industry of eastern Kentucky, railroad officials believe, as it will place the mines there in reach of the big coal markets in the West and North, especially for coking coal which is much in demand in the large manufacturing plants in that section of the country.

Toronto, Canada—A discovery of lignite has been made in boring for a well in North Cobalt, Ont. It was struck at a depth of 25 ft., and though of inferior quality at the top it is believed that it will improve with depth. A thorough exploration will be made next spring. In view of the fact that all coal used in North Ontario has to be imported the discovery is regarded as of considerable economic importance.

Jenkins, Ky.—The Elkhorn & Shelby Creek Coal Co., C. G. Evans president, is asking, it is said, for prices on second-hand mining machinery, the shortwall type preferred; 250 volts 48 in.; nothing less than 6-ft. bar. W. J. Christopher is manager of the company, which will develop 400 acres of coal property, expecting to have a normal output of from 600 to 700 tons. All the machinery except the mining machines is provided for.

Chicago, Ill.—The Chicago Coal Merchants Association held its biweekly meeting in the offices of the association this week, and announcement was made that arrangements have been effected with a prominent insurance company whereby members of the association can secure a saving in the cost of their insurance. Mr. Adams' article suggesting uniform screening arrangements, which has been widely discussed, was read, and the members asked to submit their opinion later in regard to the proposed plan.

Bluefield, W. Va.—As a sequel to the resumption of operations in certain of the steel works of the country, the demand being made upon the Norfolk & Western R.R. is believed to be prophetic of a lively pick-up in the mining business within a short time. It is hoped that by the first of the year the coal output will be not far short of normal. With the markets of the world opening up for new business, it is believed that coal mining will reach a high mark hardly later than the first of the year.

Fayetteville, W. Va.—The coal billing records of the Chesapeake & Ohio R.R. for the years prior to 1914 were recently destroyed when the billing office in the East Thurmond yard was burned. The fire occurred about two o'clock a.m., and the building was being fast consumed when the billing clerk who was asleep therein, was awakened. His first thought was for the records, and without dressing he rushed into the office, and succeeded in removing the books covering the past year's business. Nothing else was saved.

Whitesburg, Ky.—The middle of December will see the first trains running through the famous "breaks" of the Big Sandy River, with the completion of the Carolina, Clinchfield & Ohio R.R., between Elkhorn City, Ky., the terminus of the Chesapeake & Ohio's Big Sandy branch, and Dante, Va., 35 miles distant. This is regarded as the most important railroad connection made in years in eastern Kentucky and will open up a large area of coal and timber lands. The construction was accomplished at tremendous cost. In the 35 miles of railroad there are 34 tunnels.

Washington, D. C.—The constitutionality of the coal-mining laws of Ohio will be tested in the United States Supreme Court which will hear the argument of the Rail & River Coal Co. in its case against the Industrial Commission of Ohio. The operators will claim that because of the law recently enacted the coal-mining industry of the state is practically at a standstill; that the loss to operators and employees in profits and wages has already reached an enormous total. Another interesting argument will be heard in the case of the Jeffrey Mfg. Co. involving the validity of the Ohio Workmen's Compensation Law.

Charleston, W. Va.—Coal and coke shipments over the lines of the Chesapeake & Ohio Ry. during the month of September and the first nine months of the year, have been made public in the statement issued by O. D. James, auditor of freight traffic. These continue to show an increase over last year. The statement shows that 2,019,730 tons were shipped during the month, as against 1,612,323 tons for the same month in 1913, an increase of 407,407 tons. For the first nine months of the present year 15,860,912 tons were shipped, as against 12,854,766 tons for the corresponding period in 1913, an increase of 3,006,146 tons.

Birmingham, Ala.—Coal companies with properties along the Warrior River are preparing for the completion of lock No. 17. The Pratt Consolidated Coal & Coke Co. is leading in this work. This firm is constructing barges at Holt where it has a building plant. Seventeen coal mines are either ready or will be ready to dump coal from the mine tipple onto barges when lock 17 is completed. Before the end of 1915 the Warrior River will be navigable for vessels of 6-ft. draft the year round from Cordova, 76 miles north of Tuscaloosa, to the Gulf. This will bring coal mines in Jefferson and Walker counties in direct touch with tidewater for all time to come.

Charleston, W. Va.—The statement of shipments of coal and coke over the lines of the Norfolk & Western Ry., for the month of October and for the first 10 months of the year, has been issued by T. D. Hobart, general coal freight agent, and while the October shipments show a decrease the shipments for the 10 months of the present year still show an increase over 1913. According to the statement 2,061,464 tons were shipped during October, as compared with 2,209,261 for the same month in 1913, a decrease of 147,797 tons. For the 10 months of the year the statement shows 22,849,014 tons, as against 21,325,120 tons for the same period last year, or an increase of 1,523,894 tons.

Coal Trade Reviews

General Review

Warm weather threatens the anthracite market with a general slump. Bituminous situation dull and no improvement in sight. Middle Western market beginning to stiffen up notably.

The warm weather has slowed up the demand for anthracite to such an extent that the market is being maintained with the greatest difficulty. The independent operators are curtailing operations heavily, and the large companies are forcing the market in every direction in order to maintain their working schedules. The domestic sizes are failing utterly to show their customary form, but the weakness centers more particularly on the steam grades, due to the excessive production, mild temperatures, decreased industrial activity and general demoralization in bituminous coals with which they are in close competition. If the high temperatures continue much longer, a general slump in anthracite is inevitable.

While basic conditions in bituminous continue to show indications of a turn for the better, the closest scrutiny of the market fails to disclose any important change. Some slight improvement is apparent in the movement on contracts, but the spot demand continues as dull as ever and occasional market cargoes are still noticed; as a matter of fact, were it not that operators are more cautious than ever before about shipping consignment coal, the market would probably be demoralized.

Under the stimulus of a slightly improved tone in general manufacturing, the Pittsburgh district has withstood the reverse incident to the cessation of Lake shipping in a most excellent manner. Some forced sales were, of course, hardly to be avoided, and there are still sufficient cut prices in evidence to cover all the spot demand but producers are showing an increasing determination to obtain full circular prices.

In spite of the return of warm weather, Ohio consumers seem to have felt the danger of low stocks, and buying is still continuing. Dealers are placing immediate, if not urgent, orders, and there is a better tone in evidence in all directions. Screenings have stiffened up in excellent shape, and the outlook in steam coal seems more hopeful. Some inclement weather has also had a stimulating effect on the Southern markets, though the situation is not appreciably changed as yet, and it will require considerable cold weather to create any great activity.

It is evident that the Middle-Western consumers have not stocked their usual winter requirements as a great many orders are still arriving in spite of the return of warm weather. These orders are quite frequently urgent, and a good many companies are now on full working schedules. Practically all the demurrage coal seems to be cleaned up, and a fair business is anticipated throughout the balance of the season.

ATLANTIC SEABOARD

BOSTON

Little change in situation of Pocahontas and New River. Panama R.R. bids considered significant. "Market cargoes" still in evidence. Dull outlook for Pennsylvania grades. Anthracite demand slow.

Bituminous—The market this week is almost featureless. Prices on Pocahontas and New River are practically unchanged, a few spot sales still being made at prices little if any in excess of $2.50. The amount of tonnage of standard West Virginia coals offered the Panama R.R. at $2.70 or less is some indication of the view certain shippers take of the market for several months ahead, and it is extremely doubtful now if the $2.85 basis can be maintained next spring. The year of 1914 as a whole has been an object lesson to New England buyers who rushed in to tie themselves up with long-term contracts, and it will probably be hard persuading many of the important buyers to make contracts for 1915.

In New England the spot demand is light, but an improvement is shown in the call for shipments on contract. The improvement, however, is not sufficient to have any appreciable effect on the large volume of coal still standing at the Virginia terminals. It is generally understood now that the Boston & Maine, as well as the New Haven R.R., is to take Cape Breton coal as a part of its requirements, and the whole transaction has called forth a lot of comment.

An occasional "market cargo" of Pocahontas or New River is still heard from. Unsold balances at Providence have lately been sold as low as $3.20 on cars, a price that can hardly net $2.50 f.o.b. Hampton Roads. Georges Creek is in better supply than when last reported; cargoes are coming forward with normal regularity, and there is no longer any fear of a shortage of this grade later in the season.

The outlook for the Pennsylvania coals is no brighter than for several weeks past. The last cargoes for the season have now gone forward to points like Bangor, which will soon close to navigation and general inquiry is light. It is interesting to see that some of the higher grades are active competitors for Government business at Philadelphia as against the Pocahontas and New River shippers at Hampton Roads.

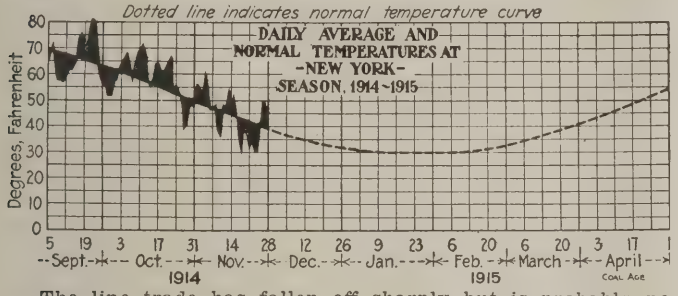
Anthracite—The state of trade is much dependent on the weather. A fortnight of low temperatures would create an active demand on the shippers, but as it is orders are few.

Quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*.....	$0.85@1.45	$1.15@1.50	$1.67@1.77	
Philadelphia*.....	2.10@2.70	2.35@2.70	2.92@3.02	
New York*.....	2.40@3.10	2.65@3.05	3.22@3.32	
Baltimore*.....	.....	.....	2.85@2.95	
Hampton Roads*.	.....	.....	.....	$2.50@2.75
Boston†.....	.....	.....	.....	3.40@3.73
Providence†.....	.....	.....	.....	3.20@3.58

* F.o.b. †On cars.

NEW YORK



Some bituminous on demurrage and the market occasionally forced. Slack stiffer. Anthracite slowing up. Individuals curtailing production and large companies putting some sizes back into storage.

Bituminous—While many operators continue optimistic as to the future, the market still fails to show any important indications of a recovery. In fact were it not that producers have been more cautious about sending consignment coal forward than ever before, it is probable that the trade would now be utterly demoralized. Even as it is the market is occasionally being forced with coal on demurrage and there was a large tonnage unloaded from one of the German vessels last week because it was showing indications of firing. Mining schedules are heavily restricted, Pennsylvania operations being at about 50% to 60% capacity; the cessation of Lake shipments has also caused a large number of the Fairmont, W. Va., mines to close.

The closing of the Lake trade has stiffened up slack prices in all parts of the country. The heavy export business in other lines is also creating a strong bunkering demand which is probably one of the best features of the market. Among the other constructive developments are reports of heavier orders from the railroads, indications that stocks are being cleaned up and a very slight improvement in general manufacturing. Prices are not quotably changed and we continue these on the same basis as for the last several weeks as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The cold snap of two weeks ago started some activity in anthracite, but the recent warm weather has caused a slowing up and the business is scarcely holding its own. Individual operators are curtailing production probably more than is generally known and although the large companies have so far continued on full working schedules, it has been only by a decided effort. Sales agencies are experiencing great difficulty in placing the tonnage and it is understood that the Reading is now putting all of its steam sizes back into storage. If the higher temperature continues much longer a general slump in all directions is inevitable.

The line trade has fallen off sharply but is probably no worse than at Tidewater. The situation on rice and egg coal is somewhat softer than last week while pea coal is difficult to move, either all-rail or at Tidewater. The other sizes are not notably changed from last week, although prices are in some cases lower, the market now being quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	5.10@5.35	5.30	4.80@5.30
Stove	5.35	5.35	5 30	5.30
Chestnut	5.60	5.50@5.60	5.55	5.35@5.55
Pea	3.55	3.45@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.25@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.40@2.25
Barley	1.80	1.70@1.80	1.75	1.25@1.75

PHILADELPHIA

Anthracite market continues to lack tone. Domestic grades fairly active, but small sizes continue to hamper operations. Cold weather will be necessary to inject any snap into trade. Reports in bituminous still adverse.

Anthraite—The past week was anything but favorable to the anthracite business because of the high temperatures. Operations were continued on full time, as a rule, but some of the large companies are hard pressed to dispose of their surplus, especially of the steam sizes. It is a notable fact that the steam sizes are not moving to the extent that is naturally expected at this season of the year, and there is a general complaint in the trade about the poor demand. This is due to the depressed industrial situation, and the exceedingly low prices for bituminous.

Broken coal is not in as good demand as usual while egg is also inclined to drag, substantial concessions from the circular being frequently noted. Stove and chestnut seem to be the only sizes for which there is a ready market; reserve stocks of the latter are still being drawn on to satisfy the demand. Outside of the two last named sizes, the market is simply holding its own.

Prices at Tidewater rule about as follows:

	Circular	Individual
Broken	$4.75	$4.50 @ 4.60
Egg	5.00	4.75 @ 4.85
Stove	5.00	5.10
Chestnut	5.25	5.25

Bituminous—While there seems to be some slight indications that better conditions are coming, there is nothing to justify this at present time. There does seem to be a better demand, due to the resumption of some manufacturing establishments, but nothing in the way of better prices has been noted, and taking the week as a whole, no improvement can be recorded.

BALTIMORE

The struggle of the coal trade against general adverse business conditions continues. Slack the only branch to show strength. Anthracite business but fair.

The demand is poor in all branches of the bituminous trade. Anthracite dealers are doing a fair early winter business on household business, but the industrial fuel situation fails to show any improvement.

Reports from West Virginia show that prices there, with the exception of slack, have undergone no change. Three-quarter gas was being quoted around 85c. and steam coals at from 85 to 90c. Slack kept advancing all the week, starting at 45 to 50c. and finally selling around 75c., or on a parity with gas run-of-mine. This was not due so much to any increased demand as to the reduced output.

Pennsylvania coals are without any material change. Lower grades were offering in some small lots at 90c. Better coals sold at from $1 to $1.10, while the best grades were moved in restricted lots at from $1.25 to $1.35.

HAMPTON ROADS

Shipments only fair. Accumulation in railroad yards about normal. November dumpings lighter than anticipated.

Dumpings over the piers at Tidewater have been about average during the week. There have been some large cargoes exported and also some heavy shipments to the New England market; in addition to this there has been some little movement to Savannah and Tampa. Vessel tonnage has arrived so irregularly that at times some of the piers have been decidedly rushed but at other times there is little or no tonnage alongside the docks. Considering the existing war conditions the number of vessels calling for bunker coal is holding up well.

Prices are generally at the circular with perhaps some cuts being made by shippers who have coal on demurrage. There are indications that some change will be made shortly in the price for bunker coals to be supplied during 1915, but it is impossible to predict what it will be. In the majority of cases payment for bunker coal was made by draft payable in London but the war and money conditions make this impracticable.

Authoritative announcement of destination of vessels is no longer made, but the following have cleared, presumably for the ports noted:

Vessel	Destination	Vessel	Destination
Celia	Iquique	Wascana	Pernambuco and other Brazilian ports
Mar Corusco	Porto Ferrajo, Elba	Sark	La Plata
Highbury	Italian port	Stromboli	Italian ports
Magda	Media Luna, Cuba	Peta	Cienfuegos

OCEAN FREIGHTS

Vessels continue scarce with rates high and hardly quotable.

Freight market conditions are practically the same as a week ago—a strong demand for steamers and a scarcity of available boats; under these circumstances it is rather difficult to quote probable freight rates with any degree of certainty. The following is the approximate market though we can then no doubt give you closer quotations:

To	Rate	To	Rate	To	Rate
Havana	$1.75@2.00	Kingston	$1.85@2.00	Tampico	$2.25*
Cardenas††	1.90@2.10	Curacao	1.75*	Rio	4.80@6.00

W. W. Battie & Co.'s Coal Trade Freight Report.

COAL CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Aurania	Italian	Philadelphia	Mediterranean	2180	
Kronprins Olav	Norwegian	Philadelphia	Havana	2509	
Laura C. Anderson		South Amboy	Jacksonville	766	$0.90
Florence M. Panley		Philadelphia	Portland	927	
Estelle Krieger		Norfolk	Puerto Cabello	1047	2.50
Modiva	Norwegian	Philadelphia	Sagua	778	
Malcolm Baxter, Jr.		Philadelphia	Boston	1479	0.60
May V. Neville		Norfolk	Texas City	1043	1.05
John B. Manning		Norfolk	Boston	955	
Trento	Italian	Virginia	West Coast Italy	2089	4.80
Daisy Farlin		New York	Macoris	285	

Note—Steamers are indicated by **bold face** type, all others being schooners.

OHIO VALLEY

PITTSBURGH

Trade suffering severely from cessation of Lake shipments, but otherwise showing slight signs of improvement. Operations at between 35 and 40% of capacity. Slack stiffening, other descriptions being cut as much as formerly, with $1.15 asked on mine-run for prompt shipment.

The coal trade is naturally suffering severely from the cessation of Lake shipments, but this is the normal experience at this time of the year, and operators are not trying to force the market except in a few instances, when prompt coal is sold at particularly low prices. In other respects the situation

shows some slight signs of improvement. Several large operators report a little increase in requirements under contracts with manufacturers, particularly in the iron and steel trade. The manufacturers have no stocks and seem to be increasing their operations slightly. Domestic demand increased somewhat last week, but a further and much larger increase is expected. The retail dealers have been buying strictly from hand to mouth, and the advent of really cold weather, after an exceptionally temperate fall, should result instantly in considerably larger demand upon the mines.

With the restriction due to the cessation of Lake shipments, operations have been further reduced in the Pitsburgh district in the past fortnight, and are now at not over 40% at the outside, though they probably average well above 30%. While little increase is expected for the near future, a rate of 50% may possibly be reached by the end of the month.

There are no contract prices being quoted, as there is no contract demand. For prompt lots most sellers are holding rather firmly, but there are cut prices enough to cover most of the demand. Slack has continued to firm up, and is now quotable at 70@80c., though by this time of the year it is usually up to the regular winter level. The leading interest in the district adheres to its quotation of 90c., and would probably buy slack if low prices were quoted. We quote the market approximately as follows, noting that except in the case of slack the prices are frequently shaded: Slack, 70@80c.; nut and slack, $1; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35.

BUFFALO

An increased activity in bituminous, especially slack. General improvement anticipated. Canada doing better. Lake trade closing. Anthracite strong.

Bituminous—There is a better feeling in the trade, though the demand has not improved as yet. Some shippers are finding better conditions and there is a general disposition to hold firmer and to ask a little more for slack. There are not so many records of slack selling at sacrifice prices and it is generally believed that it will advance before long. An adverse feature of the slack situation is that screenings are dull, selling at about $2, which brings them in competition with slack.

There is a small stir in the Canadian trade, due to the starting up of factories on orders for war munitions from England. In fact orders from Europe are becoming general everywhere and factories are also beginning to make goods formerly imported. All indications now point to a gradual return to normal conditions, though it may be some time before the effects are felt in the coal trade. The current market is certainly in better condition than it has been of late, not much coal being on car service and fewer reports of very low prices being heard.

The closing of the Lake trade affects the bituminous market in a general way. Other markets are compelled to absorb the great volume going out by Lake, but this is usually discounted to a certain extent. Sometimes this is even overdone to such an extent that with the regular increase of consumption at this time of the year, the supply runs short.

Prices are a little stronger, especially for slack, quotations remaining at $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack. Allegheny Valley coal sells at 25c. below Pittsburgh.

Anthracite—There is a good movement of all sizes of anthracite except egg, which has to be forced by refusing orders for stove or chestnut unless some egg is included. But it is believed that it will all be taken up as the late cold snap has improved the retail trade and the rail-line movement has all along been good. Lake shippers are holding on yet and are willing to pay extra insurance on a few cargoes. Shipments for the week were 146,500 tons, nearly all of it going to the heads of Lakes Superior and Michigan. As a rule the shippers are well supplied at that end of the Lakes.

TOLEDO

Lake movement practically at an end. Many vessels have gone into winter quarters at Toledo. Weather conditions affect market.

While the volume of coal passing through Toledo has been heavier than usual, business has been no comparison to what was expected. The official navigation season on the Lakes ended last Monday at midnight. Underwriters have announced that there will be no extension of insurance this year although this has not been the case in former seasons; so few vessels are out that the possible loss of even one steamer would wipe out any profit that might be made. Three vessels only are in sight for loading at the Toledo docks. Twenty-three Lake freighters are now in winter quarters here and 17 are being stored in the Bay View park harbor.

COLUMBUS

Some improvement is noted as a result of the more favorable weather and the bettering in general trade conditions. Production slightly increased and prices steadier.

While the freezing weather of a week ago was only of a few days' duration, it stimulated trade to a certain extent. Dealers placed orders for immediate delivery while buying on the part of consumers was more lively and a better tone was noted on all sides.

Steam business is still slow and prices rather weak due to the fact that West Virginia coal is being sold under the Ohio circular. Railroads are taking only a minimum amount of fuel though some show a disposition to stock up for the winter season.

Domestic trade is the strongest point in the market. Rural dealers are buying more freely since farmers are now taking time to haul their coal supply. Householders are also buying more freely. The new retail prices of Nov. 1 have been generally well maintained although there is no likelihood of another advance soon. Retailers' stocks are lower than for some time.

Production in Ohio has increased slightly under the beneficial effect of lower temperatures. The Hocking Valley produced about 60% of normal during the week. Crooksville and Cambridge also outputted a like percentage while the Jackson field is credited with 50%. In the Pomeroy Bend district, production is almost normal.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.55	$1.65	.....
Inch and a quarter	1.50	1.55	$1.40
Three-quarter inch	1.35	1.40	1.35
Nut	1.15	1.25	1.15
Mine-run	1.10	1.15	1.10
Nut, pea and slack	0.40	0.45	0.40
Coarse slack	0.30	0.35	0.30

CINCINNATI

Milder weather has cut down the domestic demand, but the steam business is improving. Prices steady.

The weather has again turned abnormally mild and domestic business has dropped off accordingly. But the previous cold spell showed both consumers and retailers the danger of short stocks, and while the movement of prepared sizes is now below what it was ten days ago, it is much better than before that time. Operators are no longer hampered by an inability to move domestic coal and screenings and steam coal are also in good demand; the steam demand is steadily improving, with every indication of reaching a high point by Jan. 1. During this month many large consumers are expected to make arrangements for their 1915 fuel supply, and business should experience a beneficial effect from this. Prices are steady, the cheaper grades being especially strong.

CLEVELAND

Warm weather and the reconsigning of Lake coal left over on the docks have made the spot market weak. Some demurrage coal noted. Slack stiffening up.

Receipts of coal have not been any heavier, but the warm weather has had a depressing effect upon the buyers. Coal on track has gone on car service and fine coal was sold at from 5 to 15c. below shipment prices. Hocking and Goshen nut and slack went as bonus, $1.55 on track here, while Youghiogheny, Panhandle, Fairmount and other high-grade steam coals touched $1.60 to $1.65. A considerable amount of fine coal has gone on car service and it seems now as if there would be little chance of the market cleaning up this week.

The domestic trade is not absorbing all the coal sent here. Pocahontas lump was offered at $3.45 to $3.50 and mine-run was shaded 5 to 10c. from shipment quotations. There has been some No. 8 from West Virginia consigned here; it is exclusively three-quarter and is being offered at almost any price. Three-quarter coal left over after the last ships were loaded Monday was sold at low prices and reconsigned to Western trade.

A further weakening factor is the excessive production of three-quarter coal to get slack. The closing of the Lake trade is causing slack to advance and is the reason for operators trying to substitute mine-run coal for fine coal. Slack will advance to the mine-run price before another week.

Quotations for shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmount	W. Va. No. 8
Lump	$3.60	.....	.....	.....	.....
Lump, 6 in.	.....	.....	$2.45	.....	.....
Egg	3.60	.....	.....	.....	.....
Egg, 6 in.	.....	.....	2.10	.....	.....
Lump, 1¼ in.	.....	$2.40	2.25	.....	.....
Lump, ¾ in.	.....	2.30	2.10	$1.95@2.00	$1.95@2.00
Mine run	2.60	2.25	1.95	1.85@1 90	1.90
Slack	2.40	1.75@1.80	1.65@1.70	1.75@1.80	1.75

COKE

CONNELLSVILLE

Heavy inquiry for furnace coke for 1915 delivery, owing to recent sales of pig-iron and expiration of existing contracts. One contract closed on sliding scale and others being negotiated on this basis. No immediate prospect of increased consumption or production.

The contract furnace coke market has suddenly taken on an aspect of great activity. Inquiries for contracts for delivery during part, or all of next year, received in the past ten days are easily larger than the total of inquiry for several months preceding, and at least one contract has actually been closed.

The suddenly increased inquiry is generally attributed to the greater activity in the pig-iron market. The Buffalo furnaces have lately made a drive and by naming very close prices have sold a quarter of a million tons or more of pig-iron, while other districts have increased their sales somewhat. It is everywhere recognized that the uncertainties of the future are such that no producer can afford to risk selling his finished product without at once covering the raw material involved.

A contract was closed a few days ago for 10,000 to 12,000 tons of furnace coke monthly during the first half of 1915, on a sliding scale, the price to be adjusted monthly according to the ruling price of pig-iron, and it is understood the minimum price stipulated for coke in the contract is but little under $1.75. The inquiries number eight or ten, involving 80,000 to 90,000 tons of coke a month. Most of this is for the first half of next year, no inquiry being for the first quarter only, while one or two are for the whole year and one inquiry involves coke for two years. The trend is stronger than usual towards the making of sliding scale contracts.

The demand for prompt furnace coke increased somewhat last week, owing probably to the holiday, and $1.60 was obtained with less difficulty than usual. Foundry coke remains very quiet.

The activity in the coke market is attributable entirely to the desire of furnacemen to cover for next year, their present contracts expiring in almost all cases with this month. There is no immediate prospect of increased consumption or production. The market stands quotable approximately as follows: Prompt furnace, $1.60; contract furnace, $1.75; prompt foundry, $2@2.25; contract foundry (nominal) $2.35@2.50, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Nov. 21, at 200,804 tons, a decrease of 5510 tons, and shipments at 200,022 tons, a decrease of 10,365 tons.

BUFFALO

Some improvement in inquiries, but no stir yet.

Here and there a coke shipper reports that he has a few more consumers asking for prices, but the improvement is not of much account and may not go any further for the present. Prices remain on the basis of $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

ST. LOUIS

The market is quiet on foundry coke, with little demand. In the past week there have been a few inquiries for the coming 12 months, on selected 72-hr.; quotations were $2.50 at the ovens. This coke takes a $2.80 rate to St. Louis.

A very limited tonnage of byproduct is moving in, whereas in former years the local domestic coke was principally byproduct. This year it has been supplanted by coke from the local gas house, which retails at $5.75, and is sold to the dealer at $4 f.o.b. his tracks.

CHICAGO

There is a little better inquiry for furnace and foundry coke, but purchasers are seemingly indisposed to give orders at the prices quoted, which are as follows: Byproduct, $4.95; Connellsville, $4.75@4.90; Wise County 72-hr. (select), $4.75; gas coke, $4.25; furnace coke, $4.40@4.65.

THE STEEL INDUSTRY

The buying movement in pig-iron, which started with large contracts at Buffalo, as reported last week, has extended to other districts. Cleveland, Pittsburgh, Cincinnati, Chicago and St. Louis in particular have participated. At the same time there are signs in the finished steel trade pointing to considerable activity in December, making that the best month in the final quarter, in point of tonnage.—"The Iron Age."

SOUTHERN

BIRMINGHAM

Coal market remains quiet, though past few days have brought out more inquiries for lump.

The coal market in this district remains about stationary. There is little demand for either steam or lump coal, though the past few days, has brought cooler weather which has helped the retail dealers to some extent. However, it will take at least two weeks of cold weather to reduce the stocks sufficiently to effect the operators. Steam fuel is in a little better shape than lump coal. The demand is practically nothing, except on the regular contracts. Some of the mines are closed down entirely, while others are running from two to three days per week. No decided improvement is looked for until the first of the year.

LOUISVILLE

Prices considerably off the season's basis. Much coal on demurrage.

Continued unseasonable weather has caused a slack demand, though there are occasional reports of some increased activity in certain sections. Prolonged cold weather will be necessary to stimulate business to any extent.

Steam coals are dull; there is much fuel on demurrage in practically all of the centers to which the Kentucky operators ship. The cheaper grades are a drug on the market and many operators with poor selling facilities are continuing to give their coal away. It is reported that one Louisville operator sold a full car of eastern Kentucky nut and slack, at the mines, for $4.65, or at the rate of 10c. a ton. Prices are running considerably less than normal, from 25 or even 60c. below what is ordinarily the case at this season. Western Kentucky lump is offered at $1, nut and slack at about 55 to 65c. Eastern Kentucky, highest grade block ranges from $1.60 to $1.75, run-of-mine, $1.25 to $1.35, with nut and slack from 60@75c. down, according to grade and character. All prices f.o.b. mines.

MIDDLE WESTERN

CHICAGO

Situation more hopeful with some improvement noted. Continued strength in screenings. Anthracite trade improved. Pocahontas weak. Indiana and Illinois coals firmly held.

The colder weather of last week gave a better tone to the market with brighter prospects for the future. The temperature is again higher, but wholesalers and jobbers report a continuance of inquiries and a number of rush orders are being filled. It is evident that the consumers have been backward in stocking fuel this year. Very little consignment coal is left on tracks drawing demurrage. There is a widespread feeling that the balance of the winter is going to see steady absorption of the normal production of the mines.

Operators who have not attempted to force the market seem to be fairly well satisfied. Some companies are now working full time, but others have not developed a sufficient amount of business to justify such a course. During the last ten days, yard stocks have been materially reduced, and orders are now for immediate shipment.

The improvement in screenings continues. Many factories and industrial plants have either resumed operations or increased their working forces. Steam coal prices have advanced from 10c. to 15c. per ton, and show a further tendency to harden.

The anthracite demand has been urgent, and prices firm. Chestnut is short, egg in over-supply, and stove normal.

Shipments of egg and nut from Franklin County are holding up well, with most mines on practically full running schedules. Screenings are strong and in short supply, which is unusual in view of the heavy movement of lump.

Indiana operators are disposing of their lump coal locally and little reaches the Chicago market. Shipments on contracts are heavy. Indiana screenings are strong.

Smokeless has shown some improvement; lump and egg are short and prices slightly stronger.

The accumulations of Hocking coals have been cleaned up and shipments increased.

Carterville mines are working full time, leading all other Illinois districts in this respect; the demand is satisfactory and no low prices are quoted.

Demand is strong in the Springfield district; circular prices are strictly adhered to and screenings are buoyant:

Prevailing quotations are as follows:

	Franklin Co.	Springfield	Harrisburg	Sullivan	Clinton
Lump	$1.65@2.00	$1.60	$1.50@1.75	.....	$1.65@1.75
4-in. lump	.....	.....	.....	$1.60@1.75	.....
Steam lump	.....	.....	.....	.....	1.15@1.20
2½-in. lump	.....	.....	.....	1.50	.....
1¼-in. lump	.....	.....	.....	1.20@1.35	.....
Mine-run	.....	.....	1.20@1.30	.....	1.10
Egg	1.50@1.75	.....	1.50@1.75	.....	.....
6x3-in. egg	.....	1.50	.....	.....	.....
Nut	.....	1.35	1.40@1.75	.....	.....
No. 1 nut	1.50@1.75	.....	.....	.....	.....
Screenings	0.65@0.75	0.60@0.70	0.55@0.75	0.60@0.75	0.60@0.75

Hocking Valley 1¼-in. lump, $1.40@1.60; mine-run, $1.25.

New River and Pocahontas lump and egg, $2.25; mine-run, $1.25@1.40.

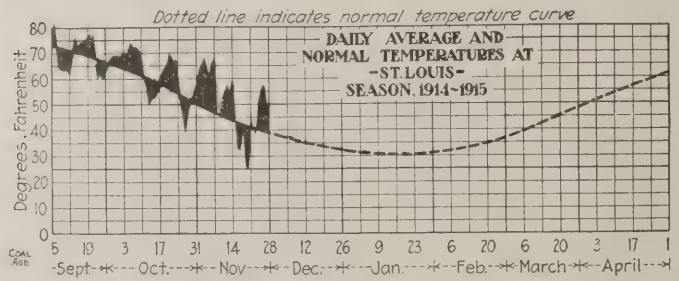
Somerset Smokeless lump and egg, $2@2.25; mine-run, $1.25@1.40.

Carterville lump, $1.60@1.75; 6x3-in. egg, $1.60@1.75; No. 1 washed egg, $1.60@1.75; No. 2 washed egg, $1.50@1.60.

Green County 5-in. lump, $1.50@1.65; 3-in. lump, $1.30@1.40; 3-in. egg, $1.30; mine-run, $1.10.

INDIANAPOLIS

Mild weather has resulted in a limited demand for domestic lump. Some improvements in slack. Mines on better running time. Slow growth in industrial demand.



The mines seem to be making better time. The cold snap of last week cleaned up the surplus slack and left the mines in position to increase operations. The price in the open market is 50 to 60c., which, at some mines is an advance of 10c. The railroad demand is still below normal for the season. A slightly improved industrial situation has something to do with the better movement of screenings; a slow improvement is expected in this direction.

A campaign has been started to eliminate the various grades of slack and return to one size of screenings. The agitation has been brought about largely by the experience of operators this year in having to find a market for the smaller sizes at the lowest prices in the history of the Indiana coal industry.

ST. LOUIS

Prices stiffening and a better tone is evident. December outlook fair. Collections the worst in years.

A slight change for the better, as regards high-grade coal, is noted in the local market. With practically no demand at all for domestic coal, there has been a stiffening up of prices on the lump size, while egg seems to hold its own. Raw and washed nut are unchanged and there is nothing to indicate an advance, except on the smaller sizes of washed coal for steam purposes; these are likely to increase with screenings which figure quite prominently in the market now.

On a contract for screenings from the Carterville field, from now until Apr. 1, several operators bid 80c. The stiffening up of the market is due to several mines in the Williamson and Franklin County field having decided to curtail their output. In the Standard field coal continues to sell below the cost of production.

Anthracite coal is heavy, with no demand, and smokeless the same. The retailers all report business slow but steady. Collections both retail and wholesale are the worst in years.

The prevailing wholesale prices are:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	....	$1.25	$1.05@1.10	$1.20
3-in. lump	.....	....	1.40	....	.....
6-in. lump	$1.35@1.60	....	1.50	1.25@1.35	1.40
Lump and egg	1.85@2.15	$2.25	.....	....	1.35
No. 1 nut	1.25@1.40	....	.....	0.75	.....
Screenings	0.50@0.55	....	0.80@0.85	0.25@0.30	0.20
Mine-run	1.05@1.10	....	.....	0.75@0.80	.....
No. 1 washed nut	1.50@1.60	2.00	1.60	....	.....
No. 2 washed nut	1.30@1.40	....	1.45	....	.....
No. 3 washed nut	1.10@1.15	....	.....	....	.....
No. 4 washed nut	1.00@1.10	....	.....	....	.....
No. 5 washed nut	0.25@0.30	....	.....	....	.....

PORTLAND

Buying in a hand-to-mouth fashion. Volume of business so far only about 40% normal.

While there was a small spurt for a few days during the cool weather, orders are falling off again. Consumers are apparently buying from hand to mouth, and will continue to do so for the winter. This will probably mean that the first real cold spell will find the dealers snowed under with urgent orders that they will find difficulty in filling promptly. Importations of coal are light at present as a result, and dealers have large stocks on hand.

PRODUCTION AND TRANSPORTATION STATISTICS

BALTIMORE & OHIO

The following is a statement of coal and coke tonnage moved over this system and affiliated lines during August, September and October of this year and last year:

	August		September		October	
	1914	1913	1914	1913	1914	1913
Coal	2,769,453	3,295,123	2,878,963	3,001,733	2,662,377	3,250,220
Coke	242,283	391,999	237,661	387,704	208,866	388,337
Total	3,011,736	3,687,122	3,116,624	3,389,437	2,871,243	3,638,557

NORFOLK & WESTERN RY.

The following is a statement of coal handled by the N. & W. Ry. during October and the past four months of the current year in short tons:

	July	August	Sept.	October
Pocahontas Field	1,314,478	1,277,621	1,390,531	1,021,699
Tug River District	263,240	293,179	295,332	270,651

[1] Includes Azores and Madeira [2] Including Anglo-Egyptian Sudan.

Nov. 23—Business is still suffering owing to scarcity of tonnage. Stocks of large coals are excessive and buyers in a position to take immediate delivery can obtain concessions in quoted prices. Quotations are approximately as follows:

Best Welsh steam	$4 80@5.28	Best Monmouthshires	$3.96@4.08
Best seconds	4.32@4.56	Seconds	3.84@3.96
Seconds	4 14@4.26	Best Cardiff smalls	2.04@2.16
Best dry coals	4.56@4 80	Cargo smalls	1.20@1.68

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both net, exclusive of wharfage, and for cash payment.

Freights—The position remains the same. Chartering orders numerous but tonnage scarce. Rates are approximately as follows:

Gibraltar	$2.64	Venice, Ancona	$4.80	Singapore	$4.32
Malta	2.88	Alexandria	4.08	Las Palmas	2.64
Marseille	3.66	Port Said	4.08	St. Vincent	2.76
Algiers	4.14	Aden	4.08	Rio Janeiro	3.84
Genoa, Savona	3.48	Colombo	4.20	Monte Video	3.36
Naples	3.48	Sabang	4.08	Buenos Ayres	3.60

Note—These indications are for Bristol Channel loading. Rates from the East Coast of England are considerably higher.

SPANISH IMPORTS

The Spanish imports of coal for the nine months to Oct. 1, of the current year, were 2,018,943 tons, as compared with 2,029,846 tons for the same period in 1913. Coke imports for the same periods were, respectively, 294,460 tons, in 1914, and 273,160 tons in 1913.

GERMANY

Considerable demand in the North to replace British coal. Heavy movement from Upper Silesia to Austria-Hungary. Belgium mines resuming operation.

Northwestern Bohemia—Although the output has been good, it is still far from normal, the car supply being about 50%. In household sizes there has been a marked falling off in the supply.

Saxony—Deliveries have shown a distinct improvement. The demand for soft coal is particularly urgent from the North, especially Hamburg, in consequence of the loss of the usual English supplies. Moreover, some industries, busy with military products, are buying heavily.

Upper Silesia—Coal shipments from this district to Austria-Hungary average 700 cars daily, of which 200 are for Vienna. The operators have promised to increase this to 1000 cars daily, if the requisite cars are furnished the Upper Rhine. The demand for steam sizes keeps brisk.

Belgium—The mines have been opened at Charleroi; about 60% of the regular force is employed.

Essen—The Syndicate has been ordered to increase the coal output to 60%, coke 27½%. The Syndicate agreement will expire Dec. 31, 1915, but negotiations have been pending for some time for the renewal of the agreement until 1921. The war stopped the negotiations and a temporary agreement is now under consideration to restrict all independent sales until 1915. As there is no disposition to dissolve the syndicate and as all wish to avoid industrial conflicts, a general acquiescence is looked for.

Coal Contracts Pending

Contract No. 14—Panama, C. Z.—In the list of bids quoted on this contract in last week's issue, the price of the West Virginia Coal Co. for 150,000 tons should have been $2.83 instead of $2.38, as noted. Delivery at Newport News and Seawalls points.

Contract No. 17—New York—Bids received on this contract (see "Coal Age" issue of Nov. 21), for furnishing the Department of Public Charities with coal, were as follows:

MANHATTAN (anthracite)—1800 tons egg, Pattison & Bowns, $5.37; 900 tons stove, Gavin Rowe, $5.70; 7000 tons buckwheat No. 1, Pattison & Bowns, $2.79; 800 tons pea (L. H.), Meyer-Denker-Sinram Co., $4.85; 30 tons egg coal (B. T. C.), Meyer-Denker-Sinram Co., $7.40.

MANHATTAN (bituminous)—10,000 tons, Geo. D. Harris & Co., $2.87; 400 tons gas coal, John W. Peale, $3.45.

BROOKLYN (anthracite)—7000 tons pea, Bacon Coal Co., $4.62; 700 tons stove, Bacon Coal Co., $6.81.

RICHMOND (anthracite)—400 tons egg, Gavin Rowe, $6.17; 250 tons stove, John E. Donovan, $6.43; 6000 tons buckwheat No. 1, Joseph Johnson's Sons, $3.38.

Address, Contract Clerk, Department of Public Charities, Room 1034, Municipal Building, Borough of Manhattan.

Contract No. 20—New York—Bids will be received by the Board of Trustees, Bellevue Hospital, until 3 p.m., Dec. 4, for furnishing and delivering 300 gross tons buckwheat coal No. 1. The security required will be 30% of the total amount of the bid and a deposit of 1½% shall accompany each bid. The time for completion of this contract shall not be later than Dec. 31. Blank forms and further information can be obtained on application to the auditor, 400 East 29th St., Borough of Manhattan.

Contract No. 21—Cleveland, Ohio—Sealed proposals for furnishing and delivering 2000 tons of Pittsburgh nut coal, 100 tons of the best grade soft lump coal and 50 tons of the best grade Lackawanna egg coal will be received by the County Commissioner until 10 a.m., Dec. 12, each bid to be accompanied by samples of not less than 25 lb. A certified check for $500 must accompany each bid. Address E. G. Krause, Clerk of the Board of County Commissioners, Cuyahoga County, Cleveland, Ohio.

Contract No. 22—Philadelphia—Sealed proposals for furnishing anthracite coal of various sizes to the different departments of the city will be received until Dec. 16. Deliveries are to be made as per specifications. Address, Director of Supplies, Room 312, City Hall, Philadelphia, Penn.

Contract No. 23—Boston, Mass.—Proposals will be received until noon, Dec. 4, for furnishing the Boston & Maine R.R. with 25,000 gross tons of low volatile coal for power house use. Mine-run coal is required, and it should be low in sulphur and have a heat value of approximately 14,000 to 15,000 B.t.u. Shipments will be in cargo lots, evenly distributed throughout the year, beginning Jan. 1, 1915, alongside Mystic Wharf, Boston, Mass. Address, Benjamin S. Hinckley, Purchasing Agent, North Station, Boston, Mass.

Contract No. 24—U. S. Navy—Only a comparatively few bids were received in reply to the recent request for tenders for coaling naval vessels at 82 different ports, the following being the complete list, all quotations f.o.b.:

BAKER, WHITELEY COAL CO. (Baltimore)—Bergen, $8.41; Gravesend, $6.67; Mauretius, $12.62.

CHESAPEAKE & OHIO COAL AGENCY CO. (Boston)—Gravesend, $6.61.

BERWIND WHITE COAL MINING CO. (New York)—Curacao, $5.40 (trimmed); Havana, $5.80; Manzanillo, $12.50 (trimmed); Naples, $6.48.

CASTNER, CURRAN & BULLITT (Philadelphia)—Curacao, $5.28 (trimmed alongside wharf).

W. R. GRACE & CO. (New York)—Callao, $13.70; Valparaiso, $17.49.

PAPARAO COAL MINING CO. (Wellington, N. Z.)— Auckland, N. Z., $6; Wellington, N. Z., $5.40.

PORTO RICO COAL CO. (New York)—San Juan, $6.20.

VICTORIA COAL MINING CO. (New York)—Bergen, $8.34; Mauretius, $12.48.

WITTENBERG COAL CO. (New York)—Bergen, $8.34; Mauretius, $12.48.

WILLARD BROS. (New York)—Amsterdam or Rotterdam, $4.56; Bermuda, $9.24.

Address, Paymaster General, U. S. N., Navy Department, Washington, D. C.

CONTRACTS LET

Contract No. 13—New York—This contract, previous notices of which, including most of the bids of various companies, appeared in this column, has been awarded as follows: Smith, Lineaweaver & Co., 14,000 tons No. 1 buckwheat at $3.19; John W. Peale & Co., 3700 tons No. 1 buckwheat at $3.67, and 15,000 semi-bituminous run-of-mine at $3.35; Joseph Johnson's Sons, 4000 tons No. 1 buckwheat at $3.30; Pattison & Bowns, 3800 tons No. 3 buckwheat at $1.97. Address William Williams, Commissioner, Department of Water Supply, Gas and Electricity, Room 2351, Municipal Building, Borough of Manhattan, City of New York.

Contract No. 16—New York Harbor—The bid of Hite & Rafetto has now been definitely accepted on this contract, which provides for furnishing and trimming approximately 17,000 tons of bituminous coal to be used by the United States dredges in New York Harbor. This bid was $3.43 per ton for Bird Quemahoning coal with a guaranteed heat value of 14,400 B.t.u. Maj. G. J. Dent, Corps of Engineers, Army Building, New York.

Contract No. 18—Brooklyn—The bids on this contract, which provides for furnishing 560,000 lb. of anthracite pea coal to the 26th Ward Disposal Works, at the foot of Hendrix St., Brooklyn, were as follows on a basis of 1000 lb., delivered: Bacon Coal Co., $2.24; Miners' Coal Co., $2.50; Wood's Sons & Co., $2.73. For previous notice on this contract see "Coal Age," issue of Nov. 21. Address, Bureau of Public Buildings and Offices, Borough of Brooklyn, Room 1003, No. 50 Court St.

Financial Department

Pond Creek Coal Co.

(*Continued from p. 656*)

New Stock—To preserve our working capital, 6333 shares of common stock were issued and offered to common stockholders at $50 per share.

Net Current Assets—These increased $54,759, to $1,445,897.

Additions to Property Account—Such additions in 1913 include the completion of the dock at Duluth, the addition of boilers and automobile stokers to the power plant at Holden; two fan houses, a sub-station, two 15-ton and six 6-ton electric locomotives, 200 steel mine cars, etc.

Legislation—In W. Va. a workmen's compensation Act took effect Oct. 1, 1913, and a state workman's compensation fund was established, to which it seemed proper that the company should become a contributor.

Outlook—Conditions for a favorable year's business appear encouraging.

CONSOLIDATED EARNINGS STATEMENT YEARS ENDING DEC. 31

†Current liabilities include bonds called for payment, unredeemed, $3150; accounts payable, $83,429; accrued payrolls, $24,700; drafts in transit, $12,419; accrued taxes, $26,575.

Note—For last previous annual report of this company see, "Coal Age," Vol. 3, p. 980.

Elk Horn Fuel Co.

An official statement of this company to the first of the current year says:

Organization—Property—Incorporated in West Virginia, Feb. 3, 1913, and its assets consist principally of coal lands; in addition to these, it owns $4,371,500 par value of stock of the Consolidation Coal Co. The Elkhorn Fuel Co. is not and does not contemplate being a coal-operating company. Its coal land holdings are all located in the eastern part of Kentucky, except some 15,000 acres in Randolph and Upshur Counties of West Virginia.

These lands can be more or less arbitrarily designated as follows (in acres): Mineral fuel, 4500; Beaver Creek, 124,883; Licking River, 47,481; Johns Creek, 21,658; Knott County, 6613; Kentucky River, 45,800; Rich Mountain (W. Va.), 14,600; total, 265,535; Beaver lands under option, 50,000; total owned and under option, 315,535.

The mineral fuel lands are located within what is considered as the best development of the Elkhorn seam of coal and which is now operated by the Elk Horn Mining Corporation. The Beaver Creek lands include the larger part of what is known as the Elk Horn coking coal region. It has been fully prospected and in part developed and operated by the Elk Horn Mining Corporation. These lands contain several seams of coal, principal among which is the Elk Horn seam, which has shown such superior qualities and uniformity in the Consolidation Coal Co. property which adjoins these lands to the south.

The Licking River lands are located principally in Magoffin County, Ky., on the headquarters of Licking River, and we believe to a large extent contain noncoking coal applicable as steam and domestic coals. The Johns Creek lands are located in Pike County, Ky., principally on the waters of Johns Creek; these coals are noncoking in character, but of excellent quality, and should be readily sold as domestic and steam coal in the West.

The Knott County lands practically adjoin the Beaver Creek lands on the south and contain the Elk Horn seam of coal of equal quality to that of the Beaver Creek lands. The Kentucky River lands are scattered over a wide area on the waters of Kentucky River. They are well within the coal-bearing area, but have not been sufficiently prospected for an estimate of quantity or quality of coal; none of them carries the Elk Horn seam of coal in known workable thickness, but several seams higher in the series show promise of good coal areas.

The Rich Mountain lands in West Virginia contain two coal seams of the so called New River series that have been fairly prospected and operated to some extent. The seams are thin, but contain an excellent quality of coal, particularly adapted for smithing purposes.

The Beaver Creek lands, under option, are a western extension of the Beaver Creek lands owned, and limits the Elk Horn coking coal region on the north and west. These lands contain workable coal seams, but it is probable that those of the northern part of the field are not of a coking type. Our option on the 50,000 acres does not expire until Apr. 30, 1918, and if advantage is taken of the option it will be purchased free of all taxes and other expenses that might be incurred in the meantime.

Leases—The Elk Horn Fuel Co. has leased to the Elk Horn Mining Corporation 24,500 acres of land, 20,000 acres of which are in the Beaver Creek lands and 4500 acres on Boone Fork of Kentucky River. The latter company is rapidly equipping itself to a capacity of 3,000,000 tons of coal per year, 2,000,000 tons of which are tributary to the Chesapeake & Ohio Ry. and 1,000,000 tons to the Louisville & Nashville R.R. This lease, with others which the Elk Horn Fuel Co. has, will cause in a few years over 3,000,000 tons of coal to be mined yearly from its property, giving the company a revenue of over $300,000 annually. Many applications for leases have been received, but conditions and railroad facilities have not warranted the closing of additional leases.

Lumber—The Elk Horn Fuel Co. has, together with its fee lands and mineral rights, a large area of timber lands, and now has operating seven saw mills having a total daily capacity of 150,000 ft.

Gas and Oil—The probabilities are strong that both oil and gas will be found in these lands; about 80% of the oil and gas rights are owned by the company.

CONDENSED GENERAL BALANCE SHEET DEC. 31, 1913 (TOTAL EACH SIDE, $31,278,560).

Assets:		Liabilities:	
Real est. & coal lands	$23,482,104	Capital stock, common	$19,000,000
*Stocks of other co's	7,298,390	Capital stock, preferred	7,000,000
Advances to subsid. co's	35,312	1st M. notes	3,970,000
Deferred debit items	20,083	Unpaid vouchers	80,896
Cash	81,814	Pay-rolls	12,294
Demand loans	335,081	Accrued interest on notes	33,083
Supplies, etc	18,590	Accounts payable	2,506
Miscellaneous	7,186	Surplus	1,179,780

* Include 43,715 shares Consolidation Coal Co., 12,000 shares Mineral Fuel Co., 7,879 shares Beaver Creek Consol. Coal Co., 1,800 shares Tennis Coal Co., 500 shares York Coal & Coke Co.

An issue of $200,000 first mortgage, 6% bonds was made by the Hocking Coal Co., the bonds dated July 1, 1912, and due July 1, 1932. They are unconditionally guaranteed by the Minneapolis & St. Louis R.R. The entire capital stock of the coal company was purchased by the railroad company about five years ago; the consideration was $550,000, and $350,000 have since been expended in improvements and extensions. The property embraces 4500 acres of coal land, including two modern shafts and 317 dwelling houses, store building, etc., all located in Monroe County, Iowa.

COAL AGE

Vol. 6 NEW YORK, DECEMBER 12, 1914 No. 24

A New Idea in Welfare Work

HERE'S *a suggestion that might be adopted by many coal companies owning a large acreage of vacant land. Perhaps it will pay you to carefully consider the plan.*

Several years ago, the president and the general manager of a big coal-mining and manufacturing concern went quail hunting. The company owned immense tracts of land, from which most of the big timber had been cut. On this land there were large open stretches of ground where the quail abounded.

At the time this incident occurred the plants of the company were either shut down entirely or were operating on a considerably reduced schedule, and as a consequence there was a dearth of life's necessities in many of the company homes adjoining the various works.

The small towns and the big city in the center of the mining-industrial district referred to were what is known as "paper-bag communities," the people buying practically every necessity of life from small stores. When business was at high tide, this plan worked all right, but when the mines were running half time, or were idle, there was nothing for the employees to fall back upon and existence grew precarious for some.

The shooting was good, but in spite of the sport, the minds of both officials were full of the burden of doing the best they could to afford work for their men to tide them through the dull period. It was desirable to keep the force intact, for there were many skilled employees whose services were valuable and whose welfare was important to the concern. The hunt which took them over a large area of company land was ended and the two men returned to their work.

The next morning the president called for the general manager and said:

"I believe we can help our men to get ready for the next dull season. We have overlooked one of our biggest assets—our vacant land. I'm going to let our miners use the land to help them make a living."

Briefly, he instructed the general manager to take certain sections of land adjoining several of the plants and subdivide same in one to five-acre tracts, move houses from the company camps to this land, construct small barns, chicken houses, etc. The rental of homes on these small tracts was fixed at the same figure as that for homes in the company towns.

The result was that employees who desired to live where they could till an acre or two of ground, have a cow, raise chickens, hogs, etc., and yet be close to their work, were invited to move into these homes; the only provision being that unless they made use of the land they would lose their places with the company. A department was created to follow up this work and aid the employees in getting the most out of their gardens and small farms.

Good times returned as they always do, and this was the real test of the plan for it was questionable if men would learn the value of getting all they could out of the land while work and wages were good at the mines. A few failed as was expected, but there were always others ready to take their places.

Again the pendulum swung and five years later another period of depression came. Now was the time for the scheme to demonstrate its value. The president and the general manager did not go hunting, but instead they visited the dozens of homes which had been created on the small tracts adjoining the works. Notice what they found:

It was winter time, but skilled men who were out of work were living comfortably at home. There were small smokehouses full of meat, winter gardens, milk and butter in plenty, potatoes for the winter, chickens by the score, in fact enough of the necessities of life to keep families in plenty until work should be resumed.

The general manager turned to the president and said: "It works all right—how much money can I have to extend it?" The president smiled and answered: "All you need—This is real **Welfare Work.**"

Using a Mining Machine in the Roslyn District

By James E. Ash*

SYNOPSIS—The coal measure pitched so heavily that the machine was unable to climb the steeper grades. Difficulty was also experienced in unloading. Both of these obstacles were overcome, however, by the use of the two simple devices here described.

The property of the Roslyn Cascade Coal Co., William Mackay, general manager, is located near Ronald, Kittitas County, Wash. It is 99 miles by way of the Northern Pacific R.R., from Seattle, and comprises about 570 acres. The present output is 450 tons per shift of eight hours, but this may be increased to 1000 tons should occasion demand. No washing is required, and the coal is loaded direct into railroad cars, the average value at the mine being $2.50 per short ton. The principal markets lie in eastern Washington and the Puget Sound cities.

Although several workable coal measures exist in this property, only one, the Roslyn bed, is being worked at the present time. This ranges from 4 ft. 2 in. to 4 ft. 6 in. in thickness, and dips at an angle of from 8 to 19 deg.

In this measure two mines have been developed, known as No. 1 and No. 2. A mining machine is employed in No. 1, while the system of mining previous to the adoption of the machine is carried on at mine No. 2. Both developments are worked by the room-and-pillar system. At No. 2 mine single rooms are driven from the entry on the pitch, while at No. 1 where there is less cover, the double room system is employed. Cap and refuse rock is gobbed in the room. The double rooms are 41 ft. wide with 8-ft. necks for a distance of 25 ft. Crosscuts are driven on 60-ft. centers and staggered, while the gob is carried roof high in each double room. Rooms are driven on an average of 66-ft. centers, a 25-ft. pillar being left between the double rooms.

The machine employed by this company is a Sullivan, short-wall CE-7 type, and is the only one in use in the State of Washington. Another is, however, to be installed in the near future. It was at first anticipated that the machine could be employed on the pitch, but on trial it was found that it was only capable of traveling on a grade of from 8 to 10 per cent., and was consequently useless on the steep inclinations encountered.

An attempt was made to assist the machine up the room by hitching a car weighing 3000 lb. onto the opposite side as a drag. The machine, however, under its own power and with the help of the drag, could not satisfactorily overcome the 14 per cent. grades encountered. Furthermore, it could only be unloaded with difficulty from its truck, since due to the pitch, the cutter bar with its teeth would catch in the bottom when the machine was being unloaded, causing considerable annoyance and loss of time. It was at once perceived, therefore, that unless some improvement could be made, the machine could not be used. The makers were, of course, notified, but after careful investigation, were unable at the time to suggest a means of overcoming the difficulty.

As the result, however, of the persistent efforts of Mr. Mackay, improvements have been embodied which satisfactorily adapt the machine to this pitch. It now travels to the faces of the rooms as easily as it before traveled on the entry, and no difficulty is encountered when working on even a 24 per cent. grade without assistance of any kind.

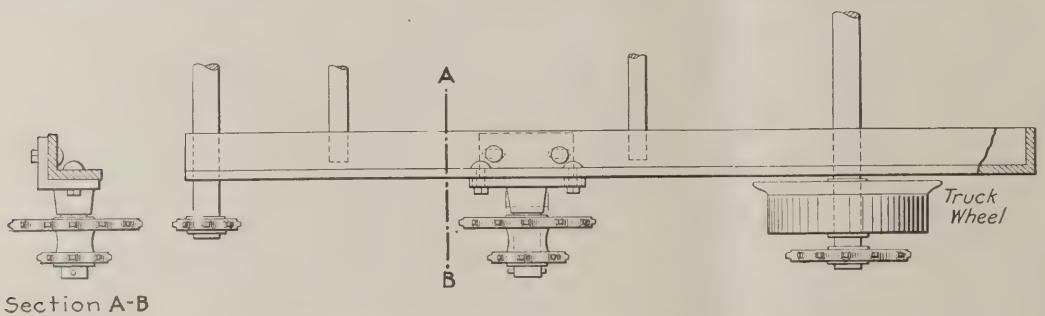

Fig. 1. Showing the Intermediate Gearing

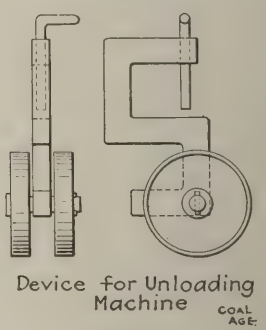

Fig. 2.

Fig. 1 shows the intermediate gearing which was employed to overcome the difficulty of moving on pitches. As may be seen in the drawing, the cast-steel intermediate bracket is, for purposes of adjustment, provided with slotted bolt holes. These slots, which are made for 5/8-in. bolts, are approximately 2 in. long, which is sufficient to give ample adjustment for the chains. The entire arrangement is so simple, and the object sought and attained so obvious, that it scarcely needs any description whatsoever.

To facilitate unloading from the truck, the device shown in Fig. 2 was built. This consists of a piece of 2-in. wrought iron bent into the form of the letter S, which fits onto the end of the cutter bar and is held in place by a pin, which passes down through the frame. A 1-in. hole was drilled in this iron at the lower bend, into which was forged an axle which carries two wheels, one upon either side. These are 2 in. wide and 8 in. in diameter, each being held in place by a 3/8-in. linch pin. This set of rollers is easily put on or taken off the

*Roslyn Cascade Coal Co., Roslyn, Wash.

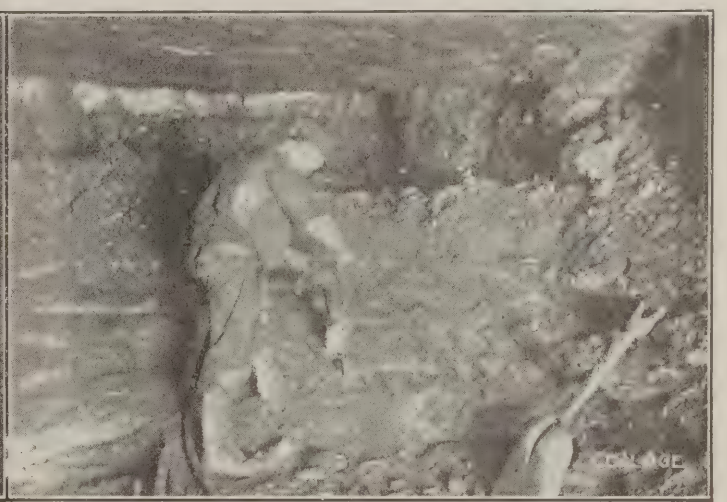
machine, and greatly lessens the time that was originally spent in unloading.

Since the installation of the machine, the following prices have been paid for contract work. Machine runner, 5¾c. per long ton for room cutting, and 6¾c. for entries; helper, 4¾c. for room cutting, and 5¾c. for entries. Loaders are paid 55c. per long ton for room work, 60c. for room necks and entries, and $1.10 per yard for brushing.

The machine puts in a 6-ft. undercut across the face of a room in from 30 to 40 min., and by its use the percentage of lump coal has been greatly increased. This always finds a ready market at from $3 to $4 per short ton, f.o.b. the mine. Where formerly about 40 per cent. of the output was lump coal, it is now aproximately 70 per cent.

As stated above, only one machine is in use at the present time as its employment was largely an experiment in this field. This has met with such success, however, that more will be installed shortly, as a better grade of coal is now being obtained for the same cost of mining.

The Electric-Air Coal Mine



By Charles C. Phelps*

SYNOPSIS—In those mines where electricity is already installed and it becomes desirable to operate punchers or other air-driven machines at the face, portable electrically operated compressors present many advantages over a large central compressing station.

Reviewing the history of coal mining from the time when mechanical methods of mining began to supersede hand work, we find that for a long time, machinery operated by compressed air practically monopolized the field. In recent years, however, with electrical energy at hand in many mines for such purposes as lighting, ventilation, pumping, haulage and hoisting, it is only natural that the attempt should have been made to design coal-cutting machinery to be driven by the same power.

A Radialaxe Cutter Working in a Clay Band

Gangway Driving with a Jackhamer Drill

Comparing electrically and pneumatically operated coal-cutting machinery, considerations of safety are on the side of the pneumatic machines. Electrical feeder wires leading to a cutting machine are an ever-present source of danger to the workmen, especially in view of the darkness and cramped positions in which the miners often have to work.

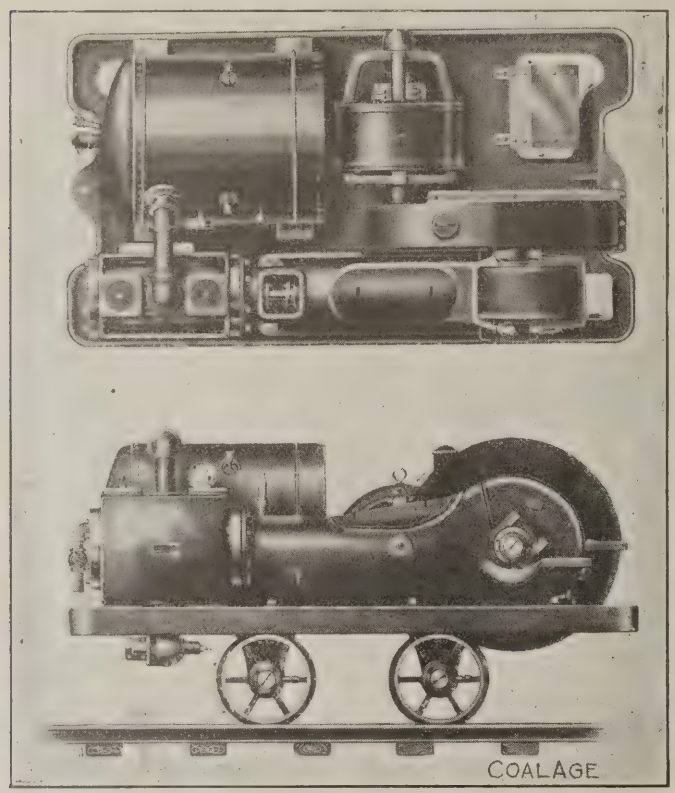
The danger of igniting mine gases is probably greatest near the freshly opened faces for two reasons: First, because of the insufficient ventilation often found in such locations, and, second, due to the fact that the opening cuts frequently liberate pockets of gas. Pneumatic machines tend to eliminate the hazard from gas at the face by the added ventilation furnished by the exhaust air.

It is a well known fact that no type of machinery excels air-operated coal-mining machines in ruggedness of design and general reliability. The nature of the pneumatic action insures a cushioned blow which protects the machine to a large extent against injury. The pneumatic mechanism is simpler than the electrical and consequently is better suited for rough and ready use in coal mines where operating conditions are never too favorable.

In order to utilize and secure the advantages of air power in mines already electrically equipped, additional air lines and compressors have to be provided. At present those mines which are using electrical mining machinery have found it profitable or expedient to do without the inherent advantages of pneumatic methods in order to secure those other advantages which can be obtained from the electrical power.

This procedure is a compromise rather than a solution.

A Practical Solution for the Electric Mine



The logical course to pursue in the electrically equipped coal mine is to find a means of deriving the benefits of compressed-air machinery while at the same time utilizing all of the advantages of the electrical system of distribution. This end is best attained by installing electrically

*Ingersoll-Rand Co., 11 Broadway, New York City.

operated air compressors in convenient places in various parts of the mine. What is a convenient location today will become an inconvenient one in a week or a month, as the mining progresses from room to room. Consequently in an ideal system of power conversion for a coal mine, these local air plants should be portable units.

As a result of these conditions, which are peculiar to the electrified coal mine, operators have been calling for a practical electrically operated portable compressor plant. This demand has been met, and in Fig. 1 is illustrated an efficient compressor of this type, introduced by the Ingersoll-Rand Co.

The truck is built for any gage of track and can be run into any entry that will accommodate a mine car. The

Top and Side Views of Ingersoll-Rand Portable Electrically Driven Air Compressor

compressor may be placed in any convenient location in one of the main entries and connected to the cutting machines in one or more rooms by means of suitable hose.

These portable outfits are designed in every way to meet mine conditions. They are built for either direct or alternating current, and for any of the voltages commonly employed in coal mines. The compressor is suitable for pressures of from 50 to 100 lb., as desired.

The herringbone-gear drive is completely inclosed and runs in a bath of oil. The compressor proper is also of inclosed construction, and has a hopper type of water jacket, which is open to the atmosphere at the top. This type of jacket requires refilling but once a day, which is an advantage in a coal mine, where clean water is usually scarce and where the best attention is not to be expected. The latter idea was kept in mind in adopting the various features of design.

The lubrication is automatic. An inlet unloader maintains a constant air pressure in the receiver, which is mounted on the truck beside the compressor. The valves are of the new Ingersoll-Rogler type, which is a complete departure from previous compressor practice. These valves combine lightness, toughness, small spring tension and large free area, from which follow a high efficiency, great durability and remarkable quietness of operation.

An additional element of economy with the portable type of compressor is found in the fact that the air is used in its heated condition, obtaining all the advantages of a reheater without actually employing this device. Of course, the full benefit of this heat is obtained only when using short air-feed lines, as the chilling of the air in passing through a long pipe is rapid.

The Economy of the Equipment

One of the first questions that the mine operator will ask is: "Are these portable outfits economical?"

Taking the case of a coal mine already equipped with electricity and desiring to operate a given number of

A Coal Puncher at Work in an Illinois Mine

pneumatic coal-mining machines, and comparing the two methods of air supply; i.e., from a motor-driven central air plant on the surface and from a number of small portable air compressors underground, the actual power consumption would undoubtedly be but little greater with the latter system, provided it were properly planned, assuming that both systems employed modern and efficient equipment.

The reasons for this are apparent. Although the motor and compressor efficiencies of the central plant would be higher than the combined efficiency of several small units, it must be borne in mind that the recent improvements embodied in the latter have given them a very fair efficiency. This difference in efficiency is largely compensated by the smaller leakage losses, lower pressure drops and reduced heat dissipation in transmitting the air over the shorter distances to the cutting machines.

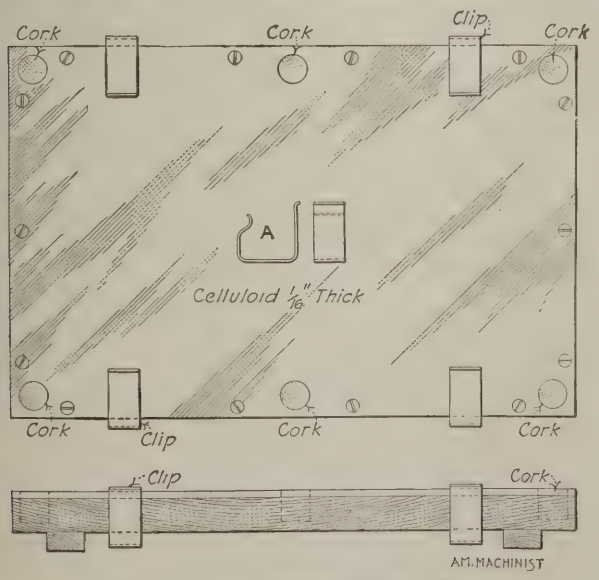
It must be emphasized that the above discussion applies only to mines already equipped with electrical power. Of course, these portable equipments would not be advocated for use in a mine not electrified, for it would undoubtedly be much more economical to compress the air in a steam-driven compressor, using slack coal as fuel, and pipe it throughout the mine rather than to con-

struct an electrical plant exclusively for driving such portable units.

Other advantages of the portable type of air compressor for the electrified mine are the facility with which the machine may be moved about from place to place in minimum of time, permitting air to be supplied to any room where needed without delay. Moreover, these equipments may be purchased only as needed, there being no necessity for maintaining a capacity in excess of the actual needs of the operation.

Now comes the question of the work capacity of these portable outfits. The following table gives the essential details concerning the various sizes of portable mine compressors already in use, as well as an approximate idea of the number of pneumatic coal-mining machines of different types that they will operate. The power cost will, as a matter of fact, figure out more favorably in actual practice in view of the fact that the service will always be intermittent rather than continuous.

PRINCIPAL DIMENSIONS OF PORTABLE MINE CAR ELECTRICALLY DRIVEN COMPRESSORS



Size of Cylinder, In.			Piston Displacement, Cu.Ft.	Air Pressure, Lb. per	Brake	Dimensions		Height over Rails (Width 10-In.
Dia.	Stroke	R.p.M.	per Min.	Sq.In.	Horsepower	Length	Width	Wheels)
7	6	300	78	90–100	12–12.5	7′	4′ 0″	3′ 2″
8	6	300	102	50–60	12–13	7′	4′ 0″	3′ 2″
9	8	250	145	90–100	23–24	8′ 3″	4′ 8″	3′ 10″
10	8	250	179	50–60	22.5–24.5	8′ 3″	4′ 8″	3′ 10″
12	10	235	304	90–100	51–53	9′ 4″	5′ 8″	4′ 4″
14	10	235	415	50–60	52–56	9′ 4″	5′ 8″	4′ 4″

An approximate idea of the capacity of these plants may be gained from the fact that the larger sizes can operate 3 coal punchers or 1 "radialaxe" machine, 6 to 8 jackhamers or from 8 to 12 "crown" coal picks.

The medium sizes will take care of one coal puncher, 2 to 4 jackhamers and 3 to 6 "crown" coal picks. The smaller sizes will furnish air to 1 or 2 jackhamers or 2 or 3 "crown" coal picks.

Avoiding Tack and Compass Holes on Drawings

On small drawing boards the following kink has proved of value, says William C. Betz, in *American Machinist* for Nov. 5. A sheet of celluloid about $\frac{1}{16}$ in. thick is fastened to the board with small flat-head screws, the drawing paper being held by means of the steel spring clips shown at *A* in the illustration.

CELLULOID DRAWING-BOARD COVER

If thumb tacks are to be used, six holes ½ in. in diameter are drilled through the celluloid into the board, but not through the latter, and are then plugged with corks which are renewed when full of holes. The principal advantage of the celluloid surface lies in its resistance to piercing with the compass and bow pen points. This is of special advantage when thin drawing and tracing papers are used, as it does away with unsightly center holes. The cork inserts for thumb tacks localize the area of the tack holes, which will be appreciated by draftsmen. The spring-clip method speaks for itself.

A Cheap and Efficient Harness of New Design

The accompanying illustration shows a mine mule equipped with a harness invented and patented by Ralph Toward, of Russelton, Penn. Aside from the collar and hames, from 15 to 18 ft. of chain, depending, of course,

THE NEW MULE HARNESS

upon the size of mule for which the harness is made, two pieces of leather, approximately 8x12 in., about 3 ft. of rubber hose, together with the necessary snaps for fastening the various parts together, and a few copper rivets are all that is required to complete this harness.

It will be readily perceived from the foreging that compared with the ordinary harness, this one is decidedly cheaper as well as being more durable. The inventor figures that the actual first cost of the equipment will be about one-half that of the ordinary harness now employed.

Furthermore, it will be readily appreciated that, due to the extreme simplicity of the construction, this harness is not liable to gall or injure the mule, and with proper care should last almost indefinitely.

The inventor, who has had long experience in driving and handling mine mules, would be glad to submit prices for this harness either singly or in large quantities. He is also desirous of disposing of his patent.

Shotfiring in Coal Mines by Electric Circuit from the Surface

By George S. Rice* and H. H. Clark†

SYNOPSIS—The current in shotfiring from the surface should be thrown on only once, for fear that the gas liberated and the dust raised by the first shot may become ignited and explode. A gap of several feet should be left in the shotfiring line when not in use, so that there may be no risk of ignition by lightning. A potential of 250 volts is recommended for shotfiring. The installation of the circuit costs from one to three thousand dollars.

When miners in the interior coal fields of the United States began the practice of blasting the coal without undercutting, or what is known as "shooting off the solid," many explosions resulted, some of them of great extent and violence, and attended with much loss of life. One of the means adopted for preventing these fatalities was to employ shotfirers to discharge the shots when all the other employees had gone out of the mine at the end of the day's shift. This system still prevails in most of the Central and Southwestern mines.

System Originated in Utah

Following the disaster at the Winter Quarters mine, Utah, May 1, 1900, in which 200 lives were lost, a system of firing shots electrically from outside and when the men were out of the mine was adopted at the operation of the Utah Fuel Co.[1] This system has also been used in France in certain mines that are subject to instantaneous outbursts of carbon dioxide. These outbursts generally occurred at shotfiring time, the blasts releasing the gas held in crevices under high pressure.

The system was also adopted at a number of other mines in Utah, at the Cokedale mine, Colorado, at the Dawson mines, New Mexico, and in some mines of the Tennessee Coal, Iron & R.R. Co., in the Birmingham, Ala., district; and more recently in certain mines in Iowa and Kansas.

At first there was much trouble from misfires, and in a few instances from the premature firing of the shots, while men were in the mine, through the shotfiring lines becoming crossed with power lines. Fortunately, however, no loss of life resulted from such premature firing within our knowledge, and latterly this danger has been reduced to a minimum by certain measures of precaution. The proportion of misfires, or failures of individual shots to fire, has also been reduced to a small number through better installation and arrangements of the shotfiring circuits, so that the system has proven satisfactory, and has stood the test of a number of years' experience. The methods and regulations employed in one mine are described in part in *Bulletin No. 10* of the Bureau of Mines.

The need of the adoption of the system, under the conditions which prevail where coal is shot off the solid by black powder or dynamite, has recently been brought to the front by the large number of shotfirers who have been killed, particularly in the Southwestern mines.

Loss of Life Most Frequent in Indiana, Kansas and Oklahoma

In some districts where there are restrictions on the quantity of black powder that may be used, and where a careful inspection is made of the holes before the shots are charged, there has been reasonable freedom from accidents; that is, only occasionally has there been an explosion, with the loss of a shotfirer or two. This has been the situation in coal-mining states like Illinois and Iowa, but in Indiana, where larger charges of explosives are permitted by law, explosions resulting in the deaths of shotfirers have been more frequent.

In Kansas and Oklahoma, however, it is admitted on all sides that the methods of shot preparation have been extremely reckless, so that explosions have been frequent. This has been due to the use of long drill holes, 6, 8 and even 10 ft. or more in depth, drilled straight into the solid, and sometimes loaded with both dynamite and black powder, such shots being used at the face of entries to crack and pulverize the coal in order that it may be easy to make a shearing. So many shotfirers in this Southwestern district have been killed and with such regularity, that at some mines they have to be paid $10 per day for a shift of only 2 or 3 hr., and this price is none too high, as the risk is tremendous. One mine, for example, had three shotfirers killed in as many explosions in one year and another two in a single month.

Regulations on Lands of Civilized Tribes

Many of these explosions, particularly in the pitching beds of McAlester, Okla., which are often dusty and gaseous, are violent, resulting sometimes in wrecking the whole mine. As most of the mines in Oklahoma are on lands of the Civilized Tribes, who are the wards of the nation, the supervision of the leases is under the charge of the Indian Bureau, the U. S. Bureau of Mines acting in an advisory capacity; both bureaus are in the Department of the Interior.

In order to lessen the loss of life in the Indian lands from the use, or misuse, of explosives, and to lessen the number of mine fires and explosions caused by the use of black powder and dynamite, the Secretary of the Interior issued an order, effective Aug. 1, 1914, afterward suspended to Jan. 1, 1915, as follows:

> On and after Aug. 1, 1914, except as hereinbefore provided, only such explosives as shall have passed the tests of the (U. S.) Bureau of Mines, and have been designated as "permissible explosives," shall be used in any coal or asphalt mine on the segregated coal and asphalt lands belonging to the Choctaw and Chickasaw nations in Oklahoma.
>
> Permissible explosives shall be fired by detonators of a strength not less than No. 6 or otherwise as may be approved by the Bureau of Mines, and shall be used in quantities and under conditions approved by said bureau.
>
> Other kinds of explosives than "permissible explosives" may be used in mines in which the holes are loaded and the shots fired by special shotfirers using an electric system

*Chief mining engineer, Bureau of Mines, Pittsburgh, Penn.
†Chief electrical engineer, Bureau of Mines, Pittsburgh, Penn.

1"Electrical Shot Firing in Coal Mines," "Engineering and Mining Journal," Vol. 88, No. 5, p. 243 (Jan. 30, 1909).

Note—Paper read before the American Institute of Mining Engineers in the Electricity and Mining Topics Section on Oct. 10, 1914, Pittsburgh, Penn.

from without the mine. The right is reserved to revoke this exception of the use of "permissible explosives" if it shall be found that explosions of gas and dust are caused thereby, resulting in loss of life or of coal through mine explosions or mine fires.

During the months of June and July, 1914, and subsequently as may prove desirable, the Bureau of Mines will supply on application, free of charge, the services of an expert to aid in demonstrating the best methods of using permissible explosives.

Shotfiring from Surface to Be Introduced into Indian Mines

At a number of mines on Indian lands where the seam worked is flat, the operators are preparing to introduce undercutting machines and use permissible explosives, which are efficient where the coal is undercut, but which, with exceptions, cannot be used effectively in shooting off the solid, since they are quicker acting than black powder and their charge limit is 1½ lb. In hard or tough coal this is insufficient to throw out material unless it has been undercut.

In pitching beds, under systems of mining now employed, there are difficulties in introducing the types of mining machines which are most popular. While it is probable that machines of equal efficiency may be developed which will be more suited to the conditions, and also that changes in the system of mining may be made which will permit some of the present semilongwall or shortwall machines to be used, there are difficulties in agreeing upon labor scales to cover such new work, and therefore some of the operators on the Indian lands, to conform to the Department's order, have indicated their intention of introducing electric systems of shotfiring from outside the mine. It is on account of the prospective wider adoption of this system that it seems desirable to have the matter of specifications for the installation of the shotfiring system and the regulations governing it brought before the American Institute of Mining Engineers with a view to a discussion as to what such specifications and regulations should be, and with a view to making the system as efficient and safe as possible.

Electrical Shotfiring Systems

Electrical shotfiring from the outside of a developed coal mine differs in general from similar shotfiring from within a mine only in the number of shots fired at one time, and the greater distance to the shots from the point of firing. There are, however, several differences in the details of the equipment and its arrangement. Outside firing, as compared to inside, requires larger firing generators, larger conductors for distributing the current, better insulation on the conductors, and better insulators to support them.

Since the main circuit of the outside firing system is permanent, extends over a large area and is exposed to various untoward influences and possible mishandling by many people, various switches and safety devices must be used in connection with the system. It is also essential that there be provided effective means for insuring that no one is in the mine when the shots are fired from the outside.

Factors Contributing to the Success of the System

In order to insure safe and successful operation, an outside system must be installed with careful attention to the following points: 1. Freedom from accidental connection with its source of power. 2. Freedom from stray currents from other sources of electricity. 3. Freedom from connection to the earth. 4. Freedom from short-circuits between the two sides of the shotfiring line.

Freedom from accidental connection to its source of power requires that several switches located at different points should be connected in series with the line, and that these should be closed in predetermined order, and only by the man authorized to perform this duty.

Freedom from stray currents requires that only properly insulated conductors be used for the shotfiring circuits, and that such circuits be properly installed and protected from roof falls and where crossing or passing near other electric circuits.

Freedom from ground connections is desirable because such connections allow the firing current to be diminished by leakage, and at the same time provide a path by which stray currents may reach the firing circuits.

Freedom from short-circuits on the firing line or from even moderate leakage between the two sides of the firing circuit is essential to the proper distribution of current to the detonators or fuses.

Tentative Specification for an Outside Electrical Shotfiring System

A tentative general specification for the various parts of a shotfiring system follows. It should be changed whenever the wisdom of such modification is made manifest as a result of enlarged experience.

1. *Generator*—The generator should be a direct-current, 250-volt compound-wound machine having a momentary capacity of about 30 kw.; 250 volts is recommended because this voltage will distribute the necessary current throughout the mine without necessitating the use of prohibitively large conductors and it is better than 550 volts because it will produce less strain upon the insulation of the line. However, 550-volt current has been successfully used, and if there is a source of power of this voltage already installed in the mine power plant, it may be used with some saving in size of shotfiring conductors.

(2) *Distributing Circuit*—The size of the conductors used should be sufficient to pass at least 1.25 amp. through each room or heading circuit immediately upon closing the firing switch. This current will insure that three or four electric igniters or detonators (if perfect) will explode, even if they vary in resistance 25 per cent. above and below the average. With less current than 1.25 amp., the Bureau of Mines has found by experiment that detonators 25 per cent. high in resistance will explode and open the circuit before detonators 25 per cent. low in resistance can become ignited.

(3) The conductors should be insulated with rubber if installed in damp places, but if used where it is dry, may be insulated with triple-braid weatherproof insulation. However, as the humidity in coal mines is generally high, it is advisable to use rubber-covered wires.

(4) The conductors should be supported upon glass or porcelain insulators placed so near together that the wires do not touch anything. It is better not to install the circuits in the same entries with other electric wires, especially trolley lines, but preferably in a parallel entry, and when they have to cross other electric circuits, the shotfiring wires should be completely protected from contact with other circuits both under normal conditions and under those that might arise from roof falls and other

contingencies. When a trolley line must be crossed, the shotfiring lines should be protected by special timbering, or placed in a channel cut in the roof, if the roof is low.

Provision for Extension in Rooms

(5) The wires that are used for connection between the room switch and the detonators will have to extend for a certain distance beyond the last insulator in order to allow for extensions without making frequent splices. These unsupported ends should be coiled up and hung on the post that supports the last insulator. From that post the wires will, of course, have to extend without support toward the face, but care should be taken that they do not make contact with the floor if it is wet.

The ends of the wires should be scraped clean of insulation and the connection with the detonator leads made by cleaning the ends of the leads and twisting them tightly about the ends of the permanent room wires. The detonators in a room should be connected in series, but the room and entry circuits should be connected in parallel.

(6) *Switches*—There should be a double-pole single-throw switch at the entrance to each room or heading of entry. This switch should be mounted securely on a post with the hinges of the switch at the bottom. The room wires should be connected to the hinge or lower terminals of the switch and the power wires to the upper terminals.

(7) There should be at the mouth of each entry a double-pole, single-throw, 50-amp. switch, mounted in the same manner as the room switch.

(8) At the foot of the shaft, slope, or borehole where the shotfiring circuits enter the mine, there should be provided two plugs with flexible lines not less than 5 ft. long to protect further the main circuit of the shotfiring system until all men in the mine have gone out. Provisions should be made for locking the plugs out of circuit.

One Throw of the Switch All that Is Permitted

(9) There should be located in the shotfirer's cabin, in a locked box, a switch that shall be thrown only by the authorized shotfirer after all the men are out of the mine and after all other switches have been thrown in. This switch should be so designed that when it has been thrown once, it cannot be thrown again until the shotfirer operates a *locked* dog, tooth, cam latch, or other restraining device. The authorized shotfirer shall be the only person having a key to this lock.

(10) There should be located in the power house a switch in a locked box, used for connecting the shotfiring circuit to the generator or power line. This switch shall be thrown in only by the shotfirer before closing the shotfiring switch, but not until all the men are out of the mine.

Explanation of Specifications

Specifications (1) to (5) are self-explanatory, but it may be advisable to make some further explanation of the paragraphs relating to switches and cutouts.

(6) With reference to the requirement of a switch at the mouth of each room or heading of entry, electrically it is of course not necessary to have such a switch, but to promote safety it is of the utmost importance. The miner in connecting up the shotfiring wires with the detonator or electric-igniter leads at the end of his shift when he is about to go out of the mine, would, if there was any stray current through grounding on a power line in the entry, be exposed to the risk of premature firing.

It much lessens the danger if there is a switch at the mouth of his room attached to a post in plain sight of the inspector or mine official going along the entry; and so placed that the miner is somewhat protected when the switch is thrown. The miner throws this switch in when he goes out of the mouth of his room or heading, after connecting up the shotfiring wires. The room and heading circuits are in parallel so that if, by any inadvertence, the miner fails to throw in the switch, it does not cut out the other working places in the branch entry off which the rooms are turned.

As an additional precaution to prevent premature firing, switches are placed at the mouth of each branch entry, such branch switches being placed in a locked box, the key of which is in possession of the official in charge of the branch or district. This reduces the area affected by possible stray currents until these switches are thrown.

Protection against Lightning

(8) The purpose of putting in the circuit a gap 5 ft. long, as specified above, at the foot of the shaft, slope or borehole where the shotfiring circuits enter the mine, is primarily to prevent the possibility of a discharge by lightning, which may strike the outer circuit entering the mine, and would jump an ordinary switch opening. This actually happened in a certain mine, evidently after the men had left their working places, so that no accident resulted. This plan of using flexible lines 5 ft. long was then adopted at this mine.

(9) The specifications of the switch in the shotfirer's cabin and in the power house are self-evident. However, the reason for arranging the switch so that it may not be accidentally closed a second time needs explanation. There is always a possibility of an electric flash at the working face on reëstablishing the current in case there is grounding of the lines when the shots are fired. Dust and inflammable gas may have been liberated when the shots resulted from the first switch closing and the electric flashes resulting from the second closure of the switch may ignite the dust and gases with violent explosive effect.

Checking-In-and-Out System

An important part of an electric shotfiring system from outside the mine, is the method of keeping track of the employees on entering the workings, to insure that the shotfiring is not done until all of them have come out. At many mines, irrespective of the system of shotfiring, the checking-in-and-out system is used. Where such a plan is employed, the check board should be kept in the shotfirer's cabin or adjacent to it.

One excellent method is to have the check board arranged so that every employee and visitor entering the mine may have a number; when the employee is working at the face his number will most conveniently be the same number as used for the checks which he places on the mine cars he has loaded. These are generally of iron; the man checks should be made of brass or other metal to distinguish them from the car checks. When no one is in the mine, all the man checks should be on the board, so that at a glance it can be observed whether or not any are missing, which would mean one of two things, either that the man was in the mine, or had come out of the mine and gone home without leaving his check.

There should be a penalty for failing to hang the check on the hook.

The shotfirer's cabin should be so located that the men in coming out of the mine are compelled, by means of fences, or by direction of officials stationed at the mouth of the mine, to pass the cabin. As a man enters he is handed the brass check, and if it is a gaseous mine he may be given his safety lamp at the same time. When he comes out of the mine he surrenders his check. When the shotfiring time comes the shotfirer examines the board, then if there is any check missing a search is made for the man. A book or list should be accessible for quick reference, showing where each underground employee ordinarily works, if he has a regular station, which is the case with 90 per cent. of the employees.

Checking System Works Well

The checking system, therefore, serves two purposes: One for the protection of the men from shotfiring, and the other in case of an accident, such as a fall of roof upon a man working in an isolated place. When he does not appear at the end of the shift he will be sought for. As suitable penalties are imposed on those who are careless either in not coming out of the mine at the proper time or in not giving up their checks when they do come out, it seldom happens, at mines where this or similar systems are used, that men fail to give up their checks promptly.

When the shotfirer has been informed by the underground officials that all the underground main switches have been closed, that the 5-ft. gap in the circuit where it enters the mine underground has been bridged by the flexible connections and is sure that all the men are out, he proceeds to the power house, unlocks the switch box and closes the switch that connects the generator to the shotfiring lines; he then returns to the shotfiring cabin, opens the box containing the shotfiring switch and operates that but once. The reason for the mechanical locking of the switch in an open position after throwing has already been explained.

Inspection Needed after Shotfiring

In mines that use black powder or dynamite for shooting off the solid, fires are frequently started by the explosive, particularly if the mine makes a little inflammable gas at the face. It is, therefore, essential after shotfiring that an inspection be made by a fireboss or other official as rapidly as the state of ventilation permits, both to extinguish incipient fires and to find out whether any of the shots have missed. If some shots have failed, it will be necessary to reconnect the shots in the room after first having opened all the switches of those branch entries where the shots have not failed. Then after reconnecting the switches leading to these shots, the balance being kept open, the officials come out of the mine and again try to fire them. In the event of a second failure it will probably be necessary to examine and test the shotfiring lines for grounds or other defects; and if none are found, to withdraw the explosive charges by the most approved means, and recharge, using fresh detonators or igniters.

Manifestly the success in handling such details will depend upon the efficiency of the mine organization; but as already stated, the percentage of failures in mines where the system has been tried for years is small.

Reason for Series Connections in Rooms

The object of having all the shots, which may be as many as three or four in a single room or heading, connected in series, is twofold:

(1) To prevent the amount of current falling below that which is necessary to discharge the detonators or igniters.

(2) To insure that either all the shots in the room or heading be discharged, or none at all. This is because in shooting off the solid where a number of shots are likely to be prepared, especially if there are three or four, the success of some of these shots is dependent upon the success of the others; in other words, they are "dependent shots." In firing shot by shot, the order in which they go off can be assured; but while this undoubtedly is the best system, the next best method is that of having them all go off at once.

It is true, it is possible to use delayed detonators or igniters. In this type, pieces of fuse of varying length are inserted, the electric current firing the fuse, and the latter in turn igniting the explosive; thus by regulating the length of fuse the shots may be exploded in the order desired. However, the complications of this in the hands of the less experienced or less intelligent miners make it somewhat dubious whether there is any material gain over firing simultaneously.

Electric Shotfiring from Outside by Districts or Branch Entries

A number of ingenious systems have been tried by which shots in a mine may be fired from outside, sectionally. That is, first one pair of entries, then another pair, and so on, the theory being that this has a less severe effect upon the mine. However, experience has indicated that the effect of discharging shots throughout the mine at one time is not any more severe than when the shots are fired by sections. In fact, at a large mine it is impossible to tell at the mouth when the shots have been fired, so unimportant is the air wave arising from their simultaneous ignition.

It would seem that the local pressures set up by the shots in the different rooms and entries neutralize one another so that there is no general concussion wave started. Further, there does not appear to be any more serious difficulty with the roof than results from the ordinary shotfiring, shot by shot.

With either method falls of rock will occur, and ventilation doors and stoppings will be blown down.

The expense of a new installation, apart from the generator, is from $1000, in a mine of moderate size, to about $3000 in a large mine.

The members of the Mining Institute of Scotland have been discussing John Gibson's paper on "Mining Economies." He pointed out that in 50 years, the standard of life in the mining village has advanced very little. Wages have doubled, the consequence being that in the household where thrift is not practiced, there is no incentive to regular working. Three days per week at the pit keeps the wolf from the door and maintains the customary standard of life. Large numbers of the mining population reside in houses of a class similar to those in which their fathers lived. If better and dearer housing were obtained, the standard of food, clothing, education and everything else would automatically rise. The present-day miner occupies his time more in amusements, to the neglect of his work. All of which goes to say that Mr. Gibson has not a very high opinion of the Scottish miner as a class.

Coaling Steamers from Barges and Fuel Lighters

By Chas. H. Hughes*

SYNOPSIS—An interesting summary of the modern practice in coaling steamers in which a general description of the more popular types of lighters is given. The problems encountered embody many novel features.

The coaling of a steamer, when the fuel is delivered alongside in barges or fuel lighters, is a most important problem; not only do the port requirements vary, but it is also essential to get the coal into the bunkers as quickly and as cheaply as possible. For it is evident that the ship owner does not wish his steamer unnecessarily detained, while from the coal companies' standpoint the fuel must be put on board at a minimum cost.

In some parts of the world labor is extremely cheap, and instead of using mechanical means, men and even women carry the coal in baskets from barges moored alongside and empty them into the scuttles on the deck or into barrows which are emptied into the bunkers. But in the majority of instances, labor is high and it is preferable to use mechanical methods. There are at present a variety of methods of coaling a steamer from barges and fuel lighters, and there is outlined below a number of types that have proved satisfactory. In every instance the one selected largely depended on local conditions.

Coaling from Barges with Cranes

This method is shown in the photo, Fig. 1, taken at New Orleans, La. Here the coal is transported in a barge from which it is taken out by a clam-shell bucket swung at the end of a crane, the one shown having been built by the Ohio Locomotive Crane Co., of Bucyrus, O. The crane is mounted on a separate barge on which there is also a tower. The coal is discharged by the bucket into a hopper and then elevated by a bucket conveyor or skip

Fig. 1. View Showing a Lighter Coaling a Steamer with a Crane. Fig. 2. A Fuel Lighter Receiving Coal through Bucket Conveyors from the Erie Coal Co.'s Docks, Cleveland, Ohio. Fig. 4. Self-Propelled Coal Lighter Designed by John H. Bernhard. Fig. 5. An End View of Bernhard's Coal Lighter, Showing the Loading Trunk and Return Flight of the Conveyor

*Naval architect and engineer, 82 Beaver St., New York.

hoist to another hopper on the tower. From this latter it is discharged through chutes leading directly to the scuttles on the deck through which the coal falls to the bunkers below.

There are many variations to this method, depending on the type of steamer, the location of the bunkers and whether they are accessible from the deck or from ports on

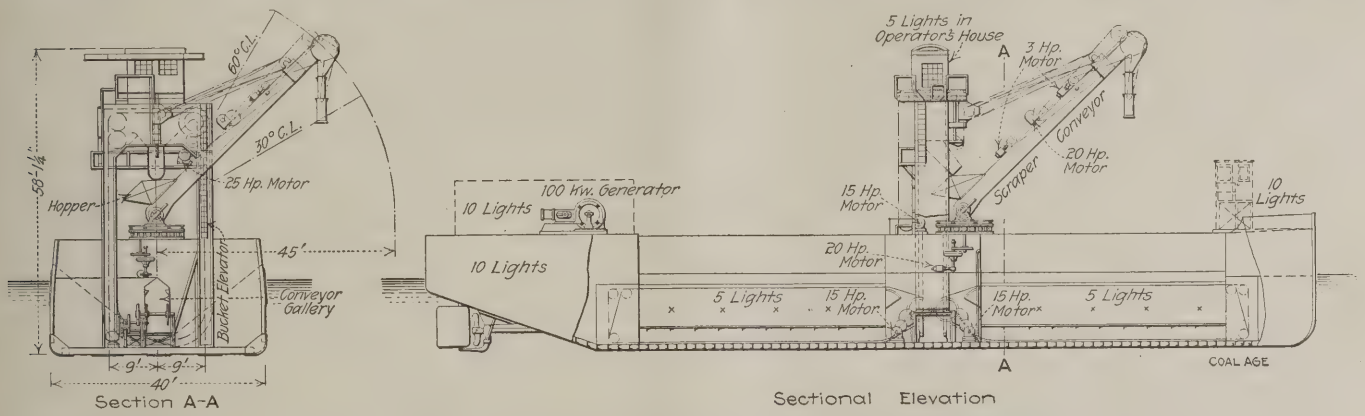


FIG. 3. SIDE AND END ELEVATIONS OF LIGHTER, SHOWN IN FIG. 2

the side. In the former case, the chutes can be used as just described, or they can be made to discharge into a hopper having chutes leading to the coal scuttles; the hopper being portable, can be moved along the deck. When the ports are on the side, a special side hopper is fastened to the ship from which the coal is discharged into barrows and wheeled away.

As ships vary in size and height above the water, it is necessary that all coaling devices must be designed so as to be adaptable to a wide range of vessels, the maximum conditions being assumed. In Fig. 1, the upper hopper on the tower can be raised and lowered and the chute leading from the hopper can be made to take different angles, for it is obvious that a change in angles is necessary when coaling a bunker on the starboard and port sides.

The speed of coaling with a machine of this type largely depends on the skill of the operator. But it is safe to say that under ordinary conditions, 100 tons of coal per hour can be easily handled with a 1½- to 2-yd. bucket at a hoisting speed of 180 ft. per min. With an intermittent system of this kind, there is time between the successive discharges of the clam-shell bucket for the men to trim the coal in the bunkers, while with a continuous system the conveyors have to be stopped occasionally till the accumulated coal has been trimmed. The cost of a crane as shown, exclusive of the barge, varies with the size and capacity, but will be between $4000 and $6000.

The barge is of the box type strongly built with square ends. Before mounting the crane with its equipment and the tower, stability calculations should be made so that when the boom is swung at its greatest radius and with the bucket well filled, there will be no danger of the barge turning over.

FUELING LIGHTERS

Another method of coaling is shown in Figs. 2 and 3, the latter being a drawing of the lighter shown in the photograph. By having the machinery aft, and the coaling apparatus amidships with the pockets on each side, no very marked change of trim takes place between the light and loaded condition, for it is practically immaterial whether the coal is taken from the forward or after pockets first.

This lighter was designed and built by the C. O. Bartlett & Snow Co., of Cleveland, O., for use on the Great Lakes. It is self propelled and is divided into rows of pockets, each holding about 50 tons. In the bottom and between the pockets is a passageway about 8 ft. high by 4 ft. wide, in which is the conveyor for taking the coal from the pockets to a bucket elevator at the center; this latter travels up one leg of the supporting member of the center structure and down the other, discharging into a hopper that in turn empties into another bucket conveyor from which the coal is spouted into a ship's bunkers.

This last conveyor is pivoted and is supported by a circular roller track, so it can be swung through an angle of 180 deg. and the one shown herewith has a radius of 45

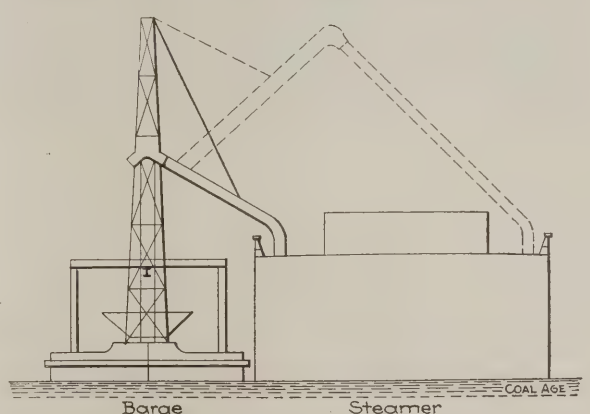

FIG. 6. SELF-PROPELLED FUEL LIGHTER

ft. At the end is a telescopic chute which can be extended if desired, thus increasing the working radius. As the conveyor can be raised and lowered and also swung through a horizontal angle of 180 deg., a wide range of action is obtained; the lighter can thus coal steamers of a variety of sizes, and under all conditions, whether they are light and high out of the water or low with their cargo on board.

The machinery is located aft; it consists of a Scotch boiler supplying steam to a vertical engine that is used for propelling purposes, and to the engine driving the dynamo that generates electricity for lighting and power purposes. The entire system of conveyors, including the pivoted one, is operated by electric motors, all of which

are controlled by a man in the center tower. With this arrangement the number of men required is kept at a minimum and the operating cost is low.

The lighter is 166 ft. overall and 41-ft. 9-in. beam. It can carry 1000 tons of coal and has a capacity of 400 tons an hour. The hull is of steel but could be built of wood if desired. The pockets are shown in dotted lines in the cross-section, and are given such an angle that the coal readily falls to the center and onto the conveyor when the doors are opened.

In Fig. 4, is shown a self-propelled fuel lighter, designed by John H. Bernhard, of New Orleans, La., where the coal is handled by bucket conveyors and scrapers. The hull, which is of steel, is divided into ten hoppers, with gates at the bottom through which coal passes to two conveyors, one running from the bow aft to the tower amid-

Fig. 7. De Mayo Coaling System

ships and the other forward from the after bins. These conveyors discharge the coal onto other conveyors located in the tower, which elevates it to a height of 43 ft. The coal is then dumped into a trunk in which there is a scraper conveyor that can raise it against any vertical angle or can retard its flow when the trunk is depressed. By referring to Fig. 5, the return flight will be noted directly over the trunk.

The trunk can be raised and lowered through a variety of angles, the maximum height being about 63 ft. At a height of 43 ft. it extends about 30 ft. from the side of the lighter, thus making it possible to coal bunkers in a steamer on the far side from the lighter.

The lighter in Fig. 4 is 240 ft. long, 32-ft. beam and on a draft of 7 ft. can carry 1000 tons of coal. It is propelled by three 80-hp. gasoline engines giving a speed when loaded of about 8½ miles an hour. All the conveyors are driven by electric motors, the current being furnished by disconnecting one of the 80-hp. engines from its propeller shaft and connecting it to a dynamo. The conveyors are all controlled from a platform on the center structure.

Another type of fueling lighter that is also self propelled is shown in Fig. 6. The machinery is located aft, while practically the whole of the rest of the lighter is used for carrying coal. Over the bin is a steel rail on which runs a trolley having suspended a clam-shell bucket. The bucket picks up the coal, carries it forward and discharges it into a hopper, from which it is fed to a skip hoist or a bucket conveyor; this last empties the coal into a hopper on the tower, from which it is led by a chute to any of the scuttles on the deck. Should the steamer that is being coaled be exceptionally high out of water, a conveyor is placed in the position indicated by the dotted lines, which could easily reach the scuttles on the far side of the steamer.

The mechanical equipment consists of a Scotch boiler supplying steam to a turbo-generator set and to a compound vertical marine engine, the latter being used only for propulsion, being of sufficient size to give a speed of 8 to 9 knots when loaded. The turbo-generator furnishes electricity to the motors for operating the clam-shell bucket and also to the hoist or conveyor in the tower. The barge shown is 160 ft. long on the water line, 33-ft. beam and carries about 1000 tons of coal.

Coaling by Portable Elevators

A novel method of coaling, which has been developed by the De Mayo Coaling Co., of New York City, is by means of portable elevators, as shown in Fig. 7. This type is particularly adapted for coaling steamers with side ports, although it can be used with various modifications for coaling through scuttles on the deck.

The elevator or unloader consists of steel-plate buckets and steel spacer plates connected by cold-steel hinge pins. No chain is used, the buckets and plates forming an endless steel belt. The end drums are entirely open and are made of cast-steel disks connected by heavy steel rods. By having the drums open no material can become wedged between the rods and the buckets. The endless steel belt is driven by an electric motor at the head or top of the unloader.

The elevator is suspended from a boom on the side of the ship, see Fig. 7, and by its own weight digs into the coal, which is raised by the buckets and discharged through chutes into hoppers on the ship's side. Two elevators can be readily placed over an ordinary barge, each digging and discharging from 75 to 100 tons of coal per hour. By swinging the booms they can be moved to any part of the barge and the coal taken out with a minimum amount of trimming.

As to the speed at which a steamer can be bunkered, this largely depends on the number of coaling ports, for an elevator can be placed at every one; in some instances six or more elevators could be working at the same time. This method lends itself to rapid coaling, as for example the steamer "Imperator" of the Hamburg-American Line was loaded with 8200 tons of coal in 19 hours.

In some cases, owing either to the construction of the steamer or that she is exceptionally light and high out of the water, the coal has to be discharged through scuttles on the deck. To avoid making the elevator unnecessarily long and hard to handle, the standard length of 39 ft. 6 in. is adhered to, the elevator discharging through chutes into a hopper from which the coal is raised by another elevator that chutes it directly to the deck scuttle. Instead of suspending the elevators from booms on the ship's sides, the coal barges have masts with booms from which the elevators are hung.

Gasoline Locomotives in Relation to the Health of Miners

By O. P. Hood*

SYNOPSIS—The author points out the danger of running a locomotive at the same speed as the air current. He also urges the use of restarting devices, so that the engine need not be run with the clutch thrown off. He believes the gasoline locomotive has a wide field of usefulness, if the limiting conditions are properly kept in mind.

None of the methods now in use for the transportation of materials underground is entirely free from more or less serious objection. The great flexibility, ease of control and economy of operation of electric tramming are accompanied by the serious menace of a trolley-wire distributing system.

As the gasoline locomotive has even greater flexibility of application and requires no similar dangerous distributing system, it might be considered a safety device which would make possible the elimination of the dangerous trolley system were it not possessed of other objectionable qualities peculiar to itself. It is found that the exhaust gases from the engine may be injurious to the health of those breathing the air in which the locomotive has been operating.

While electric shock may kill the individual who makes contact with uninsulated parts, the gasoline engine may be detrimental to the health of all those who have to work within the atmosphere vitiated by exhaust gases. The degree of pollution measures the magnitude of the menace. This may be negligible at times, but with careless operation it becomes serious. The exhaust gases from an engine are composed of nitrogen, a little free oxygen, hydrocarbons, hydrogen, carbon monoxide, and carbon dioxide, the last two being considered dangerous.

Carbon Dioxide Not Made in Objectionable Quantities

The presence of carbon dioxide as a product of combustion of the gasoline was recognized as an objection from the beginning of the use of these machines, but attention was called to the fact that the amount produced was relatively small as compared to that from other sources of this gas. Carbon dioxide, except in relatively large percentages, produces no effect such as results from reducing the oxygen content of the air that is breathed.

The presence of carbon monoxide in the exhaust gases in injurious quantities was less apparent, but it appears from what is now known that this is the limiting factor in the use of these locomotives if they are not to be injurious to health. The presence of carbon monoxide in the air in relatively small quantities has been shown to have a marked effect upon the blood, producing sickness and, if inhaled in sufficient quantity, resulting in death. A discussion of the effects of these gases is to be found in *Technical Paper No. 62, U. S. Bureau of Mines,* written by G. A. Burrell, F. M. Seibert and I. W. Robertson.

*Chief mechanical engineer, Bureau of Mines, Pittsburgh, Penn.

Note—Article read before the American Institute of Mining Engineers, Electricity and Miscellaneous Mining Topics Section, Oct. 10, 1914, at Hotel Schenley, Pittsburgh, Penn.

The Carbon-Monoxide Toxicity Limit

It is difficult to get those most conversant with the effects of carbon monoxide to assign a definite limit to the amount which may be in the air without detriment to health. There does not exist a sharply defined line on one side of which is to be found safety, with danger on the other side. It has been shown that the physiological effects vary with different people, and with the state of health and degree of activity required of the individual, so that a condition which may be considered safe may prove to be unsafe under conditions of harder work and unfavorable physical state.

After careful inquiry, the best that can be stated at this time is that, without injury to health, no more than 0.1 per cent. of carbon monoxide can be breathed except for short periods and at infrequent intervals. It is probable that one-half of this percentage could be allowed for a considerable period of time without noticeable effect.

The percentage of carbon monoxide in the mine air depends upon the amount made by the engine and on the quantity of air with which it is mixed. It is necessary to provide ventilation for the worst possible combination of gases which such engines can make under unskillful handling. The gasoline locomotive should therefore be considered as a carbon-monoxide producer, and the maximum quantity of this gas which any engine is capable of making should be ascertained.

Important to Figure on Maximum Output of Monoxide

It is not sufficient to consider the average amount produced as distributed over the whole time of running such a machine. The total quantity of gasoline burned in any one day may have produced but a small quantity of carbon monoxide, but if this has been confined to a relatively short period during bad carburetor adjustment, and in some poorly ventilated space, the momentary percentage may be very high and the consequences may be fatal. It is evident that to be entirely safe the ventilation must be sufficient to keep the percentage of carbon monoxide below the assigned limit when the engine is producing the maximum quantity possible.

If this maximum quantity is provided by proper ventilation, the chance of injury to health can be considered quite remote. Certain peculiarities of gasoline engines make the percentage of carbon monoxide generated vary between rather wide limits, but the maximum is fairly constant. No other constituent of the exhaust gases varies so much or so rapidly with slight changes of adjustment as does the carbon monoxide.

Makes Most Monoxide When Doing Most Work

Extended experiments have been made by the Bureau of Mines to determine under what conditions of running such locomotives give a maximum quantity of carbon monoxide. This maximum quantity is found when the engine is running at full load and full speed, and when burning the greatest quantity of gasoline which will

maintain these conditions. Any further enriching of the mixture results in weaker explosions, misfires, a reduction in speed of the locomotive, and thus a reduced total quantity of gases.

The weight of gasoline used per stroke may vary nearly 100 per cent. without varying the speed or power. As the mixture is enriched the combustion is less complete, reducing the efficiency, but affecting the power but little until the upper limit of explosibility is approached, when the power falls rapidly. Under these conditions a maximum quantity of carbon monoxide equivalent to 5¾ per cent. of the piston displacement may be generated and delivered into the surrounding air.

A Slow-Going Locomotive May Have Bad Carburation but Volume of Gas Is Reduced by Reason of Low Piston Speed

When the engine is throttled down to a slow speed and with a light load it is possible to produce exhaust gases containing a greater percentage of carbon monoxide but the total quantity is less because of the slow speed of the engine. It can, therefore, be stated that the maximum amount of carbon monoxide that can be generated with a gasoline locomotive is a function of its piston displacement.

SIZES OF LOCOMOTIVES IN COMMON USE, QUANTITY OF GASES THEY MAY GENERATE AND AIR NEEDED FOR NECESSARY DILUTION

* Area piston in square feet × stroke in feet × number of cylinders × revolutions per minute.

† Maximum amount of carbon monoxide which can be breathed for short and infrequent intervals without injurious effects.

The sizes of locomotives in common use are given in the accompanying table, together with the maximum quantity of injurious gases which they may generate.

The size of a locomotive that may with safety be introduced into a mine depends upon the amount of air that can be mixed with the exhaust gases in the most unfavorable portion of the run of the locomotive. For each cubic foot of carbon monoxide which can possibly be generated in the engine there should be available 2000 cu.ft. of air to mix with the exhaust gases if the resultant atmosphere is for continued breathing, while for short and infrequent intervals the proportion may rise to one part in one thousand.

Relative Velocity More Important Than Actual

The air with which the exhaust gases are mixed is the air passing by the locomotive. If the speed of the air current and that of the locomotive are the same, there would be a concentration of exhaust gases immediately surrounding the engine, which would soon reach the danger limit, and the engine runner, if no one else, would be exposed to this excessive percentage. Again, the air may be stationary, and if the locomotive passes through it at such a rate as to distribute the exhaust gases into the required quantity of air, the dilution may be below the danger limit.

It becomes necessary, therefore, to investigate the relative velocity of the locomotive and the air current, together with the cross-section of the latter, in order to determine whether a sufficient quantity of air is passed to insure a proper dilution. The mixing due to the movement of the cars and the diffusion of the gases is expected to distribute the gases through the air. An investigation of this kind will frequently disclose some portion of the run of the locomotive where the air and the locomotive are traveling together and the dilution is insufficient, forming the basis for just complaint. By a change in the speed of the locomotive, or more careful running, perhaps with lighter loads, these difficulties can frequently be overcome.

Need for Restarting Device

It is evident from the foregoing that it is a dangerous practice to allow locomotives to stand idle for any length of time in locations where there is not ample movement of air. The introduction of a self-starter on locomotives which are compelled frequently to wait for cars would be a great aid. The engines on these locomotives are usually difficult to start, and to stop the engine whenever the locomotive is compelled to wait for a few minutes would not be practicable unless some easy means of restarting was provided, but this practice would greatly reduce the chance of air pollution.

The requirement that not less than 1000 cu.ft. of air shall pass the locomotive for each cubic foot of carbon monoxide which the engine can possibly generate will limit the size of the locomotive in many cases. Sizes will have to be chosen smaller than are now in use. It may also confine the use of these engines to main entries where there is ample ventilating current.

Need for Better Carburetors and More Skillful Men

The maximum quantity of noxious gases for which provision is here made should not actually be realized with improved carburetor construction and skillful manipulation. The percentage of carbon monoxide in the exhaust gases under the worst conditions is about 13½ per cent., while under normal running conditions the amount seldom exceeds 6 per cent. It is this great variation in the possible amount of carbon monoxide due to unskillful operation that makes the experience of different users of these machines vary through the wide limits noted.

Use of Table Where More Efficient Carburation Is Secured

If a locomotive is installed in a place where the quantity of air is not sufficient to dilute the maximum quantity of carbon monoxide properly, analyses of the exhaust gases should be made to determine just what percentage is actually produced with the carburetor in use and the methods employed in running these machines. The ventilating current may then be regulated to conform to the actual amount of carbon monoxide as found. It is proposed that this be done by a method somewhat as follows:

Suppose, upon analysis, that the actual amount of carbon monoxide is found to be not over 4 per cent. We will

allow a factor of safety of 2, that is, we will assume that this percentage might on occasion amount to 8 per cent. Since the maximum percentage possible is about 13½ per cent., the ventilating current required can be estimated to be that given in the table when reduced in the proportion of 8 to 13½.

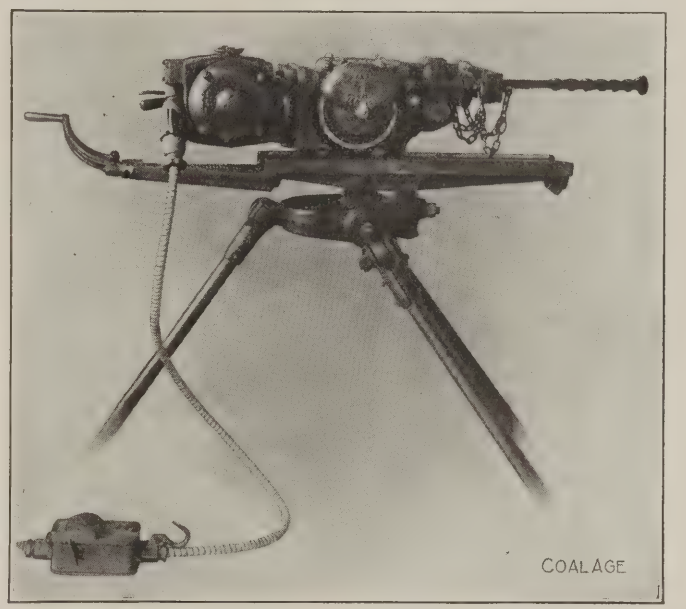
If a careful study is made of the amount of air available for dilution throughout the run of a locomotive, and the quantities are kept within the limits that are here proposed, a wide field of usefulness for these locomotives remains, where it is believed there would be no injurious effects upon health.

The Electric Rock Drill in Coal Mines

A part of the net profits that should be derived from coal mining is often absorbed in expensive "dead" or unproductive work. The excavation of rock in various forms is an absolute necessity in many properties, representing a large percentage of the total cost per ton of output. Many thin but excellent beds of coal have not been worked, on account of the excessive cost of this operation.

The wide area of the workings of the average coal mine prohibits the use of rock-drilling equipment such as is used in metal mining. Were air drills used, the distance from compressor or power plant, the amount of piping required with its attendant losses due to leakage and friction, the investment in heavy compressor plants and high power costs for the comparatively few drills necessary are all factors conducive to prohibitive operating costs, and as a result it is not surprising to find many large properties still adhering to the primitive methods of hand drilling.

The Drill May Be Easily Handled and Moved



The almost universal use of electricity in coal-mining operations permits of the introduction of the electric rock drill without an additional investment for the production and distribution of power, thus eliminating a dual power installation of electricity and compressed air.

Coal operators have been quick to appreciate the advantages of an electrically driven rock drill that is instantly available in any part of the property and may be operated direct from any underground circuit from which the mine locomotives, cutters or other mining machines obtain their power.

The Fort Wayne Electric Works of the General Electric Co., at Madison, Wis., after many years of exhaustive testing, are now extensively marketing an electrically driven rock drill that has reduced the cost of rock excavation to the minimum and is naturally of great interest to coal operators.

This drill is of the percussive hammer type. A simple and effective motor-driven striking mechanism delivers 1700 blows per minute to a slowly revolving bit. The machine with motor complete is mounted on the familiar rock-drill tripod or mining column.

The drill mechanism possesses many novel features. The striking apparatus consists of a heavy flywheel or "helve" carrying two cylinders, in each of which a solid steel hammer floats freely. As the helve revolves, the hammers are thrown outward into the striking position by centrifugal force and at each revolution deliver a blow upon the projecting tappet or drill-steel cap which transmits the energy received to the drill bit.

The Drill on Its Tripod

After delivering its blow, the hammer rebounds into the chamber or cylinder where it is completely cushioned upon the air which it traps. During the period of recoil (the helve continuing to revolve), the hammer passes the drill-steel cap and is again thrown into striking position during the remaining portion of the complete revolution of the helve.

The "shank" of the drill steel is loosely held in the revolving sleeve or chuck, which is designed to hold the bit in position to receive the hammer blow. It is retained in the chuck by means of spring-steel buffer-plates, and the entire mechanism is inclosed in a steel casing.

The drill is fitted throughout with special shock-absorbing roller bearings, and the motor with high-duty ball bearings. As all bearings are packed in grease, they require oiling but once every 30 days. The hammers, however, are supplied with oil from a reservoir, which must have attention daily.

The revolving helve or striking mechanism is flexibly connected to the motor by means of a special endless belt which permits of a wide variation of speed without the use of electric rheostats or controlling devices, the motor be-

ing stopped and started by means of a special inclosed switch.

Ample means are provided to protect both motor and drill mechanism from overload and stresses in case the rotation of the drill steel suddenly ceases, due to the bit encountering extraordinary resistance.

The cuttings from the drill bit are continuously removed from the hole by a special auger-drill steel, which is provided with veins or ribs similar to those upon the well known spiral conveyor, the center core of the steel being of ample section to transmit the hammer blows throughout its length.

Holes may be drilled at any angle from horizontal to 45° below without the use of water. For holes from 45° to vertical, water is poured into the hole in sufficient quantity to form the cuttings into a thick mud, which is readily elevated by the spiral conveyor.

One and one-half to 2½ hp. is required for the operation of this drill, including losses in transmission from the generator to the machine. A large number of these drills are in successful use in the coal-mining regions of Pennsylvania, West Virginia and Kentucky.

Extracts from a Superintendent's Diary

If ability to choose suggestive words is a criterion of literary ability, the citizens who originated some of the nicknames around our camp are certainly overlooking promises of immortality by wielding the pick instead of the pen.

These nicknames are not confined to humans alone, but include also mine mules, family horses and at least two cows, as well as several inanimate objects such as the commissary, the superintendent's office, and the camp's boarding house.

The suitableness of most of the nicknames is apparent to even a stranger, but a few of them require, for proper appreciation, some knowledge of local gossip.

The history of some of these names is very interesting. Some have been handed down from father to son, some were improvised on the spur of a moment, while still others are the fruits of deliberate planning in search of revenge. Then there is quite as much variation in the attitude of the christened ones toward their rechristening. As a matter of fact, a man's attitude toward his nickname has little effect on its popularity and there's no instance on record of a man outliving a nickname, irrespective of his efforts and inclinations.

The thing that set me to thinking about nicknames is a little incident that started yesterday and was concluded today.

One of the most popular men in our camp is a young fellow who clerks in one of the commissaries. He plays in our band, has a good singing voice, likes all the young ladies without favoring any particular one, and makes himself agreeable to every man, woman and child with whom he comes in contact.

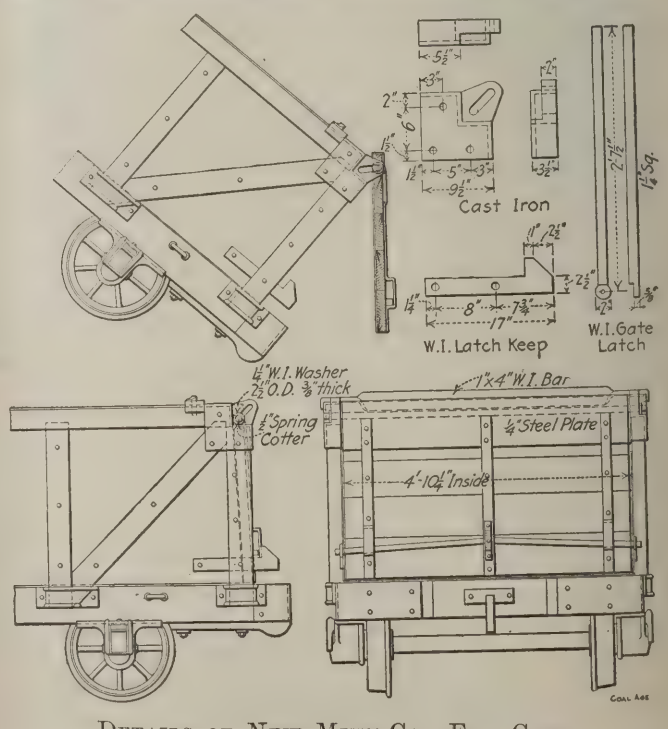
He has been with us off and on for about five years.

Occasionally, he tires of the humdrum existence that our camp affords and wanders off to try his luck in one of the near-by cities, but in a few months he always returns and finds his position still open, quite as a matter of course.

Just as he was boarding a train that carried him away, the first time he decided to try his luck in new fields, one of the youngsters at the station reminded him that "a rolling stone gathers no moss." Before he had time to reply another kid came to his assistance by singing out "no, but it gathers a lot of polish." By this time the train was moving and there was only time for a parting shot. It was furnished by a bairn whose father is an amateur geologist and talks geology at home; "Goodby Slickensides," yelled out this youth, and "Slickensides" became the young man's name from that time forth.

Last week he again left us and as usual he insisted that he would never return.

Yesterday I happened to be in the city and encountered him in one of the large retail stores acting as floorwalker. "Hello Slickensides," was the greeting I gave him. "Well I'll be blowed," was what he gave me in return, "Haven't been called that for a week, guess I'll have to go back, it's too darned formal in here."



Sure enough, today he returned and was reinstated in his old position.

He came by my office and confessed that he always got along all right while away from us, until some of his old acquaintances came along and called him "Slickensides," then he couldn't resist the longing to get back to his old haunts where people understood him.

From this time forward nicknames will be more than witticisms to me, and because of my discovery, any youth possessing rare ability to improvise names that will stick, can have a job around my office.

An Automatic Mine-Car End Gate

An automatically operated gate for mine cars has been patented by C. W. Stickler, of Lansford, Penn., which should become popular for the simple reason that it has no parts to get out of order, no levers to operate, will not bump open on level track, dumps easily and surely, and latches itself automatically. The attach-

Details of New Mine-Car End Gate

ment can be placed upon any mine car now in use at but a small cost.

A mine car equipped with this automatic device has been in use more than three months, making frequent trips from mine to tipple, and has never failed to dump or latch itself.

It is an economical device in that it does away with the services of the men now required to set and operate the car latches between the shaft and the headhouse.

As may be seen from the accompanying drawing, the attachments consist of a casting fitted to the top of the car at the gate end and the ordinary car latch, shortened, so as not to extend beyond the body of the car.

The casting, as the detail shows, has a slot for the gate bar to slide in. This slot, for 5/8 of the thickness of the gate bar, has a pitch of 60 deg. to form a pocket for the bar, so that the gate cannot be bumped open on level track. From that point it pitches at 45 deg. to a height sufficient to lift the latch from the keep.

As the car runs onto the dump the center of pressure of the contents shifts from the bottom of the car to the gate, while the momentum causes great pressure to be exerted thereon. Meanwhile, the car is tilting downward and the 45 deg. slot is assuming a horizontal position which permits the bar to slide, lifting the latch out of the keep and releasing the contents of the car.

As the car returns to the horizontal, the bar slides down the slot into the pocket and the gate slams shut, dropping the latch into the keep and automatically locking the gate.

A tie is placed across the top of the car near the gate casting to prevent the sides from spreading and binding the gate bar.

It should also be noted that the gate extends above the bar so that the car can be loaded level full.

The Labor Situation

SYNOPSIS—The Industrial Relations Commission meets in Denver, Colo., and is expected to raise much bitter recrimination. The state authorities are providing for miners on strike in eastern Ohio. Compensation for accidents is sought by Pennsylvania miners. Arkansas is quiet. An extensive strike stops mining in Kansas.

The Federal Industrial Relations Commission commenced to hold a long session in Denver, Colo., on Dec. 1. Coal-mining managers and operators, miners and officers of the unions will be called to give testimony at hearings which will be open to the public. The citizens of Colorado have become weary of investigations which do not arrive at results and seem only to pave the way for succeeding investigations and more postponements of settlement with a continuance of friction between the principals in the issue.

However, the hope that investigations will cease to probe the Colorado wound with distressing results, seems destined to be disappointed. Now it is the Rockefeller Foundation which is going to make an investigation, according to John D. Rockefeller, Jr.

Removal of U. S. Troops

Governor E. M. Ammons desires that Federal troops be removed from the state and that Colorado be permitted to resume government in the strike zones. His time of office is about to expire; his successor is a man of the opposite political party. These men are working harmoniously in this strike policy and it is expected that the reins of government will change hands so smoothly that the only effect immediately noticeable will be a general feeling that there is a more capable driver.

Investigations Stir Up Strife

On Nov. 24, both governors united in sending telegrams to President Wilson and to Chairman Frank P. Walsh, of the Industrial Relations Commission, objecting to the pending investigation. These telegrams were duplicates and stated that there have been more than a score of investigations; that it is doubtful whether any new information is obtainable; that the presence of the commission in the state at the time of changing administration would embarrass the governors in their program and might endanger the present peace in the state. Reply came by wire the following day from Mr. Walsh to the effect that the hearing could not be postponed but that the commission invited the coöperation of the two governors.

Arms and Ammunition Will Be Forbidden under Militia as under Army Rule

Governor Ammons has issued a proclamation, at the request of Col. Lockett commanding the federal troops, renewing the prohibition of liquor in the strike zones of the state until Jan. 1, 1915. Should the President accede to Ammons' request for the removal of troops, the governor will issue a much more stringent proclamation that will forbid, in the strike areas, the purchase and possession, not only of liquor, but also of firearms and ammunition.

We commented at length editorially in our last issue on the new committee of conciliation. The operators see no need for any such mediatory body. They declare that they have trouble, not in obtaining men but in securing orders for such coal as is mined by the men they have.

The Eastern Ohio Strike

In Ohio, the state authorities are trying to protect the miners from the effects of their sturdy resistance to the extremely reasonable offer of the operators. It is questionable whether state funds should be used to aid men to continue on strike for what is equivalent to an increase in wages when wages and salaries elsewhere are either being reduced or at best continue unchanged. However, so far, little action has been taken to which serious objection could be raised.

Governor Cox and other state officials have asked the federal government to donate the old uniforms of the Ohio National Guard to the miners. Usually old uniforms are destroyed under orders from Washington but there is still much wear in them and it is figured that much good would be done by distributing them among the needy miners. Dyers, of Columbus have offered to dye them free of charge.

There has been no movement toward reconvening the wage-scale joint committees in eastern Ohio or Coshocton. Generally speaking everything is quiet in the two idle districts.

A number of miners who are stockholders in the West Wheeling Coal Co. near St. Clairsville have opened the mine and are producing several cars daily.

Mines in Eastern Ohio Ask for Increased Wage

The conference of the scale committee of operators and miners held at Cleveland last week, adjourned Dec. 4 sine die, without arriving at the settlement of the wage scale. It developed after the conference was called that the miners' representatives were not empowered to make any concessions from the proposition of 47c. for run-of-mine machine-mined coal, and the operators would not agree to any such a figure. It was generally believed by operators that when the conference was called that the miners would have something to offer in the way of a compromise. But their hopes were soon dispelled and the threadbare proposition of 47c. was again put forth. It is believed that officials of the International organization, who attended the conference, had a part in keeping the miners' members of the scale committee from offering a compromise.

According to one of the scale committee the operators attended the meeting with open minds. They were prepared to accept any reasonable proposition either on the mine-run or screen basis. But they were not disposed to accept any scale higher than last year or higher than the Pittsburgh scale, which is 44.61c. But they were not wedded to either the mine-run or any other form of computing weights.

Word now comes from Cleveland to the effect that some of the operators in the eastern Ohio district will try to open

their mines on the open-shop basis. The Lorain Coal & Dock Co., of Columbus, which has operations in that field, has not yet decided that question. The officials of the company are watching the trend of affairs, ready to take advantage of conditions.

In a circular letter sent out by the state executive committee of Illinois, miners of that state are urged to loan $100,000 to the Ohio organization to help to pay strike benefits in eastern Ohio and Coshocton. Strike benefits amounting to $49 to each mine employee have been paid in the last eight months.

Criticism of Coal Screen Commission

State Auditor Donahey has criticized the Coal Screen Commission, which made an investigation prior to the passage of the mine-run law on its charges. An appropriation of $5000 to pay the expenses of the commission was made by the legislature. John M. Roan drew $1324; Morris Albaugh, $1277; and W. B. Bowman, $1266, as members of the commission. They accepted fees at the rate of $10 per day and expenses. M. B. Hammond, Phil M. Crow and J. C. Davies refused to accept compensation. A balance of $46 remained in the fund and that was given to a clerk in the office of the mining department.

J. M. Roan, chief inspector of Ohio, was called to the J. L. Poston mines near Athens to decide a disputed point as to the duties of safety foreman. He ruled that the safety foreman should act as a patrolman to visit all workings and decide on questions of safety.

J. M. Roan, mine inspector, has changed his system of working the deputy inspectors attached to his office. He is changing them from one mining district to another in order to provide for a check, one against the other as to the faithfulness of their services.

Mine-Run Law Did Not Help the Politicians.

That the espousal of the Mine-Run Law by Governor Cox proved to be a source of weakness to him among the miners, rather than of strength, at the late election in which he was defeated, seems very evident from an analysis of the miner vote, as made by a prominent Columbus operator. Cox did not carry a single coal-producing county in the state. The vote this year, which was much heavier than that of two years ago, resulted in both the leading candidates showing gains, but in all coal counties the Cox gain was the smallest. The most significant vote was that of Hocking County, in which the Mine-Run Law has had the fullest demonstration. Here Cox actually lost 14 votes, while his opponent gained 1398. In Perry, another Hocking Valley county, the Cox gain was only 48, as compared with a gain for his rival of 2472. The Governor's nearest approach to breaking even was in Guernsey County, where the mine-run law has worked out more favorably than elsewhere, because of the small per cent. of slack which results from mining. His gain in Guernsey was 1163, compared with a gain of 1239 for the other candidate. In Belmont, the chief coal-producing county of eastern Ohio, with a large foreign population, and where the scale fight is still on, Cox's gain was 1000 less than that of his opponent. The whole adds to the proof that the miners are generally dissatisfied with the mine-run plan and would be glad to be back on the old screen basis.

Miners Trying To Bring Pennsylvania To Take Correct View of Compensation for Accidents

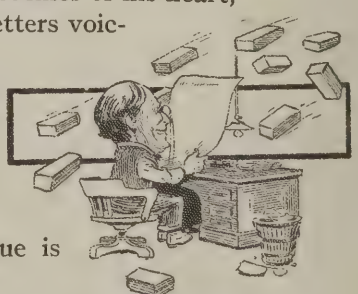
The miners are urging that accident compensation laws like those in other states be introduced into Pennsylvania. Many operators have advocated such action at public meetings and some have even voluntarily provided for the payment of benefits to those who are injured or to their beneficiaries if they are killed. The executive boards of subdistricts 1, 7 and 9 met at Clifford's Hall in Wilkes-Barre, on Nov. 27, to advocate a law like that in force in the state of Ohio.

The union has turned over a fund to erect a monument to the 14 victims in the Lattimer mine disaster to subdistrict No. 7, Lehigh, which will push the project to a conclusion.

The Editor

Written Expressly for COAL AGE *By* MICHAEL BERNARD

THE EDITOR is not a chap
Whose life is something of a snap,
And if by any chance there are
Some folks that see in him a czar
Who issues edicts from his throne
And bends all wishes to his own,
Let them at once revise the plan—
The editor is but a man.



HE'S *Forced to Wade Through Reams of Verse.*

He hasn't such a cinch to choose
The articles he ought to use
To keep his journal up to snuff
On every phase of mining stuff.
He has to winnow heaps of prose,
Some good, some rotten, heaven knows!
And sift the flour from the bran—
But yet, he's not a superman.

He's forced to wade through reams of verse
Like this—or probably no worse;
He makes amends for each mistake
And takes the blame fo every break;
He answers questioning and quiz
On every mining theme there is.
Then show him pity, if you can,
Because he's just a mortal man.

It makes his pulses thrill and start
And warms the cockles of his heart,
If, mixed with letters voicing kicks
And hurling metaphoric bricks,
He finds a note in one of them,
"Your latest issue is a gem."
Ah, that's the kind he likes to scan;
For, after all, he's just a man.

MIXED *with Letters Voicing Kicks.*

Editorials

Foolish "Muckie" McDonald

A brief description of what a man, by the name of "Muckie" McDonald, did in his innocence at Butte, Mont., will convince our readers that this same "Muckie" used very poor judgment. His crowning fault was that he believed that "what was sauce for the goose was sauce for the gander." He had a notion that he had just as much right to be violent as some of the heroes of whose actions he had read. He now knows there are distinctions of time, place and person which men of spirit must observe if they would also be men of reputation.

Muckie had heard how they "did things" in Colorado, how they kidnapped nonunion men and hid them in caves and he thought that he could successfully turn the same trick in Montana with union men. The county attorney, J. J. McCaffery, admitted practically that Montana did not object to kidnapping so long as union men were not interfered with.

He took care to point out in his plea that the men "were not deported from Butte because they were scabs." The jury might well think with some people in power that such a deportation was justifiable. He went on to explain that they were men entitled to their liberties, gentlemen of the privileged sort, not scum whose rights no one is bound to respect: "They were old-time union men. This was merely a squabble among union men. The law in even the meanest principality in Europe says a man is entitled to his personal liberty. I ask you to demonstrate the existence of that law in this country by your verdict."

You can see by the first part of that plea that the lawyer did not trust the jury. He had to appeal to its union principles, because in America it seems to be almost recognized that the personal liberty of a "scab" is not guaranteed, but that fact had not yet burned into the heart of "Muckie" McDonald. He only knew that union men had made an easy living off their dupes in Butte and that while wages for carpenters and all manner of mechanics soared, miners' wages in that camp failed to show any such tendency.

When Martin Glachin went to give in his time at the window, two men grabbed hold of him and put him in the midst of a ring of some six or seven hundred men. Several others were there already and some were pushed in afterward; there were 33 in all. He, with the rest, was marched down town and they were exhibited to the crowd as "Amalgamated stool-pigeons."

But your "Muckie" was no fierce violator of the laws, for when someone picked up a lagging, "Muckie" and his right-hand man Bradley protested loudly, crying, "None of this rough stuff here." The crowd took its captives out to a cabbage patch for trial, this deluded McDonald foolishly leading the way, and sat them down on the sand and tried them, finding them guilty of being Federation men. Someone wanted to hang them, but the pacific McDonald flared up with "Cut that rope business out." The convicted, all but Glachin, were ready to join the new union, and a bright thought occurred to "Muckie." If he could only get these men to join the new organization, it would appease their tormentors, and so he asked the crowd for such a judgment, but they were not so disposed.

Martin Glachin had "a bum foot" and the considerate Muckie helped him up after the trial. Then the men were marched to the brewery, Martin requesting Bradley to let him escape. Bradley was afraid to do this, so Martin states, because the crowd threatened violence. "Muckie," with his usual generosity, wanted to raise money to feed the captives, but that attempt to succor them met with no favor, the crowd in response to the suggestion yelling: "Put rollers under them."

The men were urged by the angry crowd to leave Butte, being warned that if they returned "they would be taken out on the flat, feet first," but the genial McDonald, amid angry comments, shook hands with Glachin and told him to come back as soon as he was ready to join the new union.

And now as leaders, or rather than as restrainers of their evil followers, McDonald receives three years and Bradley five years in the penitentiary. Had they only realized the difference between a union man and a scab, their paths might have led to privileged conferences in the White House, large audiences in Carnegie Hall and much honor in public, such as Mother Jones and others have enjoyed. Instead, their ways end in Deer Lodge Penitentiary and dishonor, consorting with horse thieves and like men of violence.

"Muckie" may think we are lecturing him at too great length, but we have one more piece of advice to give him before we finish. Let him remember the next time when he wants to violate the sacred law of private contract, that he should have the U. S. military forces back of him to make his practices safe. Let us hope that when one Woodrow Wilson, the historian, extends his short story of the United States to take in his own time, he will call "Muckie" gently to task for greatly daring, from so humble a point of vantage as that of a private citizen, to abrogate the law on which our country is founded. Meanwhile, let us rejoice that a man so good of heart, though wrong of head, has gone to the penitentiary. Sorely at times do such frowning walls need the presence of such tender-hearted men.

Savings in Fuel Costs

R. Holliday, president of the Association of Mining Electrical Engineers in Great Britain, in a recent address dealt with the use of electrical power in collieries, looking at the problem from the point of view of justification on economic grounds. He says that opinions may differ as regards its safety, but nowadays the reliability of an electrical plant is scarcely ever questioned.

Many accidents attributed to the use of electricity are due rather to the use of defective or unsuitable apparatus. As regards economy, he points to the increasing attention now paid to savings in the cost of fuel

used for power purposes which can be effected by the use of byproducts. When low-pressure steam turbines are driven from the exhaust steam of winding engines, the saving in steam consumption due to condensing alone can be taken as 25 per cent., and by utilizing the steam for power generation, 45 per cent. may be saved, or more than enough to pay for the extra capital involved in the turbines.

Enormous gains are also possible in the power transmission efficiency compared with steam pipes. Capital cost and maintenance expenses are lower for the electrical plant, and the electric motor is justified on the score of efficiency.

There is no question but that in any existing electrical plant, a reduction of 40 per cent. in the boilers may be made by the utilization of the exhaust steam. Such a saving is sufficient not only to pay interest and depreciation on the plant scrapped, but to provide interest and depreciation on the entire electrical installation, and still leave the operating company a profit.

Large Corporations and Safety

The machinery of big corporations has repeatedly and most successfully been put in operation to reduce accidents. In fact, the large companies have a great advantage over their small competitors in the humane work of saving life and most conscientiously have they availed themselves of it. All of them now have men specializing in safety and these men take care that their department of mercy is not overlooked by the men whose bent is technical or commercial. Their continual reports to headquarters raise the questions: "It pays but is it safe? It is a clever solution of a problem but is it injurious to the employee?"

We have shown, in a previous issue, how the H. C. Frick Coke Co. is one of the leaders in Pennsylvania in safety despite the fact that if the expert were asked to choose the most dangerous point for operation in that state he would select the region in which that company operates. The U. S. Coal & Coke Co. and the Bunsen Coal Co. have made notable reductions in the number of accidents and so have most of the large anthracite companies. A similar convincing proof can be secured from the Colorado inspection report regarding the Colorado Fuel & Iron Co. and it shows that this corporation, regardless of the calumnious criticism of people who are absent in residence, irresponsive in spirit and lacking in knowledge, is really doing its duty like other large financial concerns.

ACCIDENTS IN MINES OF COLORADO FUEL AND IRON CO. AND IN BALANCE OF STATE

Year 1911	Production	Number Fatal Accidents	Number Injuries	Fatal Accidents per 1000 Employed	Tons Mined per Fatal Accident	Tons Mined per Injury
The Colorado Fuel & Iron Co.	3,285,431	19	46	3.51	172,917	71,422
Balance of state	6,912,164	72	310	8.09	96,002	22,297
Year 1912						
The Colorado Fuel & Iron Co.	3,516,103	17	64	3.40	206,830	54,939
Balance of state	7,500,845	81	262	9.05	92,604	28,629
Year 1913						
The Colorado Fuel & Iron Co.	3,017,288	18*	86	3.73	167,602	34,850
Balance of state	6,251,651	90	268	11.19	69,462	23,327

* Excluding two washery accidents.

The fatal accidents in the United States in 1911, 1912 and 1913 averaged 3.58 per 1000 employed, according to the estimates of the U. S. Bureau of Mines, excluding for lack of data final figures for Kentucky in December, 1913. The Colorado Fuel & Iron Co., in those same years, had a rate of 3.54 per 1000 employed, according to the table.

That Colorado with its inherent dangers and inexperienced men has a large company, with over 5000 men employed, which beats the United States average in safety will be a surprise to most people.

Service Not Sacrifice

We had hoped when we wrote the editorial entitled, "Small Potatoes," which appeared in our issue of Oct. 17, that we had made our position so plain that further comment was unnecessary. We might have said more but we begrudged the editorial space which is all too limited for the comment which should be made. But, evidently, we have not made our point clear to Geo. N. Lantz, whose remarks were published in our discussion department of Nov. 28.

We tried to point out that a man could not get more for his labor than his employer would receive for his product, that if his product was inferior, his wage must decrease unless the employer accepted decreased profits, and that if the corporation for which he worked was already operating without profit, no such recourse was open and wages must inevitably be reduced.

As we read over the matter we wonder that we gave so much room to such needless platitudes, but still Mr. Lantz is not satisfied, so we must again affirm and defend our axiomatic statement. We will rewrite it thus: Employees are paid not for sacrifices but for service.

Trentino, the street-cleaner, sacrifices more than Caruso, the tenor, when the former sweeps in the rain and snow for the whole livelong day, and when the latter only spends a couple of hours singing at the opera. But the public values the service of Caruso, the tenor, above that of Trentino. The basis of payment is the delivery of something needed or desired and not the sacrifice expended in its production. This is especially true when the bulk of any one product like coal is gotten at less sacrifice by some producers than others or, when gotten, is of unequal quality and value.

We are surprised that Mr. Lantz says that the problem is not one of product but of wages, after the importance of product as a determinant of labor compensation was so clearly shown in our editorial. More surprised are we, seeing that Mr. Lantz lives in the very heart of the eastern Ohio trouble where the effect of product on wages is so clearly evident. If they do not bear the required relation, the employer refuses to engage the workman and that is what has happened in eastern Ohio.

Mr. Lantz says conservation and welfare work pay. One cannot see how the first can be profitable with the scale purposely schemed to make correct methods of mining expensive. Welfare work is probably not without its financial compensation but the return to capital is slow and dubious at best.

It is hard for the operator who has been compelled to run his mines at a loss or with a minimum profit and who is asked to increase the loss or see the profit wiped out to be told that he must look to recoup his losses by paying bonuses for conservational mining and by borrowing money to erect clubhouses. All this from the men who are urging higher and still higher wages.

Truly such men believe the operator's treasury a ver-

itable widow's cruse, from which the oil, though never replenished, never ran dry. We are afraid that unlike the widow and the prophet the two protagonists of the miners will find and indeed have already found that the cruse can be readily depleted if the draft on it is too heavy.

However, we are fully aware that a more artificial society might ultimately make the degree of sacrifice the determinant of compensation. But, before that time comes, there will be an end of private ownership. Then those whose work is unproductive will be compelled by law to transfer their toil to more profitable tasks, or to places where conditions are more favorable.

Mines where the coal is thin, sandwiched with impurity, sulphurous or uncertain, will not be worked and men will be moved where the captain of industry decides. A captain, indeed, he will be, for as in war, so then in peace, the regulation of a man's efforts will depend not so much on actual success in any one place as on the presumption of success by those who direct and control industry in the interest of the public.

But that is another economic period. Meantime, wages must be paid out of earnings, and the price of the product determines the wage rather than the labor of production.

Advice to American Coal Exporters Concerning the Fuel Requirements of Peru

Duncan Hood, special COAL AGE representative, traveling through the South American Republics, has appointed a number of agents to act for COAL AGE and its friends, in the large commercial and industrial centers of the different countries. In Lima, Peru, F. T. Lee, an American engineer, has been engaged as our representative. He writes us the following interesting letter relative to the coal situation in Peru:

"Yesterday, on behalf of COAL AGE, I interviewed Señor Gio Batto Isola, the leading coal dealer of Lima. He was much interested in my talk concerning the possibilities of using American coal in Peru and appeared anxious to get in communication with American exporters.

"From my conversation with Señor Isola, and several other fuel dealers, I find that coal for domestic use in Lima must be of firm structure and good weathering qualities, as the climate of Peru is unusually dry. The servant class and poorer people, in their ignorance, use only lump coal; all fine coals and dust are thrown away because it is believed they will not burn. They have probably been led to this conclusion because of the crude and inefficient stoves that are employed—there being hardly any iron cooking ranges, the majority of the kitchens being fitted with poorly designed brick stoves, or with open iron stoves similar to braziers.

"Señor Isola told me that the coal which had proved the best for this market, owing to its 'lack of fines' and low-ash content, was an Australian brand known as 'Aberdare.' Another satisfactory coal is also from Australia and is known as 'Burwood.' This latter coal, however, has a higher ash content than the 'Aberdare.' I was shown large stocks of the latter fuel and judged it to be similar to good Hocking Valley or West Virginia lump.

"The firm of W. R. Grace & Co. has started bringing coal to Peru in its own steamers from New York, via the Panama Canal, and a pile of this coal was shown me by Señor Isola, who stated that he would suffer a considerable loss on the lot he had purchased, owing to the large percentage of slack. It appeared to me that this coal was an ordinary grade of mine-run steam coal. It is evident that the Grace Co. simply used this coal to round out their cargoes and did not make any attempt to study the market; on the other hand, loading in the first coal that could be procured. Naturally, all the Lima dealers with whom I talked were disappointed with the 'sample' of American coal, and all cry 'show me.'

"I, therefore, inclose a copy of the Australian advertising circular, giving analyses of the above mentioned coal. These fuels c.i.f. Callao have cost the Peruvians $9.50 for the 'Aberdare' brand and $8.76 for the 'Burwood' coal. The unloading charges were correctly stated in a recent article in COAL AGE. These latter costs, of course, are assumed by the purchaser, so that no account need be taken of them by the exporter.

"The usual mode of payment is as follows: Once the coal is unloaded by the dock company and the weights certified by them, payment is made to the bank here in Lima with a draft at 90 days sight for the amount shown by the dock company's weights. This, in turn, on becoming due, is paid with a 90-day sight draft on London, payable in English gold, which shows the long credits obtaining here—these include time of voyage and discharge, besides the six months allowed for the maturing of the two drafts. I see no reason why the payment should not be made with a New York draft instead of one on London.

"Señor Isola stated that they were willing to pay more for screened coal, which could be used without any loss, and he was kind enough to advise me of the following conditions relative to the importation of bituminous coal in Peru, which conditions are worth repeating for the information of American exporters:

"1. The quality of coal best liked is the brand known as 'Aberdare,' which is imported from Australia and preferred because of its easy burning qualities and cleanliness, there being very little ash.

"2. After the 'Aberdare' brand, the 'Burwood' coal is favored because it has the qualities of the former, but has a higher ash content.

"3. The conditions that coal for domestic use should have are: It should be compact, without fines, easy burning and low-ash content. We prefer to pay 50c. more for a screened coal which does not carry dirt and fines.

"4. The buying here is done c.i.f. Callao, payment being according to the weights given by the dock company, with drafts at 90 days, which are in turn paid in drafts at 90 days sight on London and in English currency.

"5. If you can send us samples of coal which have the above conditions, we are ready to examine them, and, after a practical test and the opinion of our customers, are ready to enter into important negotiations, as stated above, providing the results have been favorable.

"6. The actual price of Australian coal comprising the above qualities is $9.50 for the 'Aberdare' and $8.76 for the 'Burwood' brand. Any higher price could not be considered inasmuch as the prices just indicated are those quoted by the principal importing houses of Lima for this week, from which we have just purchased 1000 tons."

Sociological Department

Wilkes-Barre District Mining School

SPECIAL CORRESPONDENCE

The fifth year of the Wilkes-Barre District Mining School, which is conducted jointly by the Wilkes-Barre Young Men's Christian Association and by the Wilkes-Barre District Mining Institute, opened for registration on Oct. 6, the first class night being Oct. 16. Classes will be held two evenings each week until Apr. 16, 1915.

The course of study includes practically every subject having any bearing on the mining of coal, and has the endorsement of leading mining officials; it is systematically arranged, so that it is possible for students to complete the entire course. This year preparatory instruction has been arranged for those who possess little education, and the subjects taught will be Reading, Writing, Spelling and Arithmetic, with special relation to mining subjects.

A Class in the Wilkes-Barre District Mining School

The regular course is designed to be covered in three years. In the first year the subjects included are Arithmetic up to and including Mensuration; Mine Gases, their occurrence, properties, behavior and detection; Mine Ventilation, the general principles of ventilation, and the production and control of air currents; Mine Law, its application and practical reference, with special attention paid to composition work; and lectures on organization, management and mine safety.

In the second year, the subjects are Arithmetic, including Mensuration, Involution and Evolution, Ratio and Proportion; Mine Surveying, its general principles, compass surveying and instruments; Mine Ventilation, the production and control of air currents, and practical considerations in elementary regulating and splitting; Mine Law and Lectures.

In the third year, the men are taught Mathematics, including Trigonometry and Logarithms; Mine Surveying, including compass surveying and instruments, general principles of mapping, linear and angular measurements, and calculations; Mine Ventilation, control of air currents, advanced study on regulating and splitting, and ventilators; Electricity and Magnetism, fundamental principles, electrical units, and application to mining; Mechanics, matter, motion and velocity, force, pulleys and gears, friction, centrifugal force, work and energy, strength of materials; Air Compression, general principles, styles of compressors, transmission and application; Mine Law and Lectures.

In addition to the night classes, a day class is held on the same days as the night classes, from 1:30 to 3:30 p.m. This is for the men who work at nights, either all the time, or every other week. Because many men work nights on alternate weeks, the work in this class is largely individual, and covers all the first and most of the second year work. If enough men enroll for this day class, it is planned to form two grades and employ an additional teacher.

The fees for this course are $8 per year. To those students who complete the entire course and pass a satisfactory examination the fees paid are refunded. This plan is made possible by reason of the interest taken in the school by the officials of the coal companies operating in and about Wilkes-Barre. At the annual banquet of the Wilkes-Barre District Mining Institute last spring, 14 graduates of the school were presented with diplomas and with checks for the amount of tuition paid by them. This was the first class to complete the course. The books are furnished by the school, and remain their property, a small fee being charged for their use.

The teachers for the school have, without exception, been chosen because of special fitness to teach the subjects assigned to them. Charles Enzian, mining engineer of the U. S. Bureau of Mines, continues as supervising principal, a position which he has occupied since the establishment of the school. C. A. Garner, mining engineer with the Lehigh Valley Coal Co., a former instructor in the School of Mines, Pennsylvania State College, is senior teacher, and is in charge of the classes in Surveying, Mine Law, and general subjects. Frank Nicholson, electrical engineer with the Lehigh & Wilkes-Barre Coal Co., formerly with the Westinghouse Mfg. Co., and the Vulcan Iron Works, teaches Arithmetic, Mechanics, Air Compression, Electricity and Magnetism.

Robert Johnson, mine foreman with the Lehigh Valley Coal Co., at Henry Colliery, and William D. Thomas, mine foreman with the Kingston Coal Co., teach Arithmetic, Mine Law, Mine Gases, and Ventilation. Edward P. Davis, assistant mine foreman with the Lackawanna Coal Co., a graduate of the school, is teaching the day class for the second year. John L. Picton, mine foreman with the Plymouth Coal Co., also a graduate of the school, is in charge of the preparatory class.

There are classes in many other subjects beside mining taught in the night schools conducted in the same building by the Y. M. C. A. Sometimes mining students find it to their advantage to supplement the regular course in mining by taking subjects other than those in the regular mining course. Especial emphasis is placed upon the classes in English for men who do not speak that language. Two classes are offered in the Y. M. C. A. Building, for the accommodation of young men of foreign birth, who wish to learn to speak, read and write the English language.

Too much emphasis cannot be placed upon the importance of all English-speaking mining men coöperating in securing students for these classes in English. The lives of those who work with the foreigner are often endangered because of the failure of the foreigner to understand the instructions given him. As a matter of self-preservation, if for no other reason, every English-speaking man should try to get these men interested in studying the English language.

The officers and directors of the Wilkes-Barre District Mining Institute, who are responsible for the Mining School, are: Thomas H. Williams, president; H. G. Davis, first vice-president; Jas. J. McCarthy, second vice-president; F. M. Devendorf, secretary and treasurer; Thomas R. Evans, A. L. Williams, Charles Enzian, Benj. D. Amos, Gilbert Jones, W. G. Thomas, P. H. Devers, M. J. Flaherty, Thos. H. Price, Thomas Martin, Thos. J. Williams, Samuel R. Morgan, R. P. Thomas, S. William Edwards, J. S. Hammonds, E. J. Newbaker, Lewis J. Davies, Thomas Thomas, and John H. Haertter. F. M. Devendorf, the secretary-treasurer of the institute, is also general secretary of the Wilkes-Barre Young Men's Christian Association.

Coal and the War Tax Bill

By A. L. H. Street*

An examination of the War Tax Bill, which became a law Oct. 22, through the President's approval, discloses that it affects the coal trade as follows:

Under Section 3, which became effective Nov. 1, 1914, an anuual tax of $20 is imposed upon "commercial brokers." "Every person, firm or company whose business it is as a broker to negotiate sales or purchases of goods, wares, produce or merchandise, or to negotiate freights and other business for the owners of vessels, or for the shippers or consignors or consignees of freight carried by *vessels*, shall be regarded as a commercial broker under this Act." The same section imposes an annual tax of $20 on "commission merchants." "Every person, firm or company whose business it is to receive into his or its possession any goods, wares or merchandise to sell the same on commission shall be regarded as a commission merchant." But after paying a tax as a commercial broker, one is not taxable as a commission merchant.

Stamp taxes are levied as follows: "Bonds, debentures or certificates of indebtedness issued on and after the first of December, 1914, by an association, company or corporation, on each $100 of face value or fraction thereof, 5c., and on each original issue, whether on organization or reorganization, of certificates of stock by any such association, company or corporation, on each $100 of face value or fraction thereof, 5c., and on all sales, or agreements to sell, or memoranda of sales or deliveries or transfers of shares or certificates of stock in any association, company or corporation, whether made upon or shown by the books of the association, company or corporation, or by any assignment in blank, or by any delivery, or by any paper or agreement or memorandum or other evidence of transfer or sale, whether entitling the holder in any manner to the benefit of such stock, or to secure the future payment of money or for the future transfer of any stock, on each $100 of face value, or fraction thereof, 2 cents."

This provision does not apply, however, to stock pledged for loans nor to agreements evidencing such pledges. When stock transfers are shown only on corporate books, the stamp must be placed on the books; and where they are evidenced by certificates, it must be placed thereon. When a certificate is assigned in blank, the seller must give the buyer a bill or memorandum of sale, to which the stamp must be affixed, showing the date thereof, the name of the seller, the amount of the sale, and the matter or thing to which it refers. Failure to comply with these requirements subjects the offender to a fine not exceeding $1000, or imprisonment not more than six months, or both such fine and imprisonment.

Every sale or agreement to sell any "products or merchandise *at any exchange, or board of trade, or other similar place.*" must be evidenced by a bill of sale or agreement, to which must be attached stamps equal to 1c. for every $100, and fractional part thereof in excess of $100. The bill or agreement must show its date, the seller's name, the price, and the matter or thing to which it refers. Violations are punishable as above mentioned. But this provision does not apply "in case of products or merchandise actually delivered at the time of sale or while in vessel, boat or car, and actually in the course of transportation * * * provided such bill, memorandum, agreement or other evidence of such sale, or agreement of sale, or agreement to sell shall be accompanied by bills of lading or vouchers showing that the said products are actually in course of transportation."

Notes, and renewal notes are subject to a tax of 2c. for the first $100, and 2c. for each additional $100 or fraction thereof.

Carriers must issue bills of lading, receipts or manifests for each shipment, where the freight charge exceeds 5c., and attach thereto a 1c. stamp. Violation of this requirement is punishable by a fine of $50.

Telegraph and telephone companies must collect from the sender of each message where the charge is 15c. or more, 1c. additional which must be accounted for to the Government. This applies to telephone conversations, as well as telegrams, but only one charge can be made for a single message although it may pass over more than one line.

Conveyances of land, not including mortgages, "when the consideration or the value of the interest or property conveyed, exclusive of the value of any lien or encumbrance thereon, exceeds $100 and does not exceed $500, 50c.; and for each additional $500 or fractional part thereof in excess of $500, 50c." A deed to coal in place, but not a coal lease, would seem to fall within this provision. In any event, when the amount payable to an owner of land for the privilege of removing underlying coal is left to be determined by future development, it must be that no tax can be levied, since the law does not afford a basis for the computation thereof.

A 10c. tax is levied on each proxy to vote at any election of corporate officers. Powers of attorney in general are subject to a 25c. tax, as are all commercial protests.

Separate provisions are made by the Act for punishment of the offenses of issuing papers not properly stamped (fine not exceeding $100); forgery or counterfeiting of stamps, etc.; evading the requirements concerning notes ($200 fine); failing to cancel stamps affixed by writing or stamping initials and date (fine not exceeding $500, or imprisonment for not more than six months, or both).

Administration of the provisions of the law is placed under the control of the Treasury Department.

The last section of the law provides that the act shall cease to apply after Dec. 31, 1915, except for the purpose of enforcing payment of taxes theretofore accruing; and that stamps remaining unused shall be redeemed.

*Attorney at law, St. Paul, Minn.

Discussion By Readers

Mining Laws, Legislation and Mine Regulation

The discussion that is being brought out on this subject is most interesting and we urge that all our readers submit their views. Eventually we hope to print a résumé of the opinions expressed and then send such summary to lawmakers in all coal states. Legislation that affects an industry, affects every individual engaged in that industry; the problem, therefore, is of vital importance to each and all of us.—EDITOR.

Letter No. 8—It is a fact to be regretted that our state mining laws are, in many cases, the product of legislative bodies composed largely of men unacquainted with mines and mining conditions. It requires no argument to convince even the most skeptical that such men cannot be expected to enact laws that will prove effective or stand the practical test. One has but to glance at the mining laws of most states to be impressed with the fact that they could be made more plain, so that their meaning would be better understood by the men who must obey them. The need of constant revision of these laws is at once evident to any man familiar with mining requirements. We may ask the question, Do we go to work in the right way when drafting these mining laws, by allowing men unfamiliar with the conditions that exist in coal mines to have a leading voice in formulating such laws? I am glad to see that this subject is to be thoroughly discussed in COAL AGE, and I hope that all classes of mining men, particularly mine inspectors, will do their part to improve the present condition in this regard.

It is important to recognize the fact, at the start, that, in many important instances, no two mine inspectors will interpret the law alike, unless they get together and compare notes and get each other's viewpoints beforehand.

I want to draw attention to one point with which I have been impressed recently. Picking up the paper, under date of Nov. 20, I read that suit has been instituted against a certain mine foreman who is held responsible by the mine inspector of the district for the death of a miner who was killed by a fall of rock in his working place. It is claimed by the mine foreman that he directed the man an hour before the accident occurred to set props under the roof, as it appeared to be unsafe. Having done this, he proceeded to inspect other working places, and was so engaged when news reached him of the accident. It is claimed, on the other hand, that the foreman or assistant foreman should have remained in this place until the timber was set and he was sure that the place was safe for work.

We may ask, Does the law require a foreman or his assistant to stay in one place until he knows that his orders have been completely carried out? This is not an isolated case, but a common occurrence. One frequently reads in the daily papers that mine foreman so and so, or a superintendent, or company is held responsible for the death of one or more of their miners. It may be that a similar accident has previously been passed without any criminal action being taken by those whose duty it is to enforce the state laws. This may be attributed to the fact that it is difficult in most of these cases to reach an interpretation of the law that would be satisfactory to all concerned. For this reason, the inspector selects a single case, which he intends to bring before the court for the purpose of having the meaning of the law interpreted thereby.

Under these conditions, it is quite possible, in the event that the court's ruling should sustain the inspector, that such a judgment might impose an unjust burden on a particular case. This fact alone, however, emphasizes the need of such a revision of the mining laws as is required to make their meaning clear and unmistakable.

In closing, I would refer, briefly, to another point that has frequently arisen. This is in regard to the requirement of many mining laws that a borehole shall be kept in advance of the headings driven in virgin territory, for the purpose of testing the ground for the possible presence of gas or water, particularly where clay veins or faults are of frequent occurrence. In many cases, this law has worked an unjust burden on the operator by unnecessarily increasing the cost of production per ton of coal mined. In many mining localities, in the same state, the necessity does not exist for the driving of such advance boreholes. Other similar cases could be mentioned where the law imposes an unnecessary burden on coal operators.

MINING ENGINEER.

Uniontown, Penn.

Letter No. 9—The suggested discussion of present existing mining laws and the need of more intelligent mine legislation and more effective mine regulations, as made in COAL AGE, Oct. 31, p. 698, is timely and of the utmost importance to the industry and to miners and operators alike, since these are so mutually dependent that what affects one necessarily affects the other.

I am glad to say that Alabama has a fairly good set of mining laws. In some instances, however, there is room for improvement. For instance, the reading of the Alabama law, in respect to the examination of gaseous mines by the fireboss before workmen are allowed to enter the mine presents such a wide margin as to practically defeat the evident intention of the lawmakers, which is to secure the greatest safety both to life and property. The weak point of the law in this regard is its failure to specify any time limit in which the inspection of the mine must be made. The statutes simply require that such inspection of the working places be made "every morning," which may be any time after midnight.

Because the mining law does not specify a particular time limit, other than "every morning," many firebosses in this state are required by the company whom they serve to commence this inspection as early as 12 p.m. (mid-

night). In some cases, they are required to commence before midnight, in order that they may cover the large amount of territory assigned to them. It is surprising that large coal companies, having extensive operations that involve the expenditure of large sums of money, should take advantage of the law's weakness, in this respect, and be willing to run the great risk of a heavy loss of life and destruction of the property, which this manner of inspection entails.

All mining men having a practical knowledge of conditions underground know that no fireboss, however competent, can conscientiously guarantee the safety of working places he has examined from four to five hours previous to the workmen entering the mine. In this interval, there has been ample time for a heavy fall of roof to occur, which might derange the ventilation and cause a dangerous accumulation of gas that would prove a veritable death trap not only to the miner working in that place, but, possibly, to everyone in the mine. It is clearly evident that the law should be more specific and require that every part of all gaseous mines be inspected not more than three hours previous to the time set for the workmen to enter the mine.

Another important point requiring recognition in state mining laws is that relating to the removal of an accumulation of gas. The law should require that, before any attempt is made to disturb or remove such an accumulation of gas, all men working on the return of that current or air split should be withdrawn. The law should further state that no person, except those actually required to perform the work, should be permitted to enter that section of the mine until the gas has been removed and the places examined and pronounced safe for work. In the reremoval of gas, the law should require that only safety lamps be used and that the antiquated practice of "brushing" out the gas should be prohibited. It should be made compulsory to remove all gas by means of the ventilating current only.

The Alabama mining law empowers the governor to remove any mine inspector with or without cause (Sec. 14). This feature of the law, in my opinion, places the mine inspector at a disadvantage, and, naturally, makes him hesitate at times to enforce requirements that he would otherwise consider essential to the health and safety of the miners. I believe the appointment of mine inspectors should be wholly competitive and that his removal from office could only be effected "for cause."

There are a number of other important points that might be enumerated if space permitted; but I will briefly mention a few of these and leave their discussion to others. Some of these points are as follows: The prohibition of shooting off the solid; the exclusive use of permissible explosives; the adoption of the electric head-lamp at the working face, in gaseous mines; the firing of all shots after the workmen have left the mine and by competent shotfirers; compulsory use of safety chains or catches on all cages and trips used for hoisting or lowering men.

By removing the weak points in state mining laws and enforcing more strictly the necessary mine regulations, we can hope for a great reduction in mine accidents.

EDWIN HUSBAND, Member,
Alabama Mine Examining Board.

Ensley, Ala.

Letter No. 10, to be published next week, is from W. L. Morgan of the Illinois Miners and Mechanics Institute.

Proposed Method of Working to Reduce Expense of Upkeep

Letter No. 2—I was interested in reading the letter of Moses Johnson, COAL AGE, Oct. 31, p. 723, in regard to adopting such a method of working as will reduce to a minimum the expense of keeping the roads open in the mine and in the working places.

In regard to reducing the cost of production, the question of reducing the expense for maintenance is one of the principal things to be considered. It matters not how well a mine is laid out, if the general plan is not adapted to the conditions existing in the strata and if the work is not properly executed, troubles are sure to arise that will greatly increase the expense of maintenance and the cost of production.

Consider, for a moment, the manner of work in some of our uptodate mines, in respect to the care taken to put the main haulage roads and main air courses in good condition, from the start; and observe how this method reduces the cost of upkeep to almost nothing. Steel timbers are used; or, if conditions are unfavorable, concrete walls and brick arches are employed to support the sides and roof. Heavy rails of 70 or 80 lb. per yd. are frequently laid on steel ties, which afford a solid roadbed and reduce the cost of haulage to a minimum. In fact, everything is done to secure the best possible conditions in regard to haulage and ventilation in such mines.

Mr. Johnson may not have made his proposed plan sufficiently clear, but it is certain that "from 6 to 7 years to drive and finish a single pair of butt entries a distance of 1200 ft." is a rate far too slow for economical working. However, he must not rely too much on getting 1000 tons of coal out of four entries, as he states, especially as the seam is only 3.5 ft. in thickness.

The best plan that I have seen adopted in room-and-pillar work, particularly where the roof is bad and the bottom has a tendency to heave, is to drive the butt entries a sufficient distance to provide for, say 30 rooms. Turn no rooms until the entry is finished. Then, drive the rooms on 60-ft. centers and instruct the entrymen to take a cut out of the rib each 30 ft. or at the joint of every 30-ft. rail. When driving the rooms, use one of these cuts for a room-neck and the other for a manhole. If motor haulage is used, not less than 25-lb. rails should be adopted, and these should be laid on a sufficient number of ties to form a solid bed. It is always easier to put down the ties before laying the rails than to put them in afterward. Care should be taken to align the tracks and ballast the roadbed thoroughly, besides bonding the rails and using good fish-plates at each joint, when the road is first made.

Assuming that conditions will permit, a great saving will result in the use of machines for cutting the coal. If compressed air is used, a 2-in. pipe line should be installed, with a tee at each room-neck. This tee should accommodate a 1¼-in. pipe running into each room. When the heading is finished, six rooms should be turned. The rail joints at the mouth of each room will be convenient for laying the frog for the room switch. These six rooms should be driven to the limit. Then, if the conditions will permit, start at once and draw back the pillars as far as is safe. The rooms should be started from the inby end of the heading; and while the pillars in the first six rooms are being drawn back, another set of six rooms should be

turned and driven up to the limit, as before. The same method should be repeated the entire length of the entry. As quickly as the room pillars are drawn back in each set of rooms, the entry stumps should be drawn and the headings closed.

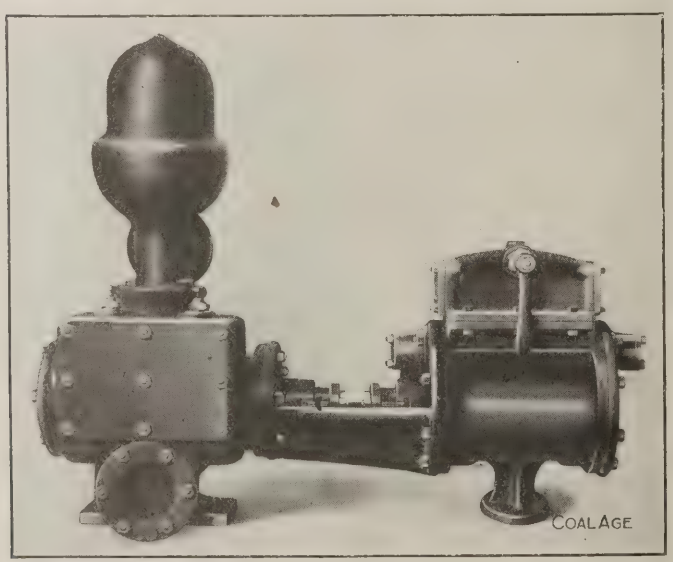
I do not like the idea of turning 24 rooms away together, although this may have to be done with a limited amount of entry available. Such a plan has the objection of a heavy expense for turning rooms at one time, besides the expense of laying switches and the necessary delay because the trackmen can only be in one place, at one time. Furthermore, the narrow work in driving room-necks affords a limited supply of coal, and there is some delay in changing the machines when cutting so many narrow room-necks at one time.

The method I have described is being worked successfully in mines with which I am acquainted; and, with proper care, the same number of men can be worked continuously in the same heading, until the last room is finished and the pillars drawn. I have known a heading to be started and finished in a year, a distance of 1800 ft.; but the work was double-shifted, running night and day. The men worked on day shift for a month and then changed with the night-shift men for the following month. The men on day shift took out all the coal, while the rock was moved and crosscuts driven by the night men. One heading furnished three trips of 50 cars each per day, or 150 cars holding, say 150 tons. This tonnage was the output of from 20 to 24 men, showing an average of about 6 tons of coal, per man, per day, which is about as much coal as can be expected under ordinary conditions of mining.

Two men of average ability can draw back a room pillar in about a month, and the chain and barrier pillars can be drawn about as fast.

In closing, I would say there would be another difficulty experienced in Mr. Johnson's plan when drawing back the pillars. The 24 rooms being started together would probably finish together, with the result that the pillar work would have to be started in each room at the same time. This would make the line of pillar work parallel to the entry when it should always run at an angle with the entry. I believe he would be unable to work more than seven or eight pillars at a time, and the remainder would have to stand for some time before they could be drawn.

I should like to hear the experience or views of other mining men on this very important phase of coal-mine operation.



THOMAS HOGARTH, Mine Foreman,
Penn-Mary Coal Co.
Heilwood, Penn.

Study Course in Coal Mining

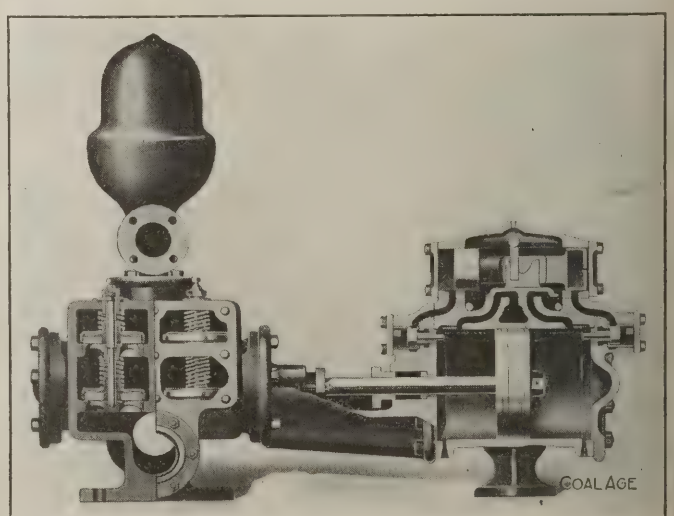
By J. T. BEARD

The Coal Age Pocket Book

One of the simplest forms of a single direct-acting pump of the piston type is illustrated in the accompanying figure. The cut is a side view, showing the steam cylinder on the right and the water cylinder on the left, the latter being

SIDE VIEW OF CAMERON PUMP. REGULAR PATTERN

partly hidden by the large valve chest, containing the valves which control the flow of water in obedience to each stroke of the piston.



The diameter of the steam cylinder of this particular pump is 12 in. and that of the water cylinder 7 in., the length of its stroke being 13 in., its size is, therefore, expressed thus, 12x7x13 in.

As shown in the figure, the valve chest, in this pump, is placed on the side of the water cylinder, which reduces the suction lift. The valve chest is surmounted by an air chamber that equalizes the action of the pump and maintains a more uniform pressure and flow of water in the discharge pipe, which is here shown behind the chamber, but can be set in any desired position on the pump.

The Coal Age Pocket Book

On this page is shown a complete sectional view of the pump described on the preceding page. The section of the steam cylinder surmounted by its valve chest, on the right of the figure, shows the steam ports, valves and auxiliary plunger common to all direct-acting steam pumps. The hand lever, which is more clearly shown in the side view of this pump, is used when the operator desires to reverse the action of the pump.

On the left of the figure is shown the valve chest of the water cylinder, with the bonnet removed so as to expose to view the valves. The chest, as shown, has two decks, each being bored with a taper to receive the brass valve seats.

SECTIONAL VIEW, CAMERON PUMP, REGULAR PATTERN

The valves are the usual poppet valves employed in pumps of this type, and are held to their seats by springs that are adjustable to give the required action. As here shown, the two valves on each end of the cylinder are mounted on a single valve stem, which can be withdrawn when it is desired to remove the valves.

Inquiries of General Interest

Norwegian Market for Coal

What opportunities are there for the sale of American coal in Norway? Can you also tell me what countries at the present time supply fuel to satisfy the demands of the Norwegian markets?

AMERICAN EXPORTER.

New York City.

Up to the present time very little American coal has been shipped to Norway. The proximity of the Norwegian markets to the British coal fields has practically given Great Britain a monopoly on this trade. However, the recurring strikes of miners in England have at times seriously threatened the coal supply of Norway to the extent that railways and shipping and industrial concerns have been compelled to retrench, and the present war emphasizes the necessity of making arrangements for a future supply from sources outside Europe.

The market for coal in Norway is quite important when it is taken into consideration that its merchant marine stands fourth among the world's nations and that Norway does not produce a single ton of coal. The importations of coal and coke in 1912 were as follows:

Countries	Coal, Metric Tons	Coke, Metric Tons
Belgium	838	12,216
Denmark	10	.....
France	.....	4,355
Germany	70,189	23,098
Great Britain	2,157,968	135,857
Netherlands	14,176	34,681
Spitzbergen	19,860	.....

According to a recent *Consular Report,* Newcastle coal is now quoted $3.71 to $3.77 per metric ton f.o.b. steamers east coast; Welsh coal is quoted at $5.35 per ton.

While the matter of tonnage for the coal trade between Norway and the United States has been the main obstacle, this difficulty is now in a fair way to be overcome, as the Norwegian-American Line has added three large freight steamers to its fleet of chartered vessels to be employed in the freight service between Norway and New York. In addition to these the Norway-Mexico line runs regular freight steamers between Norwegian ports and Atlantic and Gulf ports in the United States.

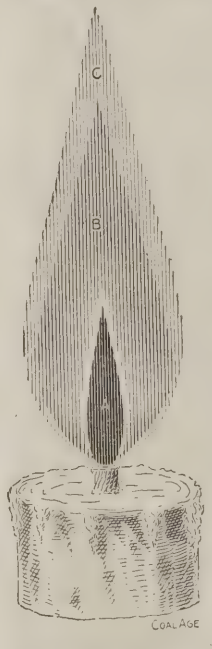
The docking facilities at Bergen are ample, the discharging capacity at the smallest docks being 100 tons daily per gang by the steamer's winches, and for the larger ones like the gas works (steam group) and the Bergenske Dampskibsselskab (electric elevator), the discharging capacity is 30 and 50 tons, respectively, per hour.

The Norwegian Government recently purchased 5600 tons of coal at Baltimore, which proved a rather expensive transaction; the high freight rate and war insurance made the cargo cost nearly double the price of English coal. Coal and coke are duty free.

The Formation of a Flame Cap

An interesting question has arisen in connection with the work of testing for gas in coal mines. It is as follows:

Why is a cap or aureole formed on the flame of a safety lamp when the air in which the lamp is burning contains less firedamp than is sufficient to render it explosive?



As this question has been variously discussed, and there appears to be much doubt in the minds of some firebosses who, above all others, should have a clear conception of the effect of small percentages of gas on the flame of the lamp, it would be of interest to COAL AGE readers to have this thoroughly explained.

"ANXIOUS."

Fernie, B. C., Can.

It is well known that the oxygen of the air supports the combustion of the flame. The combustion going on in the flame is due to the burning of the carbon set free when the hydrocarbons of the oil, which are being constantly vaporized, are dissociated or broken up by the heat of the flame. It is the incandescent carbon particles that furnish the light or make the flame luminous. The hydrogen, also set free by the dissociation of the hydrocarbons, is likewise burned; but, unlike the combustion of the carbon particles, forms a nonluminous envelope that surrounds the flame of the lamp.

In the combustion of a candle flame burning in pure air, there are thus formed three zones, *A, B* and *C,* as shown in the accompanying figure. The inner zone *A* is a dark zone filled with hydrocarbon vapors. There is no combustion going on in this zone. The zone *B* is the luminous zone filled with the incandescent carbon particles undergoing combustion. Surrounding this zone is the zone *C,* which is a nonluminous envelope formed by the burning of the hydrogen set free from the hydrocarbons of the vaporized oil, in the flame.

SHOWING THE ZONES IN A CANDLE FLAME

It should be perfectly clear that the presence of a combustible gas, such as methane (CH_4), or the carbon monoxide (CO) distilled from coal dust floating in the air surrounding the flame, will at once increase the combustion in the outer nonluminous envelope *C,* by the burning of these gases when present. The outer zone *C,* which is almost imperceptible in a flame burning in pure air, is thus enlarged and becomes distinctly visible when such combustible gases are present.

It is this enlargement of the nonluminous envelope that produces the cap, which increases rapidly with the percentage of gas present in the air. Naturally, the effect is greater at the tip of the flame which reaches upward, aided largely by the upward draft due to its own heat. It is this effect that causes the observed lengthening of the flame in an atmosphere charged with gas.

Examination Questions

Hoisting Engineers' Examination, Held at Albia, Sept. 23 and 24, 1914

(Selected Questions, Continued from Last Week)

Ques.—(a) What should be the tensile strength of a good boiler plate? (b) What should be the tensile strength of rivets used in boiler construction?

Ans.—(a) The tensile strength of a good boiler-plate steel should not be less than 60,000 lb. per sq.in.

(b) The tensile strength of good rivet iron should not be less than 50,000 lb. per sq.in., in boiler construction.

Ques.—How strong are riveted joints, in boilers, as compared to the strength of boiler plates?

Ans.—A committee appointed by the Institute of Mechanical Engineers to investigate the strength of riveted joints, in boiler construction, found that single-riveted lap joints gave an efficiency varying from 54.8 to 60.8 per cent., and double-riveted lap joints, of 3/8-in. boiler plate, an efficiency ranging from 67.1 to 81.2 per cent. For double-riveted butt joints, in double shear, the efficiency of the joint ranged from 61.4 to 71.3, although it is stated that these low efficiencies for butt joints were probably due to the use of soft steel in the rivets.

From the results of these experiments, an average efficiency of 55 per cent. for single-riveted lap joints and 70 per cent. for double-riveted lap joints may be assumed, in estimating the strength of boilers. The efficiency of a riveted joint expresses the ratio of the strength of the joint to the strength of the boiler plate.

Ques.—A boiler is 60 in., in diameter; the plates are 3/8 in., in thickness, and have a tensile strength of 60,000 lb. per sq.in.; the efficiency of the longitudinal seam is 70 per cent.; what is the bursting pressure of the boiler?

Ans.—The bursting pressure of a boiler is found by multiplying twice the thickness of the boiler plate, in inches, by the tensile strength of the steel, in pounds per square inch, and that product by the efficiency of the longitudinal seam or joint, and dividing the final result by the diameter of the boiler shell in inches. Thus, in this case,

$$p = \frac{2\,t f E}{d} = \frac{2 \times \frac{3}{8} \times 60{,}000 \times 0.70}{60} = 525\ lb.\ per\ sq.in.$$

Ques.—In a slide-valve engine, how much is the eccentric placed in advance of the crank?

Ans.—The angle of advance must be equal to the sum of the angles required by the lap of the valve and the desired lead, which must be determined to correspond to these requirements in each case separately.

Ques.—(a) How can we find the length of stroke of any engine without disturbing the cylinders? (b) How is the area of a piston found?

Ans.—(a) The length of stroke of an engine is equal to twice the distance from the center of the shaft to the center of the crankpin, which is found by exact measurement.

(b) The area of a piston is calculated from its diameter, by multiplying the square of the diameter, in inches, by 0.7854. Thus, the area of a piston 10 in. in diameter is $10^2 \times 0.7854 = 78.54$ sq.in.

Ques.—What will be the volume of a pound of steam, at 100 lb. gage pressure?

Ans.—This question can only be answered by reference to steam tables. If, however, the temperature of dry saturated steam, at this pressure, be given, the volume of 1 lb. of the steam can be found approximately by the formula

$$V = \frac{0.37\ T}{0.6235\ p}$$

For example, at sea level, a gage pressure of 100 lb. per sq.in. corresponds to an absolute pressure of 100 + 14.7 = 114.7 lb. per sq.in. Then, taking the temperature of dry saturated steam, at 100 lb. gage as 338 deg. F., and substituting these values in the formula given, the volume of 1 lb. of this steam will be

$$V = \frac{0.37\ (460 + 338)}{0.6235 \times 114.7} = 4.128\ cu.ft.$$

The actual volume of 1 lb. of steam, in this case, as taken from steam tables, is 3.89 cu.ft. The formula given is only approximate, as it assumes that the specific gravity of steam is that of water vapor (0.6235) referred to air of the same temperature and pressure. Owing, however, to the density of steam increasing more rapidly than that of air as the temperature rises, the result obtained above is too high. The question is not a fair one in an examination, unless the use of textbooks is allowed.

Ques.—(a) How much coal is used per horsepower per hour, in ordinary plants? (b) How much coal may be burned per square foot of grate surface?

Ans.—(a) The consumption of coal under the boiler will depend both on the quality of coal burned and the style of boiler used. When burning a fair quality of coal under an ordinary flue or return tubular boiler, with natural draft, an average fuel consumption may be assumed as 4.5 lb. of coal per b.hp. per hr.

(b) The weight of coal burned, per hour, with natural draft, is commonly taken as 10 lb. for anthracite and 15 lb. for bituminous coal per sq.ft. of grate surface. These are only fair average values, as much depends on the quality of the coal burned, amount of draft and kind of grate and furnace used.

Ques.—In case one of the fire plates of a boiler is "bagged" or bulged, over the fire, how would you repair it?

Ans.—The boiler should be thrown out of commission and drained, to enable a thorough examination of the plate, which may be cracked in addition to being bulged. The bulged portion should then be cut out and a patch put on the inside of the boiler sufficient to cover this spot. It is important to put this patch on the inside rather than on the outside of the plate, as it will then better withstand the pressure within the boiler.

Coal and Coke News

Washington, D. C.

It seems now practically certain, as the result of semi-official intimations, that the 5 per cent. railroad rate decision will be handed down within the next two weeks, or very shortly thereafter. The Interstate Commerce Commission undoubtedly recognizes the need of haste and is understood to be working hard on the decision.

It is an interesting fact that the Commission, though, of course, maintaining the utmost official secrecy as usual, is now pretty generally regarded as inclining more to the side of an advance than it did a short time ago, when the argument in the case had just been closed. This supposed alteration of front is due undoubtedly to the fact that there is strong pressure for some further concessions to the roads, and that they are regarded with more sympathy by the public at large, so far as indications here available may be taken to prove anything. There has, however, been nothing thus far to indicate any change of attitude as to coal, which is admitted to be paying high enough rates today.

Secretary of the Interior Lane in his report for the year, made public on Dec. 10, reviews the work of the Bureau of Mines during the past 12 months, and says that the Bureau has:

1. Invented and applied methods for extracting radium from the carnotite ores of Colorado and Utah with greater efficiency than is attained by any foreign producer of radium, and at an indicated cost of less than one-third the present selling price.
2. Developed the fact that the annual value of the by-products wasted in present methods of making coke in this country amounts to $75,000,000, and conducted investigations looking to the use of better methods of making coke and the upbuilding of byproduct industries.
3. Saved $200,000 or more to the Government in purchase of coal through the use of the specification method of buying coal on the basis of its content of moisture and ash and its heating value, and the selection of fuels best adapted to certain power plants.
4. Through an expenditure of not more than $15,000 in investigation and demonstrations, has been instrumental in saving natural gas valued at $15,000,000 during the last 18 months.
5. Conducted investigations and experiments with petroleum with a view to increasing efficiency in the petroleum industry, in which preventable wastes and losses in the development of oil fields and in transporting and storing oil are fully $50,000,000 yearly.
6. Carried on tests for perfecting "permissible" lamps, electric motors and switches, and other safety devices, which, if generally used in mines, cannot fail to greatly reduce the number of fatal and other accidents.
7. Designed and demonstrated devices for arresting dust explosions in coal mines.
8. Was first in bringing about the use of "permissible," or relatively safe, explosives, of which more than 25,000,000 lb. were used last year in many gaseous and dusty coal mines, with a corresponding reduction of the danger of explosions.
9. Rescued men after disasters; trained over 8500 miners in rescue or first-aid methods; was instrumental in greatly increasing the number of rescue and first-aid corps equipped and maintained by mining companies. Nearly 25,000 miners have received this training, and more than 12,000 sets of rescue apparatus have been purchased by private companies. (More than 3000 men were killed and more than 100,000 men were injured in the mining and metallurgical industries of this country during 1913. The money loss from these accidents is estimated at not less than $12,000,000, and hundreds of millions of dollars were lost or wasted from not employing efficient methods of mining and treating ores and minerals.)

The Geological Survey, says Secretary Lane in his report, has:

1. Completed detailed geological surveys covering 12,000 square miles, including 180 square miles in Alaska, and reconnoissance geological surveys of 57,000 square miles in the United States and 6500 square miles in Alaska, the total territory surveyed geologically during the year being as great as the combined area of Denmark, Switzerland and Greece.
2. Made topographic surveys covering 23,000 square miles in the United States, 6000 square miles in Alaska, and 342 square miles in Hawaii, or an area more than the Netherlands and Belgium combined.
3. Continued stream gaging at 1400 stations in 39 states, Alaska, and Hawaii.
4. Classified 47,000,000 acres of public lands, an area larger than the New England states, including the following items:
   a. Designated as nonirrigable and open to entry under the enlarged homestead act, 33,000,000 acres in 12 states, or enough land to make 100,000 homesteads of 320 acres each.
   b. Examined and classified 2,400,000 acres of Indian lands and 1,700,000 acres of withdrawn phosphate lands.
   c. Restored to entry nearly 9,000,000 acres of land of all kinds previously withdrawn for classification, including 8,275,000 acres of coal-land withdrawals, of which 1,300,000 acres were appraised and made available for purchase as coal lands, 188,000 acres determined not to contain oil, 260,000 acres classified as nonphosphate, and 90,000 acres decided not to be essential to water-power development.
   d. Caused the withdrawal of a total of 752,500 acres, including 209,000 acres of oil lands, 170,000 acres of phosphate lands, 92,000 acres as possibly containing potash, 183,000 acres reserved for water-power sites, and 75,000 acres of public water reserves.
5. Made its annual census of mineral production through correspondence with about 90,000 mineral producers.

HARRISBURG, PENN.

Judge Van Swearingen in an opinion handed down on Dec. 1, upholds the constitutionality of the bituminous mining law, which requires operators to maintain boreholes in the face of mine workings where gas is generated. Although this feature has been law since 1911, it has not been observed by many of the operators. They have contended that the maintenance of such boreholes ahead of the opened work was not necessary for the safety of the miners. An account of the stand of the operators in this regard can be found in "Coal Age," Vol. 4, p. 900, Dec. 13, 1913, and in the Proceedings of the Coal Mining Institute of America for 1913. It will be seen in these references that the operators claim that a change of punctuation was the cause of the change in the law and that no rewording of the statute was intended by the legislature. Certainly the new feature was not discussed before enactment. The operators contended that the law added materially to the mining cost and did not make mining safer.

Suit of State vs. I. T. Mullen and E. H. Halbert

Mine Inspector Walsh, of the 9th bituminous district, began a test case by arresting I. T. Mullen, superintendent, and E. H. Halbert, mine foreman, of the Royal mine of the W. J. Rainey Coal Co., for failing to maintain boreholes ahead of the working face. The case was argued before the court without a jury.

The court supported the Department of Mines and the inspector directed the defendants to enter pleas. The operators immediately took steps for an appeal from the decision to a higher court.

The provision of the law out of which the case grows, is Rule 18, of Article XXV, of the Bituminous Mining Act of June 9, 1911, which reads: "In the cutting of clay veins, spars or faults, entries or other narrow workings going into the solid coal, in mines wherein explosive gas is generated in dangerous quantities, a borehole shall be kept not less than 3 ft. in advance of the face of the workings or 3 ft. in advance of any shothole drilled for a blast to be fired in." The decision of Mine Inspector Walsh under this rule was that a borehole must be kept 3 ft. in advance of the face, even though clay veins, spars or faults are not being cut and are not known to be in the vicinity. It was also contended by the state that a dangerous quantity of gas is any quantity that can be detected by an approved safety lamp.

Operators Declare Borehole Rule Unnecessary

The principal contention of the operators was that even if the rule means what the Department of Mines contends, so much of it as requires a borehole kept in advance is an invalid attempt on the part of the legislature to exercise the police power of the state, and that such requirement of the rule is void. They argued that this contention is based on the proportion that there must be a real and substantial relationship between the end sought to be accomplished by the legislature and the method provided for that purpose, and that as applied in the concrete to the facts of the case the keeping of a borehole in advance does not furnish any added element of safety to the men engaged in mining the coal, in entries or other narrow workings going into the solid coal, except in cases where there are clay veins.

The court referred to the recent decision of the U. S. Supreme Court, on the famous barrier-pillar case brought by the state against the Plymouth Coal Co., in which it was held that under the act the mine inspector and the engineers of the adjoining property had authority to determine in what cases boundary pillars may be omitted. The court declared that there is no contention that by rule 18, now under consideration, authority is given anybody to declare in any case that boreholes need not be maintained.

The court held that while there may be an honest difference of opinion as to the benefits derivable in all cases from a

compliance with the provisions of rule 18, as an added element of safety in the operation of mines, the action of the legislature in adopting the rule was in the legitimate exercise of its police powers of the state, being a matter germane and properly related to the purposes of the act, and that the rule is valid.

Providing for a Real Election of Mine Inspectors

It has been alleged that some of the mine inspectors' examining boards in the anthracite region have restricted the award of certificates of eligibility, so as to nullify the law granting the electorate the right to choose mine inspectors by ballot. These boards would only certify as many men as there were vacancies to be filled.

It is said in some districts, that though a number of intelligent and competent candidates appeared before the board, only a sufficient number were passed to fill vacancies, leaving no choice to the electorate between candidates. Although the law prescribing the election of inspectors has been in existence 15 years, in all that time it is said there has not been a real contest for the office of mine inspector.

An amendment is advocated to the present law requiring the board to qualify the three best candidates appearing for examination, if there is one vacancy to be filled, and providing that not less than five candidates shall be qualified if two vacancies exist.

It is believed that this will meet the difficulty and insure a genuine contest. In addition, a provision is suggested requiring the board to make public the standing of the candidates in their examination.

This last provision is no doubt inspired by the recent decision of the Schuylkill County Court that it could not examine charges of fraud and violation of the law on the part of the examining boards, because the board members are given by law discretion to grant or refuse certificates at will, and the court could not undertake to substitute its own discretion for that of the board.

PENNSYLVANIA

Anthracite

Bethlehem—Navigation on the Lehigh Canal, between Mauch Chunk and Philadelphia, came to an end on Dec. 1, with the passing through the local locks of the last boat load of coal consigned to Philadelphia. The canal will be drained for repairs.

Plains—The First National Bank of Scranton filed an assumpsit suit against the Miners Mills Coal Co., on Dec. 3, asking over $21,000 on two promissory notes made in favor of Rissinger Bros. and made payable by the latter to the plaintiff.

The E. I. Dupont de Nemours Powder Co. filed an assumpsit suit against M. J. Healey to recover $2140 for powder purchased from the plaintiff for mining operations.

Wilkes-Barre—Objections have been made by the Lehigh Valley Coal Co., Delaware, Lackawanna & Western R.R. Co., and the Delaware & Hudson Co., to the assessment on their holdings here. The companies appealed from the assessment of $250 per foot-acre, the rate adopted by city officials and county assessors.

The Lehigh Valley Co. claims the valuation of its property in the city has been increased $400,000 by city assessors. All the companies declare that the city assessors erred in accepting the county rates and applying them in Wilkes-Barre.

Hazleton—Opportunity to study mining problems will be given the boys and men of the Hazleton region. This was decided upon at a meeting of the executive committee of the Hazleton Mining Institute held at the Y. M. C. A. building on Nov. 30. The plan of establishing a complete mining course for the aid of the boys and the men of the mines had been considered and discussed from time to time, but this is the first time that the matter has reached the stage where something definite can be expected.

The only condition surrounding the establishment of the course is that a sufficient number of applicants be registered with the committee. If the interest displayed in this plan is sufficient to justify the institute in the expenditure for the course, the work will be started at once.

Sunbury—The Mineral R.R. & Mining Co. and the Shamokin Valley & Pottsville R.R. Co., under Pennsylvania R.R. control, filed deeds for the transfer of 2142 acres of coal land in the Shamokin basins to the Susquehanna Coal Co. for $1. The railroad company also filed releases for hundreds of acres under lease to the Susquehanna Coal Co. The property is said to be worth more than $1,000,000.

Hazleton—Recognition of the value of water in the hard-coal fields, which are denuded of timber, is shown by the action of the Lehigh Valley Coal Co. in awarding the contract to build the third series of dams to hold the flow of Dreck's Creek, six miles from here. With this completed, Hazleton can be supplied with water even though it should not rain for a year.

Scranton—Thirteen men were killed in the Diamond shaft of the Delaware, Lackawanna & Western R.R. Co., on Dec. 9, when a cage in which the men were being lowered collapsed, dropping the victims to the bottom. It was an hour before the first man's body was recovered. Among the victims was Thomas Thomas, of West Scranton, a veteran miner.

BITUMINOUS

Hanover—Another contest is promised over the working of the Hanover Township roads for the coming year, as Frank Knuss, representing the coal companies, has filed a petition with the court, asking to be given the contract. He sets forth in his petition that he wants the work under the act of assembly, enabling taxpayers to contract for making and repairing highways at their own expense, paying salaries of road officers, and thus preventing the levying and collection of a road tax. There are 33 miles of highway in the township.

Clearfield—Unusual business conditions compelled the Morrisdale Coal Co. to acquiesce in an application for a receiver on Dec. 1, in order to conserve its assets. The application was made to the court and resulted in the selection of Frank H. Wiggon to manage the affairs of the concern.

The Morrisdale Coal Co. holds leases and mining rights in Clearfield County, but inability to market its coal, officials of the company said, made it impossible for the concern to meet its payroll. As a suspension of operations at this time would cause the pumps to be stopped and the mines to be flooded, stockholders joined in the application for a receiver.

Pittsburgh—Ten million bushels of coal, the largest shipment in the history of Ohio River traffic, will have been moved southward to Ohio and Mississippi River points, with the week ending Dec. 14, if the forecast of the local weather bureau materializes.

The refusal of Judge Dayton, in the federal court, to sanction the application of second mortgage holders for a sale of the Four States Coal Co., brought a statement from John H. Jones, president of the company, in which he declares that the company, relieved of uncertainty, will now rapidly rehabilitate itself, and that its reorganization will be completed within the next six months.

Waynesburg—J. V. Thompson, of Uniontown, has closed a deal with a New York syndicate, involving the transfer of 41,000 acres of virgin coal land, valued at between $25,000,000 and $30,000,000. The land is underlaid with Pittsburgh coal.

WEST VIRGINIA

Charleston—Col. M. T. Roach, president of the New River & Ohio Coal Co., has expressed the opinion that the coal trade in West Virginia has a heavy business ahead of it, as conditions are excellent all through the West Virginia fields at present, and the continuance of the Ohio strike is throwing a large amount of business to this state. Mines in the New River and Kanawha districts are operating on a normal basis, according to Col. Roach, and with prices for mine-run maintained at $1 a ton on contract and a large volume of business in sight, the prospect could not be much more favorable.

A verdict in favor of the Buffalo Creek Coal & Coke Co. has been returned in the United States District Court, in its ouster suit against H. C. Jones, et al., involving the possession of more than 1000 acres of land in Logan County. The plaintiff was given the title to 1000 acres, and J. D. Brown, one of the defendants, was awarded 15 acres.

ALABAMA

Birmingham—Coal operators are confident that the Interstate Commerce Commission will suspend the increase of 15c. per ton on coal shipped from here to New Orleans and other points in the Mississippi Valley. The committee of coal operators from Alabama who went to Washington to enter a protest for a suspension of the rate advance are confident that the rate will be suspended, pending a complete investigation of the petition of the railroads. The Memphis shippers are fighting with Birmingham against the increased rate from Birmingham to Memphis.

Birmingham—Coal companies with property along the Warrior River are preparing for the completion of lock 17. Seventeen coal mines will be ready to dump coal from the mine tipple onto the barges when the lock is completed.

KENTUCKY

Frankfort—The Workmen's Compensation Board of Kentucky is mailing to employers, subject to the recently enacted law, copies of the notice which must be posted prominently in their offices and workrooms. There are three forms, one for each class of employer—those who insure with the state, those who carry their insurance with liability companies and those who carry their own risks. In any event, it is provided that both the injured employee and his physician must notify the employer and the State Board of injuries. The notices are required to be posted by Jan. 1.

Lexington—Seventeen coal mines were in operation at McRoberts and Jenkins when the war in Europe broke out, according to Judge Allen W. Young, general counsel for the Consolidation Coal Co., who was here for a few days recently. "Now," he continued, "only two are running on full time, four on half time and the remainder have shut down altogether. The eastern Kentucky coal mines had a big export trade before the war, but fear of confiscation of ships and cargoes caused the export trade to fall almost to nothing. The timber industry of the mountains was affected in about the same way and when these two industries, which are the biggest in eastern Kentucky, are paralyzed, business of all kinds suffers." Judge Young expressed the opinion that business was due to improve rapidly.

OHIO

Toledo—Toledo coal men are watching with considerable interest the outcome of the southern Michigan coal dealers' fight against alleged excessive high freight rates charged by various railroads. Evidence was taken this week before the Interstate Commerce Commission at Kalamazoo, Mich. The railroads claim justification for the heavy charges from the coal fields on soft coal shipments.

Considerable disappointment was felt by eastern Ohio operators and their representatives in this city over the failure of the recent Cleveland meeting to adjust the difficulties. The conference lasted for three days, but was finally broken up without the contestants getting any nearer to a settlement than they have been before. The situation is looked upon as serious both by the operators and the miners. The operators here were anxious for a settlement and reopening of the mines. It is declared on what appears to be good local authority that the eastern Ohio mines will not open until after the Supreme Court has passed finally upon the anti-screen law. The miners however, declare that it is the intention of the operators to reopen the mines with strike-breakers. The tension in the mining districts is high-strung and the situation is serious. The suffering among the miners and their families is great. Some time ago the children of the miners were offered here for temporary adoption by any who cared to undertake the care and expense, and a "tag day" subscription has been taken for the benefit of the sufferers.

Columbus—After a conference lasting for several hours the Ohio Industrial Commission succeeded in harmonizing the views of oil and gas men on the one side and coal men on the other with reference to drilling for oil and gas on coal lands. The results were obtained through the special commission named by J. M. Roan, head of the mining department. The former order of the commission compelled the charting of all oil wells in coal territory, and the consent of the commission was required before drilling could be started. One of the new rules is that no well shall be drilled where it will penetrate an inaccessible part of the coal mine, that the agents of the industrial commission be allowed to make locations and that wells be protected by concrete or brick walls.

Zanesville—John Winefordner, of Duncan Falls, has been appointed receiver for the Henry Coal & Coke Co., of Zanesville, after a suit of dissolution was filed in the local courts by George S. Sarver, M. F. Sarver, W. L. Bush, R. H. Koontz and W. W. Barty. The company was organized with an authorized capital of $200,000, to develop coal lands in Guernsey County. It is claimed that there are not sufficient funds to continue mining operations.

INDIANA

Boonville, Ind.—Agitation has begun to endeavor to stop the mining of coal by stripping, and an effort will be made to have a law passed at the session of the Indiana legislature that meets in January. The representatives-elect from this county have promised to introduce the bill. Stripping is said to be against public policy and community welfare. Hundreds of acres of fine farming land are made unfit for future cultivation and destroyed as a substantial source of taxation. In this county stripping has thrown 700 miners out of employment as 10 men can do the work formerly done by 100. It is believed that legislation suggested by business men and miners will be recommended by Governor Ralston in his message.

ILLINOIS

Peoria—John S. Jones, president of the Jones & Adams Coal Co., has recently made a deal by which he becomes one of the largest coal operators in the country. Mr. Jones has purchased the capital stock of the Sunday Creek Coal Co., which concern operates about 60 mines in Ohio and West Virginia, besides owning docks at Milwaukee, Duluth and West Superior.

Springfield—Alleging that the Pittsburgh Coal Co. is seeking to freeze out other bondholders in the $2,000,000 Illinois Colliery Co. failure, Samuel H. Pulman, of New York, has filed a bill in the Circuit Court, demanding that the sheriff be compelled to accept his tender for redemption of the properties instead of a proffer by the Pittsburgh concern.

Kankakee—Clay Marcotte, a farmer three miles northeast of here, believes he has struck a rich vein of soft coal on his farm. An expert mining engineer from Wilmington will make tests as to the richness and extent of the field. If the vein proves rich and large, it will be extremely valuable because it would be the closest coal to Chicago.

Belleville—Two cars of the Illinois Mine Rescue Station, of Springfield, are now stationed here and will remain for a period of three weeks, giving instructions in mine-rescue work and first aid to the injured. All miners desiring to pass mine-examiner and mine-manager examinations for certificates will have to pass the first aid and rescue examinations also.

ARKANSAS

Fort Smith—A syndicate, headed by B. J. Jordan, of Columbus, Ohio, has been formed to purchase the mines and property of the Sanbois Coal Co., at McCurtain, Okla., and to operate the property as open mines. Several St. Louis capitalists, with others from Ohio, are interested in this proposition. The Sanbois property has been purchased for $350,000, it is understood, from the receivers, who took possession of the property after the explosion in March, 1912, when 75 miners were killed.

FOREIGN NEWS

Toronto, Can.—The approximate output of the Dominion Coal Co.'s mines in Cape Breton, N. S., for the present year, will amount to about 4,300,000 tons, as compared with 4,740,000 tons in 1913. The Springfield Collieries, which are a subsidiary of the Dominion Coal Co., will produce approximately 430,000 tons, as compared with 381,000 tons in 1913. The net decrease in the combined outputs will, therefore, be about 390,000 tons. Shipments to the St. Lawrence market show an increase. The total shipments this year were 1,921,491 tons, as compared with 1,698,131 tons in 1913. Work at the mines until the first of the year will be slack, but there is every indication that operations will be carried on steadily in 1915.

PERSONALS

John Zeller, manager of the Brazil Clay Co., has resigned to go to Indianapolis to become head of the general sales department of the American Coal & Mining Co., in which Brazil capital is interested.

A. D. MacFarlane, of LaFollette, Tenn., chief engineer and assistant manager for Neil Robinson, receiver of the LaFollette Coal, Iron & Railway Co., spent several days at Charleston, W. Va., this week.

George J. L. Wulff, who for several years has been chief clerk of the Western Coal & Mining Co., has been appointed division sales agent for the company to fill the vacancy made by H. Raymond's retirement. Mr. Raymond has been forced to retire on account of ill health.

Thomas Hammond, for the past 4½ years chief mine foreman for the Pine Run Coal & Coke Co., Vandergrift, Penn., was presented with a gold watch by the men employed at the mine when he left, Dec. 1, to accept a position with the West Penn Coal Mining Co. near Apollo, Penn.

I. M. Fleming, president of the Fleming Coal Co., returned to Kansas City after spending several days in southern Kansas visiting the mines. He reports that some of the mines are working nearly full time; most of them, however, are working less than four days a week.

F. L. Bunton, who for the past two and one-half years has been manager of the Chicago office of the Heine Boiler Co., has severed his connections with that company to become manager of the Chicago Office of the Goulds Manufacturing Co., 3801-3811 S. Ashland Ave., Chicago, Ill. Previous to his connection with the Heine Boiler Co., Mr. Bunton was for eight years manager of the Philadelphia and St. Louis offices of the Allis-Chalmers Co.

CONSTRUCTION NEWS

Lorain, Ohio—The Lorain Crystal Ice Co. has started the erection of a large storage plant for coal to hold 1200 tons. It will be completed by Jan. 1.

Lykens, Penn.—The new shaft of the Susquehanna Coal Co. is in the last stage of completion; it will add materially to the capacity of the colliery.

Kansas City, Mo.—The Eureka Coal Mining Co. having mines at Panama, Mo., and offices at Richmond, Mo., has opened an office in Kansas City. The latter is in the Dwight Building with W. Barlum as manager.

Centralia, Penn.—Work has been started on two new messhouses of hollow terra cotta at the Franklin and Parker No. 5 collieries of the Lehigh Valley Coal Co. It is understood that more of these messhouses will be put up at other collieries when the design has been tested by actual use and approved.

The new houses are 40x25x12 ft. in height. There is not a stick of wood in their construction, and they are absolutely fireproof. The houses will contain a room with tables and benches, showers and wash-basins with hot and cold water, and a locker-room for the men's working clothes.

Logan, W. Va.—The Logan Light & Power Co., recently incorporated with an authorized capital stock of $1,500,000, is planning to erect a large plant at Logan, to be operated by waterpower, for the purpose of generating current for the use of the large number of mining operations in the Guyandotte valley. It is understood that in magnitude and extent the project will rival that of the Appalachian Power Co., which supplies the operations in the Pocahontas fields. Philadelphia interests are involved, and abundant capital is said to be insured to make the project a success.

NEW INCORPORATIONS

Columbus, Ohio—The Douglass Coal Co. has been incorporated with a capital of $40,000, to mine and sell coal. The incorporators are F. J. Shaffer, D. W. Jones, R. H. Furney, M. Curto and E. E. Learned.

Akron, Ohio—The F. F. Coal Co. has been incorporated, with a capital stock of $30,000, to handle coal and coke. The incorporators are G. E. Kneedler, J. M. Shaffer, F. M. Patrick, C. G. Wise and H. E. Andress.

Philippi, W. Va.—The A. T. Thompson Co., organized with a capital stock of $100,000, by Gordon B. Ramsey, A. S. Hawkins, Austin G. Merrill, W. T. Ice, Jr., and A. S. Dayton, of Philippi, will deal in coal lands.

Castleton, Ind.—The Castleton Lumber, Coal & Supply Co. has been incorporated here, with $2000 capital, to deal in lumber and fuel. The incorporators are C. B. Williamson, C. A. Rassmann and Chas. L. Anderson.

Boonville, Ind.—The Newburg Coal Co. has been organized at Newburg and incorporated with $5000 capital stock, to mine coal in Warrick County. The directors are J. E. Abshire, Wm. A. Epperson and William O'Brien.

New Philadelphia, Ohio—The New Philadelphia Coal & Mining Co. has been incorporated, with a capital of $5000, to mine and sell coal, by Emery Ankeney, Henry Diefenbach, J. F. Gerber, Edward Lahmers, Frederick Balmer and Chris. Knecht.

Switzer, W. Va.—The Alemma Coal Co. has been organized, with a capital stock of $25,000, for the mining of coal. Fred C. Prichard, Rufus Switzer, Thomas A. Wiatt and R. H. Williams, of Huntington, W. Va., and J. M. Vest, of Switzer, are the incorporators.

New York, N. Y.—The Black Band Fuel Co., incorporated in West Virginia with an authorized capital stock of $600,000, will handle West Virginia coal lands. Walter Haviland, Henry M. Haviland, John B. Summerfield, Arthur N. Taylor and Charles A. Lewis, of New York, are the incorporators.

Tuscaloosa, Ala.—The Riverside Coal Co. has been incorporated, with a capital of $62,000. The incorporators include John S. Riegel, New York; Albert Gildersleeve, Connecticut; and R. K. Miller, of Brownsville, N. Y. The company will operate and lease mines and do a general mining business.

INDUSTRIAL NEWS

Sandusky, Ohio—The shipping season ended at the Lower Lakes Dock Co.'s plant here Dec. 1. Coal shipments for the year amount to 2,500,000 tons.

Philadelphia, Penn.—The U. S. collier "Jupiter" cleared this port for Hampton Roads with a cargo of 9800 tons of coal. The cargo is destined for the Pacific Coast.

Nelsonville, Ohio—Dow Shaffer has taken over the properties of the Silcott Coal Co. of Nelsonville and will operate them under the name of the Standard Coal Co.

Boonville, Ind.—The Sunlight Coal Co. has received and installed the third steam shovel at its mines near here. It is said that this last shovel is the largest in use in southern Indiana.

St. Clairsville, Ohio—One of the biggest coal deals ever made in Belmont County was consummated by the filing of a deed transferring 6000 acres of coal from Albert Gaddis to the Fayette Coal Co.

Lisbon, Ohio—Extensive drillings are being made near New Waterford to test a seam of coal. A number of leases have been secured and if the tests are satisfactory, development will be started at once.

Cumberland, Md.—A seam of bituminous coal, measuring between 4 and 6 ft. in thickness and of splendid burning qualities, was accidently discovered by Julius Wagner in the upper Patterson's Creek Valley.

Henderson, Ky.—The People's Mine participated actively in the recent home industries exposition which was held here. Every grade of coal taken from the mine was exhibited and attracted much attention.

Punxsutawney, Penn.—James H. Corbett and sons were recently in this vicinity, making necessary purchases and arrangements for operating their extensive coal fields just east of here. They will put up a large plant.

Gallipolis, Ohio—Almost 2,000,000 bushels of coal left this place last week on barges for Cincinnati, as a result of the flooding of the pools above the dams known as Nos. 26 and 11. It is the first shipment of river coal for some weeks.

Indiana, Penn.—The Operators Coal Co. is extending its holdings in East and West Wheatfield Townships. A number of purchases have been made recently, among the most important were 134 acres from James A. McCormick, for $8069 and a tract from Peter C. Clark for $3123.

Buffalo, N. Y.—The Secretary of War has issued an order, which he declares to be final, that no vessels may be moored alongside the Delaware, Lackawanna & Western coal dock at the mouth of Buffalo River, claiming that the practice is an obstruction of navigation. It is not known what the shippers will do to enable them to continue in business in the port.

Columbus, Ohio—George Robson, a machinist employed at the plant of the Jeffrey Mfg. Co., is the inventor of a new mine pump, which is said to be superior to those now in use. One of the pumps has been operated in an Ohio mine for about two years with the best of results, and steps are being made to put the new pump on the market in the near future.

Coonville, Ohio—The Starr-Hocking Coal Co., which has for some time been in the hands of a receiver, is operating at only about 50 per cent. of its 500-ton capacity, on account of poor market conditions prevailing recently. The mine has been cleared of water from old workings which flooded it a short time ago and is ready for full-time operations when the market revives.

Buffalo, N. Y.—Edward P. Aspinwall has brought suit against the Delaware, Lackawanna & Western and Lehigh Valley R.R. and coal companies, the members of the shipping firms of Williams & Peters and E. L. Hedstrom, demanding $963,000, or three times the amount he claims he has been defrauded of by them in driving him out of the coal trade in Buffalo. The statute provides for such claims in that ratio. The business in question is still in operation under the name of Spaulding & Spaulding.

Chattanooga, Tenn.—The Chattanooga Gas & Coal Products Co. has let all contracts for the big plant which is in course of construction in Alton Park, near here. Beaumont & Co., of Philadelphia, will furnish and install the coal-handling equipment, which will include conveyor-belt machinery for loading and unloading cars and transferring coal and coke among ovens. The daily capacity of the plant will be 500 tons of coal. In employing labor for the work the company and the contractors are giving preference to married men and those who are residents of Chattanooga.

Coal Trade Reviews

General Review

Anthracite under pressure and working schedules heavily curtailed. Bituminous continues flat with prices weak and irregular. Slack the best feature. Reactionary effects of the mild weather.

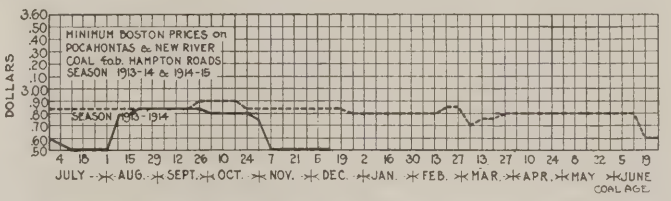
The heavy storms have failed to relieve the pressure on the anthracite trade, and a sweeping reduction in working schedules went into effect the past week. The more seasonable weather conditions have steadied up the domestic grades slightly, but the market on the steam sizes is at the lowest point for a number of years; manufacturing demand has dropped off to practically nothing, while the mild weather has naturally restricted the consumption in hotels and apartment houses. It is clear that the companies have been pushing the production faster than the market requirements justified and the outlook for the season's business is less encouraging. In spite of a heavy Lake movement last month, the gross tonnage for the season is substantially behind last year.

Heavy gales and storms, accompanied by dense fog, have seriously interrupted the bituminous movement, causing embargoes at some points and backing coal clear up to the mines. But with excessive supplies in every direction, this has not stimulated any activity or caused anxiety among consumers; as a matter of fact, sales agencies view any developments tending to curtail the movement and reduce supplies with a favorable eye. The most aggressive canvassing for business fails to shake out more than an occassional order, while prices on spot coal are weaker, if anything, and there are definite indications of lower levels on new contracts. With ocean freights continuing at record high levels, and showing indications of advancing still further, export business is more restricted, and it is clear that no relief can be anticipated in this direction.

Although mine operations in the Pittsburgh district are heavily curtailed, the production is still in excess of requirements, while prices are irregular and tending toward lower levels. The persistent reports of a better tone in business conditions must have something back of them, though selling agents, facing the problem of keeping mines supplied with orders, are unable to discover it. The reduced supply of slack has forced an advance on this grade in Ohio, but the former stiffening of prices on other sizes has given way under the influence of the warmer weather. The arrivals are in excess of the market requirements, and some accumulations of demurrage coal seem inevitable. In the Southern markets inquiries are few and the tonnage small; ten days to two weeks of cold weather will be required to reduce retailers' stock to a point where it will be necessary to place orders with the mines.

A stiffening up in steam prices is the feature of the Middle Western market, but, on the other hand, the effects of the recent cold snaps have entirely disappeared, and there is a decided reactionary tendency noted in all directions, though operators are making every effort to maintain prices. The situation is notably quiet, but there is a marked optimism among operators in anticipation of the colder weather to come.

ATLANTIC SEABOARD



BOSTON

Dull market continues on Pocahontas and New River. Contracts placed on $2.70 basis make $2.85 price seem dubious for next year. Coal in excessive supply at all points. Georges Creek steady but Pennsylvania grades very dull.

Bituminous—There is no relief to the general dullness in Pocahontas and New River. Some of the agencies have been making desperate efforts to place spot coal but so far there has been no particular result. New England buyers are not inclined to be interested at any price and shippers with cargoes on the market find the going hard. A large powerhouse contract has been placed for an 18-month term at a price to net around $2.70 f.o.b. Hampton Roads and this is regarded as a further indication that it will be difficult next year to maintain anything like $2.85. The contact demand has sagged off again, notwithstanding the unfavorable weather and the slow movement of boats, and there are no signs of activity in any direction.

Pocahontas and New River are freely offering at all the distributing points and on-car prices are weak in consequence; $3.20 on cars, Providence, seems a normal figure now and $3.30 is about the price level at Boston for inland delivery. The market is druggy even at these prices, and no improvement is looked for before the end of the year.

The off-shore trade continues dull and without special feature. South American bottoms are harder than ever to secure and the volume of coal moving to the Mediterranean is still relatively small. Coal has been offered on Long Island Sound this week that was taken out of trans-Atlantic liners interned in New York. The lack of bunker trade at Boston is responsible for some of the lessened receipts here from Hampton Roads.

Georges Creek supply is now about normal with enough orders to keep the fleet of barges and steamers up to a fair movement.

Inquiry for the Pennsylvania grades continues very light, with prices still soft. Most of the mines are on a two-day a week basis. The entire market is being thoroughly canvassed but except for a spasmodic demand all-rail the tonnage sold is very small. Operators are, however, trying hard to be in line for increased business in New England next year. The great objection this market has always had to Pennsylvania bituminous has been that the coal was not properly cleaned. With new equipment at many of the mines this objection can be met and an enlarged market is generally looked for.

Anthracite—The colder weather is helping out the retail demand, but there is as yet no life to the wholesale market. All sizes are in ample supply and there is practically no delay in securing shipments.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.45	$1.15@1.50	$1.67@1.77	
Philadelphia*	2.10@2.70	2.35@2.70	2.92@3.02	
New York*	2.40@3.10	2.65@3.05	3.22@3.32	
Baltimore*	.....	.....	2.85@2.95	
Hampton Roads*	.....	.....	.....	$2.50@2.75
Boston†	.....	.....	.....	3.40@3.73
Providence†	.....	.....	.....	3.20@3.63

NEW YORK

Embargo at South Amboy the only feature of interest in an otherwise dull market. Anthracite production exceeding the demand and mines curtailing operations. Prices easy.

Bituminous—The New York soft-coal market is so absolutely flat that there is an almost complete absence of any news. The only development of moment has been the establishment of an embargo against both bituminous and anthracite at South Amboy, due to the severe gale and heavy storm interrupting water shipments. The embargo became effective Friday night of last week and was declared off Monday at midnight, but again reëstablished at 9 a.m. With the heavy supplies in all directions, the embargo had little effect on conditions; as a matter of fact anything tending to reduce the movement is regarded rather favorably by local agencies.

The bunkering trade is about the only department that seems to be holding its own. The movement on contracts is fair. The Berwind-White Co. is reported to have increased operations to about 50% capacity. Now that this company has lost most of its market in the bunkering of ocean liners,

there is considerable speculation as to whether they will compete on the April contracts.

The local market is not notably changed, and we continue as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70 @2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—While the domestic grades are showing a tendency to steady up as the season advances, the steam sizes have seldom ever been in a worse position. It is not a question of price; there is simply no demand and No. 2 buckwheat has sold as low as 25c. at the mines. The steam demand is clear off and there has scarcely been any call at all from hotels and apartment houses because of the mild weather. There are well defined rumors that the D. L. & W. has put 150,000 tons of buckwheat back into storage since the depression began.

Egg coal has shown a very slight improvement, though reductions are still necessary to move any large tonnage. Stove continues in fair demand, and chestnut moves promptly at concessions of 10 to 15c. on the regular circulars. It is becoming more and more evident that the large companies have been pushing production faster than market conditions warrant, and as a result they are now facing the necessity of a rigid curtailment. The reduction in operating schedules was general all last week, the Reading company working only three days and still further reductions were outlined for the current week. The outlook is not as encouraging as it has been, and there are indications that work in the mining regions will be more or less intermittent till after the holidays.

The current market is quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	5.00@5.35	5.30	4.80@5.30
Stove	5.35	5.35	5.30	5.20@5.30
Chestnut	5.60	5.45@5.60	5.55	5.40@5.55
Pea	3.55	3.45@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.50@2.80	2.50@2.75	2.15@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.35@2.25
Barley	1.80	1.60@1.80	1.75	1.25@1.75

PHILADELPHIA

Anthracite trade somewhat stimulated by better weather conditions. Large surplus of steam sizes accumulating. Bituminous situation distinctly unfavorable.

Anthracite—More seasonable weather the past week has created some activity in anthracite, but it will require a couple of weeks of good winter weather to relieve the situation. The week started in with a severe storm which caused anxious investigations of the coal bins, frequently resulting in requisitions for coal. This covered all sizes from egg to pea, which is an indication that the stocks are commencing to dwindle, and the wholesale market is likely to feel this shortly.

The cessation of Lake shipping has thrown considerable extra coal on the market, in addition to the regular current output which has eased the situation on stove and nut, although these continue in good demand. Egg is still heavy and is offered at liberal concessions by the individual operators; broken continues easy. It is doubtful if any of the operators are moving off their output of the small sizes. It is claimed that the storage places of many of the large companies are filled with the steam sizes, and with the low prices prevailing on soft coal, no improvement is looked for in the near future, though pea coal is somewhat steadier.

Prices at Tidewater are about as follows:

	Circular	Individual
Broken	$4.75	$4.35 @ 4.50
Egg	5.00	4.75
Stove	5.00	5.10
Chestnut	5.25	5.25

Bituminous—The continuance of restricted mining is probably a better index of conditions in the soft-coal trade, than any fluctuations in demand or prices. While it is claimed that the calls on contracts are better, the trade generally is inclined to be pessimistic, and most of the operators can see nothing favorable in the near future. There is a distinct lack of tone to the trade.

BALTIMORE

Slack fairly strong, but the market otherwise is dull and listless with prices entirely unsatisfactory. Anthracite moderately firm.

Slack is holding steady at 70@75c. per gross ton because of the growing scarcity with the cutting down in the production of the three-quarter. The situation is exceptionally dull in both West Virginia and Pennsylvania. In the former state three-quarter gas is heavy at 85c. and Pennsylvania low-grade steam coals are selling at from 90c. up to $1.30. The storm early this week caused some delay in shipments, but the supply on hand is too liberal to make any possibility of change in market conditions. The export trade is slowing up. Fewer charters were announced the past week than for several months past. The demand for American coal to the Mediterranean has apparently dropped off again with the reopening of the large shipments of Welsh coal under admiralty orders.

BUFFALO

Better demand for slack but little general improvement anticipated before the first of the year. Some increase in factory demand. Anthracite hit hard by warm weather, but doing fairly well.

Bituminous—The feeling is better each week and there is some real reason back of it, but the actual improvement is small as yet. One jobber claims that slack went up 5c. a week ago and has dropped back again now, but others differ as to that. Mine owners, or those in close touch with mines that are making a fight to keep running strong, state there is no improvement and that there is a natural output far exceeding the ordinary consumption. It is generally felt that the price of slack is going to advance soon and that it will come close up to mine-run. There is much reason for making as much as possible of slack in the Buffalo market, as it is more easily sold in Canada, on account of the lower duty.

Canada is buying more freely now, some of the idle factories being very busy on war orders. There is practically no complaint now of coal standing on track unsold. As a rule the jobber fights against consignment coal, even if he does not have to stand the demurrage, but he is not always able to shut it off. There is a stir in the local pig-iron furnaces, but there is not much assurance of better business yet. Prices show little change, Pittsburgh lump being quoted at $2.80 for very best, with much selling at concessions, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with quite an amount of slack contracting at that price. Allegheny Valley coal is about 25c. lower than Pittsburgh.

Anthracite—The weather has been very much against this trade all the fall except for a week or so about the middle of November, as will be noted on the Pittsburgh temperature chart shown on next page. The shippers now feel easy about being able to meet the winter demand as they do not look for much clamor for coal now. The local retail trade has been only fair.

Lake shippers are winding up the season. Most of them have closed up their trestles, but one or two will continue as long as they can get tonnage, which will not be long. Rates have gone up to 50c. for the head of the Lakes, which ports are taking practically all the coal now. Shipments to the end of November for the present season amount to 4,292,536 tons as against 4,930,596 tons to the same time last season. The shipments for November were 597,495 tons, the amount for the same month last season being 525,500 tons.

To transport the final cargoes of hard coal, Buffalo shippers paid an advance of 20c. a ton on four vessels, two to Lake Superior and two to Lake Michigan ports. This was the only high rate paid this season; in an ordinary year as many as 30 or 40 ships would be paid from 10c. to 80c. extra freight.

TORONTO

Market again weak with the return of mild weather.

With the recurrence of unseasonably mild weather the trade has again fallen off This is particularly the case as regards anthracite, as many workingmen are out of employment on account of the depression and can only buy in small quantities. The city council has appropriated $1000 for the purchase of coke to be resold at cost to the poor. Wholesale prices for bituminous show a slight falling off. Quotations are as follows: Retail anthracite, egg, stove and nut, $8; grate, $7.75; pea, $6.75. Bituminous, steam, $5.25; screenings, $4.35; domestic lump, $6; cannel, $7.50. Wholesale f.o.b. cars, three-quarter lump, $3.68; screenings, $2.54.

HAMPTON ROADS

Shipments slowing up. Good bunker demand but exports light. Quite a fleet of bunker vessels. November dumpings show a decline.

Dumpings at Tidewater piers have failed to come up to expectations. A large number of foreign steamers have been here but the majority took bunker coal only, export cargoes being few. Coastwise movement has also been light. Weather conditions during nearly the entire week have been such that sailing vessels and barges were compelled to remain at anchor either off the piers or in the Roads.

The demand for all coals continues light and the greater portion of the coal moving has been on contracts made earlier in the season. Prices on export and coastwise business are being held at circular. Beginning Dec. 1, however, retail

dealers increased prices somewhat, the circular now being $8 for anthracite egg, nut, stove and broken coal, $6.50 on pea, $6 for splint and lump, $5.50 for New River and Pocahontas nut and $4.50 for steam coal.

Reports for November show that the total coal shipments from Norfolk and Newport News amounted to 869,365 tons, a decrease as compared with the same month last year. Market conditions have interfered with the movement, but taking everything into consideration, shipments have shown up considerably better than was anticipated. Of the total movement the Norfolk & Western dumped 416,931 tons, the Virginian Ry., 234,302 and the Chesapeake & Ohio 218,132 tons.

OCEAN FREIGHTS

Vessel owners holding for grain shipments on which heavy premiums are offered.

The freight market is even firmer than a week ago, and the few boats available seem to ignore coal; owners are holding them for grain, on which they are able to secure fancy figures. About $9 per ton is offered on grain to Genoa, and proportionate rates to other destinations.

A steamer was chartered last week to load coal at Baltimore for Genoa at $7.20; it is also reported that two or three steamers have been chartered for Italian coals, at rates which will probably figure somewhat in excess of this charter.

On a market like the present, it is simply impossible to quote probable rates. The situation changes not only day by day, but hour by hour.

* And to San Diego or Tiburon or both (Jan. 10).
† And to San Diego or Tiburon or both (Feb. 5).
** Or Rio Janeiro.

Note—Steamers are indicated by **bold face** type, all others being schooners.

COKE

CONNELLSVILLE

Contracts closed for about 50,000 tons monthly of furnace coke, with an equal tonnage under negotiation, but much business expiring this month is not the subject of fresh inquiry.

A fairly good batch of furnace coke contracts was closed last week, and, including one contract closed the preceding week, the movement now totals five or six contracts, involving about 50,000 tons a month, chiefly over the first half of the new year, but one contract is for first quarter only and another is for two years. There remains inquiry for 50,000 to 60,000 tons a month, but this week negotiations do not seem to be progressing so rapidly and it is possible that the entire tonnage open will not be closed at this time.

There is no likelihood of much additional inquiry appearing during the next few weeks, as furnacemen are always averse to negotiating coke contracts at the holiday season, since the prompt market is usually particularly strong at that time, due to weather and other conditions. Business that is not closed now will likely go over to January or February, the furnacemen meanwhile buying prompt coke, as nearly all running contracts expire at the close of this month. The total purchases and inquiries do not represent at the outside more than half the business that ought to be done at this season.

Much of the business closed has been on a sliding scale basis, but with a fixed price for the first quarter, and market prices are fairly well established. We quote: Prompt furnace, $1.60; furnace coke contracts, first quarter, $1.65@1.70; first half, $1.70; prompt foundry, $2@2.20; contract foundry (nominal and for best grades), $2.35@2.50, per ton, at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Nov. 28, at 179,439 tons, a decrease of 21,365 tons, and shipments at 176,749 tons, a decrease of 23,273 tons. The decreases are attributable to the holiday.

BUFFALO

The demand for coke does not improve, though the feeling in the trade is a trifle better. Everything depends on the movement of pig iron and if that continues to sell better there will be a market for coke shortly, but the price has been at the bottom for so long that the improvement will be slow. Prices remain on the basis of $4.25 for best 72-hr. Connellsville foundry, with stock coke $3.30.

BIRMINGHAM

There is no demand for either furnace or foundry coke.

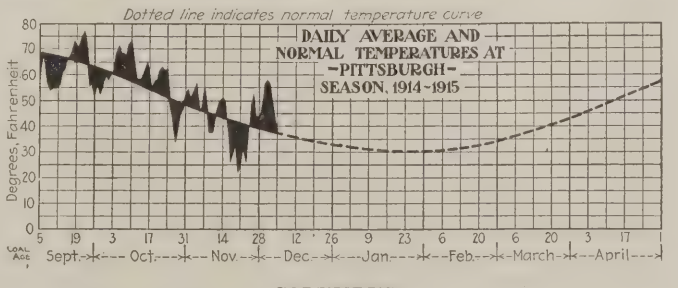
CHICAGO

There is a strong demand for coke at fair prices, which is the one particular bright spot in the fuel situation in the West. There are many inquiries out but buyers seem to be haggling over prices. Current quotations are as follows: By-product, $4.75@4.95, Connellsville, $4.75@4.90; Wise County 72-hr. (select), $4.75; gas coke, $4.25@4.35 furnace coke, $4.50@4.75.

THE STEEL INDUSTRY

Market fails to respond to lower prices. Orders continue light.

December buying of steel products, which was expected to follow rather promptly upon the appearance of a 1.05c., Pittsburgh, price for bars, plates, and shapes, is not yet large. Five weeks of better feeling have done something for order books and buying has increased in the past week, but there is thus far no repetition of the free contracting of three years ago or even of the lesser movement in January of this year.



It is still true that when any considerable business is done prices suffer. But there are rather plain indications that the response to 1.05c., Pittsburgh, quotations has not been enough to convince the mills that the market can be lifted by temporarily going under it.—"The Iron Age."

OHIO VALLEY

PITTSBURGH

Operations under 40% capacity, with prices, if anything, more irregular than formerly. Weather unfavorable to domestic demand and manufacturing demand not improved.

Mine operations on an average are less than 40% of the capacity, but are proving too heavy nevertheless, and free coal is selling at lower prices than ever, though the market is so irregular that prices cannot be quoted with any degree of precision. The weather has been unfavorable to demand for domestic coal, being on the whole unusually mild for the season. Manufacturing demand has experienced no material increase, though it has not lost in average volume for two or three weeks. Slack has been firming up with unusual slowness, since the end of Lake shipments. We quote ordinary asking prices, which are usually shaded: Slack, 80c.; nut and slack, $1; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per ton at mine, Pittsburgh district. In the case of screened coal these are prices to consumers, dealers being usually given a concession of 10c.

COLUMBUS

Warmer weather causes a reaction. Prices continue irregular and the trade is quiet. Steam buying mostly in the open market.

The return of warmer weather has caused a slight reaction against the stiffening of prices in the domestic grades. This was to be expected as the trade is purely a weather proposition now. Prices have not suffered to any great extent as they were somewhat weak even during the colder weather.

Dealers are again slow in placing orders; stocks are not generally large but they are taking a chance on being able to fill orders for the present. Collections are still bad which is having an effect on the business of the retailers. Dealers in rural sections are now buying more freely. Retail prices are fairly well maintained.

The steam business is still slow although some signs of future improvement are seen. Railroads are not taking a large amount of coal and much of the fuel for steam purposes is being purchased on the open market.

The Lake trade is now over and this has the effect of still further curtailing the production of small sizes, and these are growing stronger. Nut, pea and slack and coarse slack are all in good demand and prices have advanced. The records of the Toledo docks of the Hocking Valley show that 2,432,124 tons were handled during the present season.

Production in Ohio fields has been on the following basis: Hocking Valley, 50@60% normal; Pomeroy Bend, 75% or better; Crooksville, Cambridge, Jackson and Massillon, 50% of the average.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.55	$1.65	.....
Inch and a quarter	1.50	1.55	$1.40
Three-quarter inch	1.35	1.40	1.35
Nut	1.15	1.25	1.15
Mine-run	1.10	1.15	1.10
Nut, pea and slack	0.50	0.55	0.45
Coarse slack	0.40	0.45	0.35

CLEVELAND

Receipts light and the market weak. Outside markets stronger and difficulty is being experienced in filling orders for slack. A few cargoes still moving in the Lake trade.

Warm weather has restricted the retail business and domestic sizes are not moving. Pocahontas lump and egg are plentiful and there are close to 100 cars on track unsold. Shipping prices are off 25c. a ton on lump and egg sizes and spot coal can be bought at $3.25@3.30. Bergholz domestic sizes are held firmly at quotations because the production has been small. There is little or no demand for coarse coals, which has caused an advance in the price of slack; Fairmount mine-run and three-quarter coals are on nearly the same level. Slack is worth more than mine-run.

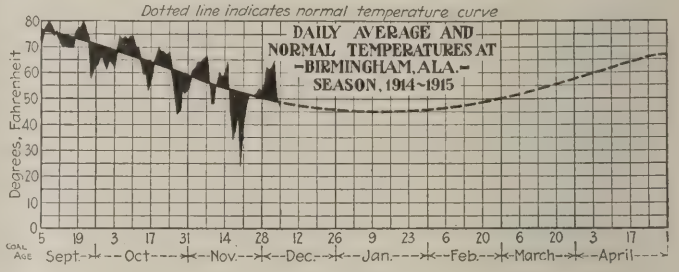
About 300 cars of coal arrived over Sunday which was more than the market was able to absorb. The Ohio fine coal is now so poor under the new mine-run law that operators are having trouble placing it. The fine coal on track is largely from West Virginia, but there is not much from the Fairmount district. Lack of orders for coarse coal has reduced the production of slack in all the Ohio fields as well as in Pennsylvania and West Virginia. Ohio slack on track is selling at $1.60 to $1.65, while West Virginia and Pennsylvania grades bring $1.70 to $1.75.

Buffalo coal shippers have come into the market for vessel space for the season of 1915 and one Cleveland boat company has arranged to float 1,500,000 tons of anthracite. The rate to all the principal ports on Lake Superior and on Lake Michigan, except Chicago, will be 30c., the same paid this year. Chicago also will take the 1914 rate of 40c. a ton.

A few cargoes of coal will be shipped next week and this week a number of boats have been loaded. The weather has been so warm and the Lakes so free from storms that a lack of cargoes alone is keeping ships in port. One cargo of coal will be shipped from Lorain next week.

Prices for shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmount	W. Va. No. 8
Lump	$3.35	.....	.....	.....	.....
Lump, 6 in.	.....	.....	$2.45	.....	.....
Egg	3.35	.....	.....	.....	.....
Egg, 6 in.	.....	.....	2.10	.....	.....
Lump, 1½ in.	.....	$2.40	2.25	.....	.....
Lump, ¾ in.	.....	2.30	2.10	$1.95@2.00	$1.95@2.00
Mine run	2.55	2.25	1.95	1.85@1 90	1.90
Slack	2.40	1.75@1.80	1.70@1.75	1.85@1.90	1.80



SOUTHERN

BIRMINGHAM

Market continues heavy with inquiries few and movement light. Contract for 175,000 tons placed.

Inquiries are few, and tonnage sold, small. The only feature of interest the past week was the placing of the contract of the New Orleans Railway & Light Co., amounting to 175,000 tons of steam coal for delivery over the next 12 months in equal monthly installments. This contract went to the Sloss Sheffield Steel & Iron Co., and is to be filled from their Ivy mines at Dora, Walker County. This is not a new contract for this district, but simply a change in the operator supplying the coal.

It will take at least ten days of cold weather to make any impression on the retail stocks, and until their tonnage is materially reduced, the operators will receive no benefit. The prices on both steam and lump coal, however, are holding up.

LOUISVILLE

Cold weather fails to help the market and business is approaching a summer basis. Hopes of a turn after the first of the year.

General pessimism pervades the Kentucky market though occasionally some operators and dealers report a good business. But for the most part this is not the case; even cold weather does not seem to help the trade now, and there are some that expect to see the market go on a summer basis at any time. All dealers have their yards full to capacity which is enough to run them through two months of brisk business. This is about the maximum amount of cold weather that can be expected in this section with perhaps a few weeks added if spring is late, but that will not create enough of a demand to help.

As a consequence operations continue to be curtailed in most cases and there is little movement of coal in any direction. Operators continue to look forward to the first of the year in the hopes that industrial requirements will improve and that there will be a general quickening of trade all over the country.

Prices are virtually unchanged since a week ago though, in fact, the range is so wide that definite figures are scarcely quotable.

MIDDLE WESTERN

CHICAGO

Demand for screenings still stronger. Domestic coals entirely a weather proposition. Prices generally holding moderately firm.

A large public service corporation here has been heavily buying screenings recently, which, together with restricted production, has naturally stiffened up prices on fine coal. Some operators have even sold their screenings for several months ahead and the bullish prices are reported to have caused the reopening of a number of manufacturing and industrial plants. An advance of 5c. to 10c. a ton measures the betterment of the week. There has not been, however, a corresponding rise in the price of other steam sizes; mine-run and steam lump are about on the same basis of the past two or three weeks. A good deal of nut coal, which is ordinarily consumed by domestic dealers, has been diverted to the steam trade.

Indiana and Illinois domestic sizes show little material change; prices vary considerably, some operators receiving circular figures while others report extremely low prices. Unfortunately the cold snap of two weeks ago lasted but a few days.

All chestnut anthracite sent to this market has been absorbed and movement from the docks has increased. The stocks of both egg and stove sizes are in excess of the demand.

The smokeless trade is again inactive; prices are far from attractive, although there is some evidence of a scarcity of lump and egg sizes.

Splint coals average about 25c. below circular and the demand is mediocre, although the docks have been showing a tendency to hold coal for stronger figures.

Hocking coals, if anything, are softer than last week.

Carterville grades show a reaction although producers have been trying to hold prices firm.

Springfield operators have been obtaining a fairly good price for the domestic sizes and have felt the firmer tendency for screenings to marked degree.

Prevailing quotations are as follows:

	Franklin Co.	Springfield	Harrisburg	Sullivan	Clinton
Lump	$1.50@1.75	$1.50	$1.50@1.75	.....	$1.50@1.60
4-in. lump.	.....	.....	.....	$1.50@1.60	.....

Screenings	0.65@0.75	0.60@0.70	0.65@0.75	0.65@0.75	0.65@0.75

Hocking Valley 1¼-in. lump, $1.25@1.50; mine-run, $1.25.

New River and Pocahontas lump and egg, $2.25; mine-run, $1.25@1.40.

Somerset Smokeless lump and egg, $2@2.25; mine-run, $1.25@1.40.

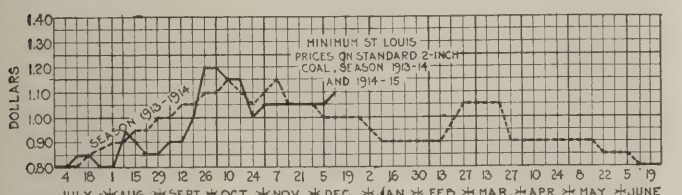
Carterville lump, $1.50@1.75; 6x3-in. egg, $1.40@1.50; No. 1 washed egg, $1.40@1.50; No. 2 washed egg, $1.25@1.35.

Green County 5-in. lump, $1.50@1.65; 3-in. lump, $1.30@1.40; 3-in. egg, $1.30; mine-run, $1.10.

Eastern Kentucky 6-in. block, $1.60@1.90; lump, $1.50@1.75; egg, $1.35@1.50.

ST. LOUIS

Steam grades improving but domestics weaker. Illinois producers slightly optimistic.



Steam sizes are advancing, but domestic grades are dropping correspondingly. Colder weather may change this, but in a general way the steam market usually improves from now until about the first of the year and then domestic sizes will begin to outstrip the demand and there will be a surplus of coal on the market.

Screenings and nut coal from No. 3 down have been in demand, while Nos. 1 and 2 are somewhat of a drug on the market. The same applies to washed coal. In the Standard field several hundred cars of 2-in. lump have been selling at as low as 95c. and dealers have been able to buy 2-in. lump at 92½c. Screenings advanced from 25 and 30c. to 35 and 40c., and everything indicates that 2-in. screenings will go to 55 or 60c. within the next week or ten days.

Practically no anthracite is moving in and there is no demand at all for smokeless. Illinois operators, in a way, are optimistic for the future, believing that conditions could not be any worse than they have been for the past five or six weeks.

The prevailing wholesale prices are:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	....	$1.25	$0.95@1.10	$1.20
3-in. lump	.....	....	1.40	....	.....
6-in. lump	$1.30@1.60	....	1.50	1.10@1.25	1.40
Lump and egg	1.85@2.15	$2.25	.....	....	1.35

INDIANAPOLIS

Slack scarce and commanding better figures. Less call for domestic lump. Mines on about same running schedule. Prices generally unchanged.

Continued mild weather, following the slight cold spell in late November, has reversed the situation, making slack scarce and higher-priced and cutting down the demand for domestic lump. The open-market price for screenings is now around 80c. Sales were made at 75c. but one Chicago buyer has had to pay 80c. The retail trade is fair, despite the unseasonable temperature. Anticipation of winter acts as a stimulant to consumers. Although retailers say there have been advances both at Indiana and Eastern mines, they have not changed the prices set in mid-September. They seem to be afraid to do so, especially those well stocked up with the Eastern coals. Indiana mines are near and retailers do not have to buy in large quantities, taking up yard room.

The running schedule at the mines remains about the same. The industrial demand keeps up to the recent average, with a tendency toward improvement, as factories make further efforts to increase operations.

A furniture installment house here is renewing its customary winter practice of offering coal at cut prices; it advertises the best grade of Linton at $2.75, which is 50c. or more below what regular dealers charge. The company states that it had great difficulty in making a contract with the mining interests.

PORTLAND, ORE.

Cargo arrives from Australia, but no more importations expected this winter. Trade quiet.

The French bark "Vendee" arrived here recently with a cargo of about 3000 tons of coal from Newcastle, Australia, half of which was delivered at Astoria and the balance is being discharged at the bunkers of the Pacific Coast Coal Co. Two sailing vessels are reported here to load grain for Europe, but instead of bringing coal cargoes, they will come in ballast, the Australian Government having placed an embargo on the exportation of coal due to the war.

The weather here has moderated considerably the past week and as a result the coal business has fallen off again, as far as domestic purchases were concerned.

KANSAS CITY

Weather continues mild and the movement slow. Illinois coals very weak but Kansas grades steady.

The long anticipated and much desired cold spell has failed to arrive and all grades are moving slowly. The weather for the last two weeks has been a little cooler, but not sufficient to create any added demand. The market on Illinois coals has broken badly while Kansas grades seem to be holding their own, due to the strike at Pittsburg, Kan., which has forced the Santa Fe R.R. to buy coal from other sources.

There has been no change in any of the price lists, but coal has been sold for as much as 25c. below the circular. Retailers have maintained normal prices.

PRODUCTION AND TRANSPORTATION STATISTICS

NORFOLK & WESTERN RY.

Distributions of shipments for September and October compare as follows:

	September			October		
	Shipped	Tipple	Total	Shipped	Tipple	Total
Pocahontas	1,225,197	16,952	1,242,149	955,892	12,534	968,426
Tug River	292,570	2,762	295,332	268,372	2,279	270,651
Thacker	246,980	9,057	256,037	217,655	9,292	226,947
Kenova	99,941	10,217	110,158	103,691	8,764	112,455
Total	1,864,688	38,988	1,903,676	1,545,610	32,869	1,578,479

Shipments of coke, entirely from the Pocahontas field, amounted to 18,734 tons in September, as compared with 55,043 tons in October.

SAULT STE. MARIE CANALS

Coal shipments through the Sault Ste. Marie Canals for October and November compare as follows:

	October			November		
	Canal			Canal		
	U. S.	Cana.	Total	U.S.	Cana.	Total
Anthracite	211,810	25,900	237,710	318,844	20,500	339,344
Bituminous	1,313,170	295,941	1,609,111	805,763	62,619	868,382

ANTHRACITE SHIPMENTS

Anthracite shipments for November and the first eleven months of this year and last year were as follows:

	November		11 Months	
	1914	1913	1914	1913
Phila. & Reading	1,082,344	1,119,247	11,043,952	11,856,164
Lehigh Valley	1,139,467	1,114,014	12,081,410	11,948,792
Cent. R.R. N.J.	761,897	727,107	8,214,332	8,429,038
Del. Lack. & West	881,645	810,921	9,010,438	9,064,157
Del. & Hudson	638,892	575,976	6,671,589	6,504,100
Pennsylvania	595,819	600,648	5,904,737	5,804,780
Erie	622,154	654,219	7,565,548	7,482,921
Ont. & Western	206,068	184,799	2,148,337	2,317,058
Total	5,928,286	5,786,931	62,640,343	63,407,010

VIRGINIAN RAILWAY CO.

Shipments over this road for October of the current year amounted to 341,703 tons, as compared with 379,113 tons the preceding month. Shipments in October of last year amounted to 476,482 tons.

Coal Contracts Pending

Contracts listed in this department are authoritative in every respect except where the source of information is questionable in which event a notice to that effect is made. All contracts are listed promptly on receipt and only repeated when additional information becomes available or in the last issue previous to the day on which bids will be closed. Liberal remuneration will be paid for all legitimate notices of this kind sent in.

CONTRACTS PENDING

Contract No. 18—Brooklyn—It has been recommended that the bid of the Bacon Coal Co. at $2.24 per 1000 lb. be accepted on this contract (pp. 933, 854), which provides for furnishing 560,000 lb. of anthracite pea coal to the 26th Ward Disposal Works, at the foot of Hendrix St., Brooklyn. Address Bureau of Public Buildings and Offices, Borough of Brooklyn, Room 1003, No. 50 Court St.

Contract No. 19—New York—Bids on this contract (p. 892), which provides for furnishing, storing and trimming coal for use in public buildings, were as follows:

3,000,000 LB. BUCKWHEAT NO. 1—Archibald McNeil & Son, Inc., $1.60; Charles B. Norton Co., $1.56; Gavin Rowe, $1.54; John W. Peale, $1.60; William Farrell & Son, $1.70; The Skeele Coal Co., $1.55.

26,000,000 LB. BUCKWHEAT NO. 2—Archibald McNeil & Son, Inc., $1.35; Chas. B. Norton Co., $1.31; Gavin Rowe, $1.29; John W. Peale, $1.34; William Farrell & Son, $1.40; The Skeele Coal Co., $1.35.

13,000,000 LB. BUCKWHEAT NO. 3—Archibald McNeil & Son, Inc., $1.24; Charles B. Norton Co., $1.16; Gavin Rowe, $1.16; John W. Peale, $1.85; William Farrell & Son, $1.15; The Skeele Coal Co., $1.19.

1,300,000 LB. BROKEN COAL—Archibald McNeil & Son, Inc., $2.59; Charles B. Norton Co., $2.85; Gavin Rowe, $2.59; John W. Peale, $2.59; William Farrell & Son, $2.80; The Skeele Coal Co., $2.53.

4,000,000 LB. BITUMINOUS COAL, MINE-RUN—Archibald McNeil & Son, Inc., $1.68; Charles B. Norton, $1.72; Gavin Rowe, $1.71; John W. Peale, $1.65; Wm. Farrell & Son, $1.70; The Skeele Coal Co., $1.70.

TOTAL ON ALL BIDS—Archibald McNeil & Son, Inc., $66,107; Charles B. Norton Co., $64,405; Gavin Rowe, $63,447; John W. Peale, $65,012; William Farrell & Son, $66,890; The Skeele Coal Co., $65,309.

Address, Auditor, Room 2141 Municipal Building, Borough of Manhattan.

Contract No. 20—New York—The bids on this contract (pp. 892, 933) which provide for furnishing and delivering 300 gross tons buckwheat coal No. 1 were as follows: Burns Bros., $3.95; Gavin Rowe, $3.74; Garfield Proctor, $4; N. L. Bird, $3.89; Joseph T. O'Connor, $3.66; Meeker & Co., $3.72. Address Auditor, 400 East 29th St., Borough of Manhattan.

Contract No. 21—Cleveland, Ohio—Sealed proposals for furnishing and delivering 2000 tons of Pittsburgh nut coal, 100 tons of the best grade soft lump coal and 50 tons of the best grade Lackawanna egg coal will be received by the County Commissioner until 10 a.m., Dec. 12, each bid to be accompanied by samples of not less than 25 lb. A certified check for $500 must accompany each bid. Address E. G. Krause, Clerk of the Board of County Commissioners, Cuyahoga County, Cleveland, Ohio.

Contract No. 22—Philadelphia—Sealed proposals for furnishing anthracite coal of various sizes to the different departments of the city will be received until Dec. 16. Deliveries are to be made as per specifications. Address Director of Supplies, Room 312, City Hall, Philadelphia, Penn.

Contract No. 25—Stockholm, Sweden—Press reports are to the effect that the Swedish State Railways have invited tenders from American operators for approximately 130,000 tons of coal. Deliveries are to be made the early part of next year.

Contract No. 26—St. Louis, Mo.—Sealed proposals are requested at the United States Engineer's office for furnishing 30,000 tons of coal. All bids must be in by 11 a.m., Dec. 23, 1914. Address B. McD. Townsend, Colonel of Engineers, United States Engineer's Office, Custom House, St. Louis, Missouri.

Contract No. 27—Delphi, Ind.—The city water-works at this place is in the market for about 1000 tons of coal. The coal must be on a 65c. rate, and may be either mine-run, pea, or screenings. Address F. L. Woodruff, Delphi, Indiana.

CONTRACTS LET

Contract No. 4—Providence, R. I.—It is authoritatively stated that this contract (pp. 696, 735, 775, 814) has been let to H. N. Hartwell & Son, representing the Smokeless Fuel Co. The duration of the contract was extended from 12 to 18 months, and the price is surmized to be $3.33, alongside, Providence. It will be filled with either Pocahontas or New River coal. Address E. H. Raquet, Engineer of Tests, South Station, Boston, Massachusetts.

Contract No. 17—New York—This contract (pp. 854, 933) has been awarded as follows:

MANHATTAN (anthracite), 900 tons egg, Meeker & Co., $5.37; 900 tons of egg, $5.37, Pattison & Bowns; 900 tons stove, Gavin Rowe, $5.70; 7000 tons buckwheat No. 1, Pattison & Bowns, $2.79; 800 tons pea (L. H.) Meyer-Denker-Sinram Co., $4.85.

MANHATTAN (bituminous)—10,000 tons, George D. Harris & Co., $2.87; 400 tons gas coal, John W. Peale, $2.45.

BROOKLYN (anthracite)—7000 tons pea, Bacon Coal Co., $4.62; 700 tons stove, Bacon Coal Co., $6.81.

RICHMOND (anthracite)—400 tons egg, Gavin Rowe, $6.17; 250 tons stove, John E. Donovan, $6.43; 6000 tons buckwheat No. 1, Joseph Johnson's Sons, $3.38.

Address, Contract Clerk, Department of Public Charities, Room 1034, Municipal Building, Borough of Manhattan.

FOREIGN MARKETS

GREAT BRITAIN

Colder weather stimulates activity. Ocean freights continue high and exports heavily restricted.

The colder weather has stimulated the trade in the London district, and orders for all qualities have become more plentiful. Prices are unchanged, but collieries are endeavoring to withdraw the special quotations of a week ago. Slacks and small nuts have also slightly improved. A notably better demand is developing from manufacturing districts, and consumption at engineering works, especially government, is well maintained. The demand is still insufficient to keep the collieries working full time, however, and the general rule is three or four days a week.

In consequence of freights having reached an abnormal level it has been impossible to transact fresh business in the coal export trade, and the market has become very dull and depressed. On the Tyne and Wear and at Cardiff the effect is naturally felt most. The Government demand at the latter place has not been so great during the past week, and the market generally is very irregular. On the other hand, the inland trade markets have slightly improved, the colder weather being the contributing cause.

Recruiting in the South Wales coalfield has been so brisk of late that the War Office has decided not to accept miners who fail to produce certificates from their managers stating that they can be spared.

The Admiralty have imposed restrictions on navigation in the Firth of Forth which will have the effect of closing the ports. This will be keenly felt by the coal-carrying trade of the district.—"The Colliery Guardian."

Nov. 27—Tonnage is still scarce and with stocks of coal excessive, values of the large descriptions are weak for prompt delivery, although sellers are unwilling to reduce forward values. Owing to colliery stoppages small coals are scarce and prices continue to rise. Quotations are approximately as follows:

Best Welsh steam	$4.80@5.28	Best Monmouthshires	$3.96@4.02
Best seconds	4.32@4.56	Seconds	3.78@3.90
Seconds	4.08@4.20	Best Cardiff smalls	2.46@2.54
Best dry coals	4.32@4.56	Cargo smalls	1.32@1.74

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage, and for cash payment.

Freights—Outward chartering is not so active but this is doubtless due to shortage of tonnage. Rates are approximately as follows:

Gibraltar	$2.88	Venice, Ancona	$4.92	Singapore	$5.04
Malta	3.12	Alexandria	4.80	Las Palmas	2.76
Marseille	3.96	Port Said	4.80	St. Vincent	3.00
Algiers	4.19	Aden	4.80	Rio Janeiro	4.20
Genoa, Savona	3.60	Colombo	4.92	Monte Video	3.96
Naples	3.72	Sabang	4.80	Buenos Ayres	4 20

Note—These indications are for Bristol Channel loading. Rates from the East Coast of England are considerably higher than this.

COAL AGE

Vol. 6 NEW YORK, DECEMBER 19, 1914 Vol. 25

"England was merry England when Old Christmas brought his sports again. A Christmas gambol oft could cheer the poor man's heart through half a year." That was Walter Scott's idea of the old time Christmas. "Cheer the poor man's heart through half a year." That's the kind of Christmas we need this year. With men out of work, and almost unheard-of conditions in the coal trade; with coal-mining companies on the verge of bankruptcy; yes, we need a Christmas that will help. "Easier said than done," you say. Sure, but the point is, let's do it. Christmas is peculiarly a celebration for the children; it's children's work to get down to the very bottom of discouraged men's hearts and make them forget all about their troubles; and they do it without realizing that they have accomplished anything. Put the children to work. But wait—first remember that many a child is troubled now and grievously troubled; don't let that keep you long, however; just establish a new road to Santa Claus' house, the old one has been lost this year, and too many children have been told about the lost trail. English and German, French and Russian, Pole and Hungarian; they are all in our midst and their hearts are heavy just now thinking of their bleeding kin across the sea. But nations have passed through sorrow before and also want; Christmas reaches back through many such experiences. It had a mission then and has a mission now. The children hold the key. It is only necessary to lend them material encouragement. Let every coal-mining community in America arrange for the biggest "doings" this Christmas that have ever taken place. The joy of the youngsters will radiate and permeate through every home, and the heavy hearts of the grown-ups will be warmed with gladness.

Ideas and Suggestions

Mining Publicity

In connection with the discussion that has been carried on of late through the public press in regard to the present condition of the coal trade, one item, at least, has been overlooked, that is, the item of publicity insofar as it affects the education of the general public that buys the coal. Is such education necessary? Many believe that it is, because there is a very general misconception in regard to the coal business.

It has been widely stated by those engaged in mining and handling coal that very little money is being made in the business and that no similar industry in the United States of equal importance receives so small a return on the capital invested and for the risk run, both by the operator and miner. The public as a whole does not believe this, and therefore, very naturally does not take kindly to the proposition to increase its fuel bill, for every one, corporation or individual, wants to get the greatest amount for the least possible outlay.

The idea is entirely too prevalent that the coal producers are trying to put one over on the public when they ask for an increased price for their product, while it is undoubtedly true that great fortunes have been made out of coal mining and while others will be, undoubtedly, in the future, the competitive conditions under which the business is now being carried on are not understood by most of those who buy coal, nor even by many of the financial centers where the coal industry has been capitalized.

Would a better understanding between the buyer and the seller in regard to just what it costs to produce a ton of coal remedy the present unsatisfactory conditions? The present hand-to-mouth policy under which so many coal operations are now being carried on cannot continue indefinitely.

Coal Mining and the Daily Papers

Why is it that the metropolitan daily papers give so little attention to the mining business, excepting the purely speculative features and these often only by a few of the distinctly financial journals? The latest divorcée in Chicago or New York gets ten times the space in the daily paper that the failure of a coal company involving millions does. The public wants scandal, do you say; very true, but the coal companies should want and demand publicity.

Why do the agricultural interests obtain immediate attention from a legislature? Because by consistent publicity the general public, which includes legislators, has been made to think that the farmers are the greatest people on earth and that they should have everything they ask for. No one would for a moment attempt to deny the importance of the agricultural interests, but the mining industry should copy some of the publicity methods of the agriculturists and if this is done, there will not be the great differences that now exist between the appropriations made by the national and state governments for the benefit of the two industries, and legislation that tends to place mining upon a more stable basis will not be tabooed as it now is. An industry that furnishes fifty per cent of the freight of the country has a right to be heard and to have its true story known.

If the real nature of coal mining were better known and the importance of the industry better appreciated, remedial legislation in states in which coal mining is upon a competitive basis would be more easily obtainable.

Need for Uniform Laws

Safety-first legislation is very desirable, but is it fair to compel the operator in one state to use measures that materially increase his costs, while his neighbor working under practically identical conditions and shipping to the same market, is practically granted a bonus upon his coal through lack of such safety legislation? Public opinion should be made to understand the differences, so that it may compel state legislatures to give equal protection to all, for unless this is done Federal control is inevitable in order to equalize the burdens upon the industry.

People as a whole are fair-minded and if they are made to understand that the present difference between the cost of mining a ton of coal and the selling price does not give a suitable return upon the enormous capital invested, they will be willing, we believe, to grant an increase, so that the miner can receive the fullest possible protection and the operator secure a just return upon his investment.

Very little has been done in this country to let the people in general know just how mining is carried on. In Europe and particularly in Germany every effort is made to teach the public about industrial undertakings. In Berlin and Munich, for instance, though comparatively remote from the mines, there are magnificent mining museums open at stated intervals to the general public and in which are exhibited all kinds of mining machinery, both separately and in combination, as, for instance, working mine tipples that show the elaborate processes of preparing coal. Methods of mining are well shown in models and every detail almost of the operation of a mine is so strikingly illustrated that the ordinary layman may understand the difficulties of the business.

Museums as Publicity Agents

America has thus far provided no such museums excepting through the world's expositions and through the small collections of mine models exhibited at some of the mining schools. Some of the models from the expositions have been collected in Washington, but a single museum in the capitol can only do a small part of the work of popularizing the coal business. Models and museums are mentioned not as *the* "cure" but as representing one phase of the cure and as one medium of publicity. Cooperation of the buying public may possibly be secured if some of the supposed secrets of the business are given out.

The uncertainty of the application or misapplication of

the Sherman law and similar legislation has naturally made the operator timid about giving too much information to the public. Even when it is not wise to give out costs, information in regard to the difficulties of operation and the many processes involved in the mining and preparation of coal can be given out without fear of giving away trade secrets or putting dangerous information into the hands of pestiferous government agents. Such companies as the H. C. Frick Coke Co. and other subsidiaries of the U. S. Steel Corporation, and the Peabody Coal Co. of Chicago have started the publicity ball rolling by presenting through the medium of moving pictures many of the operations about modern coal mines.

The Folly of Imitation

By I. C. Parfitt*

What are you? Miner, fireboss, foreman or superintendent? Are you yourself, or are you the caricature of the man higher up? Whatever position you aspire to in the mining world, if you be the possessor of good red corpuscles, you have an ideal of what the position is, what it requires, and what you should be to fill it.

Are you preparing yourself for the responsibilities and dignity of that position by a judicious or an injudicious adoption of the methods and mannerisms of a present or former incumbent, or by the cultivation of your individual faculties and character in conformity with your ideal? Are you dependent for the required qualifications upon imitation, or are you independent by acquisition?

When the position is attained, will you grace it by an honorable individuality or disgrace it by an affected personality?

Emulation is an honorable and praiseworthy ambition; imitation is a despicable one.

Two of the most powerful factors to success are *concentration* and *application*. They are not characteristic of any particular individual, but may become common attributes; they may not be possessed by every individual to the same degree in the same vocation, but they may be possessed in the highest degree by every individual in the vocation for which he has a predilection. The cultivation of these faculties develops individuality. The aping of the manners and peculiarities of another not only destroys individuality but excites derision and contempt.

Analyze them and see if the qualities you admire in others are not those which, by cultivation, you may possess yourself.

Are you imitating the peculiarities of the "man higher up"? Cut it out; you may awake to the fact that you have been worshiping false gods.

Get the habit of studying yourself and your moral relations to your fellowman.

Imitators never make any progress themselves and never confer any blessings upon the world.

If you have the ambition to get higher up, study the nature of the position and yourself; bring about a conformity; don't dress up in the other fellow's clothes, the asininity might be revealed by the bray.

Be an efficient man in the position you hold. Efficiency in a subordinate position is the best recommendation for advancement to a higher one, whether it be recognized as such or not. If you have learned how to command the respect of your fellow miners you have learned how to command respect in any position to which you may aspire.

Respect is not secured through arrogance, superciliousness, officiousness or exclusiveness, but by the individuality acquired through the commercialism of mutual recognition.

Position will not give dignity to a man, but a man may confer dignity upon any position.

Don't imitate. Emulate, and cultivate the individuality of Truth and Right.

*Jerome, Penn.

Better Things to Come

By F. S. Johnson*

The truest index of an individual's or of a nation's sanity is the ease with which they endure and then forget extreme hardships, and in the degree of firmness with which they maintain their grip upon things in general in times of stress.

So as we draw near to the close of 1914 and pause to recount the experiences that have come to us since its beginning, let us pay to it the tribute usually accorded the dying, by looking longest upon the best it has given us, and forgetting—save the benefits derived therefrom—the hardships endured.

To the coal men of America the passing year has brought its full quota of trying situations. But be it remembered that this year has also witnessed one of the greatest advancements in first aid, safety-first and general-welfare movements that the country has ever known. This fact reflects credit upon those men who have been able to hold fast to their ideals and accomplish so much toward their realization, amid such adverse conditions.

It is one of the blessings of human nature that misfortunes when viewed in retrospect lose much of their bitterness, and, if considered at sufficient length, always present some feature that has added materially to one's welfare.

Therefore, the very things that have appeared to conspire against the coal industry this year, such as the long drawn-out deliberations of the Interstate Commerce Commission, unreasonable state legislation, unsettled labor conditions and the paralyzing effect of the European war upon trade, have at the same time taught valuable lessons, and left as a reward, in the breast of every man who has performed his duty faithfully, an increased measure of self-confidence, a broader knowledge of his business and its powers of endurance, and a keener appreciation of the responsibilities devolving upon him.

With the dawn of 1915, there will come to the doors of the United States the loud rappings of opportunity, and to the men engaged in the coal industry, which forms the bone and sinew of our natural resources, will be given the unprecedented privilege of arising to their fullest efficiency, and of applying to the new conditions which will prevail, the principles drawn from the important lessons that have been learned during the past 12 months.

So as we stand on the threshold of another year, let every man look backward with the satisfaction that comes from the consciousness of a duty well done; and forward, with a confidence and sense of preparedness for what is to come, with an energy that will prove to the world the sanity of the coal-mining fraternity of America.

*Coalton, W. Va.

Steep Pitch Mining of Thick Coal Veins--I

By W. G. Wildin*

SYNOPSIS—The writer discusses the use of steel timber, declaring that it has distinct advantages where squeezing is not to be anticipated. He also illustrates the methods adopted in opening the coal by the breast and chute methods and finally describes the means by which it has been customary to attempt the removal of pillars.

This paper will be confined to a discussion of the methods in use on the property of the Lehigh Coal & Navigation Co. in the Panther Creek valley. Only the methods used in mining the Mammoth vein will be considered, those in the smaller veins being adaptations of the same.

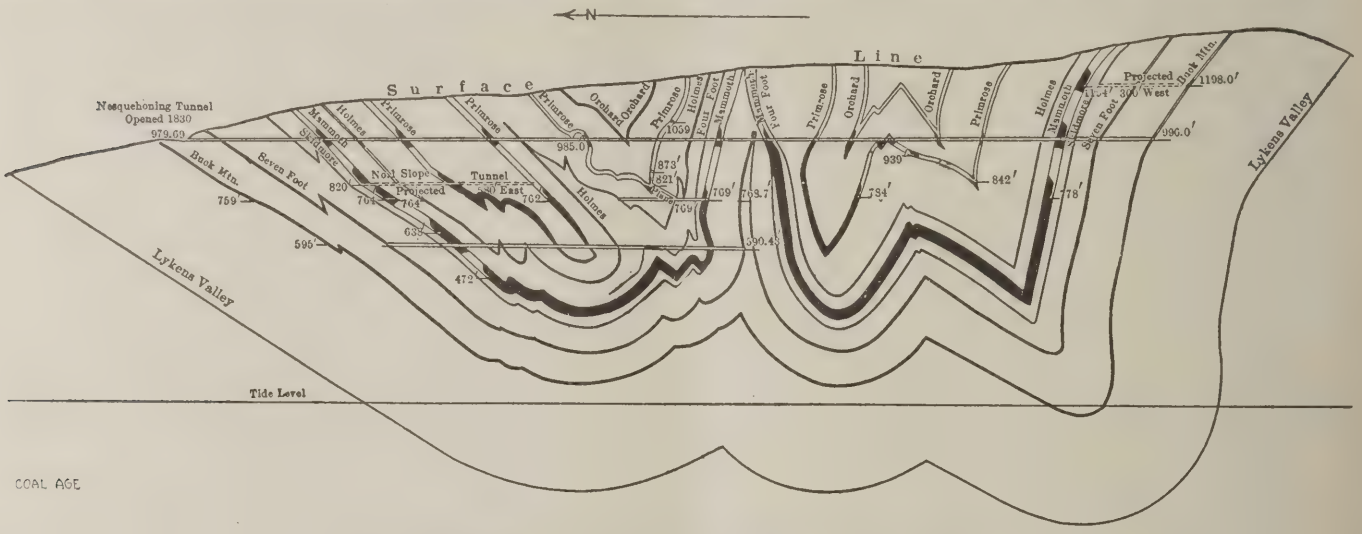

Fig. 1. Cross-Section of the Nesquehoning Tunnel

Typical cross-sections of the coal basin are shown in Figs. 1, 2 and 3.

Description of Mammoth Vein

The Mammoth vein varies in thickness. It is 21 ft. thick at one colliery, 50 to 125 ft. at another, and over 200 ft. at a third. Its normal thickness is 35 to 40 ft.

At some points in the Panther Creek basin the Mammoth vein is made up of three splits—the Bottom, Middle and Top, while in other portions the dividing strata between the benches are only 18 to 30 in. thick and the vein is practically in one. The Mammoth vein at the Greenwood colliery shows a thickness of 60 ft. The miners know it by benches, as follows: The Three-Foot, the Four-Foot, the Eighteen-Inch Slate, the Bony, the Grey Slate, the Grain Clear, the Five-Foot, the Seven-Foot, the Slaty or Dirty benches, the Blue Slate, and the Top bench.†

The present-day methods of mining are an outgrowth of the experiences of the last 100 years in this territory. The first attempt at mining, according to the company's maps, was made at Summit Hill in 1792, when open cuts and pits were made. Later the pillar-and-breast method was introduced. This and other methods will be discussed hereinafter.

Expensive Timbering

Drifts, slopes and shafts, according to the requirements and physical conditions, are the main openings, from which the gangways are driven. The gangways (haulageways) and airways are driven along the strike of the vein; the former in the various veins on the same level being connected by tunnels through the intervening rock. The gangways and airways in thick veins are heavily timbered throughout. The sets of timber, consisting of a collar and two legs, are spaced 5 ft. apart, and later, after the ground has settled, additional sets, called "liners" or "relief sets," are placed between, to relieve the strain on the original timbers, so that the result is a set of timber every 30 in.

The sizes of the ordinary timbers, when of wood, are: Collar, 8 ft. 6 in. long and 15 in. diameter; legs, each 9 ft. long and 14 in. diameter, set on a batter of 3 in. to the foot. A section of the gangways in the clear, therefore, is 7 ft. 6 in. in width at the top and 11 ft. 9 in. in width at the bottom at the height of the track, and 7 ft. 6 in. high above the track.

Steel Advisable Where Squeezing Is not Anticipated

The timber in the airways is 10 to 12 in. in diameter when of wood, and the opening in the clear is 5 ft. in width at the top and 8 ft. at the bottom, and 6 ft. in height. A considerable amount of steel timber is used, the sections for gangways being a 10-in. I-beam, 25 lb. per foot, for collar, and 8-in. H-columns, 34 lb. per foot, for legs. In airways we use a 9-in. I-beam, 21 lb. per foot, for collar, and 6-in. H-columns, 23.8 lb. per foot, for legs. Experiments are being made, using for collars 6-in. H-

*Mining superintendent, Lehigh Coal & Navigation Co., Lansford, Penn.

†This cross section was illustrated, with several others, in our issue of May 10, 1913, on page 727. On page 723 of that issue is a profile cross section of the valley at Lansford, Penn.

NOTE—Paper read at Pottsville, Penn., meeting of the Pennsylvania Anthracite Section of the American Institute of Mining Engineers, July 25, 1914.

beams, 23.8 lb. per foot, instead of the I-beams, and so far better results are being obtained.

Where wood is subject to dry rot the use of steel timber has been very successful, but where there is a constant squeezing or heaving it has been found inadvisable to substitute steel for wood. A considerable saving in the maintenance of timbering has been made up to this time by the use of steel, and its use is being extended.

All turnouts and permanent openings, where timbering is necessary, are being timbered with steel, and sections of various sizes up to 70 lb. per foot are used, according to the requirements. I cannot state at this time what the average life of a set of steel timber in a gangway will be, but the material will probably last at least 10 years.

steel will be fully 100 per cent. A turnout which had to be retimbered every nine months at a cost of $20 per set for labor and material is a notable instance of the greater economy of steel timber as compared with wood. Steel timbering costing $40 per set for labor and material was installed four years ago, and will last many years yet. It will be seen that the saving amounts to more than $60 per set to the present time.

We use practically all peeled timber, although at times we are unable to procure it. We have not used treated timber in the mines, although some of the other anthracite companies have experimented rather extensively with it for a number of years at one or two of their collieries. We are testing steel timbering instead of wood in a few of our main chutes, those which will have to be held open

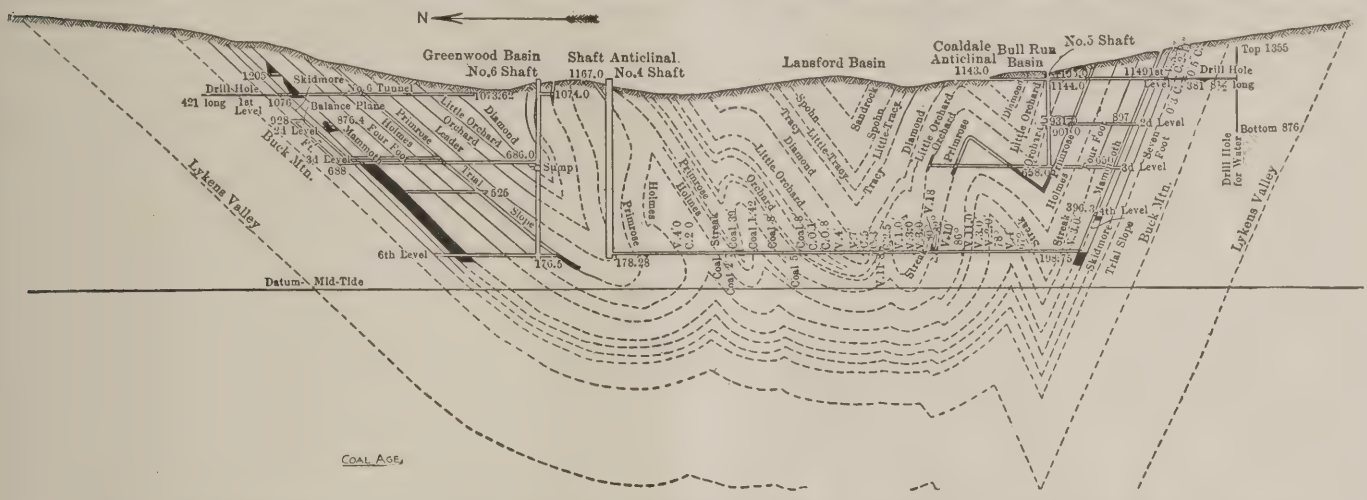

Fig. 2. Cross-Section through Panther Creek Valley on Line of Nos. 4, 5 and 6 Shafts

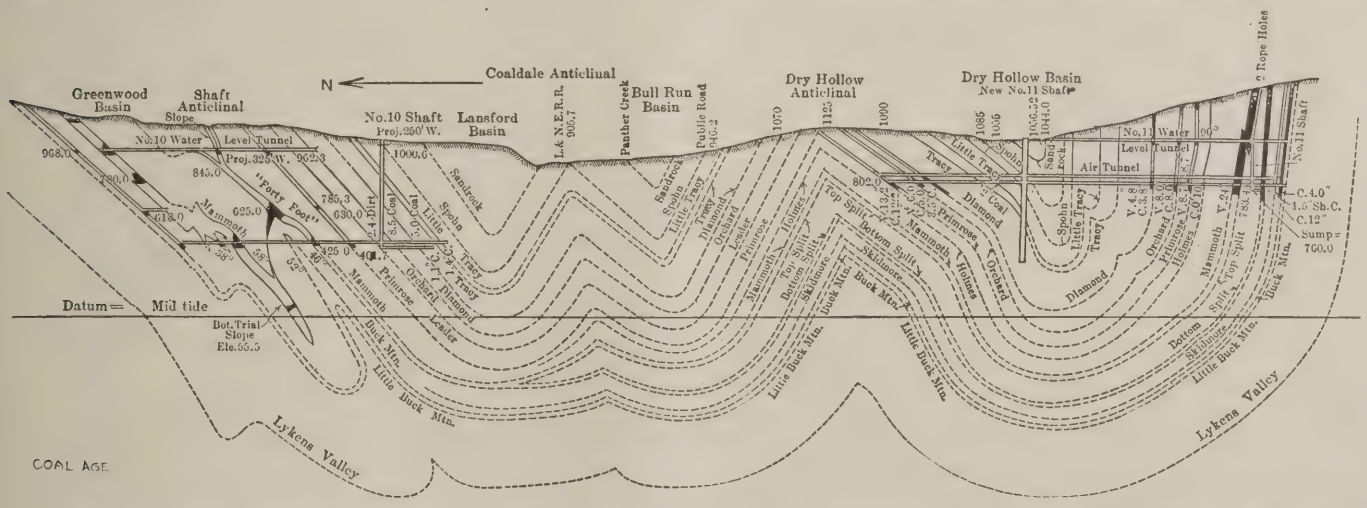

Fig. 3. Cross-Section through Panther Creek Valley at Greenwood and Rahn Collieries on Line of Nos. 10 and 11 Shafts

The average life of wooden timber in a gangway is three years. In many instances wooden timber has lasted 15, and in many others it has lasted less than one year, depending entirely upon the physical conditions. There are also many instances where it was almost physically impossible to hold open certain stretches of gangways and airways until steel timber was installed.

Steel Is Clearly Half as Costly as Wood when Life Is Considered

Figuring the average life of wooden timber as three years, and of steel timber as 10, the saving made by using for five or six years, and we believe that the use of steel will result in a saving.

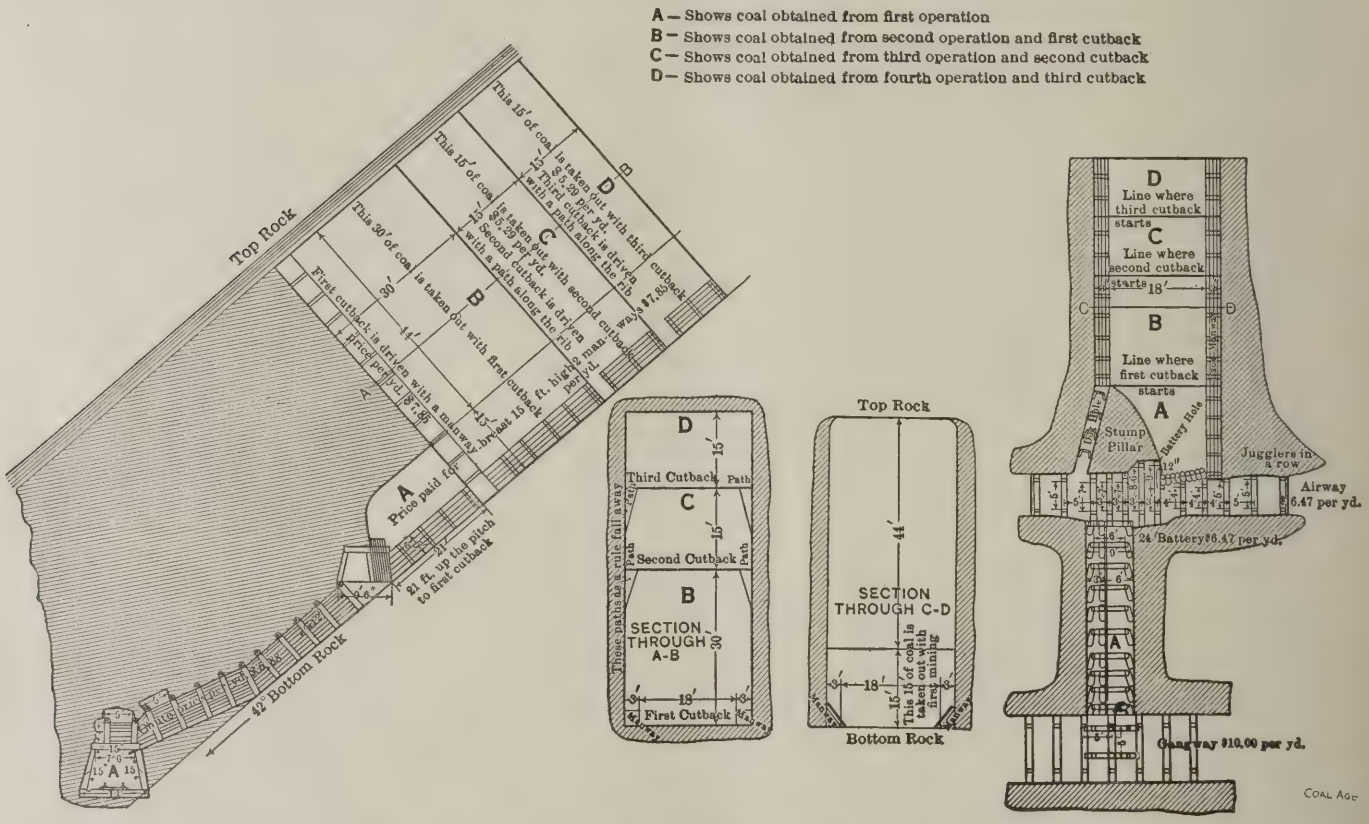
Location of Gangways

The proper position of gangways and airways with reference to the top and bottom rocks is sometimes a question. In veins pitching from 60 deg. to vertical the gangways and airways are driven along the top rock, for the reason that the loading chutes, on about 30 deg. pitch, can be driven back from the top rock to the bottom rock. In this way a safe working place is provided for loaders, and the loose coal can also be controlled. In veins

with lesser pitches the gangways are driven on the bottom rock and the airway along the top rock.

The distance between a gangway and its airway, when both are driven along the same rock, varies according to conditions. Years ago the distance varied from 20 to 30 ft., while during the last few years it has been found advantageous in some cases to increase this distance to 50 ft. in the sections where the chutes were driven on 60-ft. centers, as it results in lowering the maintenance cost of the gangways.

From Gangway to Bottom-Breast Crosscut



The method of opening a breast is as follows (see Figs. 4 and 5): Chutes, 6x6 ft., partitioned off to make a traveling way and a loading chute, are driven from the gangway on a pitch of 22 deg. until the bottom rock is met. They are then extended up the pitch of the bottom rock, to the height at which it has been decided to have the stump heading or bottom-breast crosscut. At this point a juggler battery is put in and a 4x6-ft. crosscut is driven connecting the top of the chute with the top of the next chute. This crosscut is used for ventilating and travel, and is locally known as the "bottom-breast crosscut."

The Breast Proper and Its Frequent Normal Developments Termed "Cut-Backs"

In forming a breast, the "front" manway or dog hole is driven on one side 20 ft. up the pitch, and a back manway carried on the other side; both these are opened off the bottom-breast crosscut. The opening between the back manway and the battery collar is 10 ft. wide and 8 ft. high, and this opening is carried up the pitch and gradually widened until it reaches the top of the dog hole, where a connection is made. Thus is formed what is called a "stump" above the battery. The breast is now 18 ft. wide between the manways.

A length of manway is put in on top of the dog hole and the first cut-back is made in the following manner: The top of the dog hole forms the bottom of the cut-back; manways are carried on both sides and the coal is blasted 18 ft. wide between the manways and 10 ft. high all the way back to the top rock of the vein.

After the first cut-back has been completed the breast is driven 30 ft. farther up the pitch, where the second cut-back is made. The second and additional cut-backs are similar to the first. Where the pitch of the vein is 45 deg., for instance, the loose coal does not fill the whole space made. In this case the miners carry a "path" along each rib of the cut-back. Two miners blast the coal, each traveling his own path, until the top rock is reached and all the coal is taken out between the first and second cut-backs.

Price paid per yd. $7.85

and another breast opened, probably reaching the old level.

At one colliery where the vein is practically vertical and the breasts are driven along the bottom rock, the manways are driven along the top rock, and this has been found of great assistance, because the manways are not so liable to become blocked by falls, thus interfering with the ventilation of the breast.

Another Method Made Necessary by Split Seam

The driving of breasts as I have just described is the common practice, but where the vein is divided into its various splits, a different method is used. At the Tamaqua colliery there are a bottom and a middle split, the parting slate being from 12 to 18 ft. thick. The bottom

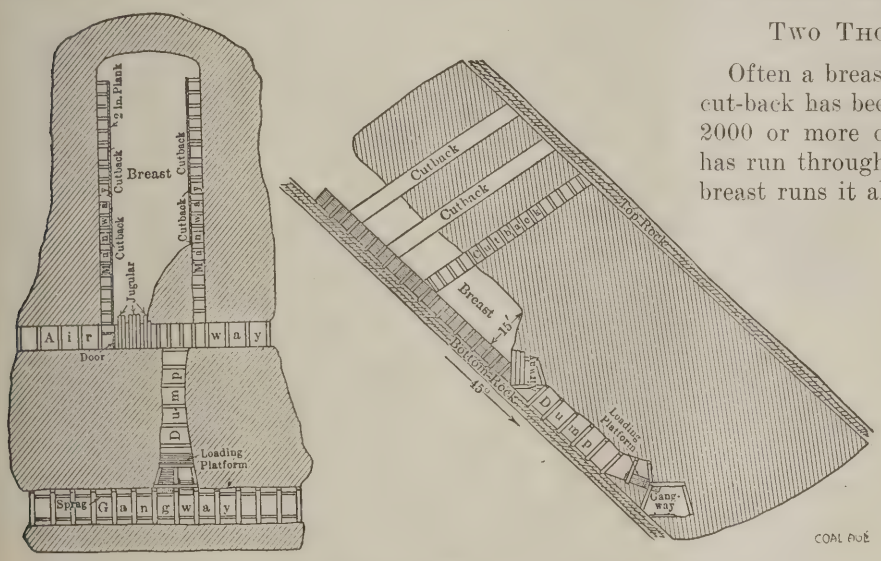

Fig. 5. Method of Working Mammoth Vein, Lower Level, Colliery No. 8

split is 7 ft. thick and the middle split 4½ ft. The gangway is driven in the bottom split, as is also the airway. 40 ft. above.

Rock holes, 50-ft. centers, are driven from the bottom-split airway to the middle split. The middle split is mined by breasts 8 yd. wide, and robbed by skipping the pillars, beginning at the top. After the completion of the robbing, the bottom split is mined in the same way directly underneath the middle-split breasts. The cost of coal mined by this method is high because two breasts have to be driven for 12 ft. of fuel thickness.

It was originally planned to use the breast method in the middle split and the chute method in the bottom split; the chutes being driven while the breast was being worked. Care was taken, however, not to commence the robbing at the top of the chutes in the bottom split until it had been completed at the top of the breast in the middle split.

It was found that as soon as the pillars were cut in the middle split there was so much squeezing and heaving in the chutes in the bottom split that it was almost impossible to hold them open, and the plan had to be abandoned. At the present time, breasts are being driven in both splits satisfactorily, except that the cost is high.

Breasts Are Now Narrower and Pillars Wider

Many years ago breasts were driven 10, 12 and 20 yd. wide, and in the old Rhume Run tunnel of Nesquehoning colliery some were even as wide as 30 yd. At the present time breasts are driven 8 yd. wide, and where the vein is free the width is not permitted to exceed 6 yd. I think it is safe to say that about 40 per cent. of these breasts are of this latter width.

As the width of breasts has decreased, the size of the pillars between breasts has increased. For instance, where 12-yd. breasts were driven on 50-ft. centers, the pillars were 14 ft. wide. At the present time 6-yd. breasts driven on 50-ft. centers give a width of pillar of 32 ft.

In thick veins breast work is preferable to chute work, especially where there is a good supply of air. The amount of blasting necessary is much less, and consequently the yield of prepared sizes is larger, for after the first cut-back has been made there is a loose end.

Two Thousand Cars of Selfmined Coal

Often a breast will run away after the second or third cut-back has been made, or sooner if the vein is soft, and 2000 or more cars will be loaded out before the breast has run through to the old lift above. However, when a breast runs it always fills with gas, and so remains until it has run through to the old workings. Great care must be taken, under such circumstances, to avoid explosions.

In chute mining in new ground the chutes are driven almost to the old lift above, and as soon as the upper section of the vein has been worked and breaks through to the old workings there is not much further trouble with gas.

The coal is mined by driving chutes back toward the top rock, where breasts are driven first along the top rock, and later up the pitch. Retreat is made down the main chute for 30 to 50 ft. and another chute driven to the top rock, and the operation repeated. This method is carried on until the chute has been robbed down.

Breast Method Cheaper But More Wasteful

All the coal has to be blasted, as heavy falls cannot be expected because of the shortness of the sections, and also because there are no loose ends. The maintenance cost of the chutes is high. The result of a test made at one colliery from 1907 to 1909 showed that the breast method cost only 60 per cent. as much as the chute method. However, the recovery by the former was only 92 per cent. as much as by the latter.

Various Pillar-Drawing Methods

The most important question in mining, especially insofar as the ultimate yield of the vein is concerned, is the robbing of the pillars. In the early mining, the practice was to cut the pillars at the bottom of the breast by stripping a slice off the pillar at the top of the dog hole and bearing into and cutting it through if possible. The pillar was followed up the pitch until it became dangerous to go any farther, or until the gob from the old breasts rushed in. By this method a large percentage of the pillar was left standing, as the heavy rock from the breast would soon rush in and the place would be abandoned.

A later method was, to drive a chute in the center of the pillar some distance up the pitch, where the pillar was

cut through from the rib of one breast to the rib of the other. A larger percentage of coal was obtained by this method, but it was soon found that the maintenance cost was high, due to the squeezing of the pillars, although it was more successful on the slighter than on the heavier pitches. On the heavy pitch, the coal and rock coming down the chute knocked the timber out, causing heavy maintenance charges.

Another former method was to couple up the old manways of the breasts on each side of the pillar and put in a battery, the old breasts being left full of coal. The bottom benches were taken out between the manways and were cut back in the middle of the pillar toward the top rock, care being taken to leave a small pillar on each side above the old manways which had been coupled, in order not to break them.

After these pillar breasts had been driven up to the same height as the face of the old breasts, loading was commenced from the three batteries, trusting that the small pillars over the manways would crush, and all the coal would be won. This method was found objectionable, as the pillars squeezed so much that it became too dangerous for men to continue to work, and they were seldom able to drive the pillar breast as far as the face of the old breast.

Experiments were then made with the chute method of robbing pillars. These chutes were driven about 25 ft. apart and to within 30 ft. of the old level above, and robbing commenced at the top. It was first thought that by this method it would be easier to reach the coal between the chutes; however, it was soon noticed that so many openings caused such a general squeezing in the chutes that it was almost impossible to keep them open, and in fact, many of them were lost. This distance between centers was then increased to 50 ft., and later to 60 ft. The main chutes were connected up by slant chutes, which were used for ventilation and later for robbing the various blocks of coal in the pillar. This method is the present practice.

A Modern Coal-Handling Machine

A contract has been awarded by the receivers of the Cincinnati, Hamilton & Dayton R.R. for the construction of a modern coal-unloading machine at Toledo, Ohio, which will cost about $350,000 and provide additional facilities for handling the road's coal traffic consigned for trans-lake shipment. The capacity of the new machine will be 40 cars an hour, and, replacing the present unloader, the capacity of the terminal will be 3,000,000 tons a season.

The steelwork will be fabricated and erected by the Wellman-Seaver-Morgan Company, Cleveland, and the foundations will be built by the Smith-McCormick Company, Easton, Penn. Work on the improvement will be started at once and must be completed, under the contract by April 27, 1915, in order to be ready for the opening of lake navigation. A feature of the new machine is that its operation will entail but a 3-ft. vertical lift, thus overcoming breakage to a large extent.

During the season recently closed a new record was established by the Cincinnati, Hamilton & Dayton R.R. when 2,000,020 tons were handled over the docks at Toledo.

Extracts from a Superintendent's Diary

Undoubtedly, we are soon to have another strike; it's in the air.

The pit committee finds something to wrangle about every day. Many little contentions hardly worth considering have suddenly become "crying wrongs" that must be righted.

Some of our foremen have been inclined in the past to yield a point here and a point there to the committee rather than waste valuable time in compelling them to live up to the spirit of their contract in little things. And now the committee is attempting to fall back upon some of these concessions, trying to force them down our throats.

The indications are that the strike is not to be local, but will affect the entire state. Some of our men who are known as good organizers are becoming very irregular about reporting for work, missing just as many days as they possibly can, without being subject to discharge according to contract, and are probably assisting to bolster up the Union organization in camps where the men are not manifesting sufficient enthusiasm.

The miners' checkweighman on our tipple has suddenly become the village wiseacre. He is literally surcharged with recollections of how we have been gouging the men on weights in spite of all his watchfulness, but he insists that it won't be possible to hoodwink him any longer, and he is proving it to the men constantly, much to the disgust of our regular tally boss, who is helpless in the matter, by stopping and starting loaded and empty cars on the scale platform in a most absurd manner, thus delaying the operations at this point unnecessarily.

We have had an understanding that required a quarterly test to be made of the tare weight to be used for the cars. Lately, we have made two special tests at the request of the checkweighman, but he is still not satisfied. It always happens that a few of the cars are missed by the men in spite of being cautioned to go into every room of the mine for the sole purpose of seeing that every empty car does get to the top; the checkweighman insists that he will not be satisfied until every car is actually brought to the scales.

As a sort of feeler, to find out just how complete is the influence of the union officials on our men, last week we gave the president of our local a chance to show his hand, and he promptly embraced the opportunity.

It happened that the said president was driving a heading that reached its limit and notwithstanding the fact that the heading just completed has been the most desirable working place in the mine for several years, we insisted that the president must take the next heading to be turned, which as it happens will be a most undesirable one because of low coal and bad top. We assured him that we regretted having to make the change, but it wouldn't do "to play favorites" (a phrase we appropriated from the president's last speech to his local). He said nothing but left the foreman's office with lowering brow.

Within two days he stirred up a hornet's nest, by suggesting a new interpretation to an old rule about extra pay for low coal and bad top when found simultaneously in an entry, and all our men are clamoring now for an adjustment in rates on this class of headings, which, if granted, will compel us to abandon that part of the mine.

Yes, undoubtedly a strike is on the way.

Concrete Lining for Steel Bunkers

When building its new plant at Duluth, Minn., the Minnesota Steel Co. also built a large circular steel tank (Fig. 1) for supplying coal to the coke plant. This tank is approximately 55 ft. in diameter, 40 ft. high and holds 2100 tons of coal. For furnishing coal for the gas producers of the openhearth furnaces there are 33 bunkers, each approximately 20 ft. wide, 12 ft. deep and 17 ft. long.

To protect these bunkers from the corrosive action of the coal, it was decided to cover the coke-oven bins with a 5-in. lining and the producer bins with a 2-in. lining of concrete, using a cement gun.

Fig. 2 shows the workmen on the inside of the round tank in the process of depositing the gunite lining. Fig. 3 is a view looking from the top into a line of parabolic bunkers after the work of gunite lining had been finished.

Numerous iron lugs were placed around the inside of the tank. To the lugs vertical rods were wired, and to the rods triangular-mesh wire cloth was secured in horizontal bands. The wire mesh was held approximately ¾ in. away from the steel and gunite was then applied. The first layer is shot through the mesh and serves to hold the wire cloth in place, thoroughly covering and protecting the steel plate. The second layer is then applied, bringing it to a total thickness of 5 in. When the work is finished the concrete is monolithic in construction and the surface is smooth and even.

The cement mortar consists of a mixture of portland cement and torpedo sand in the proportion of 1 to 3, mixed dry. It is then shot through a hose by the cement gun having an air pressure of from 40 to 60 lb. Immediately before emerging from the nozzle, the dry mixture is hydrated, the water coming through a separate and smaller hose and being under the control of the operator.

The sand in the first mixture strikes a hard surface, like a steel plate, rebounds, then falls clear of the work to the bottom in the form of clean sand and leaves a coating of cement on the surface. As soon as this coating has attained an appreciable thickness, it acts as a matrix into which subsequent deposits of material embed themselves so that the gunite in contact with the steel plate is clean cement. As a result of this, and of the pressure under which it is applied, the adhesion of the gunite to the flat steel plate runs as high as 500 lb. per sq.in.

This work was executed by the Gun-crete Co., 914 So. Michigan Ave., Chicago, Ill.

The Last Stand of the Mine Roof

By R. Dawson Hall

SYNOPSIS—An explanation of the thrusts of the roof. These could not exist if the roof was always a true beam or plate. The significance of an arch theory of roof structure, the conditions which make for localization of strain and for an unequal balance of stress, the causes of horizontal shear and the reasons for ultimate collapse are explained.

Some phenomena which at first puzzle us considerably, after a while fail to interest us at all. Such a phenomenon is "the last stand of the mine roof." We remember when we first entered a mine and heard the roof crack way up above our heads. Reasoning from analogy, we thought that the roof was ready to fall, just as an overloaded beam will when it begins to crack and split. But to our surprise the roof took on a new lease of life. Silence succeeded the ominous rending of the rock; a few props perhaps bent a little, or even broke, but the roof stayed up, silent and apparently unchanged. We have seen it so often that we have ceased to question why.

I have wearied you already by the analogy between the mine roof and a beam or plate and showed how it broke over the support on its upper surface and between the supports on its lower surface. But this is not the whole story, for a roof is by no means ready to fall in its entirety when fractured, even if those fractures reach from the workings to the surface.

The Beam Metamorphoses to an Arch

Let us suppose, as in Fig. 1, that two areas of coal have been extracted, two ranges of rooms with their pillars on either side of a double entry. The result has been a break over the solid coal ahead of the ranges of rooms at *CC* and *DD* and another *EE* over the chain pillar. The roof is also split on the underside in the midspan of each range of rooms as *FF* and *GG*. I have represented these breaks on the underside by dotted lines in the plan.

The huge blocks into which the roof is thus divided rest with their edges on the faces of the solid coal and on the flanks of the entry pillar. They promptly begin to fall forward and downward toward the open spaces, but as they do so they revolve and crowd one another as shown in the diagrammatic cross section at *F* and *G*.

The immediate effect is most harmful to the pillars. The expression generally used to express the ominous change is that the roof is "throwing her weight." Before breakage, the roof was bent into a saddle shape over the center pillar. It now tries to teeter on the edge and the change is not for the good of the room stumps. On the whole, the heart of the chain pillar is helped, but as it is customary not to have the headings anywhere near the heart of the pillar, the entries usually suffer severely and often close entirely.

The change which takes place when the roof first fractures replaces continuous beams or plates by disconnected arches or vaults. Let us now ask what constitutes a true arch or vault. It has nothing to do from a structural point of view with the form of the opening. That is really only incidental.

An arch is a structure where the stresses due to the weight combine with horizontal thrusts so that support is secured without bending-moment strain. In fact, an arch cannot exist so long as a structure is so constituted that its bending-moment strains are adequate to the support of the load. The arch may consist as in the example before you of two solid blocks only, wedged firmly into place by other blocks which may or may not form parts of other arches.

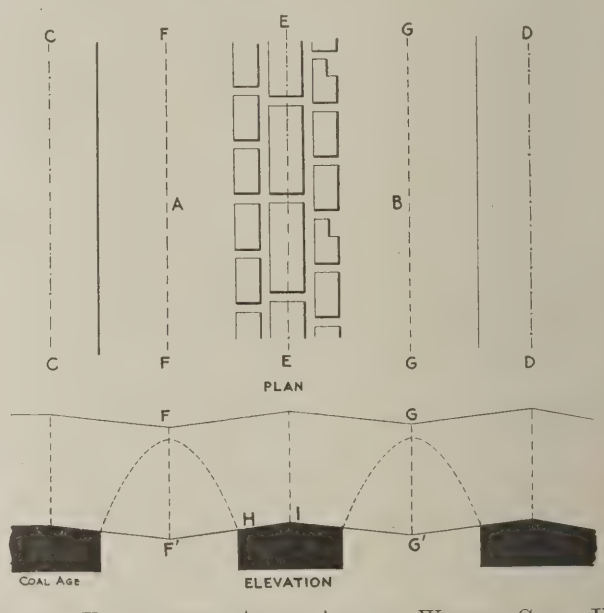

Fig. 1. Exhibiting Arch Action Where Coal Has Been Removed from Both Sides of a Heading

At each of the points *F* and *G* in Fig. 1 or near them are two equal and opposite thrusts of such a magnitude that when combined with the successive weights of the various vertical slices of rock they will form a curve of forces, an inverted funicular parallelogram passing through the arch abutments, that is, the coal pillars.

Lines of Force not Lines of Fracture

Such curves of forces I have endeavored to indicate by dotted lines on the cross-section, but it is essential that we do not misconceive their purpose. They do not represent the edges of fracture. It is true, fracture may ultimately extend somewhat in the manner indicated, but, on the other hand, it may not.

The arch is just as truly an arch if the slabs of which it is composed never show the well known arch effect. But if they do, the structure is thereby strengthened, a great load is removed from the center of the span and the thrust at *F* and *G* necessary for the permanence of the structure is reduced. And thus again further breakage tends to permanence instead of to demolition.

Horizontal Shear

It is clear that each of the two big roof slabs comprising each arch is, at the commencement of the arching action, a huge rectangular parallelopiped, or rather

NOTE—Paper read at the winter meeting of the Coal Mining Institute of America, Dec. 9, at Pittsburgh, Penn.

tends that way for probably none of the rents *CC, FF, EE, GG* and *DD* pass from the surface to the coal or from the inside of the mine to the surface, as the case may be, and perhaps the rents as far as they go are not by any means as straight as portrayed.

But supposing the blocks as giant rectangular parallelopipeds, if they are to revolve so that *F' G'* touch the mine floor they must be distorted into trapezoidal parallelopipeds as indicated in the figure, and this could be done either by a continuous deformation from the surface to the inside of the mine or by the sliding of one stratum past the one below it at points where the conditions were most feasible for that action. Where beds of slate, sandstone, shale, coal and clay appeared, the degree of malformation would be greatest and would develop soonest, roughly in the order in which those beds have just been named.

It is clear that at the mid-span *F* of the opening the deformation arises at the surface first and from the thrust

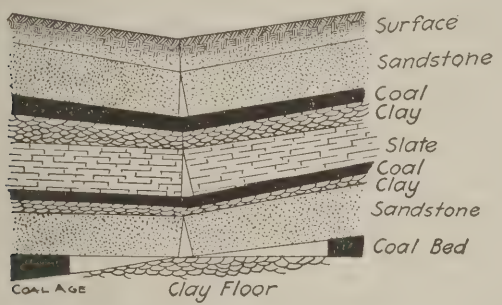

Fig. 2. Horizontal Shear Destroys Roof Mass at Its Weak Coal and Clay Strata

of the arching blocks on one another, but the deformation in the mine is from the thrust of the blocks forming the arch on the blocks against which they abut. These thrusts in the lower strata of the arch arise from those in the upper, for it can easily be seen that the block can revolve on its fulcrum at *H* without crowding at *I*, providing it is free at *F*. The thrusts at *F* keep crowding the lower strata of the roof mass toward the adjacent rock masses at *I* and *J*.

Thus all the roof is subject to horizontal shear, and if the abutting roof masses remain firm the roof will not give way till that shear has taken place and the final demolition may be delayed, as has been seen, by breakage of parts of the arch and consequently reduction in the burden to be carried.

Partial Breakage Undesirable

The partial breakage reduces thrust, but it often preserves enough of it to do the dreaded harm, and whereas a complete fall would make further pillar extraction easy, a partial fall leaves further work subject to all the dangers consequent on the existence of large vaulted areas with great crushing strength and large overturning thrusts.

Where the measures are near the outcrop, the arch is weakened by the reduced strength of the measures in horizontal shear with the consequent ease of deformation of the parallelopipeds and by the weakness and inconsiderableness of the adjacent roof masses which move freely under severe thrusts. When working against old broken areas, the abutting roof masses are not sufficiently resistant, and without much or even any horizontal shear the arched masses may settle down easily onto a support.

First Opening in Virgin Coal

But when the coal extraction starts in the heart of the hill and the roof masses around are unmacerated by the weather, unbroken by mining, vast in extent, and cannot well be thrust into flexures because other parts are not mined, then indeed it is hard to break the roof so completely as to overcome its final resistance. It is true that some compression on surrounding roof masses will permit some accommodation to the stress demands of the arched opening, but it is insufficient, and the result is that an opening in virgin coal is apt to cause a squeeze. The roof will over-ride the pillars before it will give way.

It is important to keep in mind the arch action of the roof, to visualize it by imagining spans of actual highway or railway bridges so as to get a concept of the conditions which may result in failure. It is well known that the thrust of two arch spans equally loaded per foot run will depend on the lengths of the respective spans. If the two openings are parts of one bridge and the arches spring one on each side from a common abutment, that abutment will tend to be thrust over toward the smaller span because the thrust from that span is the less important of the two.

Overturning Action

Against such an action the abutment must be designed. When the spans are equal, however, a less massive abutment will serve. It then needs only to be strong enough to uphold the downward pressures and to withstand internally all the stresses which come on it, but it does not need weight or breadth of base to cope with an overturning and unbalanced thrust. Just as an abutment between two equal spans is favorably situated, so is a mine pillar between two batteries of rooms of equal length. In some cases where the wicket system gives rooms aggregating 500 or 600 ft. on one side of the heading, and the single-entry system gives rooms about half that length on the other, the balance is far from perfect and the risk of pillar overthrow not by any means inconceivable.

Fortunately, the direction of thrust cannot be often less than 30 deg. to the horizontal, and as the coal is rarely as thick as piers are high, it is not so likely to fall over and beyond the "middle third" of the foundation even when the pillar is small.

Thrust Often Noted, but Its Source Is Overlooked

There are many mining phenomena which we overlook. I have mentioned already the partial collapse of the roof at points beyond observation, and as has been generally thought beyond stress, and also the recovery of strength of a roof which offhand might be believed to be beyond further resistance. But there is another more patent action; that is, thrust. We have all seen it and noted it, yet most of us are still convinced that the roof collapses from shear.

Testimony from all sources is that the roof just breaks and comes down; that is, shears. "Yes," some men have stated, "it breaks almost straight along the pillar edge and falls till it chokes. You can see for yourself that rock when piled in an irregular mass fills up an excessive amount of room. So the roof rock when it ultimately falls completely chokes the open space. Then only is the weight relieved."

I am persuaded that there is some truth in this story where the distance to the surface is not great. In most of such cases, shear is evidently the leading cause of demolition, and the ease of examination makes the evidence so overpowering that it is accepted as universal rather than as particular.

Thrust Is Not Rare and It Presupposes Preliminary Fractures

But the frequency of thrust should convince us that the arch action is just as common as that of the beam. If the roof did not act as an arch, there could be no thrust, and I think it true also that arch action could not exist in an unbroken roof beam. It would be a beam then, not an arch.

A continuous girder crosses abutment after abutment. The spans are now short, now long, but there is no thrust, for the truss is self-sufficing and sustains in itself its tensions and compressions just as does the roof beam till it breaks. Then it has to rely for its stability on its abutments, the pillars and the abutting roof measures, and depends on these till failure is complete.

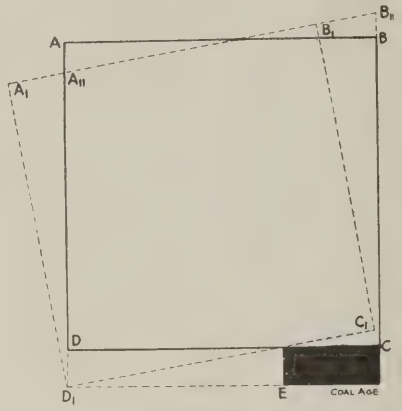

Fig. 3. Shows How the Distortion of the Roof May Easily Be Greater Than Its Subsidence

For present purposes, we will assume that the pillars do not crush, the bottom heave, the adjacent roof mass give way either by compression, folding or sliding or the falling block bend toward the opening and so by flexure reach the mine floor. What, then, must be the distortion of the block of rock which falls forward to crowd into the excavated space?

Let us suppose the block to be *A B C D*. If it fell forward unrestrained it would reach the position *A′ B′ C′ D′*, but instead it is distorted into the shape *A″ B″ C′ D′*. The vertical fall *DD′* involves the distortion *A′ A″* and *B′ B″*, and this will be greater or less than *DD′*, as *B C*, the cover, is greater or less than *D′ E*, the collapsed half span. It is also proportional to *DD′*, which is the coal thickness.

Modifying Actions

Of course the tendency is for the ends *AD* and *BC* to sag and consequently the fall is less than *DD′*; moreover, the bottom will heave and the pillar will crumble, decrepitate on the edge and compress. All these actions reduce the value of *A′ A″*. But in any event, the distortion is significant and one begins to see roof demolition in its true light. When we see how immense is the change in shape, we begin to wonder that the roof ever falls. Its strength in bending moment and still more in shear and as an arch is marvelous, though the latter resistance is soon rendered futile when the pillars or abutments on which it rests are removed.

Thrust a Local Action

But there is another consideration. You have often noticed in pictures of European churches and perhaps also in the illustrations of the new cathedral of St. John the Divine, New York City, buttresses which take up roof thrusts and curve them harmlessly to the ground. There is little prospect of such stress-line curvature in the coal pillar itself, because the load is mostly on the pillar edge and the downward pressure declines as the heart of the pillar is reached. Still the stress line in the coal rib like that in the cathedral buttress is somewhat curved in its short length and, in any event, is located definitely by Nature. That is, we may not know where it lies, but lie it does at some place and not at any other.

The curvature in a bending beam, the tilting in a broken roof mass and the arching which follows, all put pressure on the edge of the pillar and not on its center. That is why it is so important to emphasize the flanking strength of pillars rather than to consider what their power of resistance would be if they were stressed over their whole area.

By the strength of the edge, a pillar stands or falls. If the edge is unequal to the load and thrust, it is annihilated and a new edge appears. If this is unequal to the work of resistance, it fails and the burden moves back till it comes to an edge which is resistant or until the whole mass is overborne. The pillar is destroyed not

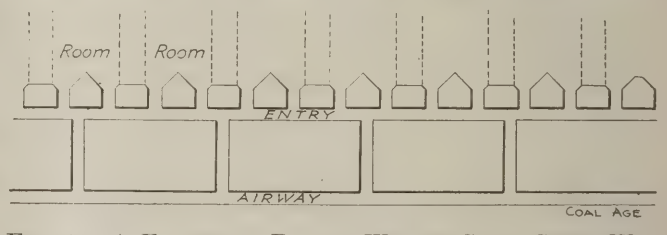

Fig. 4. A Flanking Pillar Which Soon Gives Way, Destroying Mine Entry

so much as a whole as in parts, even as an adequate army may be overcome by progressively attacking with superior forces detached battalions along the front.

Nevertheless, we always make the mistake of making the edge of the pillar weaker than the heart. It is, for instance, on the edge we break it up with room necks. Sometimes we weaken it further by widening our rooms with a 45-deg. slope on one or both sides, but everything beyond the room neck proper is gone beyond repair.

No argument based on structure can defend the funnel-necked or half-hopper-mouthed room. The only excuse for such a chamber is to be found in convenience in widening. The argument for funnel-necked rooms is that coal anywhere is a source of strength. It is about as true as the statement that a regiment anywhere, even with the enemy surrounding it, is a help in the battle line.

Two Necks to a Room or Three Rooms to a Neck

Also it is necessary to call your attention to the fact that the flank of a heading from which rooms are turned is nearly always weaker than the chain pillar which is only pierced by crosscuts. Especially is this true where double rooms are driven with two mouths to each chamber. It would be far better if we could get to the better "Main Line" or "Altoona" System and put three rooms to a neck.

Some of the expense in making room necks long and the stumps thus adequately deep could be met by reducing the size of the chain pillar and economizing in crosscut payments.

Chain Pillar a Ventilating Device Only

For the chain pillar is first, last and all the time a ventilating device and not a roof support. It does not sustain the roof. That work is done by the heading stumps if it is done at all. In fact, as has been seen, it may be seriously doubted whether the heart of a chain pillar is as heavily burdened after mining around it as it

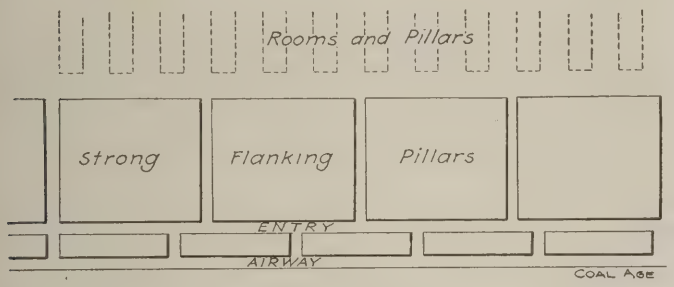

Fig. 5. The "Main Line" or "Altoona" System, with Strength Concentrated on the Flanking Pillar

was before a pick entered the territory. The old military rule of protect your frontiers is as true of mining as it is of strategy.

Perhaps I may add another military maxim: "Always respect your adversary." There has been a disposition to adopt the panel system to excess. The first man who said "panel" to me urged a panel every ten rooms. He wanted a room-and-pillar space left at every tenth room. This might work in the weak-topped Freeport measure. It might work anywhere—where it is not needed.

But when paneling is expedient, excessive paneling is worse than none at all. The roof must be given a chance to break, and if it will not break, to bend and come down. The wicket system of operation is the most desirable except where a long continuous breaking face extending from room heading to room heading is provided.

Some people favor drawing just a few rooms at a time, and then a few more. If the top breaks easily, this does no harm, for no harm can possibly be done when the roof is fragile. But where it breaks with difficulty, there can hardly be a worse method. A break is what is needed, and the area to provide one should be opened up as speedily and as completely as possible, and around that prepared break, strong pillars should be provided.

Mere Shear Theories Overlook the Facts

Finally let me remark that no matter what may be said about the roof, the statement is bound to be attacked. There are always a number of people who believe that a theory regarding anything is a waste of time and a folly. So we are told the roof is not a beam or a plate, not an arch or a vault. It is so much easier to say the roof just "comes down and chokes the opening as anybody would know if he went into the mines." Such "practical" people, as voice such sentiments, refuse to consider the question and completely overlook, as usual, the fact that they have an unacknowledged theory which put into scientific words is "all failure is from shear." Let us hear affirmatively from those whose whole attitude has hitherto been negation.

Till such a time one may be permitted to believe in a progressive advance in demolition. First, a condition as yet, I believe, unnamed, a condition symbolized by the tunnel in solid rock in which roof and sides and floor all partake of the beam strain. Second, a horizontal shear which converts the sides into mere supports and the roof into a true beam or plate. Third, a rupture of the roof which converts it into an arch, and finally, a failure of the arch or vault by one of the many weaknesses to which such structures are subject.

Composite Pit Propping in Great Britain

The following article from the Glasgow *Herald* of Oct. 26, 1914, says the *Daily Consular and Trade Reports,* shows the working of a new British system of pit propping:

"On the invitation of the Lothian Coal Co., the members of the National Association of Colliery Managers, to the number of 150, visited Newbattle Collieries, Newtongrange, to inspect the system of composite pit propping which has been successfully inaugurated in the pits there. Consequent on Germany declaring pit wood to be contraband of war, there is a perceptible scarcity in the material commonly used for propping underground. On that account the system practised in Newbattle Collieries, by which the use of pit wood has been almost entirely eliminated, has aroused considerable attention in mining circles.

"The visitors were received by the mine managers for the Lothian Coal Co. They were taken through the workings underground and shown the propping arrangements at the working faces, the machine runs, and in the vicinity of the conveyors. The composite type of support used is a steel tube containing a wooden prop and renewable end pieces. The renewable end pieces, 6 to 9 in. long, are made of seasoned larch. It is claimed that the props are easily set, that they occupy a minimum space at the face, that they can be easily withdrawn, and that when even buried under a fall of roof can be recovered if they are seen. The workmen have a feeling of security when working with these supports, as the roof is allowed to creep down steadily on the props, while the latter, instead of weakening under the load, are strengthened. Old tubes may be utilized, such as those from water-tube boilers or disused compressed-air piping. An advantage is that these composite props can be conveniently made at collieries.

"The coal company's agent indicated that the system, which was begun about three years ago, was now proving successful in every way. It took time and supervision to make it successful, but he claimed for these composite props that they possessed infinite possibilities for underground work."

The council of the Derbyshire miners has expressed itself in favor of electric lamps. Recently this council discussed a proposal to introduce electric lamps at the Glapwell colliery. It was pointed out that the spread of nystagmus among the miners was a serious matter, and that the leading medical authorities had expressed the opinion that the general introduction of the electric lamp in collieries would mean a diminution of nystagmus cases, and might lead to the stamping out of the disease altogether.

Meeting of Coal Mining Institute of America

By R. Dawson Hall

SYNOPSIS—The session at Pittsburgh was well attended and fully up to the high standard maintained by the organization. The papers were of exceptional merit. No summer meeting will be held next year.

The Coal Mining Institute of America met at Pittsburgh, Dec. 8, with the officers afflicted with a severe attack of the blues. The summer meeting at Monongahela, Penn., had been a comparative failure; the finances were in as unfortunate a condition as at any time in the history of the organization and "ways and means" seemed the most important matter to discuss.

But Pittsburgh always seems to galvanize the institute into life. The winter meetings held there are always successful, many members coming from long distances to take part in the discussions. Even a summer meeting called almost without notice was fairly attended eighteen months ago. But as has been said, the officers arrived discouraged and proposed dispensing with the summer meeting, and the members showed no resentment so the recommendation was adopted.

But the idea did not arise out of the attendance at the winter session. No more successful meeting was ever held. Someone had overlooked sending invitations to the Carnegie Technical School and the University of Pennsylvania, relying on the newspapers to do the work. The papers though furnished with printed press notices of the meeting were too busy recording the war to have space for technical societies. As a result the attendance of the institute consisted solely of members and yet was larger than a year ago when numbers of students filled the chairs.

The Annual Election

The morning was devoted to the election. Unfortunately the full attendance had not then arrived. The returns were as follows:

For president: J. K. Johnston, East Haven, Conn., 23; W. Seddon, 18.

For first vice-president: W. Seddon, Brownsville, Penn., 24; W. R. Crane, 8, and J. Williams, 8.

For second vice-president: J. Williams, state mine inspector, Altoona, Penn., 26; W. R. Crane, 11, and R. D. Hall, 5.

For third vice-president: W. R. Crane, dean of mining, State College, State College, Penn., 20; R. F. Monteith, 11; C. L. Clark, 9, and H. Kinlock, 8.

For three executive board members: George E. Gay, consulting engineer, Uniontown, Penn., 39; W. E. Fohl, consulting engineer, Farmers Bank Bldg., Pittsburgh, Penn., 35; J. Knapper, state mine inspector, Philipsburg, Penn., 34; C. L. Clark, 29.

For secretary-treasurer: C. L. Fay, president, Lehigh Oil Co., 18; C. L. Clark, 13; R. D. Hall, 7; S. B. Smith, 5.

It will be seen that J. K. Johnston and C. L. Fay have been reëlected, which is evidence of the confidence the members have in their management of affairs.

Longwall in Pittsburgh Measure

The afternoon session opened with the president's address and as is usual in such institutes, it dealt with the discouraging question of finances. Then the question box was opened with W. E. Fohl in the chair. W. Seddon opened the discussion on the query: "Is the Longwall System Applicable to the Pittsburgh Seam of Coal?" S. A. Taylor followed, pointing out its lack of applicability to the bed in Ohio which is known as the No. 8 seam. The roof breaks up too high, sometimes as much as 20 ft. and the bottom is too soft.

Leo Gluck, formerly assistant to the president of the Pittsburgh Coal Co., and for some time engineer of the Spring Valley Coal Co. in Illinois, spoke on the Illinois longwall methods and the conditions under which difficulties were encountered. Mr. Gluck declared that the irregular work in the Pittsburgh region would make longwall operation difficult as steady work day by day is desirable. Mr. Lewis emphasized the difficulties of driving longwall forward with a straight face and said that in Nova Scotia he had found that the scalloped working line gave far better control. T. A. Mather and W. H. Howarth also discussed the question.

Longwall Is Commercially Feasible if Someone Will Volunteer to Build the Packs

The criticism of the discussion made by one of the speakers was quite apposite. Nearly everybody avoided saying anything definite about the adaptation of longwall to the Pittsburgh measures. Those who did declared against any longwall advancing methods. The only possible form of longwall favored was retreating and the evident consensus of opinion was that a longwall which was a mere development of room and pillar was the only possible solution. By reducing the widths of the rooms and by increasing the size of the pillars, a long cutting face is obtained without any need for packwalling.

The miner today wants a definite pay for cutting coal and extra for building a pack. Though longwall coal can be dug more easily and rapidly than room-and-pillar coal, he wants to get the same price per ton. As for the packwalling, he will graciously consent to let the operator do it for him, if in so doing he will keep out of his way and not hinder the movement of cars to the face. That is largely why longwall fails and will fail. Neither miner nor operator seeks to sustain the severe burden of conservation of fuel resources.

The Vexed Question of Voltage

John I. Pratt opened up the question, "What Is a Safe Voltage for Use in Coal Mines?" He urged the abolition of overhead wires underground. No one doubts but what the trolleyless locomotive and the leadless coal cutter are desiderata but it will perhaps be some time before the first is generally used for main-line service, despite its unquestionable excellencies for gathering coal cars.

The difficulty of excessive weight and size *might,* however, be excused in such a locomotive but clearly a mining machine propelled by cells is at present too cumbrous for consideration. It is true the batteries could be kept on the rails but in that case, the mining machine would have leads and the present dangers would only in a small degree be eliminated.

W. A. Thomas, who was scheduled to reply, was not present. J. S. Jenks spoke in favor of high-voltage, saying that while much inadequate low-voltage equipment was on the market, the high potential equipment was generally reliable. Anybody could make the former, and competition caused frequent departures from safe practice.

He advocated the use of oil switches and, on an inquiry being made, denied that any risk of fire was to be apprehended from such apparatus if properly constructed. The temperature rise should be negligible and the flash-point of the oil such as to eliminate risk. He did not think that the one English instance mentioned by the questioner was an important evidence of the dangers of oil switches or would indicate that they should be excluded from any coal mines. It had been argued that where there was no danger of gas it was a mistake to introduce the oil switch and expose the mine to the risk of an oil explosion or a fire.

Mr. Jenks is not an enthusiast in the matter of high voltage, for while advocating 2200 volts alternating current for distribution purposes, he recommended that the voltage be reduced to 220 volts before the current was used or passed along open wires.

Do Compensation Laws Decrease Accidents?

E. N. Zern replying to the question, "Do Compensation Laws Increase or Decrease Accidents in Coal Mines?" spoke quite favorably of the effect of such legislation. This should be stated because the local press, emphasizing what was said about malingering, misconstrued Mr. Zern's remarks. Mr. Zern addressed a letter of inquiry to several operating concerns and his article was a brief of the replies. One operator reported an increase in accidents and eight others a decrease since the compensation laws went into effect. Twenty-five operators denied that there was any increased carelessness on the part of the miners. Ten found evidences of malingering, fourteen found none.

It appeared that the reform legislation quickened the conscience of the operator without any apparent dulling of the miner's sense of duty. The employer took an increased care to guard the workingman as a result of his knowledge that he must compensate the latter for all injuries. John Simpson refused to discuss the matter as the law had been in force at his mines only a few months and during quite a large proportion of that time the mines were idle. S. A. Taylor declared he had suffered from a perfectly obvious piece of malingering and he introduced the statistics from the State of Washington, to show that accidents had increased immensely since the compensation law went into effect.

Portable Electric Lights

Gus. H. Deike read an interesting paper in answer to the question, "What Are the Advantages and Disadvantages in the Use of Portable Electric Lamps?" J. L. Ryan, who was also scheduled to speak, was unable to be present, owing to ill health. E. M. Chance said that the Philadelphia & Reading Coal & Iron Co. had had marked success with electric hand lamps so long as they were used by officials but had found the results less favorable as soon as the lamps were given out promiscuously to all the men in the colliery. The cry about the failure to detect bad air had also been raised relative to acetylene lamps, but he hardly thought it worthy of the consideration given to it.

F. A. McDonald, chief engineer, National Mining Co., stated that there was difficulty in inducing the miners to accept flame safety lamps but that the men had taken quite kindly to the electric cap lamp, and he had found that it gave satisfaction, doing away with the necessity for mixed lights. It thus "filled a long felt want in the Pittsburgh district." He said the National Mining Co. had tried lamps of 10 different makes for several months and is now buying more. The compensatory provision in the mining scale is insufficient in itself to recoup the operator for his loss in introducing the lamps but the increased safety makes up for the defect in the differential.

Mr. Dunbar stated that there was really no objection to the safety lamp. Where it was used exclusively there was never any lack of men. It was in the mixed-light mine that there was difficulty in introducing safety lamps.

Regulation of Coal Prices

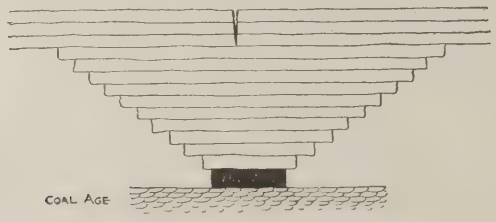
The banquet in the evening was addressed by H. Martin Chance, of Philadelphia, Penn. Mr. Chance said that the coal business needed no further regulation. It had already been subjected to enough. The wage of the employee, it is true, had not yet been made a part of legislation, nor had the actual price of coal, but only these items remained for further legislative interference. Perhaps no one present adequately realized, till the speaker pointed it out, how extensive and apparently burdensome the regulation was. T. L. Lewis, former president of the United Mine Workers of America, pleaded for a law setting a minimum price for coal and for a new era of safety and conservation in place of present ruinous competition.

Pollution of Rivers by Mine Waste

C. M. Young, of the University of Kansas, followed with an address on the pollution of streams by sulphuric acid. He has been conducting an investigation for the federal government to ascertain the causes, effects and means of correction of that condition. He said that the federal authorities were indisposed to put a burden on the coal industry by requiring it to remove the acid from the mine water but he could not say what might be done. Certainly the condition was liable to get worse rather than better as the streams were fast becoming acid, the natural alkalinity being removed by chemical reactions with the sulphuric acid of the pickling plants and the "sulphur water" of the mines.

Mr. Young said that the mine waters could be utilized to make paint, fertilizer and chemicals for gas purification. Whether ferric hydrate is merely a stimulant or a real plant food is not clear but certainly vegetation shows excessive greenness wherever this chemical is deposited by water. The sulphuric acid in the streams is causing some damage to locks and a solution is desirable if the cure is not more expensive than the injury it repairs. Prof. H. H. Stoek, dean of mining of the University of Illinois, though announced, was unable to be present.

An Embargo on British Coal



On the second day, Dr. E. W. Parker read an article on the "Foreign Trade of the United States." Dr. Parker suggested that Great Britain would probably shut off the export of her coals for fear of their ultimate exhaustion. Someone took strong exception to this and indeed anyone acquainted with the individualistic spirit of the British would find it hard to believe that they could

adopt such a policy before other nations. They may copy social measures of that kind but even the most serious necessity will not induce them to initiate them. As was stated, the 25c. export tax on coal was hardly imposed before it was removed.

E. C. Roberts spoke favorably of briquetting fuels for foreign use. E. M. Chance declared, however, that the finer sizes of anthracite, known as slush, were often too impure for the making of good briquettes. E. W. Parker urged that ground barley and rice coal would make a good grade of boulets at a lower price than could be placed on anthracite coal of equal size. It seemed generally believed that the boulet trade suffered from the antagonism of the anthracite retailers who found it competed with the unsophisticated egg coal.

The Progress of the Roof from Beam to Arch May Be Reversed

R. D. Hall read a paper on the "Last Stand of the Mine Roof." Lack of time prevented a sufficient criticism of this paper, but S. A. Taylor's comment, hardly understood by the reader of the paper, was nevertheless much to the point. He thought that when the mine roof was resisting as an arch, a large fall of the material composing the span might so reduce the loading that the bending-moment stresses might be able to take up the burden.

A Cantilever Mine Roof

The split in the roof may not be sufficient to destroy the beam resistance. The breaking of the beam over the open spans enables the tensile stresses to cope with the roof loads.

In fact it does seem that the change of the roof from a beam to an arch may be a gradual transition and may as Mr. Taylor suggests be retrogressive on occasion as well as progressive. The illustration shows a condition where the fracture at the surface may be insufficient to prevent the roof from acting as a cantilever after large falls have taken place in the spans on either side of the pillar.

C. L. Clark thought the author's criticism of his own paper was justified in that sufficient stress had not been laid on the dome as opposed to the arch structure. On motion of W. E. Fohl, it was provided that the editor and author should republish the two papers previously presented by him on that subject in the proceedings for 1914 so as to make the series complete.

Dr. Crane Describes His Interesting Experiences

Dr. W. R. Crane spoke at the afternoon meeting on "Personal Observations in Alaska." This was perhaps the leading feature in the program though a thoroughly untechnical number. Sumner S. Smith, U. S. mine inspector for Alaska, addressed the meeting on mining frozen ground.

L. M. Jones, assistant mining engineer of the U. S. Bureau of Mines, read a paper on "Coal Dust Experiments at the Experimental Mine, Bruceton, Penn." It seems that the failure of the Taffanel barrier in case of light explosions is probably due to the inability of such explosions to perform the task of upsetting the boards loaded with shale dust. At first it was suggested that the Taffanel barriers failed because they were completely discharged of dust before the last of the flame reached that point in the gallery. To correct this a barrier which could be partly discharged by a light wave and then completely destroyed by a heavier one was designed. The principal value of the Rice barrier appears now to lie rather in its sensitiveness than in its double-barreled action.

Kentucky Mining Institute

The regular mid-winter meeting of the Kentucky Mining Institute was held in Louisville, Ky., Dec. 4 and 5. There was a good attendance at this meeting, in the neighborhood of sixty coal men being present. The papers presented were interesting, and the discussions that followed their reading were of much educational value. The program was carried out practically as published in Coal Age, Nov. 7, p. 752. It will only be possible here to refer briefly to the several papers read, many of which were discussed by the members present.

The meeting was called to order Friday afternoon, at 2 o'clock, by the president, H. LaViers, of Paintsville, Ky. In the absence of the mayor of Louisville, the address of welcome was made by Charles F. Taylor, of the Board of Public Safety. A telegram was received from George H. Cushing, Chicago, Ill., expressing regret at his inability to be present; and his paper, dealing with the opportunities for an increased export trade for coal, was read at a later session. F. V. Ruckman, general manager, Highland Mining Co., Providence, Ky., read an interesting paper on "Coal Mining in Western Kentucky." This was followed by another paper presented by J. W. Paul, of the Federal Bureau of Mines, entitled "Some Benefits of First-Aid Work in Mining." An informal address, by J. T. Beard, on the need of more intelligent and efficient mining laws and legislation, closed the session.

At the banquet in the evening, White L. Moss, vice-president of the Continental Coal Corporation, Pineville, Ky., acted as toastmaster, and the occasion was enjoyed by all present. The speakers were H. LaViers, president of the Institute; Frank H. Cassell, president Merchants and Manufacturers' Association, of Louisville; W. H. Cunningham, of Ashland, and E. B. Wilson, of Scranton, Penn.

Following the reading of Mr. Cushing's paper on the coal-export trade, at the Saturday morning session, the Institute listened to a very interesting and profitable paper by K. U. Meguire, president, Harlan Coal Mining Co., Coxton, Ky., which discussed the features and possibilities of the Workmen's Compensation Law in Kentucky. The constitutionality of the law was then being considered by the Court of Appeals, which was expected to make its report the following Tuesday or Wednesday. After the reading of Mr. Meguire's paper, Assistant District Attorney Caldwell, of Frankfort, at the request of the members, outlined the general procedure that would be followed by his office, in case the constitutionality of the law was affirmed. Mr. Caldwell stated that proper blank

forms and instructions would then be issued and distributed to the coal companies for their information and direction.

Prof. C. J. Norwood, dean of the College of Mines and Metallurgy, of the State University of Kentucky, then read an interesting paper describing the need of the better education of miners, and the efforts being put forth by the university, to that end. This paper was followed by a very practical paper on the "Humidifying of Mine Air, as Practiced in Eastern Kentucky," which was prepared and read by J. W. Reed, assistant inspector of mines in Kentucky.

Owing to the heavy rain falling, few of the members made the projected trip to the Speed Cement Works, in Indiana. Those who availed themselves of the invitation were amply repaid by the demonstration given at the works, where a blast of 960 lb. of dynamite was exploded in the quarry, dislodging 960 cu.yd. of rock.

In the evening, the members of the Institute were entertained at a local theater, where they witnessed Billie Burke, in "Jerry." During the sessions, the privileges of the Engineers' and Architects' Club were extended to the members of the Institute by Malcom Elliott, president of the club.

It is to be regretted that it will be impossible to publish in full, in COAL AGE, the several papers presented at the meeting; but these will be abstracted in future issues.

A Unique Advertising Scheme

A Denver coal and coke company recently used a novel advertising scheme. An ordinary 10-in. electric fan was installed in the window, over which was placed a heavy wire guard, shaped like an inverted wastepaper basket. Inside and fastened to the upper part of this guard, six red lights were hung. Next, two dozen red ribbons, a half-inch wide and eighteen inches long were attached to the upper part of the guard; then chunks of coal about the size of a cocoanut were piled around the whole in pyramid form having a 12-in. opening at the top. Through this opening the ribbons projected, and were kept extended and fluttering by the draft from the fan.

At night a distance of forty feet away, the combination presented a vivid spectacle as of a mass of coal on fire with flames belching from the top. Placards, quoting prices and telling of the superior qualities of the coal handled by the firm were distributed about the window.

Many considerations should be taken into account when selecting the type of rail bond for any given track service; otherwise, the bond may fail to give satisfactory results through no fault in its design or construction. The first thing to be decided upon in making such a selection is whether the bond shall be concealed or exposed. In laying new tracks, bonds can be placed under splice bars at little or no additional cost, provided, of course, there is sufficient space for them. In this position they are protected from breakage, due to external causes, but are not open to visual inspection, nor can their conditions at later periods be determined except by making electrical tests at the joints.

How Much Longer Will He Be Driven?

The Labor Situation

SYNOPSIS—The Colorado strike is declared by the Union to be at an end. Another conference is planned in eastern Ohio.

The Colorado strike at last has come to an end and none too soon. The public will perhaps say how much better it would have been if the operators had conceded what the miners asked and saved for the country the eighteen million dollars which the struggle cost. The operators will say the same about the miners. Surely neither side can risk such a collision again for many years.

The operators can well afford to meet the possibility of renewed agitation by giving every reasonable and unreasonable assurance of their determination to subject their mine weights to the most careful supervision and to comply with every tittle of the law. Gradually by education they can bring their men to have a clearer conception of the economic situation and by taking the public into their confidence can assure themselves a better hearing than in the past before the bar of public opinion.

The union officials have paid out more than $3,000,000. The loss of wages is said to amount to more than $6,000,000; 66 persons have been killed and about 50 injured. It is disgraceful that disorders have been permitted to run to such length without prompt and due state control.

Mistakes in Publicity

The operators have been unfortunate in their publicity. There is no question but that the testimony given before the Federal Relations Committee about the booklet "Facts concerning the Struggle in Colorado for Industrial Freedom" must have done much damage. Yet only one bulletin was found to be at fault while the Union publications and the public-press notices have been full of the most obvious misrepresentations from end to end. It all goes to show that the operators are held far more accountable than their persecutors for what they say and do. As it is, a thousand people have read the criticism to one who has perused the book.

It is unfortunate that the operators did not, on the title page, acknowledge their action in publishing the volume. It is a mistake to veil such attempts to influence public opinion and, in this case, the disguise was so feeble as to be dangerous. All attempts to lead the public should be open and above board and the writer of the paper ought to be willing to acknowledge his work. As a matter of fact, no one was foolish enough to believe the book was a publication put out by nonunion miners in defense of their resistance to the Union. Such paper, editing, language and circulation argue the backing of money and education and no one was deceived.

The Conclusion of the Strike

The mine workers' officials pretend that the strike ends as a victory, though they find it hard to back up the statement with facts. The so called strikers are to try to obtain work. Those who do not will be supported by the Union in the tent colonies as before the strike, according to the statements of the Union officials. Meanwhile, Low, Mills and Gilday will make their inquiry and the miners hope they will yet get the recognition they desire and a commission which will regulate mine employment. The Federal Commission on Industrial Relations expected to complete its work on Dec. 16 and to leave for Washington, beginning further hearings on Dec. 28.

The Conference Which Failed to Confer

The development of interest in the labor situation in Ohio during the past week was the effort on the part of certain officials of the Ohio district of the United Mine Workers organization to call another conference of operators and miners to discuss the situation in eastern Ohio. The date set for the conference was Dec. 11 and the place, Canton, Ohio. But the operators were skeptical and refused to attend. Moreover, only a few of the miners appeared and so no meeting was held. The harmony committee of Wheeling, W. Va., was back of the conference. This is composed of the merchants doing business in the districts where the strike still continues.

No Open Shop in Ohio

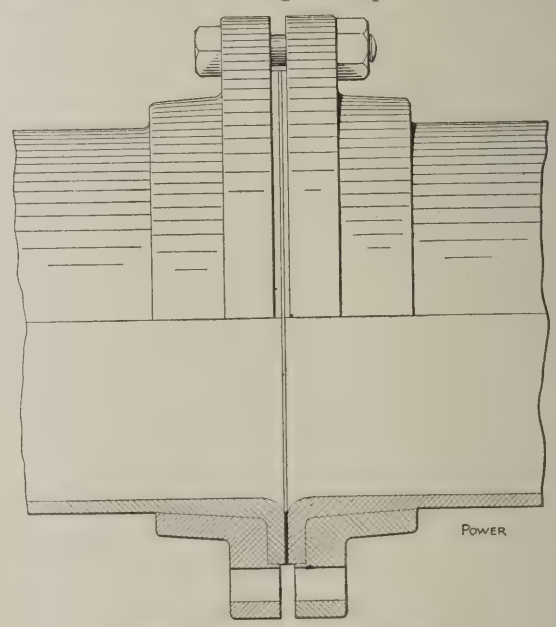
At a meeting of eastern Ohio operators in Cleveland last week the question of opening mines on the "open shop" plan was discussed pro and con. It was learned that quite a majority of the operators were opposed to employing strike-breakers and as a result a declaration against the plan was made.

The sentiment of the meeting was that the operators would wait until after the convening of the next legislature in the hope of having the mine-run law repealed. Quite a few of the operators wanted to re-open their mines but they gave in to the larger number. It is doubtful if there is any strong sentiment in the legislature for the repeal of the measure but a strong fight will be made to that end.

A temporary agreement was made with the miners by the Oden Valley Coal Co., just west of Conesville in the Coshocton district. This fixes a price of 67.6c. per ton for pick-mined coal and the operators are to return the empty cars to the point of loading or are to pay at the rate of 4.5c. for pushing.

The West Wheeling Mine, it is said will reopen on Monday on a profit-sharing basis. It is said the Ohio Mining Department has been at Bellaire inspecting the mine. It is thought that other mines may test the value of such arrangements. The effect of profit-sharing as opposed to operation under a scale will be to utterly disrupt the Union and it will probably bankrupt the coal companies also.

The "United Mine Workers' Journal"



The "United Mine Workers' Journal" has appeared as a magazine. Instead of 8 pages, there are 32 including the advertisements and the cover. Its appearance is certainly more attractive than it was. The magazine measures 10½x13½ in. and will appear weekly as before. The operator will do well to notice an important innovation. Parts of the paper are published in three languages, English, Italian and Slovak. It is time that operators did as wisely as the Union in providing their men with information. They should impress their viewpoint on their employees year by year as steadily as the Union emphasizes its aims and ideas on its followers.

In Arkansas the strike still continues. E. Stewart, who is investigating conditions for the Federal Department of Labor, says it will last all winter.

Improved Reinforced Van Stone Joint

A type of Van Stone joint, known for a number of years as the improved reinforced lap joint, says *Power* for Nov. 17, is made by spot welding a collar to the end of the pipe, which is then flanged.

After flanging, the joint is faced on the front, edge and back and turned on a regular taper to the end of the

DETAILS OF NEW LAP JOINT

collar to fit a correspondingly tapered bore flange. The matching is done so that a neat fit is obtained between the pipe joint and the flange.

This joint gives about one and a half times the thickness of full-weight pipe on the face and double the thickness of the pipe through the curve. The joint, see illustration, is manufactured by W. K. Mitchell & Co., Inc., Twenty-ninth and Ellsworth Streets, Philadelphia, Penn.

Who's Who in Coal Mining

Leo Gluck

Another coal man, of long experience in coal-company service, has entered the ranks of the professional consulting engineers. The individual we refer to is no less a person than our good friend Leo Gluck, of Pittsburgh, Penn., who has just recently resigned his position as assistant to the president of the Pittsburgh Coal Co. The following record, therefore, of Mr. Gluck's work and accomplishments is of particular interest at this time.

His early education was obtained at the St. Louis Manual Training School, from which institution he graduated in 1883. From 1886 to 1889, he studied practical mining methods in the mines of Missouri, Illinois, Kansas, Colorado and Michigan. In 1889 he was graduated

Leo Gluck

from the Washington University, St. Louis, Mo., with the degree of mining engineer.

Following the completion of his university work, he accepted a position as chemist with the Mine La Motte Lead Co., of Mine La Motte, Mo. While serving this company, Mr. Gluck obtained valuable experience in the mining, milling and smelting of lead ores. From 1890 to 1893 he was assistant to the state geologist of Missouri, making a specialty of economic geology of coal. From 1893 to 1896 he worked for the Spring Valley Coal Co. in Illinois, holding the position of mining engineer. It was during this period that he received a State Inspector of Coal Mines certificate for the State of Illinois.

In 1896 Mr. Gluck left the Illinois field and became connected with the engineering department of the Anaconda Copper Mining Co. and the Senator W. A. Clark interests in Butte, Mont. He served these people for three years, when he was appointed superintendent of the Whitmore Mining Co., Leadville, Colo. This work held his attention for one year.

In 1900 Mr. Gluck returned to Illinois, and for six years thereafter served the Spring Valley Coal Co. as chief engineer; at the same time he acted in the capacity of consulting engineer for the Illinois Third Vein Coal Co. In 1906 he was appointed chief engineer of mines for the Chicago, Milwaukee & St. Paul R.R., this work taking him through properties in Colorado, Montana, Iowa, Utah and Illinois. In 1907 he severed his connection with the railroad people to accept a place as assistant to the president of the Pittsburgh Coal Co. This latter work has occupied his attention for the past seven years.

Mr. Gluck is widely known throughout the coal industry of the entire country. His experience has been so varied in its general character, and of such a broad scope, that he is specially well fitted for the general line of engineering work he has now entered.

Recent Legal Decisions

Rights of Owner of Coal in Place—Where coal in place is conveyed by deed, as distinguished from a mere lease, two separate perpetual interests arise: Ownership of the surface and title to the coal. The owner of the latter does not lose his title thereto howsoever long he may delay in removing it, unless, of course, the time for removal is expressly limited. (Indiana Appellate Court, McBeth vs. Wetnight, 106 Northeastern Reporter 407.)

Coal Company's Liability for Subsiding of Surface—A coal company is not liable for injury to the pipes of a water company laid under a township road in Pennsylvania, caused by the surface of the road subsiding in the conduct of mining operations by the coal company, if the water company laid the pipes without condemning the right to do so, since, being a trespasser, the water company cannot complain of an injury inflicted upon it without wantonness. (Spring Brook Water Supply Co. vs. Pennsylvania Coal Co., 54 Pennsylvania Superior Court Reports 380.)

Contributory Negligence of Injured Miner — Employer's Duty Concerning Appliances — Judgment against defendant coal company for injury to plaintiff, a miner, while engaged in moving an undercutting coal machine, is reversed on the ground that if he was injured while knowingly doing his work in a dangerous manner, in violation of instructions, he could not recover. But if the appliances were not in reasonably safe condition, and if the company was chargeable with notice of a dangerous defective condition which directly caused the accident, and if plaintiff was not chargeable with such notice, he can recover, although negligence of a fellow employee may have contributed to the accident. Plaintiff cannot be held to have assumed the risk of any defective condition which existed unless he knew thereof, or it was obvious. (Kentucky Court of Appeals, Fluhart Collieries Co. vs., Meeks, 169 Southwestern Reporter 686.)

Validity of Coal-Weighing Ordinance—It is within the legitimate police power of a town or city to adopt an ordinance requiring coal and other bulky commodities sold within the city to be weighed on public scales. "It will be noted that the ordinance does not require products weighed in the city to be weighed on public scales, where they are not to be sold or offered for sale within its limits. A municipality in the exercise of its police power may enact and enforce regulations for the protection of its inhabitants against false and fraudulent weights in the sale and exchange of bulky commodities." But enforcement of such an ordinance may be enjoined if ample provision is not made for weighing. Nor can the ordinance give the public weigher full discretionary power to fix the tare and reductions from the gross weight of coal, "according to the custom of the trade, or as conditions necessary to fairness and justice require," and make the tare or reduction thus ascertained by him a conclusive determination of the same. On the other hand, it is no objection to the validity of such an ordinance that it tends to destroy the business of a particular dealer. "Whatever injury or inconvenience one may suffer in such cases, he is, in the eye of the law, compensated by sharing the common benefit resulting from the exercise of this power for the protection and benefit of the public." (Georgia Supreme Court, City of Cartersville vs. McGinnis, 82 Southeastern Reporter 487.)

Editorials

It Is Not Full Pocketbooks as Much as Thankful Hearts that Make a Merry Christmas

A mine manager, perplexed with the problem of making ends meet, sat in his office a few days before Christmas. He could see from his window the big stores all filled with holiday goods. "The Blues" somehow obsessed him as he looked at the visible signs of "Merry Christmas" and thought of the hundreds employed by his company whom he could hardly imagine having a happy Christmas this time.

In his fit of melancholy he was forgetting that happiness and thankfulness are to be had even when money is scarce, but he couldn't see it that day.

He thought of all the work his company had done in looking after the safety and welfare of its employees, improving living conditions by furnishing comfortable and clean homes, pure drinking water, fenced gardens, sanitation, etc., to say nothing of schools, churches, picture shows, and efforts to keep the men from throwing their earnings away for beer, whiskey, etc. He had learned to love all this work. In fact, he was just the man his company wanted to carry out its policies through good times and bad.

But there were still outsiders who, in spite of visible signs of material progress and contented workmen, accused the company of ulterior motives, and today the manager was blue. To get rid of this depression he went out in the street for a walk.

Almost the first man he met was an old employee, a miner who had been in the service for years. Greetings were exchanged and the manager inquired as to how things were going. To his astonishment the miner said:

"Well, very good. I never had so much to be thankful for as now. Of course my four boys are working only half time, but I'm grateful for that. We've a little laid by, and I know the company is doing its best for us."

"But," the manager said, "How can you feel so thankful as you say?"

"Why," the miner replied, "It's when I look across the sea and think of my old home in England and where my four boys might be if I had not come to America, that I am happy. They would all be fighting there, and here they're safe at home with their wives and children.

"Thank God for America," the old miner said. "It's a grand country to live in, and it is companies like yours that make it better every day."

The manager was getting interested now and skilfully he drew still more on the miner's store of thankfulness. He learned how as a boy eight years old he had first entered the mines in Scotland because his presence in the pit meant another car in the day's turn for his father. The miner told him of how his first work was in 12-in. coal with a band of fireclay overhead; how the men must cut and take down with them their own mine timbers and often leave home at three in the morning to be first in the mine so as to get the first cars, and so on. Then, briefly he told the manager of what it meant to work in such mines as his company operated, where safety was first and the turn and wages were absolutely fair.

The manager interrupted and asked:

"Well, how about the rest of the men—how are they going to be fixed for Christmas? Will they be thankful too?"

"Why sure," the miner replied. Then he explained that since the yards were fenced, nearly all had winter gardens and many had a cow and chickens. Also that since the plan of operating the commissaries to make money off the men had been changed, so that the stores were run solely as an aid to them; the miners could buy the best goods as cheap or cheaper than elsewhere.

"And you know," the miner said, "you've got rid of the loan sharks and all those kind of people, and as the result of your policies you've trained the men to save some of their earnings. Oh, the men have all got lots to be thankful for this Christmas."

The manager went back to his desk and in his heart there was more of Christmas cheer, thankfulness for what his company had done for its men, and a strong determination to do more.

The foregoing is a true story. Many a mine manager can duplicate it in nineteen fifteen. How many will?

The Roscoe Letter

We are in receipt of a letter on the letter head of Eclipse Local No. 854, United Mine Workers of America, stating that the Union at that place has passed a set of resolutions asking for aid on behalf of those persons in that community who are in need of help.

They state that the miners in that town have been idle because of the war in Europe which has stagnated industry and owing to the lack of rain which has prevented the shipment of coal down the Ohio River to the Southern ports.

Leroy R. Bruce, who is secretary-treasurer of the Relief Committee and who asks for "anything in the line of food, clothing, blankets or money," says truly "The cotton grower of the South has been affected by the war and has raised the cry for help. We say help him, but do not forget the coal miner when you are doing it."

We have written to Roscoe to ascertain the facts in the situation and find that they are as represented. In reply to our letter, F. W. Allison, secretary of the Roscoe Welfare Association, writes that:

> While conditions are very bad here and all along the valley, we in Roscoe and vicinity believe we can, at present, take care of all appeals for help. Our people are responding nobly to the demands made upon them. On Wednesday evening, Nov. 26, 1914, a meeting of citizens was held and an organization was formed comprised of miners, business men, clergy and physicians to look after needy cases. As treasurer, J. W. Stevens, assistant cashier of the First National Bank of this place, was elected to take charge of all finances, and we believe that this organization, the "Roscoe Welfare Association," will conduct its affairs on strict business principles.

We are fully of the opinion that not only in Roscoe, but in many other places money is badly needed to tide the miners over the present severe depression. We hope everyone will do his best to see that the good name of the mining industry is not injured by niggardliness at this time.

The cry of a portion of the public will undoubtedly be: "Take care of America first and let Belgium go by the board." We should undoubtedly take care of our own people, no matter if seven million hungry persons need our help in Belgium. As a matter of fact, we are hardly measuring up to our high standard as Americans. We have hardly a right to pride ourselves as worthy of our heritage till we give more liberally to both our own people and that other nation which has cast its very life as a bleeding oblation to Liberty.

Let us take a look at our generosity to Belgium. To the Belgian Relief Fund, apart from the Rockefeller contributions, we have given perhaps a cent and a quarter per inhabitant of this country, including money, gifts in kind and promises, and to the Red Cross four-tenths of a cent. The men, women and children of the United States have not given more than three cents to the European war per head of population. Let us give at least another three cents to the miners and others who are suffering from the stagnation of business and if that does not suffice perhaps we can even find a dime. Our national honor demands that much liberality.

The people who are so urgent to help America first are many of them helping neither America nor Belgium, except as they assist the former through payment of their taxes. Seeing the Belgian Relief Committee only demands 4c. per ration per day from those who can pay for the food which the committee supplies, apparently the Belgian poor are living on less than a nickel a day. From what we have been able to learn, however, the cost of the food supplied will be about 5c. per diem. We are firmly of the opinion that if the Belgians can live on that, no one need starve here. Rather let those of us who have a competence open our hearts and give. There is no need that any miner or any workingman whether here or in Belgium should suffer from starvation.

Meantime, someone should volunteer to collect and distribute money to those who are in need, not only in Roscoe, but in many other places. In no better way could the solidarity of the salary earners and the miners be better shown. We do not doubt but what the records of many company stores will show a clear sense of duty on the part of operators to whom mining has this year been anything but a source of income. Others, few in number, who have given their men steady work and whose employees are consequently well cared for, could help to swell a fund to aid miners in places where, owing to trade conditions, business has been sorely depressed

A Shakeup in the Anthracite Industry?

As time goes by, it is becoming steadily more evident that the big hard-coalers are acutely feeling the loss of their powerful leader, Mr. Baer. As is well known, the responsibilities of Mr. Baer's office were distributed among a number of men, and there are persistent rumors current pointing to a breakdown of the harmony that has always been so characteristic of the anthracite trade.

For instance, close observers of anthracite conditions are of the opinion that there is a marked tendency to force the market this year, and there has arisen a latent suspicion between the different companies that their rivals are not in every instance adhering rigidly to circular prices. Certainly, the production records some companies are making, as compared with that of others, would tend to substantiate this contention. In fact, there are some who believe that, unless there is a prompt readjustment and a more thorough understanding effected, it is not unlikely that the so called anthracite trust may be subjected to one of the worst price-cutting wars in the history of hard-coal mining.

An American Merchant Marine

In the neighborhood of 110 vessels have come under American registry since Congress, on Aug. 18, amended the Navigation Laws to foster the growth of an American merchant marine. This action on the part of ship owners is significant in that it may mark the commencement of a period of regeneration for our flag on the oceans.

Last year, American vessels in the foreign trade had a total tonnage of only one million as compared with nearly twenty million for the United Kingdom and five million for Germany. However, our foreign trade is insignificant compared with our coastwise shipping. Of 27,190 American ships, 23,520 with a tonnage of nearly seven million are engaged in coastwise trade.

The principal advantage an American merchant marine now gives to foreign shippers is the lower rate of insurance. The rate on American vessels is ¾ per cent. as compared with from 3 to 5 per cent. for British ships. This favorable situation augurs well for the expansion of a really worth-while American merchant marine, and we trust that our government will lend such encouragement to this movement that before very long, the stars and stripes will enter foreign ports that have not been visited by our ships since those early days of American preeminence on the ocean highways.

No More Coal-Car Statistics

Our readers will learn, with regret, that the American Railways Association has announced that they will discontinue their bi-weekly report on the car surpluses and shortages. The decision was apparently due to the general retrenchment and economy propagandas instituted by all of the important carriers.

Coal Age early adopted a standard table and chart, giving in detail the exact status of the coal-car supply as shown by this report. This was by far the most detailed analysis of the coal-car situation given by any paper or journal in the country.

There are some statements to the effect that the statistics compiled by the Association have failed to effect the economy expected, but it is to be hoped that in the more prosperous days to come the publication of these statistics will be resumed. Until that time, these statements must necessarily be omitted from our columns.

The industrial supremacy of the Anglo-Saxon and Teutonic races is largely due to their possession of ample coal resources. The coalless countries have fallen back in the world race for commercial preëminence. Where coal is found, there we find great industries congregated.

Sociological Department

Club Houses for Mine Workers

Work has been started on two new mess houses of hollow terra-cotta tile at the Franklin and Packerton No. 5 collieries of the Lehigh Valley Coal Co. The design of these mess houses has been practically standardized, and it is understood that similar buildings will be erected at other collieries when the design has been tested by actual use and approved.

The first "mess," or club house, for the outside employees of the Lehigh Valley Coal Co. was opened at the Prospect Colliery in January last year, and was described and illustrated in COAL AGE in our issue of Jan. 25, 1913, p. 153. It proved such a success that a careful study was made of the needs of the men and the facilities which such buildings should afford. As a result a standard design was provisionally adopted.

The new houses measure 40x25 ft. and are 12 ft. in height. There is not a stick of wood in their construction, so they are absolutely fireproof. The hollow terra-cotta tile, which is a standard fireproof material, will be covered with plaster inside and out. The sashes of the doors and windows will be of steel, and the gable roof of corrugated asbestos laid on metal.

The houses will contain a messroom with tables and benches, showers and wash basins with hot and cold water, sanitary conveniences, and a locker room for the men's working clothes. Their sides will be largely of glass and they will be scientifically ventilated, and heated with steam from the boiler houses, so there will be plenty of light, air and heat. A caretaker will keep the houses clean and in order.

This is not the only enterprise of this sort of the Lehigh Valley Coal Co. The space beneath the coal pockets of the Buck Mountain breaker has been utilized for a mess room with shower baths and sanitary conveniences for the use of the men, and there are similar rooms for the benefit of the employees in everyone of the company's fifty boiler houses.

State-Wide Meet at Billings, Mont.

BY JOHN SANDERSON*

The first state-wide meet for first-aid workers in the State of Montana was held in the Coliseum Building, Billings, Mont., on Nov. 21, under the supervision of W. D. Ryan, of the U. S. Bureau of Mines, and Messrs. Steidle and Broadman, of U. S. Mine Rescue Car No. 5, stationed at Billings.

The meet was held under the auspices of the Montana Coal Operators' Association, the United Mine Workers of America, District No. 27, and the U. S. Bureau of Mines. On the committee of arrangements, M. F. Purcell represented the operators' association, H. Drennan and R. Condon, the Union, and D. D. Ryan and E. Steidle, the Bureau.

The judges were all doctors and included M. H. Arnold, J. B. Barrett, E. G. Balsam and W. R. Morrison, all of Billings. As only five teams competed the judges were well able to keep the events under observation.

*State mine inspector, Helena, Mont.

The teams and their ratings were as follows:

	One-Man Event	Two-Man Event	Team Event
Northwestern Improvement Co., Red Lodge, West Side Mine	97.5	96.0	98.5
Northwestern Improvement Co., Red Lodge, East Side Mine	97.0	98.0	94.0
Anaconda Copper Mining Co., Washoe	98.0	98.0	94.0
Republic Coal Co., Klein	96.0	98.0	95.25
Cottonwood Coal Co., Lehigh	96.0	92.5	94.0

It will be seen that the Washoe team of the Anaconda Copper Mining Co. took first prize for the one-man event, which was $15 cash. The West Side Mine of the Northwestern Improvement Co. took the second prize in that event, receiving $10. The East Side Mine of the same company obtained third place and a prize of $5.

In the two-man event the Northwestern Improvement Co. East Side Mine, the Anaconda Copper Mining Co. Washoe Mine and the Republic Coal Co. Klein Mine were first and equal. Another test gave the award to the last mentioned. The prize was $15. The second team was that of the West Side Mine of the Northwestern Improvement Co., and the third that of the Lehigh Mine of the Cottonwood Coal Co. The prizes were the same as in the one-man event, $10 and $5 respectively.

The team-event prize was won by the West Side Mine team of the Northwestern Improvement Co. This was a silver cup presented by the Montana Coal Operators' Association, to be retained permanently by the team obtaining first place for two consecutive years. Bronze badges were presented by the American Mine Safety Association. The second prize went to Republic Coal Co. Klein Mine and consisted of $15 cash. The third place was obtained by three teams and on a further competition the Northwestern Improvement Co. was awarded the prize for third place which was $10 in cash.

The names of the members of the cupholding team are Matt Woodrow, Wm. McIntosh, Ed Heidleston, John R. McFate and L. A. Woodbury.

University of Pittsburgh's Mining Extension Classes

The School of Mines of the University of Pittsburgh has opened its University Extension classes in the mining towns of western Pennsylvania for the third year. Five classes have been organized to study mine gases, ventilation, law and safety, in preparation for the examination for fireboss. These classes are located at Uniontown, Mt. Pleasant, Leisenring, Yukon and Russellton. In addition, a class in more advanced subjects, to prepare candidates for the examination for mine foreman, is being conducted at Irwin.

The enrollment in the six towns is 157, exceeding that of the two previous years. Among the numbers are 5 superintendents, 4 mine foremen, 8 assistant foremen, 14 firebosses, 3 hoisting engineers, 2 electricians and 4 mining engineers. The remainder are chiefly miners, motormen, machine runners, pumpers, timbermen, drivers and clerks, but a few have occupations other than mining. The ages of the students range from 16 to 51. Many are following the courses with a view of taking examinations for certificated positions, while others are taking the opportunity to review subjects already covered, or are pursuing the study as a matter of general interest. With few exceptions, all who have finished the course have passed the state examination for either fireboss or mine foreman.

Each class meets once a week in the evening, from October to April, and is instructed by a member of the faculty of the School of Mines. Notes covering the subjects taken up in the course have been prepared especially for this purpose, together with illustrative problems. The lectures are accompanied with demonstrations of the apparatus studied.

The cost of these courses to the student has been reduced to a minimum. The School of Mines offers the instruction without charge, and expects only that the traveling expenses of the instructor be met by the class. It is hoped that in the near future it will be possible to comply with all the requests received for the organization of mining classes.

Discussion By Readers

Mining Laws, Legislation and Mine Regulations

The discussion that is being brought out on this subject is most interesting and we urge that all our readers submit their views. Eventually we hope to print a résumé of the opinions expressed and then send such summary to lawmakers in all coal states. Legislation that affects an industry affects every individual engaged in that industry; the problem, therefore, is of vital importance to each and all of us.—EDITOR.

Letter No. 10—The suggestion for a frank discussion of mining laws, legislation and mine regulations, COAL AGE, p. 698, is particularly opportune at the present time. The recommendations of practical mining men are always deserving of attention; and their suggestions made with a view to improving the conditions in and around the coal mines of this country, if acted upon, must go far toward ameliorating the dangers of mining.

Not only the changing conditions in the mining of coal, but the lessons taught by recurring mine disasters compel both the revision of existing laws and the making of new ones. It was the Avondale (Penn.) disaster that first opened the eyes of mining men, in this country, to the danger of single openings in mines. The lesson taught by that disaster has resulted in the mining laws of every coal-producing state requiring at least two openings to every mine, one of which must serve as an escape shaft. The Cherry (Ill.) disaster taught the lesson of greater fire protection for mines and the fireproofing of shafts.

The purpose of mining laws is to provide the necessary protection for life and property; and when this object is attained, both miners and operators are benefited. At the present time, in Illinois, the greatest need, it seems to me, is a law that will compel operators to provide a definite quantity of air at the face of all working places. It is true that the law empowers the inspector to order the men to withdraw from the mine or any section thereof, if, in his opinion, the ventilation is such as to endanger health, and he may forbid them to again enter the mine for work until the condition is improved.

Taken as a whole, the Illinois mining law is fairly good; but, in respect to providing adequate ventilation at the working face, too much is left to the judgment of the mine manager subject to the approval of the mine inspector. If a working place is reasonably free from smoke, it is too often assumed that the air is good. It is a fact that, in many of the mines, the carbide light is used in preference to an oil lamp, simply because the circulation of air is too poor to permit of the use of oil lamps with any degree of comfort. While there are many conscientious mine managers who use the best means in their power to ventilate the mine properly, there are, unfortunately, some managers who, when a complaint is made that the air is "poor," only adopt palliative measures and strive to improve the air at the face by putting up a temporary brattice or repairing a leaky door or stopping. These are matters that should not be left to the will and judgment of the mine manager. In mines where the strictest economy is necessary, in order to reduce the cost of production and yield a profit on the coal mined, what can be expected in respect to the ventilation of the mine when the law in this regard is not specific?

One of the conditions with which coal operators of Illinois have to contend is that, owing to strong competition in the state, the selling price of coal is below the cost of production, for six to eight months of the year. The operators must then rely on cold weather to increase the demand and insure a yearly profit.

The law forbids the coal operators to combine and fix a selling price on their coal. In my opinion, the result of such a combine would guarantee to the public that the selling price of coal was just, and only what would yield a reasonable profit on the money invested. This is a matter that might well be considered, in respect to Illinois, when discussing suitable mining laws. As has already been suggested, what benefit is the Compensation Act, in Illinois, if conditions are allowed that threaten to close the mine and render the operator bankrupt? I believe the coal operators of Illinois would all agree to operate their mines under the Compensation Act if suitable protection was afforded them in the effort to maintain the price of coal.

In my opinion, it would be well if a law was enacted prohibiting the use of gasoline motors in mines. It is argued that these motors cheapen the cost of production and give greater flexibility of operation. On the other hand, it is well known that the exhaust of this class of motors pollutes the mine air and may, under possible conditions, produce a dangerous amount of carbon monoxide, the poisonous qualities of which are well known. In regard to this question, it must be remembered that conditions in a mine are quite different from those existing in a factory or other plant. While the motor is not liable to be overloaded or mistreated in other places, its misuse in the mine is a matter of common occurrence. Suppose, for a moment, there is a demand for coal and one of the carburetors of the motor is not working. Is it to be expected that the locomotive will be sidetracked until this defect can be remedied? It is safe to say that the locomotive will be used as long as it will run when the demand for coal is urgent.

Another matter deserving of attention is the political influence that is often allowed to control the appointment of members of mine-examining boards. It is unnecessary to state that every member of such a board should be able to pass any examination relating to coal mining. They should be men who possess both practical and theoretical knowledge, in respect to the mining of coal.

In regard to the examination papers being returned to the candidates, after they have been corrected by the board, I would say that the examining boards are not in-

structors, but their duty is to find out what a man knows. In this state, the candidate's papers are preserved for not less than a year, and any candidate has the right in that time to examine his papers, or to obtain a copy of the same upon the payment of a reasonable fee.

W. L. Morgan, Instructor,
Illinois Miners' and Mechanics' Institute.
East St. Louis, Ill.

Letter No. 11—In response to the request for a full discussion of points relating to mining laws, legislation and mine regulations, that appeared in a recent issue of Coal Age (Oct. 31, p. 698), I would like to submit a few comments on the statements made in the letters already written on this subject.

Referring to Letter No. 2, Coal Age, Oct. 31, p. 722, I beg to differ from Mr. Parfitt, in respect to the benefit the candidate would derive from the return of his papers by the examining board. As Mr. Parfitt has previously admitted, the papers are open to examination by the candidate, under the supervision of the Department of Mines where they are filed. In considering this question, it should be remembered that the oral examination of a candidate is of greater importance in determining his practical capability than the written examination. Consequently, the return of his papers would inform him only partially on the result of his examination.

As a further argument why these papers should not be returned to the candidate, I would suggest that examiners usually manifest much sympathy in marking the papers of candidates whose elementary education has been limited. In many cases, the examiner "reads between the lines" and gives a man credit for what he evidently meant to say rather than for what he wrote.

Notwithstanding Mine Inspector Rose's sympathy with this proposal, as expressed in Letter No. 4, Coal Age, Nov. 14, p. 799, I believe that the majority of examiners would oppose the return of candidates' papers to them, because of the fear that such a procedure would necessitate much correspondence with those who failed to pass the examination. I believe a better plan is to group the questions into proper divisions or subjects and give to each question a definite value or number of points. After the examination of the papers is completed, every candidate should be informed of the number of points he has made in each subject; as, for example, ventilation, gases, methods of working, mine laws, etc.

I quite agree with Mr. Parfitt that all members of examining boards should have the necessary individual qualifications for the position they hold, and should possess a certificate of competency or be able to present other evidence that they are so qualified. I would recommend the excellent system adopted in West Virginia, where examinations are conducted by the district mine inspectors, under the supervision of the Chief of the Department of Mines, although this system possesses the disadvantage that the work of examination takes these men, responsible for the safety of the mine, away from their duties in the field for several days and adds to their already heavy burdens.

I note, from Mr. Rose's letter, that the same system is practiced in Tennessee. I cannot, however, indorse his statement that an examining board should seek to ascertain, as far as they can by practical questions, "what the applicant knows about mining *from experience*, instead of what he has learned *from others*." In my opinion, all true education is based on experience.

In mining practice, the most successful men are undoubtedly those who possess theoretical knowledge combined with practical experience. Practical mining men are prone to discount book learning and technical knowledge; and, for this reason if for no other, there should always be required of candidates, in mining examinations, a certain amount of technical knowledge.

In Letter No. 3, Coal Age, Nov. 14, p. 798, Mr. Scholz suggests that there should be more coöperation between mine workers and their employers, in respect to the adoption and observance of suitable mining laws and mine regulations intended to safeguard the work of mining. Too often, these laws and regulations, though quite adequate if enforced, are disregarded and violated by the very persons they are intended to protect.

I cannot indorse, however, Mr. Scholz's suggestion in respect to lobbying in order to secure more intelligent and effective legislation. As Mr. Beard stated in his introductory article, Coal Age, Oct. 31, p. 698, "Too often has mine legislation been influenced if not controlled by lobbyists whose main object and purpose have been to secure the enactment of laws that will favor their own selfish ends."

It is well known that any lobbying, in legislative halls, or "junketing" around with legislators, during sessions of the legislature or at other times, on the part of employers of labor, does not generate the best of feeling among the working classes. By no possibility can this class be led to believe that such activities, on the part of employers, are for their benefit or safety.

What Mr. Scholz has said, in respect to the Workmen's Compensation Act, in Illinois, leaves one in considerable doubt in regard to his opinion of the practical operation of this law. I would assume that he would be inclined to oppose such an enactment; and, yet, his arguments present a very strong advocacy of the need of such a law as a means of protection for both the operator and the mine worker, in the hazardous operations of mining.

The practical working of the compensation law, which has now been in operation 15 months in West Virginia, has proved an inestimable boon to mine workers and their dependents. The fund, which has been contributed to by both operators and workmen, without hardship to either party or to the trade, has made ample provision for widows, orphans and injured workmen, who would have been unable, in Mr. Scholz's own words, to have "drawn blood from a turnip."

Firing Shots in Mines

In the issue of Coal Age, Oct. 24, p. 665, there appeared a description of a chemical fuse lighter whose action depended on the sulphuric acid introduced into one side of the tube, eating its way through a celluloid diaphragm and reaching the combustible matter contained in the tube. By this means, the fuse to which the tube was attached became ignited. This was described as taking place about two or three hours after the tube was charged with the acid, thus giving the miners or the shotfirers ample time to withdraw from the mine before the shots were exploded.

The question was asked, Is the idea practicable? While I do not doubt but that shots could be fired with this device in the manner described, the adoption of such a method in coal mining appears to me to be not only impracticable but extremely hazardous.

We will assume that the miners or shotfirers, as the case may be, have prepared the shots and charged the chemical fuse lighter with the acid and that all the men have left the mine and gone home, with the expectation that in from two to three hours the acid will eat its way into the combustible matter and ignite the fuse and the shots will be exploded. Suppose, however, that, through some fault of the acid or celluloid a longer period than what is expected elapses before the acid reaches the combustible in any one or more of the shots so prepared. It might even happen, in such a case, that the delayed explosion would take place as the workmen were entering the mine the following day.

Or, suppose again that the place where the shot was to be fired had been examined for gas, after the shot had been prepared; but, in the interval between that time and the exploding of the shot, a fall of roof had occurred, with the result that the place became charged with gas. The firing of the shot under these conditions would endanger the entire mine and, perhaps, result in a heavy property loss.

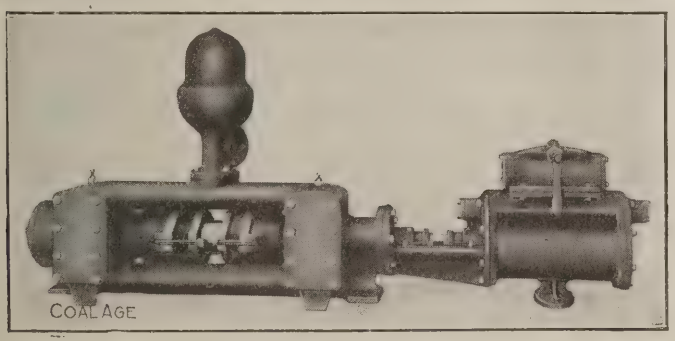
The same result might follow the firing of two shots in the same working place, as it would frequently happen that the explosion of both of the shots would take place at practically the same time. Then, the dust and gases of the first shot would be ignited by the flame of the succeeding shot and possibly cause an explosion that would extend throughout the mine.

An instance of such an occurrence causing a fatal mine explosion is given on pp. 24-6 of Miner's Circular No. 7, issued by the Bureau of Mines and entitled "The Use and Misuse of Explosives in Coal Mining." The report states: "This explosion wrecked the entire mine, dislodged timbers on the main entries, and its force extended even to the tipple 300 ft. from the mouth of the mine;" and adds, "If other men had been in the mine they would undoubtedly have been killed."

In conclusion, I wish to say that, to avoid danger in firing shots in mines, they must be prepared, loaded and fired under the supervision of a competent shotfirer. Each place must be examined for gas, and if dust is present the place should be well watered before any shots are fired. Where two shotfirers are employed in the mine they should not be firing shots at the same time, on the same split of air.

PENNSYLVANIA MINING ENGINEER.
Uniontown, Penn.

Study Course in Coal Mining



BY J. T. BEARD

The Coal Age Pocket Book

The main feature and chief advantage of the **plunger type** of pumps is the elimination of most of the wearing parts in the water-end of the pump. Owing to the fact that the plunger does not occupy the entire cross-section of the water cylinder or pump barrel, there is no wear of the pump linings, as is the case in piston pumps. The wear in the water-end of all plunger pumps is confined to the packings.

As previously stated, there are three styles of **plunger packings;** namely, outside, end-packed; outside, center-packed; and inside-packed. These have each been illustrated, in detail, on a previous page.

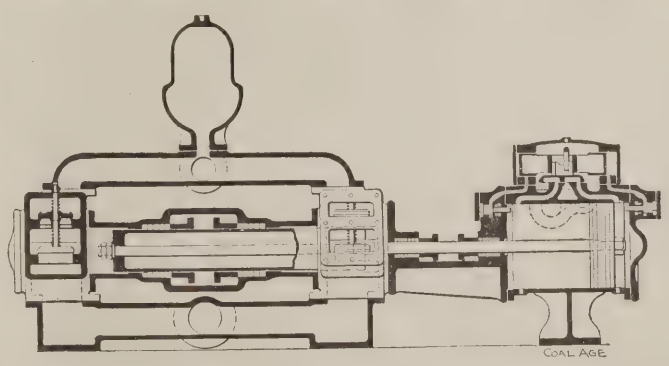
Plunger pumps also differ in the arrangement and number of their plungers and cylinders or pump barrels. For example, a **single-acting** plunger pump has but one plunger, working in a single barrel and is outside, end-packed. A **double-acting** plunger pump may have a single plunger, working in two separate barrels, as shown in the accompanying figure, which is an outside, center- and end-packed pump, of the Cameron regular pattern.

SIDE VIEW OF CENTER- AND END-PACKED PUMP

In other styles of this pump, the plunger is operated by means of side-rods and a crosshead connection, by which the end-packing, shown in the figure, is eliminated; and the pump is then simply a center-packed pump.

Again, two plungers, connected by side-rods are operated in two separate barrels, both plungers being end-packed. This type is, in fact, a duplex, single-acting plunger pump.

The steam-end of this pump is identical with that of the piston pump, previously described. The side view here shown makes clear the manner of tightening the stuffing-boxes, by means of the bolts, as may be required by reason of the wearing of the packing. In this style of pump and, in fact, in all center-packed pumps, there is not the same tendency of the plunger to sag that there is in an end-packed pump.



The Coal Age Pocket Book

Plunger pumps are particularly adapted to the work of unwatering mines, because of their ability to handle water containing sand or other gritty material, without the excessive wear that results in a piston pump.

Another distinct advantage that this class of pumps possesses over piston pumps is the elimination of the loss due to "slippage," which often reduces the discharge of piston pumps from 10 to 15 per cent. of that obtained in plunger pumps of the same size and operated at equal piston speed.

In this pump, the two valve chests are connected, by a pipe of ample size, with the discharge or column pipe. This connecting pipe, as shown in the figure, is surmounted, at its center, with a suitable air chamber to equalize the pressure and maintain a more uniformly constant discharge.

The figure on this page represents a complete sectional view of the pump, a side view of which appeared on the preceding page. On the right of the figure is shown the

SECTIONAL VIEW OF CENTER- AND END-PACKED PUMP

steam cylinder, surmounted by its valve chest. The water-end, on the right, consists of two separate pump barrels, in which a single plunger operates. The section shows this plunger mounted on the same rod that carries the piston, as in all direct-acting pumps.

The interiors of the two valve-chests are shown to contain, each, two poppet valves, which are held to their respective seats by springs. These valve chests are connected above and below by ample discharge and suction pipes. The section also shows the packing rings in the stuffing-boxes at one end and between the pump barrels.

The pump here shown has a stroke of 18 in. The diameter of the steam cylinder is 12 in.; while the diameter of the plunger is 6 in., which makes the size of the pump 12x6x18 in.

Inquiries of General Interest

Mixtures of Air and Mine Gases

Will you kindly explain the nature of the following mixtures of air and gases, in respect to their danger to health or as affecting the explosive condition of the mine air. These mixtures are numbered consecutively and the proportion of each gas is given in percentage.

No.	Air (O)(N)	Methane (CH_4)	Carbon Monoxide (CO)	Carbon Dioxide (CO_2)
1	85	15	..	..
2	30	70	..	trace
3	80	8	12	..
4	80	8	..	12
5	98	..	2	..
6	98	..	..	2

Please state what these mixtures of gases and air represent in actual coal-mining practice.

FRANK BERANEK.

Tarr, Penn.

We will explain, briefly, the character of these gaseous mixtures, in respect to their danger to health and safety in the mine, by reference to the numbers of the respective mixtures given above.

1. Assuming that this mixture has been formed by the addition of methane (CH_4) to pure air, it contains oxygen, 17.76 per cent.; nitrogen, 67.24 per cent.; methane, 15 per cent. While this mixture will dim a candle flame almost to extinction, the flame would not be extinguished unless the proportion of methane in the mixture reached 16.7 per cent. The given mixture can be breathed with impunity; since when no gas is present producing a toxic effect on the system, the first difficulty in breathing is experienced when the oxygen content has fallen to about 14 per cent.; and fatal effects may only be expected when the oxygen content is reduced to 10 per cent. The chief danger of this mixture, however, lies in the fact that it is not only explosive, but may be rendered more so by the possible addition of air.

2. Assuming, again, that this mixture has been produced by the addition of methane to pure air, it contains oxygen, 6.27 per cent.; nitrogen, 23.73 per cent.; methane, 70 per cent. This mixture is extinctive of flame, nonexplosive (though it may become so by the addition of air) and unbreathable, producing death by suffocation.

3. This mixture contains sufficient carbon monoxide to produce instant death if taken into the lungs. It is also inflammable and highly explosive. The introduction of a flame would cause its ignition and explosion.

4. Assuming, as before, that the mixture has been produced by the addition of methane and carbon dioxide to pure air, it contains oxygen, 16.72 per cent.; nitrogen, 63.28 per cent.; methane, 8 per cent.; carbon dioxide, 12 per cent. This mixture contains almost sufficient carbon dioxide to render it nonexplosive, that point would be reached were the proportion of carbon dioxide increased to 12.5 per cent., in the absence of other gases or dust. The given mixture is, therefore, feebly explosive. If breathed, such a mixture would not prove fatal, except after the lapse of considerable time. It would, however, produce headache and nausea; and, finally, unconsciousness if the inhalation was to be continued.

5. This mixture contains sufficient carbon monoxide to produce fatal results in a brief period of time. The mixture is not inflammable, or explosive, or extinctive of flame.

6. The percentage of carbon dioxide in this mixture is not sufficient to produce any ill effects, except a slight headache or nausea, aftter continued breathing. It is not extinctive of flame.

Color of Coal Ash

Will you kindly explain the cause of the difference in the color of the ash of different coals. Does this difference in color indicate a material or important difference in the composition of the coal and its value for fuel purposes? I have observed that while some coals give a red ash in burning, the ash of other coals is almost pure white. If the so called "red-ash" coal is now being mined, kindly state where it can be obtained.

CONSUMER.

Jersey City, N. J.

The color of coal ash is due to the presence of different impurities in the coal burned. The red color of the ash is the result of the presence of iron, in some form, in the coal. This iron occurs mostly as oxide or sulphide. The oxides of iron vary from bright red (hematite) to brown (limonite), in color. The sulphide of iron is the well known pyrite or pyrites, which may occur in segregated masses or nodules, or be disseminated in finely divided particles or layers, in the coal formations.

The "red-ash" and "white-ash" coals are anthracite. They are mined by the Lehigh Coal & Navigation Co. in the Panther Creek basin. According to Report 1, p. 180, of the Second Geological Survey of Pennsylvania, the names "red ash" and "white ash" were adopted by this company to designate certain coals mined from the Mammoth and Red Ash seams. It is stated that these names do not necessarily imply that the ash obtained from the combustion of these coals is always white or red in color; although, presumably, the general color of the ash suggested such designation.

Red-ash coal is handled by the Philadelphia & Reading and the Susquehanna Coal companies. The Sunday Creek Coal Co., of Columbus, Ohio, advertises a "white-ash coal." Owing to its superior hardness and resistance to breakage in handling, red-ash coal is generally higher priced. The average specific gravity of this coal, however, is given as 1.584, while that of white-ash coal from the Mammoth beds is 1.631. The average of these coals contains 3 per cent. of moisture and about 4 per cent. of volatile matter, the red-ash coals averaging 88 per cent. of fixed carbon and 4.4 per cent. of ash, while the white-ash coals average 84 per cent. fixed carbon and 8.2 per cent. ash.

Examination Questions

Hoisting Engineers' Examination, Held at Albia, Sept. 23 and 24, 1914

(*Selected Questions, Continued from Last Week*)

Ques.—What care should be taken of steam boilers to secure the best results, in their use?

Ans.—Boilers should be cleaned at regular intervals and carefully examined to detect any signs of weakness. The feed water should be as pure as possible and should be passed through a feed-water heater before it is allowed to enter the boiler. The water should be fed into a boiler in small quantities, at regular intervals; and care in firing is necessary to maintain an even temperature and a regular pressure. It is important to avoid any sudden changes in temperature or pressure, in boiler practice.

Ques.—What care do the various appliances of a boiler require?

Ans.—First, care must be taken that water is feeding into the boiler properly; that the feed pump is in good order and the check valves tight. The safety valve of the boiler should be tested frequently to see that it works freely and responds properly to the steam pressure. Also, the steam gage should be tested from time to time, in order to know that it registers accurately the pressure in the boiler. The water gage and try-cocks should be kept clear, so that they will show the true level of the water in the boiler. The fusible plugs should be examined frequently. It is also necessary to keep the mud drum free of sediment and the blowoff valve from leaking.

Ques.—(a) How often should a boiler be cleaned? (b) What causes scale to accumulate on the heating surface of boilers?

Ans.—(a) The frequency with which a boiler should be cleaned will depend chiefly on the purity of the water used in the boiler. In any case, a boiler should not be allowed to go longer than a month without cleaning. In general practice, this will be too long a time and better results will be obtained by shortening this interval.

(b) The accumulation of scale on the inside of the boiler is generally greatest where the plates are most intensely heated. The scale consists of the condensed impurities of the water, which have been for the most part precipitated by boiling. The sediment contained in dirty water does not ordinarily give much trouble, as it is readily blown off from the boiler or collects in the mud drum, from which it is readily removed. The principal impurities that form the hard scale that is difficult to remove from the inside of the boiler are the carbonates and sulphates of lime and magnesia. These salts are precipitated by boiling and often become firmly attached to the boiler plates and can only be removed by the use of scrapers, drag chains and other tools.

Ques.—How can we tell what pressure is on a boiler? Explain the operation.

Ans.—The pressure of steam in a boiler is indicated by a steam gage. The most common form of gage employed, in boiler practice, is a brass tube, flattened and bent in the shape of a horseshoe or part circle. One end of the tube communicates with the boiler; the other end being closed and free to move is connected by a lever and rack movement to the pointer that moves over the face of the dial. The pressure of the steam within the tube causes an outward movement of the free end of the tube, which movement is communicated to the pointer and serves to register the pressure of the steam.

Ques.—Which is the more dangerous steam gage, one that is "fast" or one that is "slow?"

Ans.—A fast steam gage is one that registers a higher pressure than the actual; while a slow steam gage is one that registers a lower pressure than what exists in the boiler. The slow gage is, therefore, more dangerous.

Ques.—Show by sketch how a shot should be undermined, and indicate the position of the charge of powder in the coal, assuming a uniform seam of coal 4 ft. 6 in. in thickness.

Ans.—The accompanying figure shows a shot placed in the coal, which has first been undermined by cutting out the bottom coal to a depth almost equal to the depth of the hole. The position of the shot midway in the seam, in this case shows that the coal breaks down easily and does not adhere to the roof.

Ques.—What precaution would you take in a mine where solid shooting is practiced and the mine is dry and dusty and generating firedamp?

Ans.—"Solid shooting" should not be permitted in a bituminous mine, under these conditions. When shooting off the solid, there is every possibility of producing a blowout shot; and in case the coal is soft and friable, much fine dust will be produced that is highly inflammable.

If solid shooting, however, is to be permitted, under the conditions named, shotfirers should be employed and all shots should be fired after the men have gone out of the mine. The shotfirers should be competent miners who should examine all holes before they are charged, in order to determine the depth of the hole and the exact position of the charge in the coal. The shotfirer should have the power to condemn and refuse to fire any hole that in his judgment is dangerous. He should determine the weight of charge to be placed in each hole, and should give careful instructions in regard to tamping.

A suitable water system should be installed throughout the mine that will make it possible to thoroughly sprinkle the working face and the sides, roof and floor of every room or entry where shots are to be fired. This watering should extend from 15 to 20 yd. back from the face of the coal. No shots should be fired in places that have not been watered. The mine foreman and his assistant should see that all fine dust and slack are loaded out and the working places kept free from all accumulations of fine coal.

Coal and Coke News

Washington, D. C.

The various reports submitted to Congress by the different departments of the government are furnishing an unusual amount of information with respect to the coal situation of the country. Probably the most important document on the subject is the report of Secretary Lane of the Interior Department, who describes the situation as to the land-leasing system for Alaska as follows:

Congress supplemented its railroad bill by the passage of another act of no less significance, a bill providing for the leasing of the great coal fields of Alaska. As this is virtually the first bill to pass Congress authorizing the leasing of any of our resources, it may be well to outline its provisions. It first provides for a survey of the coal lands of Alaska, preference to be given to the Bering River, Matanuska and Nenana fields. These fields would doubtless supply the needs of the far West for many years if made accessible. The Nenana field is some 30 miles from Tanana River and could feed the great interior, while the Matanuska is but a short distance from Cooks Inlet on the coast, and the Bering River is near Controller Bay and the city of Cordova. In the two best fields (Mantanuska and Bering River) a reservation is to be made for the government, not alone to supply the needs of our ships, but to be operated in the event that the price of coal is raised to such a figure by monopoly as to make this of public value. The surveys are to be in 40-acre blocks, and the leases are not to exceed 2560 acres, which is the average coal operation of the United States. As a coal mine under modern conditions is much more than a tunnel or a shaft, and requires a plant costing from a quarter to half a million dollars, it was necessary to make the acreage large enough to justify such an expenditure. The leases are to be awarded through competitive bidding or otherwise, under general regulations made by the Secretary of the Interior, with a minimum royalty payable to the government of 2c. a ton and an annual rental of from 25c. to $1 per acre applicable on the royalty. This last provision as to rental is to make it onerous to hold land undeveloped. The leases are to be for not more than 50 years, subject to renewal on new terms.

Strict Control of Operation

The utmost care will be taken by Congress to guard against monopolization of the fields. Railroads are not permitted to hold more of these lands than will supply their own needs. Leases may be transferred only with governmental consent. No one may be a shareholder or otherwise have an interest in more than one holding. And for violation of its general and specific prohibitions criminal penalties may be imposed. Provisions against waste and for care in the operation of the mines are required in each lease. The safety and welfare of the miners are safeguarded, and an eight-hour day for underground workers is specified. Wages shall be paid twice a month, and the company store as a compulsory base of purchase is frowned on. The miners are to be insured the fair and just weighing of the coal mined, and other measures may be provided in the leases which may be needed "for the protection of the interests of the United States, for the prevention of monopoly, and for the safeguarding of the public welfare."

Leases may be forfeited by appropriate proceedings in court for noncompliance with the provisions of the lease or of general regulations, and the lease may provide for enforcement of other appropriate remedies for breach of specified conditions therein.

To care for the strictly local and domestic fuel needs provision is made that a limited license or permit, for 10 acres and running for not more than 10 years, may be granted to any person without payment of royalty. As Alaska contains many scattered coal beds easily accessible from mines and towns, this is a provision that it is thought will make for general relief. Having provided in the manner just roughly indicated against those conditions which have arisen within the United States and which have threatened Alaska, Congress has restored the coal lands of that territory to the world's use.

Alaska Dependent on British Columbia

With reference to Alaskan coal the head of the Bureau of Mines says:

The outbreak of war in Europe of August of this year had the effect of strongly reminding the people of Alaska that they are still largely dependent upon British Columbia and other countries for the coal they consume for domestic and industrial purposes, notwithstanding the fact that the territory has practically unlimited quantities of high-grade coals awaiting development on a commercial basis. It was considered possible, with the presence of warships of some of the belligerent powers in the waters of the Pacific coast, that the supply of coal from British Columbia might be cut off, thus creating a serious condition among coal consumers in Alaska, and the situation seemed to accentuate the importance of the United States having a permanent source of coal supply in Alaska, together with a coaling station that would be accessible at all times. The importation of coal from the States and from foreign countries during the last fiscal year amounted to 93,101 tons, valued at $295,123. The importations show a slight decrease over those of the previous year, due to the more extended use of fuel oil in various industries.

Harrisburg, Penn.

If the anthracite tax law is declared unconstitutional by the Dauphin County Court it will probably be on the ground that the law is local or special legislation.

Three coal companies from the 60 appealing were picked by agreement as representing the various phases of the case. These were the Alden and the Plymouth of Luzerne County, and the St. Clair of Schuylkill County. The principal contentions of the companies were:

That special legislation is prohibited in Pennsylvania.

That local legislation is prohibited under Section 8, Article 3 of the Constitution and the Act of 1874, unless notice is published in the newspapers of the intention to introduce such local legislation. It was acknowledged that in none of the nine anthracite coal-producing counties was such a notice published in the newspapers.

The attorney general contended that as the governor had signed the bill it must be presumed that legal notice was given of the intention to present the measure, and further, that the court had no power to go behind the signature of the governor.

The coal companies asserted they are now paying a state tax on their capital stock; that of the 67 counties in Pennsylvania only nine produce anthracite; that considerable areas in these nine counties produce no coal and that these communities under the act, which provides that the state return one-half of the tax collected to the counties in which it is originated, would receive sums equal to or greater than their municipal expenditures.

In connection with the Alden and Plymouth cases it was asserted that in Luzerne County coal is mined in only 14 of the 36 townships, and that the remaining townships would receive large returns from the tax.

This is the largest tax settlement case heard in the local court in years, for it is estimated that the companies have collected upwards of $5,000,000 from the public by increasing the price of their coal. Of this sum only $19,000 has been paid into the State Treasury, and most of this under protest. If the act is decided to be unconstitutional the question of how this money can be returned to the people will be an interesting one.

If the court finds the act is unconstitutional, the companies will immediately appeal to the Supreme Court, and a decision may not be returned until late in 1915.

Counsel for the company urged that the act was special legislation, seeing that the state did not tax producers of semianthracite, semibituminous or bituminous coal. It was declared that the line of demarcation is slight between the various grades.

Changes in Department of Labor

Among the suggestions which the legislative committee of the State Federation of Labor received at its meeting here this week was one for the consolidation of the State Department of Labor and Industry and the Department of Mines. These matters were not put forward in the form of resolutions, but suggested for such action as the committee might determine.

The formation of a code of laws was also suggested regulating the safety and work of men employed in slate quarries and other operations not now protected by law. Steps to pass statutes covering such work were taken by the last legislature and a report may be made by the Chief of Mines, James E. Roderick.

There is a feeling among some of the leaders of the United Mine Workers for a reorganization of the State Department of Mines, so that the chief of the Department may have two assistants, one in the anthracite and the other in the bituminous region.

Tripp Shaft Disaster Not an Explosion

There are no new developments in the investigation of the accident at the Tripp shaft of the Diamond colliery of the Delaware & Lackawanna R.R. Co., at West Scranton, Bolinski, the only passenger on the cage out of 14 to escape death, declares there was no explosion, that the "carriage jerked and jerked and jerked and the men went down."

The coal company officials point out that the cage had

carried 9600 lb. many times every day, and that the combined weight of the 14 men, if they had weighed 200 lb. each, would be only 2800. One theory given was that the cage might have caught in the shaft, and that when the slack was taken up by the engineer, the bottom was ripped from the cage. Manager Phillips says that if this had happened there would have been marks on the buntons made by the steel strips extending from the sides around the bottom. The shaft was left in such condition following the disaster that the two carriages used in it were working as well as ever a short time following the disaster, except that the cage in which the accident took place had no bottom.

Discounting the explosion stories are the facts that the timbering of the shaft was not damaged in the least; that the flooring of the cage, while broken, does not show any of the tearing and rending that an explosion would cause; that the bodies of the men found in the shaft bottom (sump), 300 ft. below where the flooring went out of the carriage, did not show any injuries or tearing around the feet, which would be natural did the dynamite explode immediately on the cage floor; that Martin Bolinsky, the man who was saved by clinging to an iron rod, was not injured about the feet, although, if there was an explosion, it must have been almost where he stood; that no smoke poured from the mine mouth after the headman heard the noise he thought was an explosion; that several sticks of dynamite were found unexploded among the bodies of the men.

PENNSYLVANIA

Anthracite

South Bethlehem—The largest diamond drill core ever cut has just been presented to Lehigh University by H. H. Otto, division engineer of the Lehigh Valley Coal Co., of the class of 1912. It was cut in the Marcy vein, at the Maltby colliery near Wilkes-Barre, Penn. The specimen is a core of an 11-in. diamond drill and the core is 10 in. in diameter. The object of the drilling was to drain some old workings at the Maltby colliery. A barrier of 183 ft. had to be penetrated before the water, which had a head of 176 ft., could be tapped. The core shows the middle rock of the Marcy vein.

Hauto—It is estimated that the Harwood Electric Co., a subsidiary of the Lehigh Coal & Navigation Co., will lose half a million dollars, according to figures given out by the corporation, as a result of damage done by the storm that visited the Lehigh coal regions during the week of Dec. 14. Thirty seven of the steel towers were pulled down by the heavy coating of ice on the wires. Hazleton City has partially recovered from the effects of the storm, but many of the collieries which were supplied by the Harwood Electric Co. were forced to suspend operations.

Kingston—Inspection of mine timber which had been treated for experimental work is showing good results. In a certain place in one of the mines here where timber lasts only six months, the pit timbers were replaced with creosoted loblolly pine, and in between these timbers were placed others of the same kind of wood that had been peeled and seasoned. In the same locality loblolly pine sticks treated with lime were placed, so that they would be subject to the same general conditions. These timbers lasted about five years and all seem to be sound. At the end of the sixth year, however, the lime-treated sticks were decayed to such an extent that they were replaced with timber treated with creosote and chloride of zinc. The simple lime treatment which increased the life of the timber from six months to six years shows how necessary it is to care for mine timber and the economy of so doing, for the creosoted timbers are practically sound after seven years.

Pottsville—Pottsville, Scranton and Pittsburgh capitalists have purchased the Whippoorwill colliery on Broad Mountain, an operation abandoned many years ago. Work of reclaiming the mines will be started at once, as big coal deposits have been discovered.

It is also announced that the Madeira Hill colliery, on Broad Mountain, just opened by Philadelphia capitalists, will be placed in operation on Jan. 1, as will the East Bear Ridge colliery, owned by James Bros., of Shenandoah. These three new operations will give work to 3000 men.

Pittston—Thousands of dollars' worth of property was wrecked and several families made homeless on Dec. 14, by one of the most destructive mine caves that ever occurred in this region. The caving was unexpected and the property owners had no warning from the Pennsylvania Coal Co. Rumbling noises were heard early in the morning, and the first depression occurred a few hours later underneath a new double home owned by Michael Dunne, of Searle St., erected a few months ago at a cost of $5000. The settling continued all through the day, creating greater damage to the Dunne home and extending to six other houses in the vicinity.

Pittston—A tunnel driven through solid rock, at some places penetrating bodies of quicksand, and which has been in course of construction by the Pennsylvania Coal Co. for the past eight years, was completed recently. The tunnel is to be used exclusively for the draining of collieries in the vicinity of Pittston.

ALABAMA

Birmingham—The order for 175,000 tons of coal which is given annually to an Alabama coal operator by the New Orleans street railways went to the Sloss-Sheffield Steel & Iron Co. this year.

The American Coöperative Coal Mining Co. has filed a petition in voluntary bankruptcy, liabilities amounting to $36,770.37; assets, $45,187.40. E. H. Dryer, referee in bankruptcy, has appointed W. H. Bonham, of Collins & Co., receiver.

KENTUCKY

Barbourville—Nine Pennsylvania coal-mine operators were members of a party which has just made an inspection trip of holdings in the Clay County coal field where, it is said, the intention is to add another boundary of 12,000 acres to the original holding of 20,000 acres. In this connection plans for a railroad to run from here into Clay County are being discussed with renewed interest. Heavy investments made in this section indicate that a railroad is not far in the future.

Hazard—The Haley Coal Co., of which C. B. Slemp, congressman of the Ninth Virginia District, is president, and the Virginia Coal & Coke Co. will each make developments of its coal property on the new First Creek Branch of the Lexington & Eastern immediately below here. It is the purpose of both companies to be ready to begin shipping coal by Apr. 1, immediately upon the completion of the First Creek Branch road. The Perry County coal fields now present a spirit of increased activity, and the new year will show great prosperity throughout.

The Warner Coal & Coke Co., with headquarters at Columbus, Ohio, has leased a large area of coal lands on First Creek in the Perry County field and will soon begin the initial work looking to its development. By the first of the year, the development will be well under way. The company will ship over the First Creek Branch of the Lexington & Eastern R.R. It expects to have a daily capacity of about 12,000 tons.

Whitesburg—Orders aggregating over 90,000,000 tons of coal—perhaps the largest coal order ever placed in this country—have just been secured by the Consolidation Coal Co. in the Jenkins-McRoberts-Burdine-Dunham coal field, and a number of miners will be put to work at once. Much of this coal will go via the Carolina, Clinchfield & Ohio new line through "The Breaks" via Dante, Va., and so on to the South Atlantic ports for export to foreign markets.

OHIO

Cincinnati—The report of Capt. Charles J. Menges, trustee in bankruptcy of the Consolidated Coal & Mining Co., which is to be filed shortly in the United States District Court, will show a distribution to creditors of the company of about 5 per cent. of their claims, assets amounting to about $12,000 and liabilities to $72,000. The only assets of the company were the retail delivery and river equipment. The company's lease on the property at Zaleski, Ohio, operated by it under the name of the Cardiff Coal Co., was found by the trustee to be worthless, on account of arrearages on the payment of royalties and other dues.

Columbus—The Detroit, Toledo & Ironton Ry. Co. has requested the Ohio Public Utilities Commission to rescind its order, made three years ago, reducing coal rates on the Hocking Valley R.R. between Nelsonville and Toledo, on the ground that this competition made it also necessary for the petitioning road to reduce its rates between Wellston and Jackson and points in northern Ohio and Michigan to an unprofitable extent.

Bellaire—Belmont County coal mines, now closed by the strike, are likely to be operated on the profit-sharing plan. One hundred former employees of the Pittsburgh-Belmont Coal Co., whose mine is at Neff, have requested that their former employers permit them to take stock and operate the mine under lease on the coöperative plan. A similar plan has been made by the employees of the Schick mine, and the unions in other parts of the country are expected to make like proposals. The operators have the propositions under consideration, and as it offers a solution for the deadlock which has existed since Apr. 1, it is thought their answer will be favorable.

ILLINOIS

Chicago—Five large coal mines in Montgomery County, which have been under lease to the Peabody Coal Co., have been taken over by receivers appointed by Judge Carpenter in the U. S. District Court. The receivers are Francis S. Peabody, of Hinsdale, Ill.; Jackson K. Dering, of Lake Villa, Ill.; and Jabez Wooley, of Evansville, Ind. The mines of which they will assume charge are the Peabody No. 10 Mine at Nokomis, two large mines at Witt, the Kortcamp and the Taylor Springs mines near Hillsboro. Seven Indiana mines are also included in the receivership. All twelve properties have been owned or worked under lease by the Chicago & Eastern Illinois R.R., and go into receivership through orders of the court on account of the present financial condition of the railroad company. It is stated that the receivership will not interfere with the operation of the mines.

Chicago—A number of Indiana and Illinois operators, headed by C. M. Moderwell, president, Illinois Coal Operators' Association, and F. C. Honnold, secretary of that association, have placed before Secretary Lane, of the Interior Department, a statement of the appalling conditions found in the coal industry of the States of Illinois and Indiana at the present time. The salient points of this appeal are the inability of the operators to coöperate, because they do interstate business and are amenable to the anti-trust laws, and that if they could combine, they could simplify their selling and operating methods, create many economies, and prevent the present wasteful methods of mining. Coöperation would not only greatly benefit the workmen and investors in coal enterprises, but would mean the establishment of other industries connected with the byproducts of coal.

Chicago—J. B. Jones, coal operator, who recently bought out the Sunday Creek Co. in the proceedings undertaken by the government for breaking up the Eastern Ohio and West Virginia railroad combine, has applied to the Ohio Utilities Commission for leave to place a new mortgage for $3,934,000 upon the properties of the Sunday Creek Co.

Mount Vernon—The largest coal-land deal ever made in this vicinity has been concluded in the sale of 10,000 acres south of here. The purchasers represent New York and Pennsylvania capital, and the deal was made by A. C. Snively, of Pittsburgh, Penn., with George W. Trelkeld and W. H. Green, of Mount Vernon. It is the intention of the purchasers to sink a shaft on the line of the Chicago & Eastern Illinois R.R., probably near Ina.

COLORADO

Pueblo—The Pueblo Savings & Trust Co. has filed a petition in the District Court, asking that a trust deed and mortgage held by them against the Colorado Central Coal & Mining Co., of Fremont County, be foreclosed, and that a receiver be appointed to conduct the affairs of the company The trust deed secures a bond issue of $300,000.

ARKANSAS

Russellville—The lease and property of the Ideal Anthracite Coal Co., operating one of the largest coal mines in this section, has been ordered sold to satisfy a judgment in the Pope Circuit Court for damages of $16,500 for injuries received by W. F. McBride, a workman in the mines.

FOREIGN NEWS

London, Eng.—A dispatch from Stockholm, Sweden, says that the Swedish State railways have invited tenders from America for 130,000 tons of coal, to be delivered from January to March, 1915. This is the first time that American coal has been allowed to compete for Swedish State requirements.

Sydney, N. S.—The Dominion Coal Co. is grappling with the problem of securing additional markets for its output. It has been found practically impossible to compete with American operators for the South American trade, in view of the advantages enjoyed by the latter in the matter of transportation, and the war has cut the company off from a possible market in Norway and Sweden. The company has an overproduction of slack, but the blowing in of an additional furnace by the Dominion Steel Co. will enable them to dispose of a considerable amount of the surplus. The output for November was 297,407 tons, a decrease of 110,000 tons as compared with November of last year.

Tokio, Japan—An explosion occurred on Dec. 15 in a coal mine in Fukuoka, 65 miles north of Nagasaki, imprisoning 800 laborers in the workings. Present advices do not state the number killed or injured.

OBITUARY

George Wettengel, 90 years old, a veteran coal operator and a resident of Pittsburgh for 73 years, died at his home, 805 Kerr Ave., Dec. 11.

Henry Horn, Sr., one of the pioneer coal operators of southern Illinois, and of Perry County in particular, died at his home, on Dec. 10, at the age of 83 years. The Horn Coal Co. was one of the largest producers in the state a decade ago, but practically all of the Horn mines have been worked out and abandoned years ago. In addition to coal operating, Mr. Horn was engaged in the banking business and was president of the Horn Bank. In addition to mine holdings in this county, he was also interested in one of the mines at West Frankfort, Ill.

Daniel Francis Connor, general sales agent of Whitney & Kemmerer, died at his home, 255 West 90th St., New York City, on Dec. 10. It was not generally known in the trade that Mr. Connor had been seriously ill, and his death therefore came as a shock and complete surprise. He died of Bright's disease after being confined to the house only a few weeks.

Mr. Connor was a distinct character in the coal trade. As a young man, he was for a short time connected with the retail trade in Boston under the firm name of Phillips & Connor. At an early age, however, he became associated with the firm of Whitney & Kemmerer in New York, and after a short time was transferred to their Boston office, but, in 1896, upon the death of Albert Darling, he returned to New York to assume charge of the business in that city. By his aggressiveness and knowledge of the business he soon forged ahead into a position of prominence in the trade, and was later admitted as a member of the firm. His genial disposition and strict adherence to principles of business integrity formed for him a wide circle of loyal friends.

In addition to being a member of the firm of Whitney & Kemmerer, Mr. Connor was a director in the Coal & Iron National Bank, Three-In-One Oil Co. and other corporations. He was a member of the Columbia Yacht, Meridian and Railroad Clubs. Mr. Connor is survived by his wife and one daughter.

The funeral was held Dec. 12 from the Church of St. Gregory the Great and was largely attended by the prominent men of the coal trade who gathered there to pay their last respects. The interment was in Woodlawn Cemetery.

PERSONALS

A. R. Beisel, general superintendent of the U. S. Coal & Oil Co. at Holden, W. Va., has been transferred to Cincinnati, to have charge of the Huntington and Cincinnati coal docks.

Carl Scholz, of Chicago, was reëlected president of the American Mining Congress; Harry L. Day, Wallace, Idaho, M. S. Kemmerer, New York, Walter Douglas, Bisbee, were chosen as vice-presidents; and James F. Callbreath, of Denver, was reëlected secretary.

B. F. Hoffacker, chief assistant to the late John W. Boileau, of Pittsburgh, has taken over Mr. Boileau's office. During the period of Mr. Hoffacker's connection with Mr. Boileau he acquired a wide and varied knowledge of coal properties in Pennsylvania, Ohio, West Virginia and Kentucky.

E. H. Carr, general manager of stores for the LaFollette Coal, Iron & Ry. Co., of LaFollette, Tenn., was in Cincinnati recently for the purpose of buying a large quantity of goods of all sorts for the company's commissaries. Mr. Carr commented upon the bad condition of the iron business in his section and the South generally, stating that the company's furnaces are shut down for lack of business. He said, however, that the coal business had never been better, the volume of the movement being large and prices good.

TRADE CATALOGS

Golden-Anderson Valve Specialty Co., Fulton Bldg., Pittsburgh, Penn. Leaflet of 8 pages, 9x12 in.; illustrated.

Westinghouse Electric & Manufacturing Co. (Industrial and Power Department), East Pittsburgh, Penn. Bulletin No. 3002-A. Central station power in coal mines. Illustrated, 16 pp., 6x9 in.

Mannesmann Light Co. of America, Inc., 331 Fourth Ave., New York. Catalog. "Manlite" electric safety cap lamp. Illustrated, 20 pp., 6x10 in.

Siebe, Gorman & Co., Ltd., Westminster Bridge Road, London, Eng., H. N. Elmer, 1140 Monadnock Block, Chicago, Ill., agent for North America. "Smoke Helmets, Self-Contained Breathing Apparatus, Resuscitating Apparatus, etc." Fifty-nine pages, 8½x11 in.; illustrated.

CONSTRUCTION NEWS

Scranton, Penn.—Kingsley & Wescott have been awarded the contract to erect a breaker in Peckville for the Mid Valley Coal Co. George H. Campbell is president of this new company.

Hazleton, Penn.—After having been in the courts for years, the coal rights at Pond Creek have been sold by the owners to a New York syndicate, which will build a new breaker and develop the tract on a big scale.

Whitesburg, Ky.—The Louisville & Nashville R.R. Co. is reported to have let a contract for construction of a five-mile branch road, to run from the main line of the Lexington & Eastern R.R. at Typo to the coal properties of the Haley Coal Co. and the Virginia Coal & Coke Co. Langhorne & Langhorne, of Richmond, Va., are said to have been awarded the contract, and will begin work at once.

Louisville & Nashville engineers are rapidly locating the Rockhouse Creek branch of the Lexington & Eastern R.R. from Blackey, the new town, up Rockhouse Creek into the rich coal-land holdings of the Mineral Development Co., the Swift Coal & Timber Co. and the Rockhouse Realty Co., all three of which plan development of their property, the work to begin the first of the year. It is expected that a contract is to be let at once for the construction of this important branch, especially from a coal and timber standpoint.

NEW INCORPORATIONS

Peoria, Ill.—The McMasters Coal Sales Co. has been incorporated here, capital $2500, by A. T. McMasters, D. A. Covey and H. C. Seward.

Tuscaloosa, Ala.—Riverside Coal Co., capital $162,000, incorporated by John S. Riegel, of New York, R. K. Miller, of Brownsville, N. Y., and others.

Oklahoma City, Okla.—The Capitol Coal Mining Co. has been incorporated here, with a capital of $12,000, by G. H. Fleece, R. S. Nelson and W. S. Nelson.

Cincinnati, Ohio—The Virginia Fuel Co. is being organized here for the purpose of selling the output of the Long Flame Coal Co., of Stow, W. Va., with mines on Buffalo Creek, Logan County, W. Va. When fully organized, W. J. Pritchard, of Bramwell, W. Va., will be president, and Thomas J. Burke, formerly with the Glen Alum Fuel Co., secretary-treasurer.

INDUSTRIAL NEWS

Walamun, Alta., Can.—The Walamun Power & Coal Co. has opened up a 25-ft. bed of coal of superior quality and will shortly begin shipping.

Parsons, Penn.—Thirty acres of land in Wilkes-Barre and Parsons were transferred by the Delaware & Hudson Co. to the Northern Coal & Iron Co. in a deal made known Dec. 15.

Rington, Penn.—Bennett & Randall, contractors, have completed the great No. 5 reservoir to supply water for the Girard collieries. The capacity is 28,000,000 gal. The work was commenced in May, 1913.

Shamokin, Penn.—The coal house of the Cameron breaker of the Susquehanna Coal Co. was destroyed by fire on Dec. 13. It is believed to have been ignited by sparks from a freight-train locomotive. The loss is estimated at $5000.

Pittston, Penn.—Fire destroyed the E. W. Wing breaker and washery at Port Griffith, near here, on the morning of Dec. 11. The plant was owned and operated by the Pennsylvania Coal Co. The blaze entailed a loss of over $800,000 and put 2500 men and boys out of work.

Jackson, Ohio—The Detroit, Toledo & Ironton Ry. Co. has placed an embargo on all shipments of coal from West Virginia over the Chesapeake & Ohio R.R. and the Norfolk & Western R.R. This was done because of congestion at the transfer points, due to lack of equipment of the Detroit, Toledo & Ironton.

Philadelphia, Penn.—The Old Lick Run Coal & Coke Co. of this city has accepted an order for 250,000 tons of coal for delivery to South American ports, subject to the outcome of a conference to be held in London, looking to a satisfactory adjustment of credits for American coal exports in the South American markets.

Cincinnati, Ohio—The H. T. Hackney Coal Co., operating mines near Knoxville, Tenn., has changed its corporate name to the Superior Coal Co., a change in control of the company being responsible for the new name. It is announced, however, that no change in mining connections or in the selling branch here, in charge of H. L. Smith, will be made.

West Liberty, Ky.—The largest cannel coal territory in the world has been opened up by the Morehead & Norfolk R.R., which has just completed a tunnel through the mountains, intersecting the waters of Elk Fort and Straight Creek. The Continental Coal, Land & Lumber Co. has purchased a large part of this area and will begin development operations at once.

Hazard, Ky.—R. T. Hoskins and S. H. Means, of Bluefield, W. Va., have leased a good boundary of coal lands on Buffalo Creek, immediately above here, and announce its early development, the initial work to begin Jan. 1. A contract for the building of 250 houses has been let, and simultaneously with this work the mines will be opened. At least 300 men will be given work at the start.

Shickshinny, Penn.—Because two electricians' helpers were discharged when they refused to do the work of master workmen, 1200 employees at the Moconaqua colliery of the West End Coal Co. went on strike Dec. 13, and the colliery will be shut down until the grievance can be adjusted. The colliery employees contend that the two helpers were forced to perform work that requires a master electrician and that the apprentices were right in refusing.

Washington, D. C.—Formal announcement of successful naval tests of coal from government-owned Matanuska fields in Alaska was made Dec. 14, by Secretary Daniels, before the naval committee of the House. Trials by the cruiser "Maryland," Mr. Daniels said, had determined that the Matanuska coal was as good as any to be found and pointed the way to an adequate supply of fuel for the Pacific coast as soon as transportation facilities are available.

Lexington, Ky.—Charles Swetner, vice-president of the East Jellico Coal Co., has announced that his company has contracted for sale to the Russian government of 50,000 tons of coal to be delivered at Odessa, on the Black Sea. The company, which has mines at Shaffer, Ky., and Bluefields, W. Va., will ship from Bluefields. Mr. Swetner said that he did not think this coal would be contraband, as it was to be used for commercial and domestic purposes.

Hemphill, Ky.—White L. Moss, M. J. Moss and others, of Pineville, Ky., have just leased a large coal-land tract on the Yount's Fork branch of the Lexington & Eastern R.R. near here, from K. S. Potter, and make the announcement that development of the property will be begun soon after the first of the new year. White L. Moss will be general manager. The company will have a daily output of about 1200 tons from the beginning, and the plant is to be electrically equipped.

Lansford, Penn.—The Lehigh Coal & Navigation Co. has been experimenting with a new device manufactured by the American Concentrator Co., that automatically reduces the quantity of coal in the slate discharge. This apparatus has been in operation on a Joplin jig at the Greenwood washery for over a month, with marked success, and will be attached to the other jigs in the washery as well. Before the device was adopted the jig-runner was forced to watch the discharge continually and put his hand in the water to ascertain the height of the slate. This was trying, especially in cold weather. With this apparatus the action is entirely automatic.

Coal Trade Reviews

General Review

Cold weather creates a sharp advance in anthracite though the wholesale market continues heavy. Bituminous operators still pushing vigorously for business. What few changes there are seem to be of a constructive nature.

The first severe cold snap of the season appeared at the beginning of the current week, creating great activity in retail circles the effects of which were felt in the wholesale business though mining operations have not been increased as yet. The change has come just in time to avoid a severe slump in the market, and even now it will take some little time to clean up the excessive accumulations and put the trade on a firm basis. The Lake movement to the Northwest has been fully 20% less than last year, but the upper Lake ports are well supplied, partly because of the heavy stocks carried over from last season. The mines continued on curtailed running schedules this week, but full time operations will probably go into effect next week.

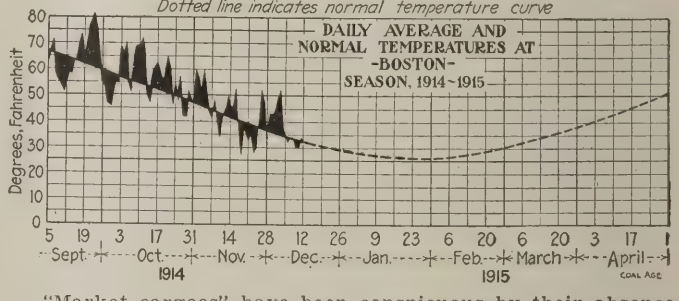
The heavy storms of last week, resulting in the complete loss of some vessels and long delays to all the others, has created a temporary stringency among bituminous consumers dependent upon regular and continuous shipments, which has afforded an opportunity for the agencies to urge additional tonnages upon buyers. However, the technical position of the market continues on the same unsatisfactory basis with operators vigorously pushing for business. While occasional plants are working full time on war orders, it cannot be denied that the New England trade as a whole is doing scarcely better than two-thirds the normal business. Ocean frieghts on export shipments continue at the same high level, or higher, with the result that there is still less being done in this direction though rates are somewhat easier to the West Indian trade where return cargoes of sugar will soon be available.

Considering the adverse effects of the final and complete elimination of the Lake business, operations in the Pittsburgh district continue relatively strong, but there is still an absence of inquiry on new contracts, and the circular is not well defined. There seems to be less disposition to buy ahead than in former years, but what little change there is, seems to be of a constructive nature. It is generally agreed that most concerns are running on light stocks.

The colder weather has created a better tone in Ohio, and the producers are showing less tendency to crowd the market at the prevailing low prices. Expiring contracts as a rule, are not being renewed, buyers covering their immediate requirements in the spot market, the tendency being to hold off until after the first of the year on any new business. In the Southern markets the domestic demand seems somewhat better at the moment, though prices are substantially under the circular as compared with steam coal which is holding close to the regular schedule; collections are bad.

In the Middle West the colder weather has started the most important movement of the year, and shows indications of a still more active demand for the domestic grades in the near future. Screenings continue to lead the market. With winter weather conditions now in effect there will be a strong, healthy undertone through the market, but negotiations will generally be delayed until after the first of the year.

ATLANTIC SEABOARD



BOSTON

A slight spot demand for Pocahontas and New River, but f.o.b. prices unchanged. No let-up in anxiety to move coal. Pennsylvania grades still meet with only scattering demand. Slightly better call for anthracite, although independents still make concessions on slow sizes.

Bituminous—There has been some interest this week in spot coal on the part of buyers, but it has been due to the weather conditions and the slow movement of transportation along the coast. Cargoes have been held up by fog and storm for ten days or a fortnight in some cases, and some few of the consumers, dependent on an uninterrupted supply, have been pinched for coal. If general market conditions were not so dull and flat this would hardly be noticed but it is eagerly used by some of the shippers to induce contractors to accept deliveries a little faster.

The weather is now more seasonable; the Kennebec River has frozen over, and the trade is beginning to settle down to winter conditions, even though accumulations at the Hampton Roads terminals are as large as ever. No contracts of any moment have been placed since last report and there is nothing new on prices; $2.85 continues the nominal basis, but such sales as are made are well down to $2.70 or less.

Pocahontas and New River shippers are vigorously canvassing for business, spot and future, but it will be several months before New England buyers are interested unless there is a marked change in industrial conditions. Scattered plants, mostly textile and shoe, have large foreign orders that keep them running at full capacity but by far the larger number of mills and factories are on two-thirds time. In the spring these interests contracted for a normal tonnage of coal and hence it is that stocks everywhere are large.

"Market cargoes" have been conspicuous by their absence during this after-storm period and those now arriving will probably command slightly higher prices. It depends, however, on the volume of coal whether on-car prices at Providence and Boston will show a material advance. Portland was actually short of steam coal this week until an over-due steamer arrived.

The steamer "Carolyn," lately a coastwise collier, was chartered to take cotton from Savannah to Bremen, Germany.

The storm interfered with receipts of Georges Creek in this territory and it will probably be several weeks before the shippers catch up with their orders.

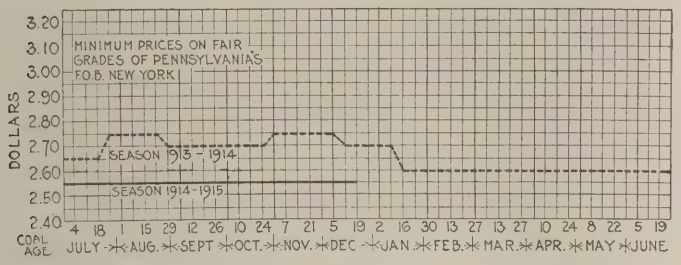
The better Pennsylvania grades continue only in light demand. Prices are at a minimum level, with operators holding their output down to what the market will absorb. All-rail the movement is slightly better but at Tidewater the demand is still only scattering.

Anthracite—There has been a little start in the local demand for anthracite, but it is of a hand-to-mouth character. The retail dealers feel it is easy to get coal forward on short notice and they are not trying to be forehanded. The shipping companies are able to load all sizes promptly, so much so in fact, that independents are offering egg and chestnut at 25@50c. below the circular.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.45	$1.15@1.55	$1.67@1.77	
Philadelphia*	2.10@2.70	2.40@2.80	2.92@3.02	
New York*	2.40@3.05	2.70@3.15	3.22@3.32	
Baltimore*	.....	.....	2.85@2.95	
Hampton Roads*	.....	.....	.....	$2.50@2.75
Boston†	.....	.....	.....	3.48@3.78
Providence†	.....	.....	.....	3.43@3.73

* F.o.b. †On cars.



NEW YORK

Bituminous buyers still indifferent. Some preliminary negotiations on new contracts. Severe cold weather checks the decline in anthracite. Retail trade active.

Bituminous—Buyers continue indifferent and the trade is still awaiting some new developments, such as a general reawakening of industrial activity. The usual slowing up that always marks the holiday period is already being felt and no great activity is anticipated now until after the first of the year. The bunkering trade does not seem so heavy at the

moment, and mine operations continue on about the same basis, that is, 60 to 65% capacity.

The embargo put into effect at South Amboy last week was raised on Thursday of the same week, but with the appearance of severe cold weather it is not unlikely that it will be reëstablished. When the embargo was originally declared, it is reported that all of the sidings on the Pennsylvania R.R. were practically choked up with coal, most of which was said to belong to the Berwind-White Co. While the embargo was essentially due to the delayed water movement, due to the heavy storms, it was probably somewhat aggravated by the reduction of the train crews on the railroads, which is in line with their general curtailment policies.

Negotiations on new contracts are not yet under way, but tentative figures are being made at the same level as last year; it seems doubtful at present if these will hold, and it is probable that concessions of 5 to 10c. per ton may be found necessary. A few cargoes of demurrage coal can occasionally be picked up at low figures, but as a rule this has been well cleaned up and the nominal market continues essentially on the same basis, as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The first really severe weather of the winter appeared the early part of the current week and undoubtedly saved the anthracite market from a more or less complete demoralization. So far the effect has not extended beyond retail circles, but there is great activity in that branch and dealers are particularly well pleased that the buying movement was started before the snows made deliveries slow and expensive. It is not to be expected that the change will affect mine operations immediately, but the importance of the weather on the anthracite market is generally recognized by all, and the trade is watching temperature conditions with a critical eye.

There is no change of importance noted in the wholesale situation as yet. Reductions are still necessary to move egg coal, while stove is plentiful in all directions and can now be obtained at 10c. under the circular. Nut and chestnut are about the only sizes in any demand at all at the present time. The steam grades continue in the same rut as for the past several weeks. Mine operations were still curtailed during the current week, but a continuance of the low temperatures will soon necessitate full-time schedules.

We continue the market quotations on the same basis as last week, with the exception of stove coal, which is 10c. lower, as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05

BUFFALO

Bituminous gaining slowly. Slack doing better than sizes. Weather too mild for an active anthracite trade. Lake season ended.

Bituminous—What little change there is in the situation seems to be in the direction of an improvement. Slack is selling freely and promises to be strong, in the near future; there is less surplus than usual which will be noticed as soon as the Lake business is out of the way and the trade settles down for winter business.

Canada, which has taken little coal for the past year, will probably start up soon, as they have large orders for goods for the British army; our factories are also feeling a decided improvement in the same direction and it looks as if the industrial depression might soon be over. There seems to have been less disposition to buy ahead than for some time; it is also well known that the railroads have light stocks everywhere and should they start buying there would be a lively rush for coal.

There are some good contracts offering now and the report is that quite as good prices are in prospect as were obtained a year ago. Current prices are slightly stronger, on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack. Only best grades bring these prices, but the market is much less demoralized than it was during the fall.

Anthracite—The market is quiet, but with the return of winter weather the demand is stronger and the trade will soon show increasing activity. The surplus of egg coal continues, but the demand for stove and chestnut is not so strong as in former years.

The Lake season closed with a total shipment of 4,286,226 net tons. The amount for the previous season was 5,133,696 tons, which was the largest on record. As a rule the shippers were satisfied with the amount sent forward, most of them closing down before the Lake fleet was all out of the market. On account of the excess of egg some of the companies have taken considerable tonnage for immediate loading to hold during the winter. Three or four cargoes are already loaded.

PHILADELPHIA

Cold snap causes additional demand for coal. Collieries operating more freely. Bituminous about the same as last week, although there seems to be a better feeling in the trade.

Anthracite—The cold snap the early part of the current week caused an increased demand for coal from the retailers, which was naturally reflected in the requisitions on the wholesalers. Operations were much curtailed last week, some companies suspending two or three days, and it will require more than a week of cold weather to place the trade on a normal basis. All the dealers seem to have ample stocks, and they are rather chary about selling to everyone that comes along.

There is no doubt that the industrial depression has had an unusual effect on the demand for coal. Dealers are sometimes pressed with requests for coal, but when the question of credits comes up, the order is in many instances turned down; credits have been closely scrutinized during the last year or two, as many of the dealers have suffered heavy losses. Prices at retail still continue at $7 for egg, $7.25 for stove and $7.50 for nut, notwithstanding the implied threat on the part of the retailers to advance quotations 25c. all along the line. Pea coal retails at $5.50 per ton.

Prices at Tidewater remain about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	4.75@4.85
Stove	5.00	5.10
Chestnut	5.25	5.25

Bituminous—The cold weather is likely to cause a temporary improvement in the demand for soft coal, but the general apathetic condition of the trade still continues. Here and there better reports are heard, but, taking the situation as a whole, no improvement is noted.

BALTIMORE

Bituminous still on unsatisfactory basis. Colder weather stimulates some interest. Anthracite livens up a bit.

Snow, sleet and freezing weather in many sections of Maryland, West Virginia and Pennsylvania have affected the situation materially. Much of the coal arriving at tide was weather bound, and the rail movement was more intermittent also, though there was no scarcity of fuel at any time.

West Virginia fuels are offering at from 75 to 90c. The call for three-quarter gas has continued particularly poor. Pennsylvania low-grade coals were offered freely around 90c. to $1, with medium to best grade at from $1.10 to $1.35. Western Maryland steam coals are in poor demand and were quoted at the mines around 85c.

Local dealers report a better demand for hard coal, the market being regarded as a strictly weather affair. Steam grades are still decidedly lacking in strength.

A marked increase in the number of export charters has given hopes that the December total for foreign movement might be considerably better than has been expected. Coastwise shipments, except in company-owned or long-term chartered vessels, remained dull and featureless.

Contract renewals that come into the market at this time are being taken up generally on about the same basis as last season. There may be some cutting in larger amounts, but the trade as a whole is standing firm behind its former figures despite the depressed state of the market.

HAMPTON ROADS

Demand continues light on all grades. Heavy weather has interfered seriously with coastwise movement.

Dumpings at Tidewater are hardly coming up to expectations. The severe storms have interfered to some extent with all classes of vessels. Steamers loaded for Northern

ports last week should be back for new cargoes now but have been delayed in passage both ways; this has, of course, caused some falling off in dumpings at the various piers, and to date the total tonnage at all piers is probably less than last month. Coastwise shipments, as usual, have gone principally to New England ports although there has been a small movement to Charleston and Jacksonville.

Circular prices are being maintained even though the demand on all grades is light. The accumulation of cars in the railroad yards is still above normal and while a few shippers are short of coal, others have a large surplus. The accumulations are mostly due to the weather conditions, and it is expected that this will clear up shortly.

Clearances during the interval, Dec. 8 to 11, were as follows:

Vessel	Destination	Vessel	Destination
Harewood	Genoa	Posteiro	Pernambuco
Finn	Gibraltar for orders	Stephen	Para and Manos
Atlantide	Porti Ferrajo, Italy.	Tibagy	Rio de Janeiro and Pernambuco
Hermod	Canal Zone	Fanny	Buenos Aires
Bjorn	Santiago		

OCEAN FREIGHTS

Rates continue advancing and American operators are practically excluded from foreign markets. West Indian situation easing up.

The freight market continues to advance. Owners seem to be able to secure about any rates they ask on grain, cotton, general cargo and time charter trades. There is little business in export coal, as Americans find it difficult to compete with Cardiff at the present differential in rates.

Two large sailing vessels have been chartered for coal (one from Norfolk and the other from Philadelphia) to Rio at $5.50 U. S. gold per ton. Steamers can be secured at fairly favorable figures for Cuban and West Indian trades, as these cargoes combine with Cuban sugar home, which will soon commence to move.

Olson & Mahoney		Atlantic Range	San Francisco	799	4.74
William C. May		Philadelphia	Jucar	607	2.00

Note—Steamers are indicated by **bold face** type, all others being schooners.

OHIO VALLEY

PITTSBURGH

Operations continue at under 40% capacity, with demand no better except in domestic, which has been favorably affected by a cold snap. Prices very irregular.

The general demand for coal has reflected no improvement to speak of, and mine operations continue very light, averaging less than 40% of capacity. Considering, however, that the Pittsburgh district always suffers a severe curtailment after the close of the Lake shipping season, even when general demand is good, the condition is not as distressing as might otherwise be assumed. Railroad demand is probably not much over 60% of normal, while demand from manufacturers, almost wholly against contracts, does not seem to be more than 40% of normal. Domestic demand has experienced a further improvement this week, there having been a heavy snowfall Sunday, accompanied by a drop in the thermometer to the twenties while by Tuesday morning the zero point was touched.

Prices continue irregular for free coal, and there being no inquiry to speak of for contract coal the operators have no fixed schedule. Slack is fairly firm at 80c., but otherwise the following quotations represent little more than the level from which cutting begins, though some operators are holding firmly to these or higher prices, and booking correspondingly little business: Slack, 90c.; nut and slack, $1; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district. The prices on screened coal are to consumers, dealers being usually given a concession of 10c.

COLUMBUS

Colder weather again stimulates the domestic trade and a better volume of business is expected. Demand for small sizes is increasing. Steam trade continues dull.

The lower temperatures have had a stimulating effect on the local trade. While the increased volume of business is slight, it has given a decidedly better tone to the market. The domestic trade was affected more than any other department, the steam business still being dull and there is little hopes for immediate improvement.

Prices are no better and it will require several weeks of the increased business to have any effect upon quotations. Prices still continue a little under the circular which is still in force. The small sizes are the only ones showing an advancing tendency, nut, pea and slack and coarse slack all being stronger.

The steam trade is dull in every way and there is little hope for improvement in the immediate future. Manufacturing has not been greatly affected by the large number of war orders which are said to have been placed here. Railroads are not taking any large amount of coal. Buying is still being done on the open market where contracts have expired.

Dealers' stocks are not large as a rule, although there are a few exceptions. Collections are still bad which is affecting orders from the dealers. Prices in retail circles are fairly strong despite the weakness in other lines.

Production in Ohio fields has been on the following basis: Hocking Valley, 60% normal; Pomeroy Bend, 75@80%; Crooksville, Cambridge, and Jackson, 60% of the average.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.55	$1.65	
Inch and a quarter	1.50	1.55	$1.40
Three-quarter inch	1.35	1.40	1.35
Nut	1.15	1.25	1.15
Mine-run	1.10	1.15	1.10
Nut, pea and slack	0.60	0.60	0.55
Coarse slack	0.50	0.50	0.45

TOLEDO

Toledo trade brisk and prices firm. Orders coming in better and the trade more hopeful.

The weather conditions have greatly stimulated the domestic trade and dealers are much more hopeful. Orders are coming in well and prices are holding firm. There is practically no coal on track. The docks are cleaned up also, being left in better shape than is customary. The Lake shipping is now over for the season. Orders are coming in well both for domestic and steam coal and dealers are optimistic over the outlook.

CLEVELAND

The retail trade active due to the colder weather. The effects not yet felt by jobbers and operators. The market firm, but not active.

Slack is being held at 5c. above last week's prices in most instances, but coarse coal is selling at anything it will bring; this is due to West Virginia No. 8 operators selling three-quarter coal on consignment. This coal has been coming into the market when it was the weakest and though only 15 to 20 cars arrive at one time, it has kept other fuels at below cost. Some of this No. 8 has been sold in competition with mine-run.

The tone of the slack market is shown in the prices asked for Hocking. Ohio slacks are firm at $1.65@1.70 on track here while Fairmount is being sent to other markets and Pennsylvania coals are too high priced to compete here. Youghiogheny is being sold at 80 and 85c. at the mines.

No more coal will be loaded into vessels for delivery this season. The steamers "Rees," "Yosemite," "Sonora," "Capt. Thomas Wilson," "H. W. Oliver," and the "W. H. Wolf," left Lake Erie ports for Milwaukee on Friday and Saturday of last week. The "Wolf" was a week late in reporting for her cargo at Cleveland and the "Rees" was two days ahead of her schedule at Lorain. A block of 500,000 tons of soft coal, for delivery at Superior next season, was placed with a local vessel company last week at 30c., the same rate that prevailed this season.

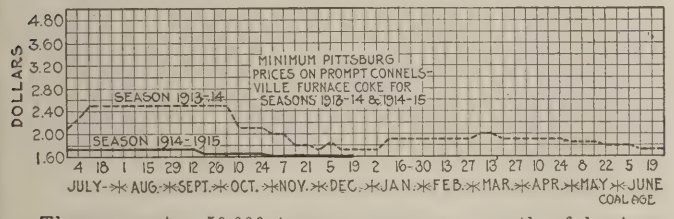
Prices for shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmount	W. Va. No. 8
Lump	$3.35	.....	.....	.....	.....
Lump, 6 in.	.....	.....	$2.45	.....	.....
Egg	3.35	.....	.....	.....	.....
Egg, 6 in.	.....	.....	2.10	.....	.....
Lump, 1½ in.	.....	$2.40	2.25	.....	.....
Lump, ¾ in.	.....	2.30	2.10	$1.95@2.00	$1.95@2.00
Mine run	2.55	2.25	1.95	1.85@1.90	1.90
Slack	2.40	1.80@1.85	1.70@1.75	1.85@1.90	1.80

CINCINNATI

A week of colder weather has improved the demand and better prices are in evidence. Contracting continues slow, but the tone of the market is more favorable, and operators are less inclined to push for business.

Real winter weather, with considerable snow for the first time this season, has created some activity in the trade, particularly the domestic market. Retailers are buying more readily, although not in large quantities. Prospects seem good for better prices and operators are less inclined to crowd sales at current figures.



Contrary to expectations, there has been comparatively little buying on contract, because of the continued dullness in most industrial lines. The tendency is to wait for new developments until after the first of the year. Improvement is noticeable in the iron and steel trades, indicating that conditions may be better shortly. A large volume of river coal is expected in this market shortly, which will give considerable relief to handlers of this grade, whose supplies are almost exhausted.

COKE

CONNELLSVILLE

Furnace coke contracting under way, with about 100,000 tons a month closed, 50,000 to 75,000 tons under inquiry, and 50,000 tons or more not heard from. Prices steady and unchanged. Production and shipments partially recovered from the holiday week.

Contracting for furnace coke for next year's requirements has continued active. In last report the contracts closed were summarized as involving 50,000 tons a month, and since then additional contracts have been closed making the total 90,000 to 100,000 tons a month, first-half contracts predominating, full year contracts coming next, with two contracts closed for two years and one for a quarter only. About two-thirds of the business has been at flat prices, particularly that most lately closed, at $1.65 to $1.70 for the quarter, about $1.70 for the half-year, and in exceptional instances at $1.75 for the second-half. In one case $1.65 was done for first-half and $1.75 for second-half, but this is considered exceptionally low. Inquiry now out totals 50,000 to 75,000 tons, and most of this business is likely to be closed shortly.

There remains 50,000 tons or more per month of business now being filled on contracts, expiring at the close of this month with consumers who have not put out fresh contracts, while there is of course a much larger quantity of possible consumption involved in furnaces now idle that may resume next year, but cannot contract for their possible requirements now. The operators would not think of selling at present prices to a furnace that would only resume in case conditions improved. Foundry coke is very quiet. The annual contracts generally run from July 1 to June 30. We quote: Prompt furnace, $1.60; contract furnace, first-quarter, $1.65@1.70; first-half, $1.70; prompt foundry, $2@2.20; contract foundry (nominal and for best grades), $2.35@2.50, per net ton at ovens.

The "Courier" reports the production in the Connellville and lower Connellsville region in the week ended Dec. 5, at 195,575 tons, an increase of 16,136 tons, and shipments at 196,157 tons, an increase of 19,408 tons. These increases, however, merely represent a partial return to the rate obtaining prior to the previous week, when the Thanksgiving Day holiday cut into production and shipments.

BUFFALO

The demand for coke has not improved and there is no stir in prices. If the reports of orders for steel manufactures from Europe continue there will be an increase of demand after a little, but such reports usually need confirmation. It is felt that the up turn cannot be far away and some of the idle smelting furnaces here are starting up. Coke prices are still based on $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

BIRMINGHAM

There is absolutely nothing new in the coke market.

CHICAGO

The coke trade has improved. A number of contracts have been renewed, and large shipments are being made on old engagements. Byproduct coke is about the same, being influenced by the domestic trade demand. Current quotations are as follows: Byproduct, $4.75@4.95; Connellsville, $4.75@$5; Wise County 72-hr. (select), $5; gas coke, $4.50@4.75; furnace coke, $4.50@4.75.

ST. LOUIS

There is practically nothing doing on foundry coke, and not much anticipated until the railroads begin to get in the market for supplies. A small amount of byproduct coke is coming in, chiefly for domestic purposes, and the local gas house coke is moving slow; some of the latter is being shipped out of the city, but not to any extent.

THE STEEL INDUSTRY

Slowing down over year end but some buying ahead. Expectations of a wage cut.

Buying of finished steel for the first quarter of 1915 has increased somewhat, but it is evident that December will not put on the books the volume of new business needed for a strong revival of mill operations after Jan. 1. The last two weeks of the year, from all signs, will take their usual quiet course.

The possibility of wage and salary reductions at the beginning of the year is again having attention, since it became known that no stock offerings to employees will be made by the Steel Corporation, and with the expectation that there will be no bonus distribution. Counting against wage reductions are the improvement in financial and security markets and the better railroad buying looked for after the generally predicted advance in Eastern freight rates. On the other side are the poor balance sheets of the year and the indications that profitable iron and steel prices are some months distant.—"The Iron Age."

SOUTHERN

BIRMINGHAM

Steam and lump grades continue quiet. Blacksmith coal improving.

The past week has shown little change in the lump coal market, though the movement may be slightly better. Steam coal is in some better demand, but the increase can hardly be noted. Prices on lump coal are about 50c. under the schedule, while steam coal is only slightly under the regular circular. Blacksmith coal is increasing in tonnage, with prices the same. The furnaces report a heavy sale of pig-iron covering the first half of 1915.

LOUISVILLE

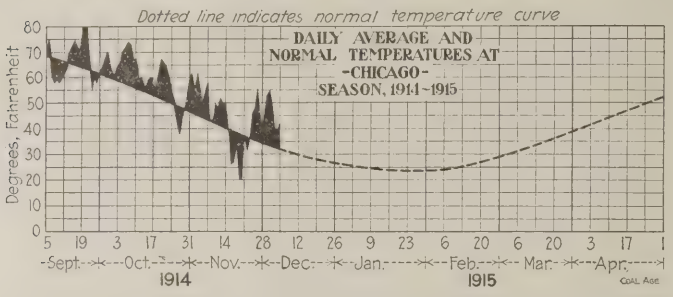
Steam market shows some improvement and there is none on demurrage. Domestics continue heavy and collections are slow.

An improvement in the steam coal market is the most notable event in the Kentucky field this week. For the first time in a long period there is little or no steam coal on demurrage and orders are more plentiful. The domestic market has not shown a great deal of improvement in spite of the cold weather.

Though a large proportion of the eastern Kentucky mines are closed down, others are running better than the western Kentucky operations, which are doing only about two days a week. Highest grade block coals are bringing from $1.75 to $1.90 f.o.b. mines, with prices ranging downward on all other grades. High grade nut and slack commands from 50 to 60c. and the poorer grades from 25 to 40c. f.o.b. mines.

MIDDLE WESTERN

CHICAGO



Seasonable weather lends encouragement, but prices for domestic coals are irregular. Householders buying only sufficient for immediate needs. Screenings strong. Anthracite steady.

Colder weather has again appeared and indications point to a more active demand for domestic sizes. The tendency in screenings is still upward, and prices have reached the highest level for several months past; some screenings have been sold at 80c., and the average price has been around 70c.

It is freely predicted that a continuation of present conditions will see screenings averaging from 80c. to 85c. per ton in a short time; this is due to the increased demand and the curtailment of output.

The improvement in domestic demand is slight, although the cold weather has increased the buying. Householders continue to purchase only current requirements, which has had its effect on the retail yards. The Central West is now covered with snow, and it only needs the continuation of wintry weather to give a healthy tone to domestic and coarse sizes.

In anthracite there has been a shortage of chestnut coal in this market which has been overcome the last few days by increased shipments. The demand for stove and egg is about equal to the receipts; prices are holding steady at circular quotations.

The Sullivan County and Clinton district mines in Indiana are shipping most of their domestic coals to the local trade at fair prices, and are disposing of their screenings at an increase of 5c. to 10c. per ton over the prices of last week.

In Franklin County there has been a recession in prices except for screenings, and very few of the operators are receiving circular figures for domestic coal. The variation in prices is wide, and shipments of coarse coal have been accumulating at the mines awaiting disposition.

Smokeless lump and egg is in good demand, but there is practically no call for mine-run.

Little activity is shown in splint coals, and prices average 25c. to 35c. below the list.

A slight improvement is reported in prices for Hocking coals owing to the decreased production; demurrage coal has all been absorbed.

Carterville grades are steady, and operators in that field are making an absolute minimum of $1.60 for No. 1 washed coal, while most of the sales are at $1.75.

In the Springfield district the mines have been operating steadily and screenings are particularly strong. Some of the mines in this district are shipping egg and nut coal to the steam trade at the same price prevailing for steam lump fuel.

been a little short of hopper cars. Mine-run coal is still selling low, at $1 to $1.10 in the open market.

Retail prices continue unchanged from the mid-September schedule which is less than the usual winter level. There is apparently some disposition to force sales. One of the local companies had a bargain day, Monday, by offering 2000 tons of best Indiana lump at $2.50, the general price being $3.25. This undersold by 25c. a ton, the furniture installment house that is offering it to its customers and "friends."

ST. LOUIS

Colder weather has started some coal moving and the situation is slightly better. Screenings slowing up. Conditions expected to be quiet till after the first of the year.

There has been a slight improvement as a result of a few days of cold weather, the first this season. It did not last long enough, nor was it sufficiently severe to create a demand that would start domestic sizes upward, but it stimulated interest to such an extent that some coal began to move. It also stopped the advance in the screenings market. All sizes from No. 3 down are in good demand from all fields. The washed market is improved on the larger sizes, but otherwise conditions are much the same.

Anthracite is still slow. Winter weather is expected from now on, and this will help the market to assume a steadier tone. No great rush is anticipated before the first of the year, as the holiday season is always slow.

The prevailing wholesale prices are:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta

KANSAS CITY

Colder weather has increased the consumption. Prospects that Jan. 1 will see prices advanced.

The first real winter weather of the season has appeared and the dealers are at last commencing to move the coal stocked in September. A slight scarcity of slack is noted, due to the increased consumption, combined with the small production of block coal and the consequent short supply of slack. Illinois coal is still off; many dealers have cars standing on track, but these will probably be moved under present winter conditions. Kansas and Missouri coals are rapidly stiffening up and salesmen have been notified to expect a change in prices at any time; Oct. 1 price lists are still in force.

INDIANAPOLIS

Colder weather and slightly increased factory operations have helped both the domestic and steam coal movement. Slack selling at about normal prices. Mines making better running time.

There has been a week of temperature below freezing which has stimulated the movement of domestic lump and there are also indications of industrial improvement, especially at Chicago. The colder weather has increased the consumption of steam grades about 10%. The mining companies have no trouble to dispose of their surplus screenings on the open market at 75c., which is about a normal price for December.

Operations at the mines are fair, one company working four of its mines on full time and the other three four days a week. Still the operators contend that the trade is dull in spite of the fact that all the mines in the state are probably making an average of four days a week. The railroad facilities are generally satisfactory, although some companies have

SAN FRANCISCO

Foreign shipments being resumed now that the German fleet has been disposed of. Colder weather stimulating local business.

Shipping is now picking up, with the announcement of the annihilation of most of the remaining German squadron which has menaced shipments of coal to this country for several months. On several occasions they held up vessels and took off what coal they needed as was the case with the steamer "Sacramento," flying the American flag. Many of the South Sea Island towns were shelled and destroyed by this fleet. Several of the sea-fighters were in this harbor at various times to take on supplies, making use of the 24-hr. privilege.

Weather the past two weeks has been very cold and there has been an increased demand for domestic and steam coal. Dealers throughout the city are sanguine of steady business for several months to come. Quotations still remain normal, the latest quotations being $6.50 for steam coal and $7.50 for domestic.

Coal Contracts Pending

Contracts listed in this department are authoritative in every respect except where the source of information is questionable, in which event it is noted. All contracts are listed promptly on receipt and only repeated when additional information becomes available or in the last issue previous to the day on which bids will be closed. Liberal remuneration will be paid for all legitimate notices of this kind sent in.

Contract No. 22—Philadelphia—The date for receiving bids on this contract (pp. 933, 972) has been extended until Dec. 21. Address Director of Supplies, Room 312, City Hall, Philadelphia, Penn.

Contract No. 26—St. Louis, Mo.—Sealed proposals are requested at the United States Engineer's office for furnishing 30,000 tons of coal (see p. 972). All bids must be in by 11 a.m., Dec. 23, 1914. Address B. McD. Townsend, Colonel of Engineers, United States Engineer's Office, Custom House, St. Louis, Mo.

Contract No. 28—Brooklyn, N. Y.—Bids will be received by L. H. Pounds, president, Borough of Broklyn, until 11 a.m., Dec. 23, for furnishing and delivering coal as follows: (1) 9,678,000 lb. of anthracite coal to the various public buildings, baths, courts and comfort stations, Borough of Brooklyn, under Schedule No. 1; (2) 8,586,000 lb. of anthracite coal to the various public buildings, etc., Borough of Brooklyn, under Schedule No. 2; (3) 3,692,000 lb. anthracite coal to the various public buildings, etc., Borough of Brooklyn, under Schedule No. 3. The security required will be 30% of the total bid, and the contract will run till Dec. 31, 1915. Blank forms and further information can be obtained at the office of the Bureau of Public Buildings and Offices, Room 1003, No. 50 Court St., Borough of Brooklyn.

Contract No. 29—Brooklyn—Bids will be received by the Department of Parks until 3 p.m., Dec. 23, for furnishing and delivering coal. The amount of security required will be 30% of the amount for which the contract is awarded, and deliveries will be made until June 30, 1915. Address, Department of Parks, Borough of Brooklyn, or the Department of Parks, Municipal Building, Borough of Manhattan.

Contract No. 30—New York—Bids will be received by the Park Board, Department of Parks, until 3 p.m., Dec. 23, for furnishing and delivering 2,000,000 lb. of anthracite pea coal, No. 1, for the botanical gardens, Borough of Bronx. The amount of security required will be 30% of the total amount for which the contract is awarded and will run over 120 calendar days. Blank forms and other information may be obtained at the office of the Department of Parks, Municipal Building, Manhattan.

Contract No. 31—New York—Bids will be received by the Department of Parks until 3 p.m., Dec. 21, for furnishing and delivering 600,000 lb. of egg coal, No. 1, for the parks in the Borough of Bronx. Deliveries will run over 120 days, and the amount of security required will be 30% of the total amount for which the contract is awarded. Blank forms and other information may be obtained at the office of the Department of Parks, Municipal Building, Manhattan.

Contract No. 32—New York—Sealed bids will be received by the Department of Water Supply, Borough of Manhattan, until 2 p.m., Dec. 21, for furnishing, delivering, storing and trimming coal in the Borough of Queens. The security required will be 30% of the total amount for which the contract is awarded, and deliveries are to be completed June 1, 1915. Address William Williams, commissioner, Department of Water Supply, Gas and Electricity, Room 2351, Municipal Building, Manhattan.

Contract No. 33—Yonkers, N. Y.—The Board of Public Works desires bids for supplying 300 gross tons of steam coal and 60 tons of nut coal, to be delivered at the bath houses; 250 tons of Scranton pea coal to the crematory; 280 tons of egg coal and 10 tons of steam coal to the City Hall Building. Address T. A. Brogan, City Clerk, City Hall Building, Yonkers, N. Y.

Contract No. 34—Newark, N. J.—The Board of Street and Water Commissioners is in the market for 800 gross tons of buckwheat coal. M. R. Sherrerd is Chief Engineer.

CONTRACTS LET

Contract No. 11—Portland, Maine—This contract, which provides for furnishing 30,000 tons of coal to the Portland Gas Light Co. between Mar. 1, 1915, and Mar. 1, 1916 (pp. 814, 854, 892), has been let to the Westmoreland Coal Co. Address Burton Smart, Treasurer, Portland Gas Light Co., Portland, Maine.

Contract No. 18—Brooklyn—This contract (pp. 972, 933, 854) has been awarded to the Bacon Coal Co., at $2.24 per 1000 lb. Address Bureau of Public Buildings and Offices, Borough of Brooklyn, Room 1003, No. 50 Court St.

Contract No. 19—New York—This contract (pp. 972, 892) has been awarded to Gavin-Rowe, at $63,447. Address Auditor, Room 2141, Municipal Building, Borough of Manhattan.

FOREIGN MARKETS

GREAT BRITAIN

Dec. 4—There is no improvement in the general state of the steam coal trade. Owing to the stormy weather, tonnage arrivals are few, and in consequence pit stoppages are more numerous. Buyers in a position to take immediate delivery can obtain substantial concessions, but there are few able to take advantage of the opportunity. For forward loading, values are upheld. Quotations are approximately as follows:

Best Welsh steam	$4.80@5.28	Best Monmouthshires	$3.96@4.02
Best seconds	4.32@4.56	Seconds	3.78@3.84
Seconds	4.08@4.20	Best Cardiff smalls	2.52@2.64
Best dry coals	4.32@4.56	Cargo smalls	1.44@1.80

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage and for cash payment.

Freights—Chartering is fairly active but tonnage is scarce. Rates are aproximately as follows:

Gibraltar	$3.00	Venice, Ancona	$4.92	Singapore	$5.28
Malta	3.24	Alexandria	4.56	Las Palmas	2.76
Marseille	4.06	Port Said	4.80	St. Vincent	3.00
Algiers	4.29	Aden	5.04	Rio Janeiro	4.20
Genoa, Savona	3.90	Colombo	5.16	Monte Video	3.96
Naples	3.72	Sabang	5.04	River Plate	4.08

ITALY

Consolidation Co. has a large contract. Operators must arrange to quote c.i.f. prices.

Naples, Nov. 25—Large quantities of coal have been shipped during the past three months to Italy for use of the Italian Railway and Navy. The Consolidation Coal Co. has closed an important contract as it was able to offer the Italian Railways c.i.f. prices.

A very large business could be secured if American shippers were able to offer coals c.i.f. to the various Italian ports, and the quality naturally must be suitable as regards analysis, which should be as nearly as possible to the following: Volatile not to exceed 20%; sulphur, 1.10%; ash, 5%; moisture, 1%; calories, 7800 (Thomson).

GERMANY

Transportation facilities much deranged by military operations and a coal shortage is developing at some points. Situation particularly acute in Austria.

Upper Silesia—The demand is heavy, exceeding the supply, owing to the lack of cars, chiefly. Transportation to Vienna and the south has been broken, repeatedly. In 1913 over nine million tons of English coal were shipped to Germany, of which two and a half million tons went to ports on the Baltic. This coal was mostly for household use, and was consumed in the cities of northern Germany. How to meet this deficiency is, now, a matter of great concern.

Northwestern Bohemia—Although the pits have more orders than can be filled, the deficiencies in transportation are making it difficult to handle even the smaller production, which is but a little more than half the normal. The pits in Russian Poland which touch this district are in possession of Germany now, and are being operated under German administration.

Berlin—The shortage in household sizes is keenly felt. In 1913, Berlin consumed 1,654,466 metric tons of English coals. Although it would be easy to fill this tonnage from German mines under usual conditions, the problem has become a serious one with the reduced output from the pits, and worst of all, the car shortage. The military operations in the East have hindered the mines from shipping even the lessened production.

Vienna—The municipal authorities have had repeated conferences concerning the winter coal supply. The situation appears to be more acute here than at other centers. The shortage is due in a great measure to the small receipts from Upper Silesia.

Financial Department

The Rocky Mountain Fuel Co.

President D. W. Brown reports for the year ended June 30, 1914, as follows:

The number of tons of coal mined this year aggregated 924,000 tons. The coal handled on brokerage and through retail department aggregated 317,494 tons. The gross earnings were $2,210,322 and the net earnings were $328,743. The combined net earnings for last three years amounted to $1,161,662, or a yearly average of $387,221. The existing strike, although very serious, has not reduced net earnings to the extent generally expected. Normally there had existed a strike in the northern fields for a period of more than four years and the calling of strike in southern field on Sept. 23, 1913, had very little effect in the northern district, and your company was, therefore, able to procure the necessary men to produce a nearly normal tonnage.

INCOME ACCOUNT

Gross earnings, $2,210,322; operating expenses, $1,742,415; general expenses, $139,164; balance, net earnings	$328,743
Accrued interest, $184,140; other items, $63,075; total	247,215
Balance, surplus for year	$81,528

Total accumulated surplus June 30, 1914, $326,941.

BALANCE SHEET JUNE 30, 1914

Assets—Property, equipment, etc.	$12,195,615
Deferred obligations from subscribers for bonds and stock of company, $702,992; less deferred payments on property acquired, $700,000; balance	2,992
Cash, $59,263; accounts and notes receivable, $661,577; total	720,840
Items paid in advance, $12,719; material and supplies, $121,693; total	134,412
Liabilities—Common stock, $4,000,000; preferred stock, $4,000,000; first and refunding bonds, $3,948,400; total	11,948,400
Accounts and notes payable, $619,340; pay checks and pay-roll items, $56,480; total	675,820
Interest accrued, $49,081; taxes and other items accrued, $53,616; total	102,697
Surplus	326,941

Lehigh Valley Coal Co.

Vice-President and General Manager F. M. Chase reports for the fiscal year ended June 30, 1914, as follows:

Results—The total net income, after deducting charges for royalties, sinking funds, depreciation and interest, amounted to $564,859, a decrease of $906,415. This shrinkage is due almost entirely to the restricted demand for anthracite coal as a result of the mild winter. This not only reduced the profits by reason of the smaller volume of business done, but also added materially to the cost per ton of mining such coal as was shipped.

The production of anthracite coal from the lands owned and leased by the company, including that mined by tenants, was 7,877,390 gross tons, a decrease of 982,642 tons. The percentage of sizes above pea produced by our mining operations was 66.46%, a decrease of 2.22%. The Snow Shoe lands in Centre County, Penn., produced 252,731 gross tons of bituminous coal, a decrease of 97,373 tons.

Additions, Etc.—Additions and betterments cost $344,785. The new breaker at Franklin colliery has been put in successful operation. Developments have been continued in order to place the Park colliery on a better operating basis; the unwatering of the old workings at the western end of the property, so that mining can be undertaken in that territory, is under way. Extensive renewals and improvements have been made to Centralia breaker. The new washery at Springdale for the purpose of reworking the culm banks on the Delano lands is now in operation. The shaft at Blackwood colliery has been sunk so that mining can be conducted on a lower level, and, upon the completion of the necessary tunnels and gangways, operating conditions at that colliery will be improved. At all collieries considerable sums have been expended to reduce the fire risks. Prospecting on the Snow Shoe property has demonstrated that there is sufficient coal in the lower or "A" vein to warrant the construction of a plant to mine same, and the necessary construction work is now under way.

Leases—The leases with the Girard Estate at the Packer and Continental collieries expired by limitation Dec. 31, 1913, but were renewed for a further period of 15 years at higher rates of royalty. As soon as the new leases were executed, the construction of a new steel fireproof breaker was undertaken at Packer No. 5 colliery and extensive alterations and betterments at Packer No. 4. Many important underground developments and mining improvements are also being prosecuted. These expenditures will place these operations on a most economical basis, as was necessary because of the high rates of royalty.

New Office Building—The general offices located in rented quarters in Wilkes-Barre have of late years been very inadequate. The company has, therefore, erected a modern office building, of fireproof construction, on North River St., Wilkes-Barre, with sufficient space for both present and future requirements.

Taxes—Our tax assessments have increased heavily in recent years. The taxes for the late year were about 25% greater than in 1912-13. This does not include the special state tax of 2½% of the value of the coal mined. The question of the constitutionality of the law imposing this tax is now before the courts for determination.

Financial—No new capital obligations have been issued and short-term notes given for the purchase of property in prior years have been reduced by $100,000. Sinking fund payments amounted to $111,136. Current assets are $2,543,103 in excess of current liabilities.

PROFIT AND LOSS ACCOUNT FOR YEARS ENDING JUNE 30

	1913-14	1912-13	1911-12	1910-11
Total surplus beginning year	$3,714,239	$3,486,637	$4,864,200	$3,393,443
Net income for year	564,859	1,471,275	1,162,241	1,512,844
Improvements Jan. 1, 1909, to June 30, 1912, originally deducted from income	.....	1,407,917	.....	.....
Total	$4,279,098	$6,365,829	$6,026,441	$4,906,287
Deduct—

COAL AGE

Vol. 6 NEW YORK, DECEMBER 26, 1914 No. 26

Let's Look Forward

Written expressly for COAL AGE
By BERTON BRALEY.

NOW that the old year's almost thru,
Let's start in rightly on the New
With cheerful hearts and faces,
Let's wipe the Old Year from the slate,
With all its woe and war and hate
And all their evil traces;
Let's lift our eyes and gaze ahead
Away from all the past that's dead,
Away from last year's sorrow,
Let us be wise enough to say
"We have forgotten Yesterday,
We're gazing toward Tomorrow."

It's bitter hard to keep your cheer
When through a long and cruel year
You've nearly starved at mining,
When food is high and work is slack
And clouds of gloom are grim and black
And show no silver lining;
And yet these woes of yours and mine
Will not be lighter if we whine,
Grief is a heavy fetter,
So, though things may be looking glum,
Let's smile and take them as they come
And try to make them better!

Let us take heart in spite of dearth,
In spite of war that shakes the earth
It cannot last forever,
With fortitude that will not cease
Let us seek brotherhood and peace
By brave and high endeavor;
Let us resolve that this shall be
A year of progress fine and free,
A good, a kind, a true year,
Let us forget the past that's dead
Lift up our eyes and look ahead
To greet

A Happy New Year!

A Message for 1915

By George Stockdale

AFTER you have addressed your last New Year's card, sit down and address a few resolutions to yourself, but this time don't close the incident with a wish. All your life long you have been hoping that good luck would watch out for you; turn about in 1915 and try to advance yourself; Providence has a bad memory for those who do not help themselves. Fortune does not canvass from door to door—you can be or have as much as your equal if you will labor as hard and manage as well.

There are no limits to the possibility of human will; however, desire is not a creative force. Hope is only an architect—you must build as well as plan. Those who have accomplished the most are not necessarily superior human beings. Man does not perform miracles—he merely achieves practical results through earnest application.

In every community there are a few persons who think clearly, cling to their determinations and persist in their efforts to rise. The tools for success are standard. They belong to rich and poor alike. No sound and whole body enters this world possessed of faculties which Nature did not bestow upon all humanity.

The majority of people make no genuine effort to utilize their advantages to the utmost. They fail to do justice to their natural gifts. They have not even examined their human machine shop. Back of each forehead there is an equipment of lathes, drills, engines and dynamos, which, when properly applied, can perform any task.

Opportunity Still Beckons Us

TIME and again we have complained of lack of chances, when all the while Opportunity has been signaling us, smiling, calling and crooking her finger in our direction every hour of the day. How often have we remarked to our friends that we have thought of a device, an improvement, an enterprise, or an idea, which rendered another man famous or affluent.

We are not handicapped except by our lack of initiative—we aim too low, and tire too easily—our ambitions are commonplace—we lack daring and doggedness.

The common answer to all this is: "My education was neglected; I have been held back by my responsibilities; the openings in the town where I live are very few." Excuses, every one of them. Education is only training, and everybody who can be benefited by a common-school education has a mine of knowledge which can be developed by self-training.

Prosperity doesn't belong in any one spot. It doesn't require a certain soil nor a special climate—it finds fertile ground everywhere. You must uncover your talents before your neighbors can discover them. Form the acquaintance of your latent self. There's a superior being lurking within almost every commonplace human, unable to assert its individuality because its other self won't give it a hearing.

Remove Self-Imposed Limits

DURING the last 12 months you have probably not made one earnest attempt to drag your bigger personality out of its concealment. You accepted conditions as you found them—not that you were not aware that a hundred changes could be made in the very mine where you now work. Time and again you have remarked that some fellow ought to take hold of things and put some spirit into the work. *You* are the man—it is not necessary to look further.

Simply execute the very ideas that you are leaving for an unknown to develop. Nobody can limit your future if you remove your self-imposed limits. Possibilities become probabilities as soon as they are seriously attempted.

Openings do not come ready-made—capability can assert itself in a small mine as quickly as in a large one. Believe in yourself and equip your body and brain to fulfill your aspirations. Live sanely, think fearlessly, and then set about finding a road for your ambition. You can surely survey it; within your own heart persistence and courage will guide to all goals.

No man is greater than his resolutions. Success, like charity, must begin at home. Success does not help those who do not help themselves. The world neither elects nor selects its leaders. It acknowledges their superiority only after the individual has forced his fellows to recognize his strength.

So here's hoping that 1915 brings you to yourself.

A Happy New Year, Mister Bankboss!

By Wesvania

Say, Mister Bankboss, let me salute yer. Me and my buddies has been talking about yer, 'cos we've noticed yer've been terribly glumpy lately, and we sure would like to see yer cheer up a bit.

The place doesn't seem like the same, when yer're looking down yer nose.

We all have a warm feeling for yer, in spite of the little "differings" we have had at various times.

Yer're terrible hard to move at times, and we know that "wild horses" couldn't move yer till yer ready, but all the same, we've seen yer get a battling, hustling swing on, when the real call came!

Yer've got a mighty thick hide too, but we know that yer've a warm heart within yer, fer didn't yer look after Dick Jones' family for a whole month when he was so sick last spring?

And we all know about yer sending out them grocery parcels to some of our poor folks in the camp, when we had that slack run last summer.

Then, by Jinks, we knows yer're nervy, 'cos we minds when we had that big fire in Tom Camp's room, how yer "crep" in on yer hands and knees among all that smoke and heat, and "drug" Tom out to the fresh air.

Say! has the Big Boss been nagging again? We knows yer has a weary time with them office fellers, when things are not going chirpy inside!

Or, maybe, it's that trouble that yer've got at home with yer sick wife and boy, that's worrying yer so much and making yer look so glumpy!

So my buddies says to me, says they, "Let's give the Old Man a bit heartnin' up this New Year—maybe he'll 'preciate it."

So we want's to tell yer, Boss, that we sure would like to see yer cheer up and be more like yer old self again.

We've had lots of tough fights with yer, and we minds how yer "rared round" when we wouldn't "chip in" on that tonnage price yer offered us in the Third East pillars.

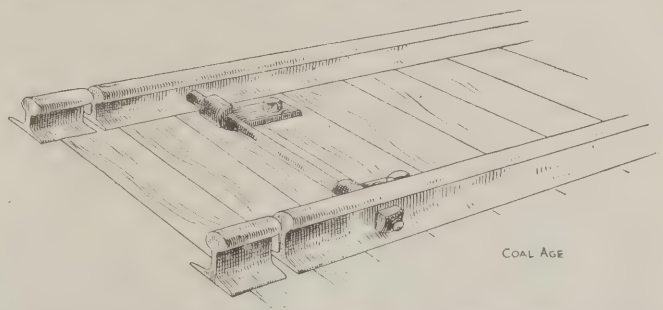
And also how yer raised "Cain" with us all when we had that "spat" about the wet places in the Fourth North.

Still we all stand for yer being fair and square—straight up and down—when it comes to making a bargain and keeping it; as well as how yer've given us the "pull" lots of times even when we didn't deserve it.

So cheer up, old feller! *Nix desperashun!!* Let's see that old-time twinkle in yer eye again, and hear that breezy "Howdy" of yours, when we comes up to the shanty of a mornin'.

Give us a handshake, stick out yer chest, straighten up yer back, and shake off that office phantom; then we'll all take a hop, and help yer on with them new resolutions and new efforts which we know yer'll be making this New Year.

Times are hard and things do have a nack of going the wrong way lots of times, but let's throw off our glumpy feelings, and we'll all pull together and help yer to make this the best year we've ever had together.

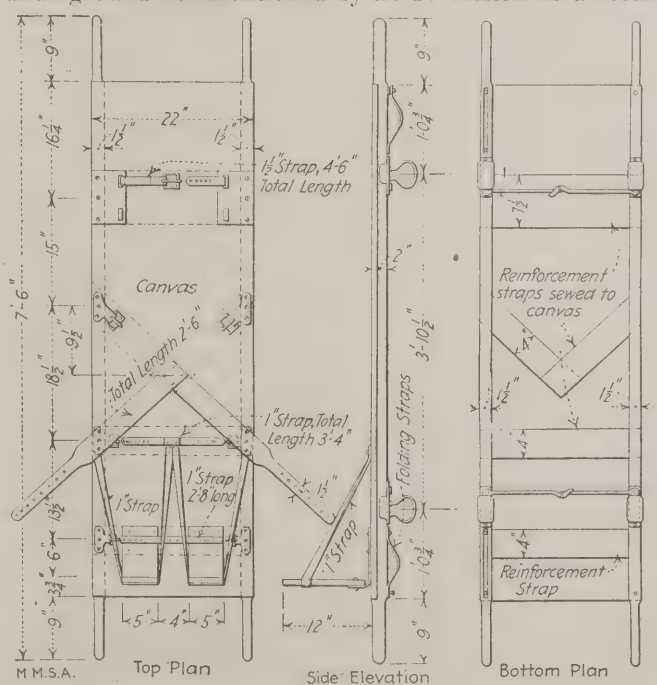


So, Buck up, Boss! and we'll make some of our neighbor chaps look small as Jack Rabbits when they hear tell of the old crew, screwing up the strings of the old mine till she's ringing a better tune than she ever did in her best days.

And if we can be of any further help to yer, why, don't forget to give us the call; so I must now conclude by wishing yer, once again: "A Happy New Year, Mister Bankboss"!

A Remedy for Slipping Rails

By Geo N. Lantz*



Mining men often experience some difficulty when the rails of the track on the tipple floor slip forward against the dump-rails, or the rails on the scales creep. The accompanying sketch illustrates a remedy for this difficulty.

Run a stiff iron rod through both rails and bolt securely. By means of iron plates—one end curved to fit over the rod and the other end bolted to the tipple floor—the rails may be held in place. The curved plates should be placed as near as possible to the rail, without interfering with the flange of the car-wheel. They may be placed at intervals, if desired, but one set of holders will usually be found sufficient.

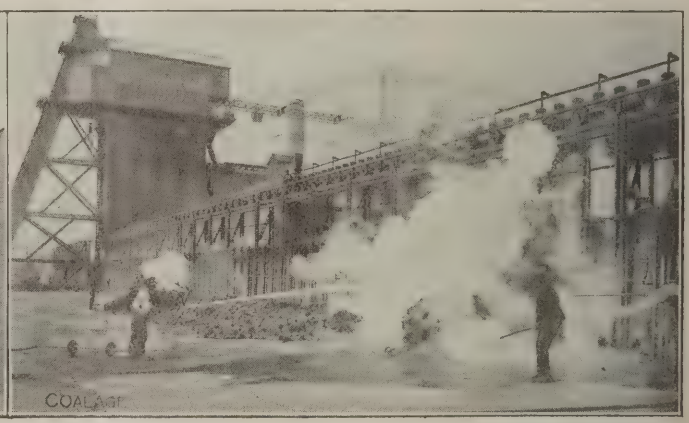
Underground Stretcher

The accompanying illustration shows a stretcher for underground use mentioned by B. F. Tillson in a recent

Bulletin of the Mining & Metallurgical Society of America, as employed at the Franklin Furnace mine of the New Jersey Zinc Co.

*New Straitsville, Ohio.

A Visit to European Mines



By Samuel Dean*

SYNOPSIS—Observations at the mines of Germany, France and Belgium. The Germans excel in the matter of systematic planning. Their educational scheme is quite remarkable. It costs about $15,000 to train a modern German mining engineer. Mining methods in Belgium. In the mines of this latter country, $2 per day is big earnings.

All the officials in German factories and mines are "educated." The government of Germany places scientific knowledge, to a certain extent, above militarism. If the young German can produce a certificate showing that he has attained a certain standard of scientific knowledge, or, in other words, passed a severe examination, he is allowed to cut a year off his term of active service. This brings the cavalry term down to two years and the infantry term down to one year. Young men in Germany put forth tremendous efforts to obtain the certificates which shorten their terms of service in the army.

Colliery No. 11 at Lens, France

"Koppers" Byproduct Ovens at a French Colliery

The colliery owners in Germany also are firm believers in education and maintain schools where their aspiring employees are trained. One such school at Bochum near Essen is considered by many to be the finest in the world. It is supported by a levy on the output of what is called the inspection district of Dortmund, which has an area of about 750 sq. miles. This district has an output of 90,000,000 tons of coal a year, and about 375,000 miners are employed.

There are also numerous "preparatory" schools, where instruction is free, and where miners and others are admitted who have been employed in the mines for not less than two years. Attendance at the preparatory schools lasts for two years, eight hours weekly during the first 18 months and 10 hours weekly during the last six months. The subjects taught are German language, arithmetic, geometry, drawing, elementary natural science, and laws relating to coal mining.

The Bochum School

The school at Bochum is for the purpose of training men for the positions of under-officials at mines, both underground and on the surface. Before admittance the applicant must show that he has worked for at least four years underground and that he is a capable workman. Surface employees are compelled to supply proof of their skill as engineers, mechanics, blacksmiths, machinists, etc., and must have had at least four years' practical experience, one of which may have been underground. All applicants are compelled to pass an examination before they are admitted, but this is only to show that they are able to draw a little and have other elementary knowledge.

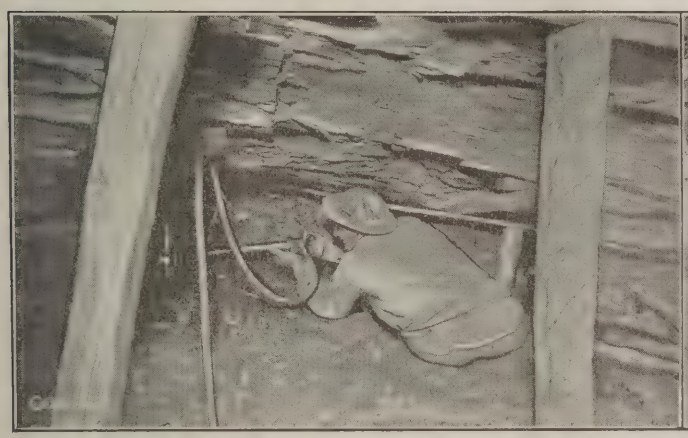
There are two divisions of instruction, and in the lower division the students attend the school 20 hours each week during the first year and 24 hours per week during the second year; during this time they continue at work in the mines and support themselves. The excellent railroad and tram-car service enables them to travel quickly between the mines and the school, and they may attend classes either during the morning or afternoon. School hours are from 7 a.m to 11 p.m., and from 3:30 p.m. to 7:30 p.m.

In the upper division the student attends school six hours per day, and he often saves sufficient money to keep himself during the time he is away from the mines; some favored or exceptional students, however, receive assistance from the owners of the mines at which they are employed.

Young Men Are Given a Practical Training

The training the students receive is *practical;* that is, they are taught how to take a piece of machinery to pieces and put it together again—the school is equipped with hundreds of models and machines—they are taught how to test ropes, how to test fuels in boiler furnaces, how to analyze gases, and note gas caps on safety lamps in chambers containing known percentages of methane, how to lay track, and do various forms of timbering in a gallery, how to remedy defects in pumping appliances, etc.

And particularly are they taught how to plan and lay out mining operations and surface plants. The German is a great believer in planning things; he likes to see the end of a job on paper before he begins work on it. The minor official and the workman are guided by the blue-



*Delagua, Colo.

print. If they propose to introduce some new method of working, they spend weeks on it in the drawing office before commencing actual operations. If it is found necessary to make some slight change in the haulage arrangements, for instance, they first prepare their plans and work according to the blueprint.

At the Bochum school the students are taught mechanics, machine design, mathematics, drawing, surveying, mining, coal screening, electricity, natural science, mining law, and rescue work.

The students are enabled to quickly acquire knowledge which they might never have an opportunity of obtaining at a mine, or which would probably take many years to grasp without systematic instruction.

For example, there is an excellent large-scale model of a coal-washing plant, complete in every detail; the students could take this apart, build it up again, and go to work washing coal; then they could make a test and see what percentage of coal there was in the residue, and what percentage of moisture and ash there was in the washed coal. So it is all down the line, with all the different appliances connected with coal mining. And bear in mind the student receives all this tuition *gratis*. This partly explains the success of the Germans; they are strong believers in organization and system.

Undercutting Thin Seam with Pneumatic Hammer

A Group of Miners at a Colliery in France

Germans Not Greatly Interested in Sports

It also shows a strong determination; the young man who works every day in the mine and puts in four hours' work a day at school is setting himself no trifling task. Naturally few of them know anything about ball games, football, golf, etc., and as I have always been interested, more or less, in such things, I inquired how they managed to maintain health and good physical condition. "Oh, we get our physical culture and gymnastic training when we go for our period of service with the army," they said.

I asked this question also: Is it possible for a miner, in your mines, to rise from the pick to the position of, say manager? They answered reluctantly, No. I then said, Could not an exceptional miner, a man with unusual natural ability, and who had saved money, or who had been provided with money by some benefactor, to enable him to study at the schools—could not such a man rise to the position of manager? They replied that such a man might rise to the top, but said they knew of none having done so in recent years. There were a few old men on the boards of directors of mining companies who in their early years had dug coal.

Then they explained to me the gruelling training which a man goes through who is destined to be a mine inspector, mining engineer, or general manager. Such men do not receive their training at schools like Bochum, but at the mining academies, and universities at Berlin, Aachen, Freiburg, etc., and before a man could enter such a university he must have passed through a high school. So that if he had studied at Bochum it would be necessary for him to go back to the high schools before proceeding to the university, and by that time he might be up in middle life.

The Making of a Mining Engineer

The training of a mining engineer in Germany is about as follows: He starts going to school at the age of 6, and at 18 or 19 he enters the mines and works underground for one year. He then takes his first examination, and, having passed it, starts on another period of four years' training, and then comes his second examination. Having passed that he has another four years' training in front of him, and during this last four years he will serve his one or two years with the army. He is not at the university during the whole of the last two periods, but for two or three months at a time he is at the mines holding generally an official position of minor importance. He then takes his third and final examination; he may pass it, or he may not; if he does not pass he sits again and may be over 30 years of age before he secures his final certificate and is available for a position as inspector of mines for the government, or able to act as manager or mining engineer. After passing his final examination he is given the title of *Bergassessor*.

I was told that it cost as much as $15,000 to train a modern mining engineer, and that he generally speaks English and French in addition to his own language.

A Knowledge of Foreign Languages

How very few English-speaking mining men are able to read German and French mining literature. Continental people are a long way ahead of us in this respect, and this calls to mind an incident during my travels. It was "tag day" in Rotterdam one Sunday morning when I was there; the "tags" were in the form of roses, and two maidens, natives of Holland, approached me and fired away in their native tongue. With a shrug of the

shoulders I said I did not speak Dutch. "I'll bet you do," said one of them, and naturally, of course, I bought a rose.

In France many mining engineers and managers speak English and German, especially the younger men. Watteyne, of Belgium, speaks English, as also does his assistant, Lemaire. Taffanel and some of his assistants speak English.

The Mines in France

It was a delightful sojourn in the colliery districts of France. How happy the people appeared to be, and they were unfailingly courteous. One wonders what the country looks like now. Around Lens, where some of the heaviest fighting has taken place, there are collieries as far as the eye can see, and the district all the way up to Lille is thickly populated. Lens is the home town of Taffanel, and was formerly the home of another famous Frenchman, Georges Carpentier, who worked in the pits a few years ago. Lievin, where the experimental gallery is located, is only a few miles away.

Coal Mining in Belgium

In Belgium the shafts are deep, the seams thin, the pitches variable, and often steep. Perhaps there are no

Showing Large Supply of Props Kept on Hand at a French Coal Mine

more gaseous mines anywhere. Sudden outbursts of gas sometimes throw out or dislodge 100 tons of coal. The laws are naturally strict. Shotfiring is not allowed in mines subject to sudden outbursts.

The mines are divided into three classes, viz:

1. Mines where firedamp has once been seen in a safety lamp, but not an explosive mixture.
2. Mines where firedamp is seen frequently.
3. Mines subject to sudden outbursts of explosive gas.

In mines of the first class, shotfiring is allowed in brushing, but not in mining coal. In No. 2 mines, shotfiring is allowed in brushing intakes, but not in returns. In No. 3 mines shotfiring is allowed only in rock tunnels, not in brushing mine ways or in coal.

In the three categories, ventilation must always be ascensional, except in No. 1 mines, where the air can descend, but not along the faces. In 2 and 3 the air must always ascend.

In mines where gas has never been found, shotfiring is allowed in the coal. Black powder is allowed in mines which are not classed, and there is no charge limit on black powder. In classed mines permissible explosives are used exclusively, not by law, but by suggestion. The highest charge limit is 1 lb. 15 oz.; the charge limit varies with different explosives. Only very few shots of any description are fired, however, even in mines where explosive gas is never found. The miners shoot their own shots in nonclassed mines.

A Freedom from Dust Explosions

The volatile mater in Belgian coals is low, not often exceeding 13 per cent. The ash content is high, being from 10 to 25 per cent. And as the seams are thin, there is much brushing which forms incombustible rock dust, and all these conditions probably account for the freedom from dust explosions. The object of the "powers that be" has always been to remove the cause of explosions, or prevent them from starting. The rules regarding safety lamps are severe. They keep track of the number of safety-lamp glasses broken per year at each mine. The inspectors suggest that electric safety lamps should have two thick glasses around the bulb, and that the space between the glasses should be filled with water.

The majority of the seams are only about 1 ft. 6 in. thick, and when it is remembered that shotfiring is not allowed in the coal, it will be seen at once that the pick does the work. Very few coal-cutting machines are employed on account of the pitch of the seams and irregularity of the strata, but some small single hand air punchers are used. A few face conveyors are coming into use, and more such machines may be used in the future.

Where shots are fired, "external tamping" is frequently employed, but not generally. A board is suspended or supported in front of the hole, and on this board is a pile of shale dust. The mines are not treated specially by either watering or stone dusting.

Accidents

The fatal accident rate for years has been low, being about 12 fatalities per year per 10,000 men employed. Roof falls caused 50 to 60 per cent. of the accidents. Systematic timbering is employed only in one or two mines. The roofs are dangerous and timbering costs are high, being over 20c. per ton in many places. The working faces are cross-barred. Back timbers are not withdrawn; the props being short and thin are valueless after being withdrawn; they easily break with the weight.

Benzine locomotives are used only in intakes, but such locomotives are prohibited altogether in mines of the third class. Compressed-air locomotives are used, but not electric locomotives. The gage of the tracks varies, but is generally about 2 ft. The capacity of the mine cars is from 700 to 1000 lb. each.

The total output of coal in Belgium is about 25 million tons, and 100,000 men are employed underground. The mines work on an average 300 days a year. There is one 9½-hour shift for coal hoisting, and one 9½-hour shift for repairs. Prices paid for mining are variable on account of the difference in the hardness of the coal and pressure of the overburden. Miners' earnings average about $1.20 a day; there are some men, of course, who make over $2 per day. The minimum is about $1, but this is not a legal minimum. Company men who do the packing behind the longwall faces receive 80c. to $1 a day. The miners timber their own working places.

There Are Two Labor Unions

There are two unions of miners in Belgium, the Catholic and the Socialist. The majority of the men belong

to the Socialist union. The unions are not recognized by the operators. The general strike of last year lasted only 15 days; it was a political strike for the principle of "one man one vote." Long strikes are unknown.

The government of Belgium is conservative; mine workers are well treated and receive old-age pensions after the age of 55 years.

Coal sells as high as $5 a ton at the mine. The price of patent fuel or briquettes is $3.60 per ton f.o.b. at the mines. There are 2,700,000 tons of briquettes manufactured per year, these being used largely on locomotives on the railroads, and under stationary boilers. They are made from the finest slack or dust; pitch is used as the binder.

The production of byproduct coke is 3,000,000 tons per annum, the price of coke being $4.20 per ton at the ovens.

The deepest coal-mine shaft in Belgium is 4000 ft. deep. The average depth of all mine shafts is about 2200 ft.

(To be Continued)

Extracts from a Superintendent's Diary

Last night I dropped in on the members of our first-aid team while they were assembled for their monthly meeting.

After the regular session was adjourned, some of the men remained behind for an informal talk and the talk became so interesting that I regretted the arrival of midnight with its turning out of all of the camp's electric lights, causing a rush for home.

Many of the points discussed and adventures related had to do with outside camps, as our men have volunteered their services at most of the explosions that have occurred within a radius of 100 miles of our mines, and this fact rather added to the interest of the narratives.

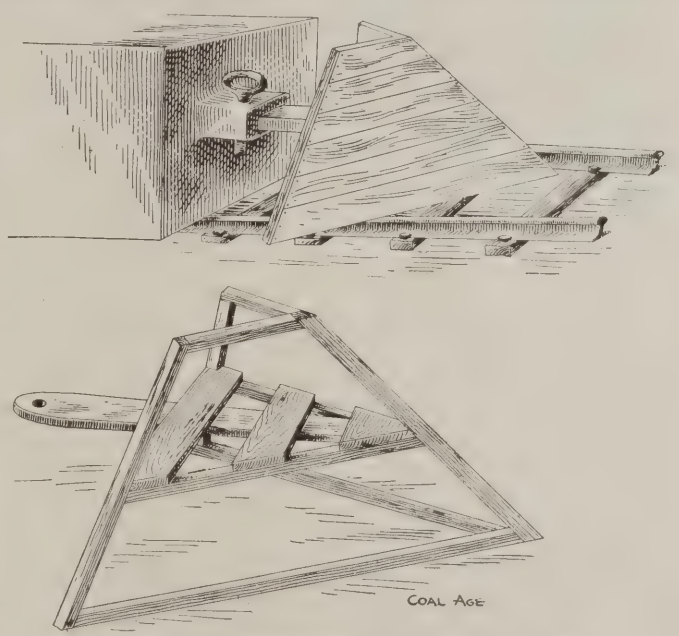
The most interesting discussion had to do with the necessity of the front helmetman of a party dragging a line of some kind along with him. The man who suggested the question once found himself in an entry with another helmetman, and just as they had about reached the face of the heading, they realized that their helmets were defective and they were in the midst of a large amount of blackdamp. The man's buddy began to show the effects of the damp almost immediately by his crazed actions and as he was much the larger man, our narrator hurried out in search of help and other helmets; he feared that should he attempt to lead his companion out, both of them might perish.

He found help and with these rescuers, returned to where he had left his companion. Although but a few minutes had elapsed, the other man had wandered away, and they were so long locating him that he had perished before they found him. If the two had had a rope with them, our man would have tied it around the waist of his companion and they would have had no trouble in following him no matter how much he might have wandered around.

At another time, under almost identical circumstances, except that the two men had a rope with them and the man left behind was tied, the fellow who went in search of help came upon three men without helmets at the mouth of the same entry and although they were afraid to penetrate far into the entry on account of blackdamp they managed to bring the man to them by pulling on his rope.

Another point brought out during the evening, was the terrible risk that helmetmen run, especially in fighting mine fires, where there are no emergency helmets left on top to be used if some of the rescuers inside meet with an accident.

Several instances have occurred where helmetmen have been left to their fate, because no apparatus was at hand to make possible their rescue.



Whenever the talk got too gruesome, some of the fellows would relieve the strain by relating some of the foolish things that some of the others had done while under the influence of gas.

In almost all cases, men crazed by damp tell their companions to leave them and rescue the others and then follow such heroic utterances by foolish talk and singing. Two of our men who have been irreconcilable enemies for some time were made to feel very much ashamed of themselves when told of their actions some months back while both were two-thirds overcome by gas, but filled with heroism.

Our team is considered the best trained squad in the state, and when called to mines where the rescue work seemed to drag, they have sometimes taken the initiative before being urged to do so. This has kindled a little jealousy with outsiders but it has created a get-together spirit within our own squad that comes to the surface whenever our men meet.

A Unique Snow-Plow

The accompanying illustrations show a snow-plow which was used successfully by an Ohio coal company last

SHOWING CONSTRUCTION OF SNOW PLOW

winter. With this device, pushed by the motor, one or two trips accomplish the work, which ordinarily required two or three hours' work for the entire outside force.

A snow-plow of this sort should be made of heavy material, and the pole should be large enough to entirely fill the opening in the bumper of the motor, thus insuring rigidity.

Bunker Coal at Panama

By James Steelman

SYNOPSIS—The government invites private companies to participate in the business of supplying ships at Panama with bunker coal. Storage sites will be rented upon reasonable terms. The government will make a charge for use of the federal coal-handling machinery. The plant on the Atlantic terminus will store approximately 500,000 tons of coal. Both wet and dry storage will be arranged for. War precautions taken.

Now that the Panama Canal is in active operation, the question of bunker coal becomes of interest. This is especially true inasmuch as the first seven weeks of operation has disclosed a greater canal business than was anticipated. The European War began about two weeks prior to the opening on Aug. 15, so that we may very well consider that the canal has made a first-rate start.

Setting the Steel Caissons that Will Contain the Concrete Columns Designed to Support the Coal-Loading Wharves

During these opening weeks, an average of two vessels per day used the waterway. About 30 per cent. of these were British vessels and 50 per cent. American. It is scarcely probable that this relation will be maintained. In fact, more British vessels went through during September than did American, although during the previous two weeks only two British ships used the canal. If we include the tonnage of 115 barges which used the canal prior to the day of formal opening, the total net tonnage passing through up to the end of September amounted to 297,655. Including pilot charges, the tolls amounted to $360,706.29—an average of $1.25 per net ton.

Price on Coal at Panama

Although the two big Government coal-handling plants have not yet been installed, coal is now obtainable at either end of the canal. The price on the Pacific, or southern, end is $1 per ton more than on the Atlantic, or northern, end. At Cristobal, the Atlantic terminal for coal, the price of bunker coal is $5.40 per ton, trimmed in bunkers. This represents coal delivered from lighters. If the ship's own gear is employed in loading from railroad cars alongside wharf, the price is $5.15. The use of steam hoist and crane may be obtained for $1 per hour. The difference of $1 in cost is due to the expense of transportation across the isthmus. No coal is being brought from ports on the Pacific Ocean. The present sources of supply are the coal fields of Virginia and West Virginia. Probably the whole passes through the terminals located at Hampton Roads, Va.

On the Atlantic end of the canal, coal is transferred to vessels either by the aid of lighters or else by a single cantilever crane serving a coal wharf. On the Pacific end, lighters are the sole dependence. The capacity of the present facilities at either terminus is about 600 or 750 tons per 9-hour day. When the new Government plants go into service, there will be an enormous increase in capacities.

Where ships approaching the canal or on the way through may want to advise of their desire for coal or to inquire the price and so on, the proper procedure is to send in a radio message directed to *Receiving and Forwarding Agent, Panama R.R.,* either at *Cristobal* or *Balboa,* according as it is desired to do business with the Atlantic or Pacific terminal. There are Government radio stations at both ends of the canal, which handle commercial messages. When it is desired to take on coal at Cristobal, the radio station at Colon is the one

nearby. If the coal is to be taken on at Balboa, there is a station at the same point. In case inquiries of a general character are to be made, the officer addressed is properly the *Captain of the Port, Cristobal* or *Balboa* as the case may require.

The present radio stations have limited transmission capacities. The Colon station has a reach of about 300 miles in the daytime and the Balboa station a 200-mile daytime reach. More powerful stations are now under construction by the Government. When these are put into service, it will be possible to transmit in the daytime to a distance of 500 miles.

The two coaling plants will not be duplicates in design nor in construction, although there will be duplicate features.

It seems to be anticipated that the great bulk of the bunkering business will be at the Atlantic terminus. A controlling factor is no doubt the increased cost of getting coal to the Pacific side. This increase in cost is not due merely to the fact of a longer haul. The toll charges play an important part. All commercial vessels using the canal are subject to a toll of $1.20 per measured-ton of cargo space, when going through with a partial or complete load. If the passage is made in ballast, the same cargo space is charged for, but at a 40 per cent. discount. The Government recognizes no intermediate condition between a full load and no cargo at all. A barge going through with a load will pay $1.20 per measured-ton of cargo space one way, and $0.72 the other way. As a measured ton is 100 cu.ft. and as 2000 lb. of bunker coal occupy about 40 cu.ft., we have for the round-trip toll charge $0.768 per short ton or $0.860 per English ton or $0.845 per metric ton. Most of the vessels that have so far used the canal have gone through loaded.

The Government Invites Private Enterprise

With reference to the new coaling plants, which are expected to go into service in 1915, the policy of the Government is to welcome private parties and concerns who wish to participate in supplying ships with bunker coal. The Government will make a moderate charge for the service of its handling plant, the use of coal barges, etc. Storage land will probably be rented upon reasonable terms. At present, the license is revocable at the pleasure of the Government and without provision for reimbursement for permanent improvements on the land. These terms are, of course, unattractive, and cannot hope to find responsible takers who have in contemplation the expenditure of any considerable sums upon wharves, piers, etc. However, this situation will surely be corrected by Congress. The Isthmian Canal Commission called attention to the matter in its report for 1913. The real estate tax upon the value of the improvements is 1 per cent. per annum. There is also a merchandise tax of 5c. for each short ton of coal sold.

Originally, the design for the plant at the Atlantic terminus had in contemplation the storage of 300,000 tons; but it has been decided to increase this 62 per cent. This change of plan has arisen because of the demand for space. The area is to be 1700 ft. long and 310 ft. wide. A large part of the coal in storage will be perpetually under water. To provide a suitable site for the wet storage, a suction dredge was put to work some time back with instructions to dredge to 28 ft. below the sea level. Dredging of the berths alongside the wharves is to be carried to a depth of 41 ft. for a frontage of 1065 feet.

The general site is located at the north end of Mindi Island between the present Panama Canal and the old French Canal. It will thus be situated alongside the sea-level stretch to the north of Gatun Locks. There will be an unloader wharf where coal will be loaded in and a reloader wharf where coal will be loaded out. The reloader wharf will extend along the west side of the site—the side facing the Panama Canal. The unloader wharf will extend along the east side—the side facing the old French Canal. Both these wharves will be 1170 ft. in length and will be connected on the north by an end wharf. The three wharves will inclose the storage spaces and will provide for the coal-handling equipment. The wet storage space will be at the northernmost end. South of this will be the dry storage space. This latter site has already been filled to the required level of 2 ft. above the sea. A certain amount of work has also been completed on the concrete construction. Thus, the side walls of the dry storage space were about completed on Oct. 1.

Concrete Piers for a Foundation

The wharves will presumably rest upon the rock. The foundations are being constructed of great concrete piers

Excavating for a Coal-Storage and Coal-Handling Plant at Panama Canal

6 ft. in diameter. These are constructed by driving 6-ft. cylindrical steel shells to the level desired. As these go down, they are added to at the top, so that when the lowermost section has reached the rock, there will be a continuous shell extending all the way to the surface. The interior is then excavated by means of orange-peel grab buckets. A steam hammer is employed in driving down the shells. After the interior has been cleared of earth, the great shell is filled with concrete. It is a matter of indifference, I suppose, as to what ultimately becomes of the shell. Probably, only the upper part will yield to corrosion in any short period of time. The fluctuations of the tide on the Atlantic end of the canal are slight, so that only a few feet are exposed to wind and water. Corrosion will no doubt operate some feet further down than the minimum level of the water; but will probably have only a very slow effect far down. However, even if it all rusts off, we still have a heavy column of concrete.

The wet storage section of the coal pile standing on a plane 19 ft. below the surface of the water—that is, 19

ft. below mean sea level—will have a bottom stratum about 20 ft. thick that will always be submerged in salt water. This coal will be known as *wet*. The stratum of 20 ft. next above will be known as *normal dry*, and the top of the pile—a stratum perhaps 10 ft. thick—will be termed *emergency dry*. The entire height of the coal pile will accordingly be about 50 feet.

When the sea is at extreme low water, the wet coal will stand in 18 ft. of water; when extreme high water occurs, it will stand in 21.65 ft. There will thus be a total variation in the surface level of the sea of 3.65 ft. The precise level of the top of the wet coal and bottom of the normal dry will probably vary from time to time, and perhaps from point to point. It is assumed as 1 ft. above mean sea level. The wet coal is reserved for naval use. The 50-ft. pile will have its top 31 ft. above mean sea level. When the plan area of the pile was reckoned at 1000x250 ft., the entire contents were estimated at 298,800 short tons. In the wet stratum were 125,000 tons; in the normal dry stratum, 121,000 tons; and in the emergency dry stratum, 52,800 tons. The pile will, with the area extended to 1700x310 ft., contain 485,000 tons.

The equipment that will be mounted on the wharves will be quite heavy; so that the big concrete columns will really have a duty commensurate with their size. Toward the end of September, 35 steel caissons had been sunk to rock on the site of the loading-out wharf and excavated; 45 more have been set in position. On the site of the loading-in wharf, 40 caissons have been set. The rock lies from 30 to 65 ft. below the sea bottom. It is overlaid presumably by coral rock and sand—that is to say, the same materials encountered by the suction dredge when it was well under way with the dredging of the wet storage basin.

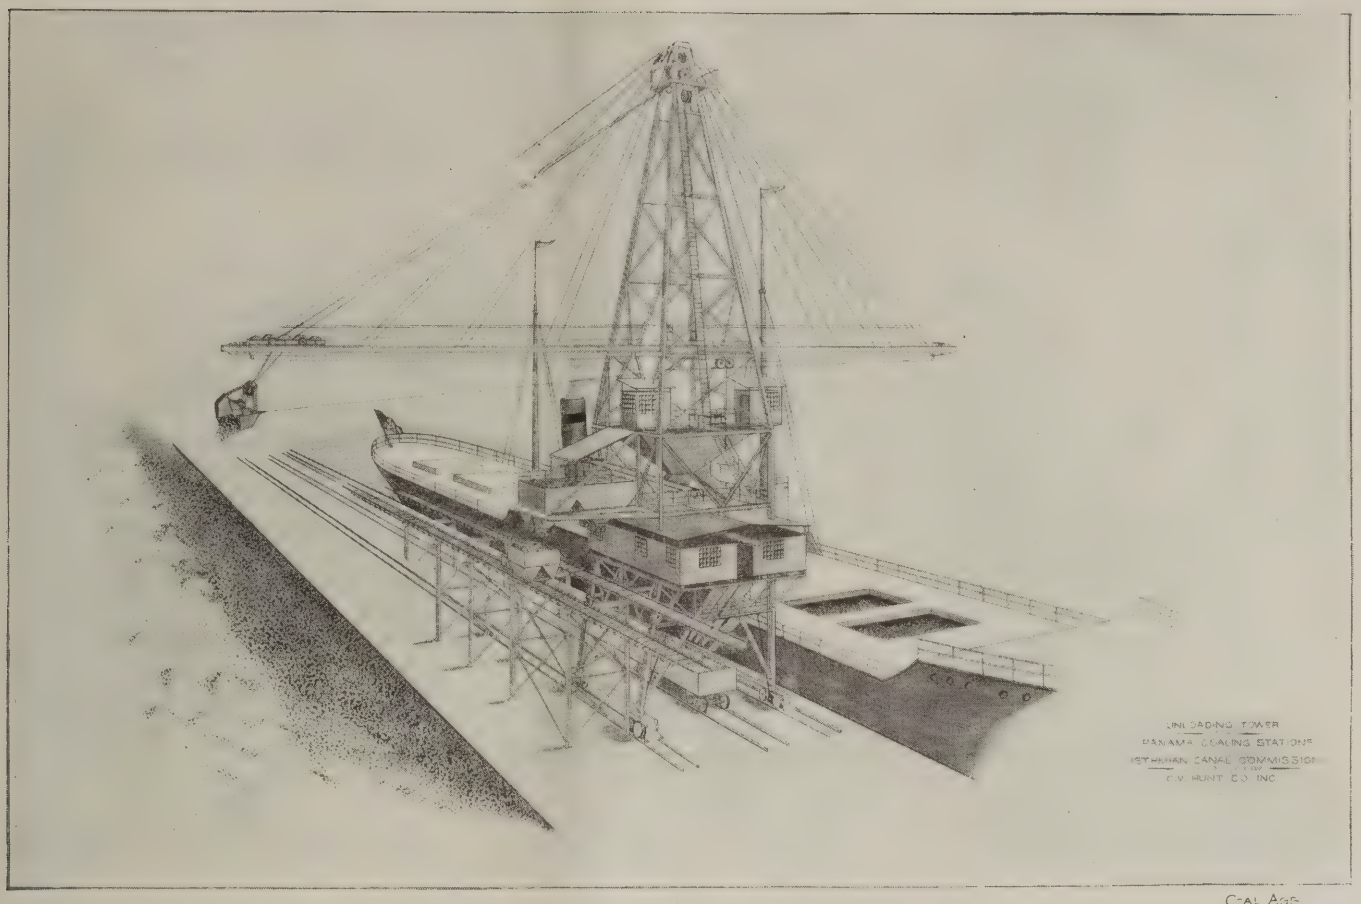
At the loading-in wharf, the channel will be about 500 ft. in width; at the loading-out wharf, the berth will be 250 ft. wide or more.

General Scheme of Operations

The general scheme of operating the plant is as follows: Coal will be brought to the loading-in wharf by collier or other vessel. Two vessels may be unloaded at a time, as four unloading towers will be provided—two for either vessel. These will dig the coal from the hold, elevate it and either deposit it in a hopper from which it may be delivered to a conveying system or to railway cars, or else transfer it immediately to the storage pile. The pile itself will be commanded by stocking and reclaiming bridges. These will serve to perform the usual functions of such apparatus. There will be a conveying system, a part of whose duties it will be to receive coal from the hopper on an unloading tower and convey it to various parts of the storage pile. Another loading-in function of this system will be the transportation of coal from a tower to the wharf bunkers.

In loading out, coal will be reclaimed and loaded by the bridges, the conveying system, the unloading towers and special reloaders. Small amounts of coal may also be loaded out from the wharf bunkers. The mechanical apparatus may be used in loading out in a variety of ways. Thus, at times it will be convenient and possible to reclaim coal from the storage pile by means of an unloading tower and to discharge it by the same means into the vessel being loaded. It is a question of the conditions at the moment.

The reloaders, however, do not act alone. They receive coal from the conveying system and deliver it to the vessel. The reloaders introduce flexibility into the loading-out operation, permitting coal to be delivered to vessels varying in freeboard and size and location of hatches. The transfer of coal from one part of the plant to another will be accomplished by means of the bridges and the conveying system.



The Unloading Towers

The unloading towers are perhaps the most interesting feature. Each of the four is a self-contained unit dependent upon nothing else for its operation. It is not driven by an electric current supplied from some station, but by steam on board the tower from a coal supply always available. It is self-propelled, and in short performs all its functions by and through itself. It seems that the object especially in view in making these apparatus independent of other apparatus is to minimize the risk of having them put out of service during a war. It will not be possible for an enemy to destroy or damage an electric station and thus necessarily put an end to mechanical coaling operations. The unloading tower must itself be destroyed or damaged to make it useless. The destruction of one unloader will not affect another further than possibly to interfere with its mobility by piling up débris on the track used by the towers.

Now the unloaders are able to perform the complete operation of loading out, provided only that there is a supply within reach back of them. They may be used, too, to transfer coal from a barge to a vessel, both lying parallel alongside the wharf. From what has now been said, it will be understood why the operation has been made dependent upon power generated on board. Further, steam has probably been selected largely for war reasons. There will always be coal at hand, if the tower is to be used at all. Consequently, it will always be possible to have fuel for power generation.

The towers move on a track which parallels the dock. They are of skeleton steel construction, and rise to a height of 150 ft. above the rails, of which four are required to make up the track. Two are arranged on one side and two on the other, each pair forming a subsidiary track for the four-wheeled trucks upon which the tower is mounted. Measuring between the center lines of the subsidiary tracks, we have a distance of 34½ ft. The subsidiary tracks themselves are laid upon a 3-ft. gage. The rails are let down into the concrete floor of the wharf until their heads are flush with its surface. There are four trucks altogether, two on a side. One on either side drives while the other trails. The transmission of power to the driving trucks is effected by means of worm gearing.

Seventy-nine feet above the rails, a long boom is arranged in such manner that it passes right through the body of the tower and extends 61 ft. out from the water side and 71 ft. from the rear. The entire length of the boom is thus in the neighborhood of 170 ft. The coal is recovered from a vessel or from the stock pile by a 2½-ton grab bucket whose carrier travels along the boom from end to end. The boom is supported from the peak of the tower far above by means of suitable ropes. The inshore reach of the boom is sufficient to permit a two-track elevated railway to be located between the tower and the storage pile and still reach a point over the latter. These tracks accommodate the inter-plant conveying system.

SHOWING GENERAL STYLE OF UNLOADING TOWER AT THE NEW PANAMA COALING STATIONS

THE COAL HOPPERS

Beneath the boom but within the limits of the tower is arranged a 50-ton hopper. There are also two smaller hoppers at a lower level arranged over the elevated tracks, one over each of them. The big hopper delivers either to railway cars far below on a track arranged between the two pairs of narrow-gage track supporting the tower or else to the small hoppers. A 42-in. conveying belt carries coal from the big hopper to either one of the smaller ones.

It will now be understood that the tower is able to take coal at either end of the boom and deliver at the other end or to railway cars or to the conveying system. The 61-ft. outboard reach enables the boom also to cover the case of two vessels alongside, one a collier and the other a vessel seeking to replenish its bunkers.

There are four independent power units, all steam operated, which perform the separate duties of hoisting and lowering the bucket, of traversing the bucket carriage, of raising and lowering the boom and propelling the whole tower, and of operating the conveying belt. The first is a direct-connected, double-cylinder, 18x24-in. engine; the second is a double-cylinder, 12x24-in reversing engine; the third is a geared, 10x12-in. engine; and the fourth is a double-cylinder, 6x8-in. engine. All these units are located in a suitable closed-in space beneath the big hopper. This 50-ton hopper is constructed of ⅜-in. steel plates, and is 12x30 ft. in plan. Delivery to the railway cars beneath the power room is effected by chute. The four towers operate on the loading-in wharf facing the old French Canal.

THE BRIDGES USED FOR STOCKING

The bridges used for stocking and reclaiming are of the duplex variety—that is, each is equipped with two carriages and their buckets. The buckets are of 5-ton capacity. Eight four-wheeled trucks support a bridge. Just as the towers were self-propelled, steam-operated units, so these are self-propelled, electrically operated apparatus. They may be shifted along their track at the rate of 50 ft. a minute. These machines have a rated capacity of 1000 tons per hour. Any one of them may be used to stock and reclaim simultaneously. They deliver either to the stock pile or to the conveying system.

The function of the special reloaders is to receive coal from the conveying system and make delivery to the vessel to be coaled. There is a hopper at one end of the movable apparatus, which serves to preserve a balance between receipts and deliveries. A telescopic chute is arranged at the other end. A conveying device transfers coal from the hopper to the chute. These machines are in effect movable pockets. They operate on suitable tracks laid on the loading-out wharf facing the Panama Canal. Their individual rated capacity is 500 tons per hour.

Minor demands for coal may be taken care of by means of a stationary wharf bunker, constructed of steel and concrete, having a capacity of 1500 tons. It is subdivided into three compartments, each of 500 tons capacity. Two valves serve each compartment. The delivery opening may be made as large as 6 sq.ft. in cross-sectional area. By means of a folding chute, each compartment may be made to deliver coal through a vertical range of 14 ft., half above the wharf and half below. There is a second chute which delivers at an unvarying level of 5 ft. above.

The coal leaves the bin at points 28 ft. above the wharf. The tilted floors provide a constant pressure which becomes instantly available when the doors are opened.

The Atlantic plant is connected with the Panama R.R. A spur from the yards at Mt. Hope follows a southerly direction for about 3000 ft. when it swings to the west, making the crossing of the old French Canal by means of a pile trestle, and then goes north for 3500 ft. or thereabouts to the site. The trestle work is later on to be removed and replaced by a steel bridge with a movable span. This will permit the navigation of the old French Canal past this point.

The Balboa Coal-Handling Plant

The coal-handling plant at Balboa is subordinate in interest and size to that at Cristobal. Two of the 150-ft. towers are to be located here, where their functions will be similar to those of the four towers at the other end of the canal, except that the two towers will not connect with the storage pile.

In designing the plant as a whole, it seemed advisable to utilize certain cranes which had served constructional purposes at Miraflores, especially as these cost about $300,000. There are four of these double cantilever cranes. These will command the storage yard, 240x500 ft. in area. Here will be accommodation for 210,000 tons of coal, divided 100,000 in the wet stratum, 80,000 in the normal dry stratum, and 30,000 in the emergency dry stratum. The coal in wet storage is here reserved for the use of the Navy just as at Cristobal. In loading in, it is proposed to chute the coal from the towers directly into the storage pile. It will then be rehandled by the cranes. There is to be a conveying system here also. It will serve both the cranes and the towers when loading out is going on. It is expected to develop a loading-out capacity of 1000 tons per hour by using all six units—the four cranes and the two towers.

As before pointed out, the towers at Cristobal will be steam operated. The same applies to the two at Balboa. But, apart from the towers, the operation of all devices at both plants will be by electricity. There will be suitable substations for supplying current.

Government Colliers Will Carry Coal to the Canal

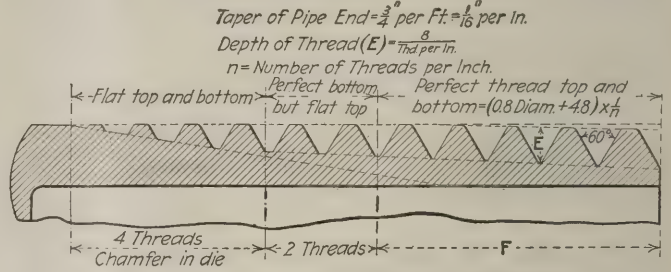
The Panama Canal will operate at least two colliers, whose names will be the "Achilles" and the "Ulysses." They will be used to carry coal from Eastern United States to the two coaling plants on the canal, and will be quite similar to the navy colliers, "Orion" and "Jason." They will have a length of about 500 ft., a beam width of 62 ft., and will be 39½ ft. deep. Their cargo capacity will be 12,000 tons each. Apparently, their own round-trip bunker supply will be in excess of this capacity. When loaded to the maximum they will draw about 28 ft. of salt water, and will have a speed capacity of 14 knots. The cost will be $987,500 each. They will probably go into commission during the early part of 1916. At the end of August, 1914, both vessels were more than a month ahead of contract time as respects their construction.

The quantity of coal obtained from the Jalainor mines, North Manchuria, in 1913, was 142,857 tons, of which 125,000 tons were delivered to the Chinese Eastern Railway and 17,857 tons to the Trans-Siberian Railway. The sales of coal from the Japanese coal mines at Fushun have increased considerably, the sales for 1913 being reported at 170,143 tons.

Standard Pipe Threads

The threads, as produced in the Briggs system, says *Power*, for Nov. 3, are shown in the illustration. The taper employed has an inclination of 1 in. to 32 to the axis, therefore the total taper is 1 in. to 16 in., i.e., ¾ in. to the foot or $\frac{1}{16}$ in. to 1 in. The angle of the thread is 60 deg. and its depth four-fifths of the pitch, or 0.8 $\frac{1}{n}$, where n equals the number of threads per inch.

Threads F are perfect at top and bottom. Back of these are two threads with perfect bottoms but flat tops; behind these are the imperfect ones produced by the chamfer of the die.



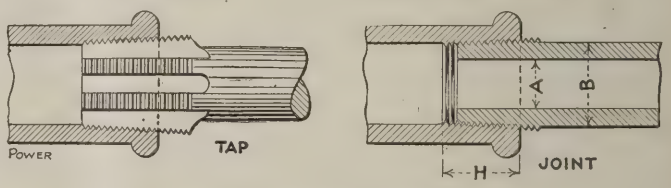


FIG. 1. LONGITUDINAL SECTION OF BRIGGS PIPE THREAD

Briggs' Standard Pipe Thread

It can be readily seen by the foregoing how necessary it is to have the pipe and fitting sizes match, so that the full, perfect threads in each will register with the other. A thread made up more or less than this will result in a less perfect joint.

PIPE THREADS

Diameter	Threads per Inch	Diameter of Drill
⅛	27	21/64
¼	18	29/64
⅜	18	19/32
½	14	23/32

West Virginia Mine Fatalities Show Decrease

The fatality list in the coal mines of West Virginia for the month of November has just been issued by the Department of Mines, and shows a total of twenty-five deaths from accidents at the mines, a decrease of nine as compared with the report for the previous month, when thirty-four were killed, and a decrease of one from the corresponding month for last year.

Eleven of these fatalities were caused by falls of roof and coal, four by mine cars, three by locomotives, three by electricity, one by mining machine, one by explosive, and two miscellaneous. The last two, while reported to the Department, were not really chargeable as fatal mine accidents, one death being due to scalding on the outside, and one due to blood poisoning, following a slight injury to the hand. Thirteen of the victims were Americans and twelve were foreigners.

Steep Pitch Mining of Thick Coal Veins--II

By W. G. Wildin*

SYNOPSIS—Only 64 per cent. of the steep pitching Mammoth bed has been obtained in the Lansford section by four successive minings, the first gangways being along the bottom rock, the second along the top rock, the third in the middle of the bed and the fourth in the Skidmore seam below. All this could have been mined out through the last mentioned gangways at great saving of cost. Paneling methods will cause an important conservation of coal and more speedy development.

At the Greenwood colliery a record was kept of every step in the driving of two adjoining breasts and in the robbing of the pillar between them (see Figs. 1 to 4), in order to determine what recovery of the vein was being made by the method in general use. At this point the coal was 59 ft. thick. The section was 190 ft. long and its total contents were 590,000 cu.ft. of solid coal or 8260 mine cars of 125 cu.ft. each. Of this 5442 mine cars were loaded out, making a 65.9 per cent. recovery. This work was done in 1909, 1910, 1911 and 1912.

The method of robbing the pillar was as follows: Chutes were first driven along the manways; slant chutes were driven across the pillars and a chute driven back almost to the top rock. Then a breast was driven up the pitch and the coal mined. Chutes along the small pillars between this breast and the old breasts recovered that part of the vein. After all the coal had been mined near the top rock, another breast was opened off the main chute (driven back through the pillar), and later chutes were driven to mine the small pillars between the breast and the old breasts.

When all the coal possible had been mined in this way toward the top rock, a breast was opened up the pitch along the bottom rock. Again chutes were driven to mine the small pillars between this breast and the old breasts. After all this had been done the upper part of the pillar was supposed to have been robbed completely; then retreat was made down the chute about 30 ft. and a main chute driven back through the pillar, and the whole operation repeated.

The drawings show a network of chutes and breasts. It has been found by experience that, in order to recover a good percentage of the coal, where the vein is so thick, chutes must be driven in any and all small pillars that have been left between any of the breasts or chutes. In every case, however, the pillar being robbed must be controlled; it cannot be allowed to run away.

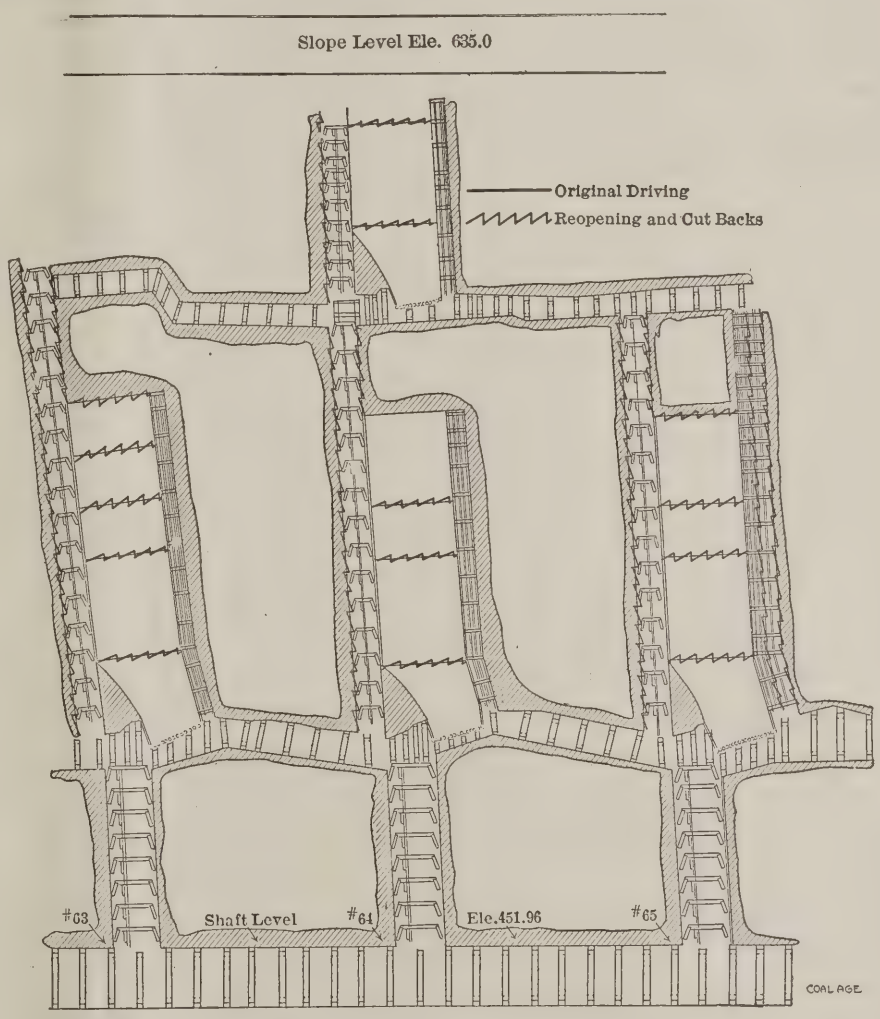

Fig. 1. Method of Working Breasts and Pillars, East Mammoth Shaft Level, Colliery No. 10

Reworking the Mammoth through the Skidmore

The reworking of old territory is always an interesting problem. Years ago it was the practice to reopen an old gangway in the vein and as a rule the cost was heavy, especially if the ground had not been standing long enough to settle thoroughly. In some instances six or seven years suffices for such settlement, but in other cases fifteen years is insufficient for the completion of that action.

The most satisfactory way to rework the old Mammoth territory has been by driving the gangways in the Skidmore vein and driving rock chutes up to the Mammoth. At first these chutes were driven about 100 ft. apart. This distance has now been extended to 120 ft.,

*Mining superintendent, Lehigh Coal & Navigation Co., Lansford, Penn.

NOTE—Paper read at Pottsville, Penn., meeting of the Pennsylvania Anthracite Section of the American Institute of Mining Engineers, July 25, 1914.

140 ft., and even 150 ft. at one colliery. The rock chutes are connected at the top with slant chutes; then, about 10 ft. off the rib of the rock chute, main chutes are driven straight up the pitch, and these main chutes connected by slant chutes across the pitch. These slant chutes provide ventilation and also determine the location of any pillars which have not been worked. At several collieries where the pitch is almost vertical, a straight or box chute about 40 ft. in length is driven up the pitch from the apex or meeting point of the two slant chutes (Fig. 5). At the top of the box chute two other slant chutes are driven, and again at their meeting points a box chute is put in. This is continued and we are able to reach up the pitch any distance desired, in many cases over 400 ft. This method has proved its value and at all times the miners are held safe.

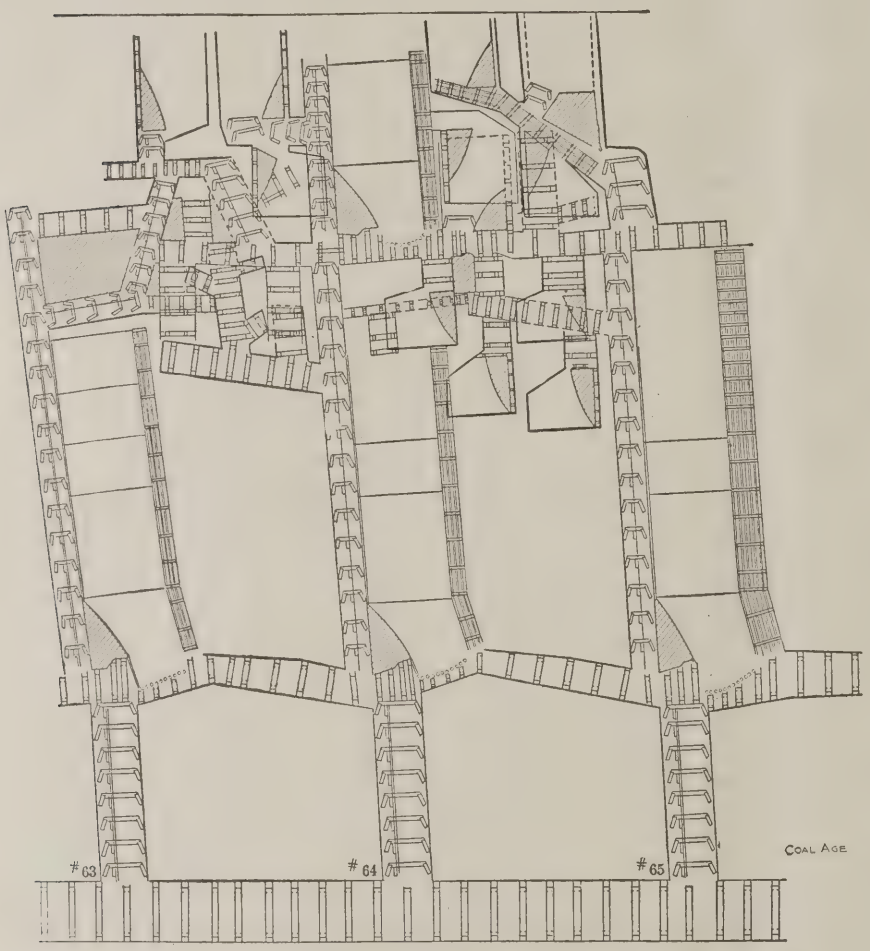

FIG. 2. METHOD OF WORKING BREASTS AND PILLARS, EAST MAMMOTH SHAFT LEVEL, COLLIERY NO. 10

THE BOTTOM BENCH OF THE MAMMOTH WAS LEFT AS TOO HARD TO MINE

As a rule this system of chutes is made in the bottom bench of the vein, which in most cases has been found solid; the reason being that the coal was extremely hard and many years ago could not be mined at a profit. At intervals, holes are driven through the 18-in. slate into the middle and top benches of the vein, and the gob from the old breasts is drawn out. Where the gob is of such a nature that it can be driven through, chutes are driven on a pitch of 30 to 35 deg. through the vein into the top rock. A pitch of 35 deg. is not too heavy through gob, as more rock has to be handled, and the gob itself is sticky or gummy.

Where the bottom bench has been worked, it is necessary to do all the opening work for robbing purposes in the gob. On the steep pitches we prefer to make the chutes on a pitch of from 30 to 35 deg. and drive across the vein (along the strike) or else directly through it (at right angles to the vein), for the reason that in the gob it is necessary to protect the roof of the chute by driving poles, 6 to 10 ft. in length and 4 to 6 in. in thickness, ahead of the actual working face, to give full protection for the placing of the next set of timber.

It is readily seen that in loose ground, if the chutes were driven directly up the pitch of say 70 deg., the poling process would be of no benefit, and miners would be in danger from falls of material.

SPACING OF ROCK CHUTES DEPENDENT ON ROCK THICKNESS

In driving rock chutes from the Skidmore to the Mammoth vein, the question often arises as to the economical spacing of the rock chutes, due to the varying thickness of the rock between the two veins. Our experience has been that where the interval is 30 ft., the chutes can be driven 100 ft. apart. Where it is 40 and 90 ft., the chutes should be spaced 120 and 150 ft. apart respectively.

About 1891, when the fourth and fifth levels at the Coal Dale colliery were opened, the gangways were made in the Skidmore vein and rock chutes driven every 50 ft. to the Mammoth vein. These chutes were about 30 ft. in length and on a pitch of 35 deg. The mining in the Mammoth vein was done according to the usual methods such as I have described. These Skidmore gangways required much repair, due to the poor top rock of the Skidmore vein at this colliery, and also to the small distance between the chutes.

At one colliery, where the pitch varies between 80 and 90 deg., a somewhat different system of slant chutes was adopted. They were driven across the pitch at about 30 deg., and along the bottom rock. At the junction point of the slant chutes a chute was driven through the vein to the top rock, then turned back again to the bottom rock and slant chutes again driven. There are a number of instances where more than 1000 ft. of such chutes have been driven from the top of one of these rock chutes.

CIRCUMVENTING A RUNAWAY BREAST

In other cases (depending upon the conditions), instead of driving the rock chute from the Skidmore to the Mammoth, a chute has been driven up the pitch in the Skidmore to the predetermined height, and then a

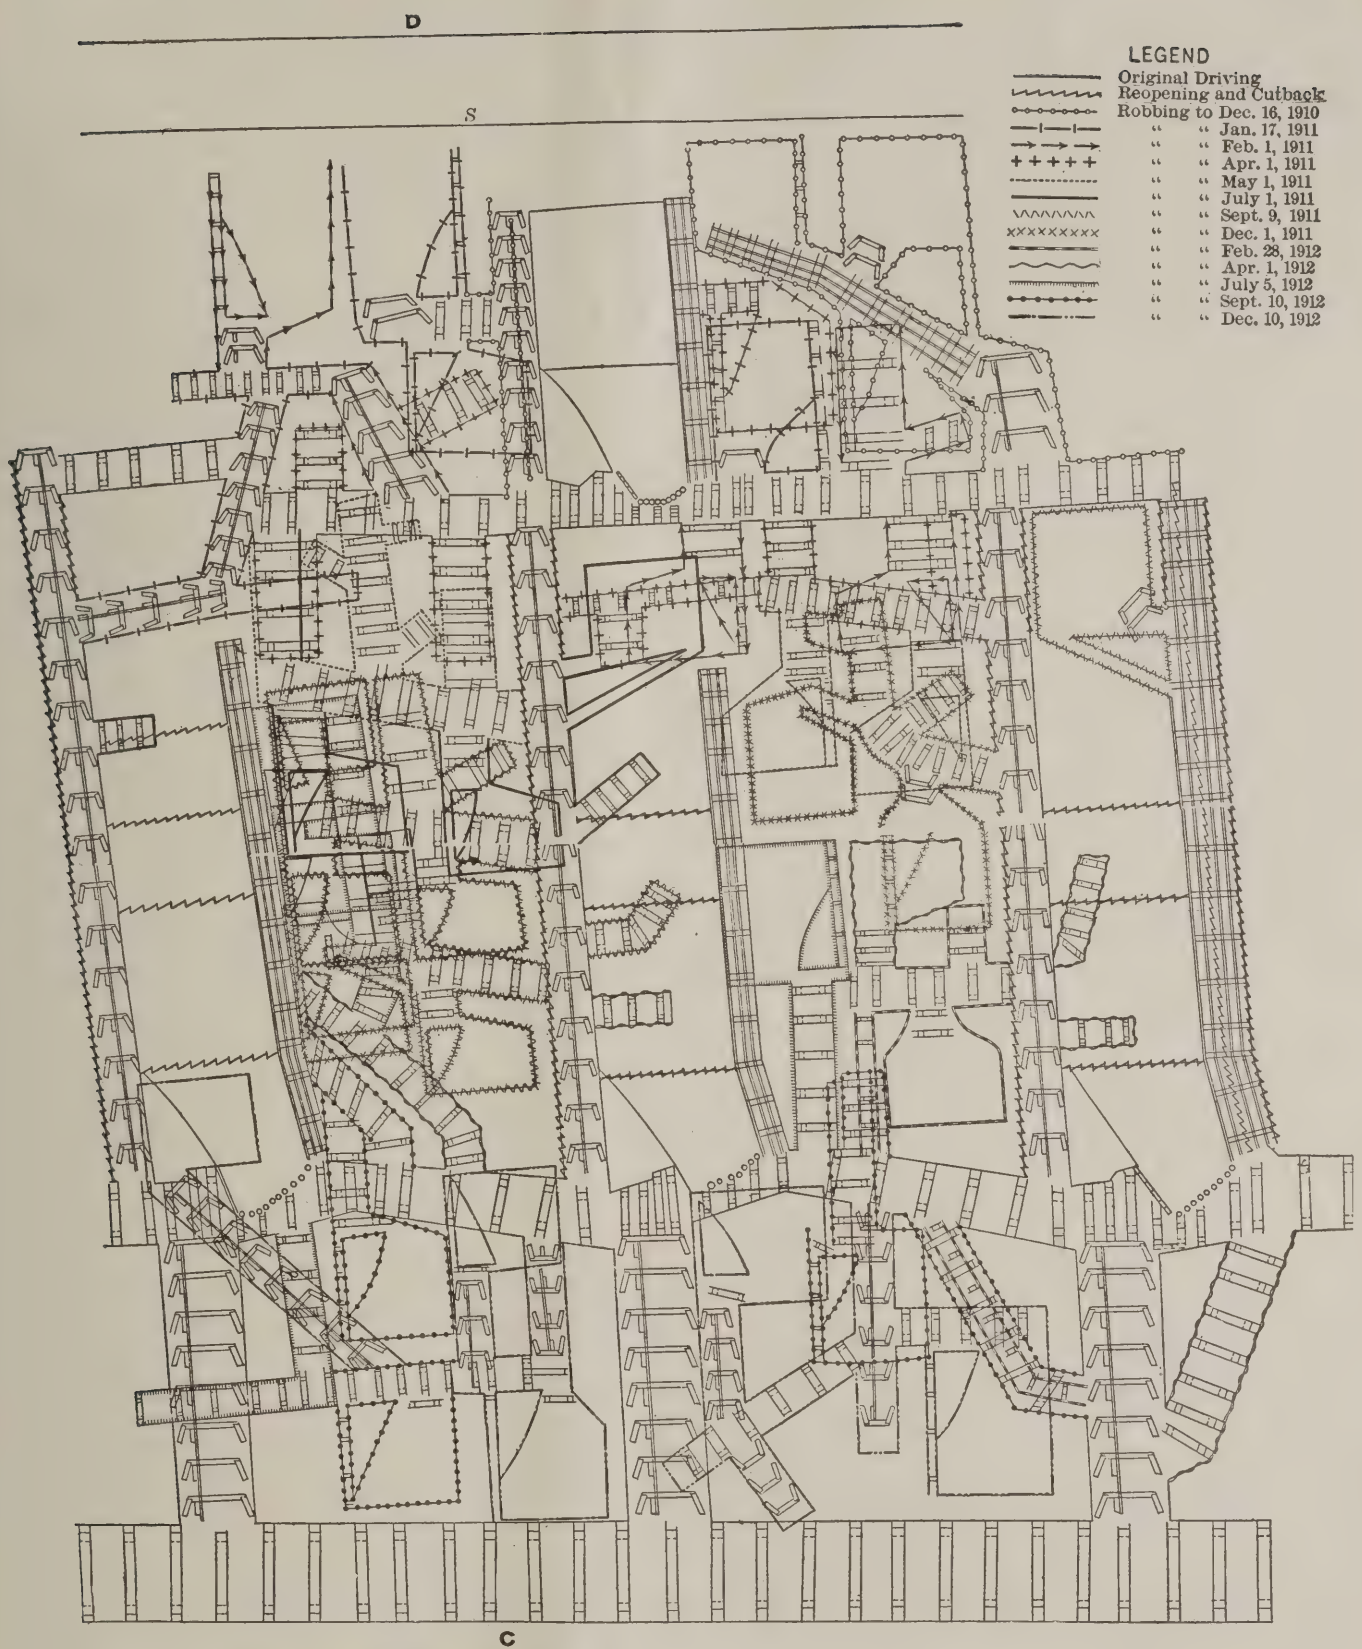

FIG. 3. METHOD OF WORKING BREASTS AND PILLARS, EAST MAMMOTH GANGWAY, NO. 10 SHAFT, GREENWOOD COLLIERY

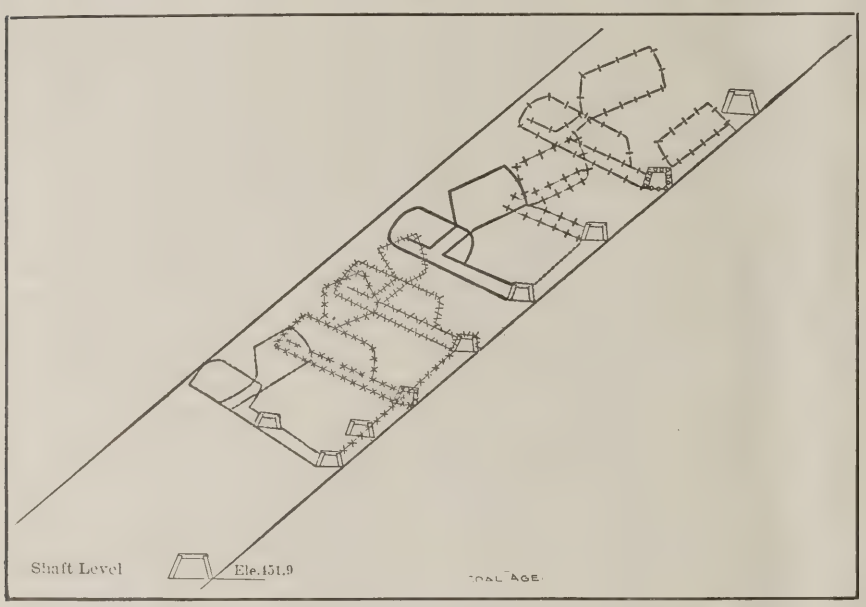
rock chute driven into the vein, the object being to make the opening above the point where the breast has run away and filled with rock. Where we have been able to work this method it has proved successful.

A variation of this method is being tried out at the Lansford No. 4 colliery (Fig. 6), where the vein is on a pitch of 72 deg. The rock chutes are driven from the Skidmore gangways to the Mammoth, and from the top of these chutes long slant chutes—7-ft. collar and 7-ft. leg—on a pitch of 35 deg., are driven along the bottom slate of the Mammoth vein to the bottom of the old breaches on the surface. This is being done for the

purpose of re-robbing the old workings between the old Water Level gangway and the surface, the lift being about 300 ft. From these slant chutes, straight chutes—5-ft. collar and 5-ft. leg—are driven up the pitch at about 35-ft. centers, depending upon the condition of the gob. The robbing work is started at the top and is continued down the pitch. Great care is taken to keep the robbing faces so far ahead of the chutes driven later that a squeeze may not result.

Still another variation is being tried out at Lansford No. 4 colliery, fourth or Slope Level. This plan (Fig. 7) differs only from the scheme used in the Water Level, just mentioned, in that a 6x8-ft. chute is driven from the Skidmore gangway straight up the pitch in the Skidmore vein for 15 ft., these chutes being spaced 140 ft. apart on the gangway. From the top of the straight chutes, slant chutes on a pitch of 35 deg., 6x8 ft. in size, are driven along the bottom rock of the Skidmore vein for about 80 ft. and connected at the top. From that point a rock chute—6x8 ft.—on a pitch of 35 deg., is driven back to the Mammoth vein, about 30 ft.; then long slant chutes are driven on 33 deg. pitch along the bottom rock of the Mammoth vein to the old level above. The intention was to strike the Mammoth vein above the batteries of the old breasts which were filled with rock.



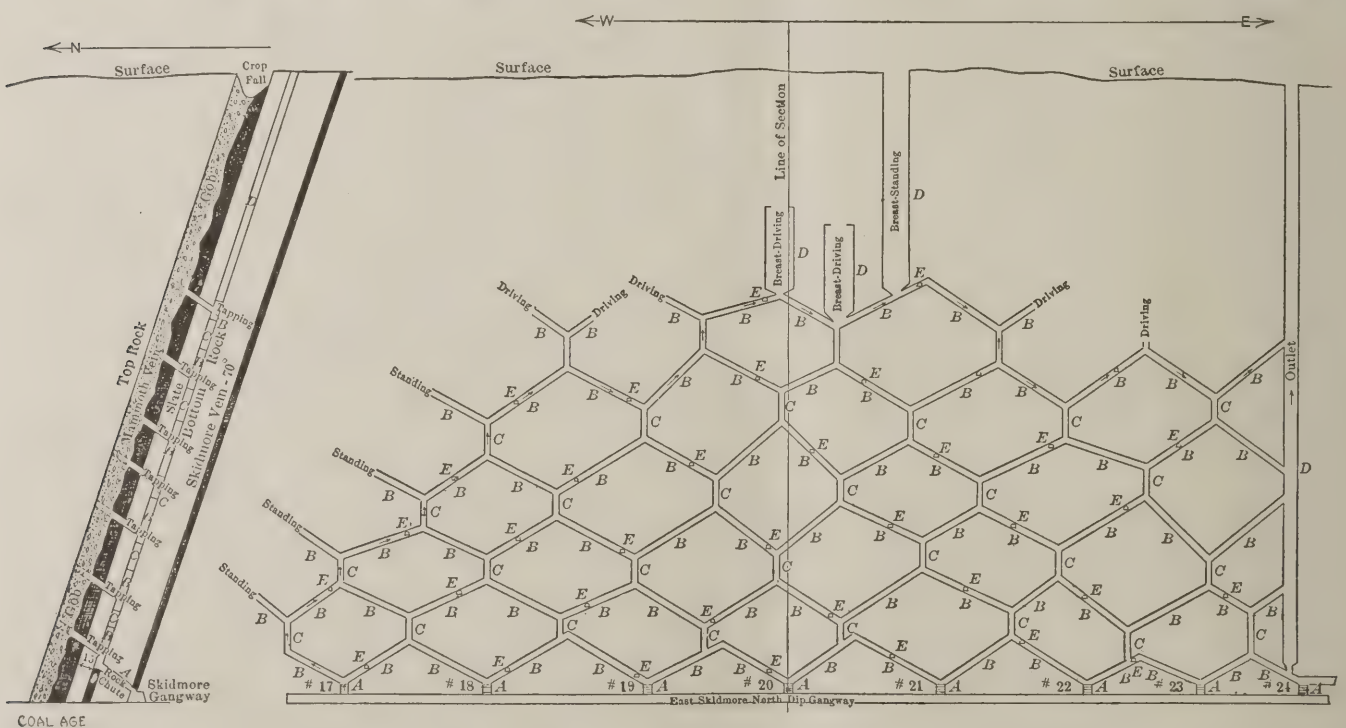


FIG. 4. SECTION THROUGH C-D OF FIG. 3

We have lately arranged to make further tests of these schemes in working new territory, in order to make comparisons with the results obtained from the old established pillar-and-breast method.

The question naturally arises, which is the better of these chute plans? The chute yardage driven is practically the same in both systems, though a little saving is made by using the long slant chute. The great advantage, however, of this latter method over the use of the box chute lies in the fact that the coal passes through practically its whole course over a light pitch and thus there is much less breakage. The only real drop of the coal is in the straight chute

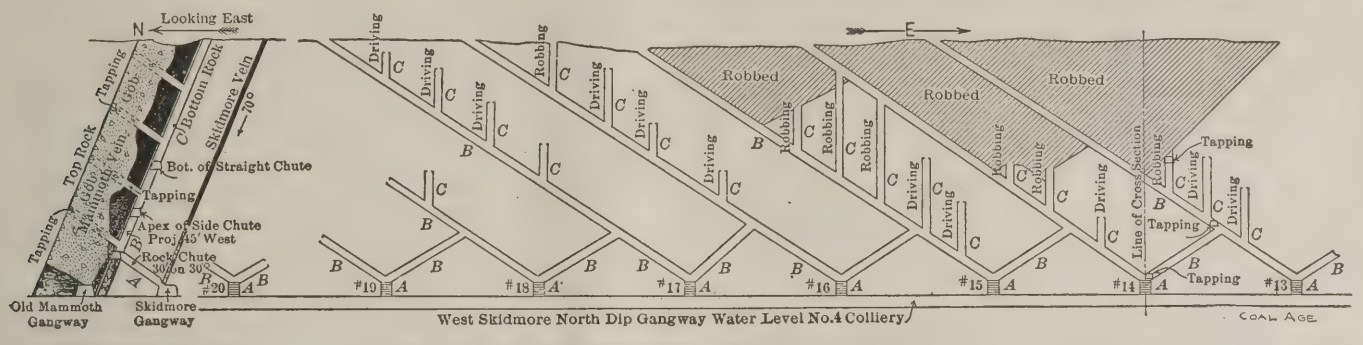
About 70 or 80 ft. long on 35°, 6x6-ft. chutes. (C) Straight chutes up the bottom rock of bottom split of Mammoth. About 20 ft. long on 70°, 5x6-ft. chute. (D) Breasts on bottom rock of bottom split of Mammoth. About 160 ft. long to surface on 70°, 8-yd. breast, 50-ft. centers. (E) Tapping chutes from bottom split to middle split of Mammoth. Used as batteries for running coal.

FIG. 5. METHOD OF WORKING BOTTOM AND MIDDLE SPLITS OF MAMMOTH VEIN, AS VIEWED AT RIGHT ANGLES TO THE PITCH. NO. 5 SHAFT, SECOND LEVEL, EAST SKIDMORE, NORTH DIP GANGWAY

immediately at the robbing point. In the other method there is bound to be much breakage in the straight box chutes unless they are kept full at all times and this requirement, we know, is frequently neglected by the workmen. At best there is bound to be a certain amount of grinding of the coal in the box chutes.

The Fourth Attack on the Same Piece of Coal

In many cases the present working is the fourth mining of the same piece of territory, 30 per cent. having been extracted on first mining, 16 per cent. on the second, 8 per cent. on the third and 10 per cent. by the fourth and last.

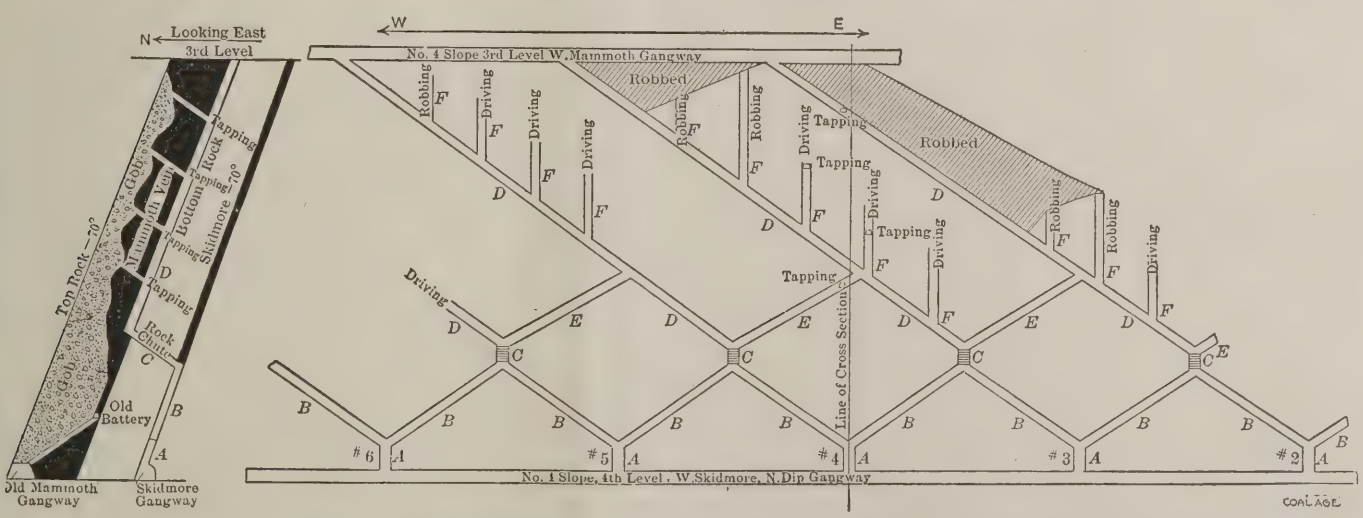


At Coal Dale No. 8 colliery workings, about 60 years ago the first gangway was driven in the Mammoth vein along the bottom rock, and mining was done by the old pillar-and-breast method. After the gangway had been driven to its limit it was robbed out. About 15 years later another roadway was driven through the same territory along the top rock of the vein, and this in turn was robbed out. About 30 years ago a third gangway was driven at a level about midway between the two just mentioned and the crop; later this roadway also was robbed out. Five years ago, believing there was a large quantity of coal to be won in this territory from the Mammoth vein, we began to drive a gangway in the Skidmore vein 30 ft. underneath the Mammoth and drove rock chutes, 100-ft. centers, to the old Mammoth workings. We figure the present recovery from this section at 10 per cent.

Only 64 Per Cent. Is Saved after Four Minings

If the present method of mining—that is, mining the Mammoth vein from the Skidmore vein by means of rock chutes—had been adopted in the original mining, not only the 10 per cent. now being obtained could have been recovered but also the 54 per cent. which has been secured only after driving the three gangways and their airways above mentioned, with their various breasts and chutes.

I have kept a record of the recovery and the cost of working 900 ft. of this territory during the past five years, and estimate that the $45,000 or $50,000 which these old openings cost could have been saved. The cross-section (Fig. 8) of the vein shows the position of the old gangways and the present Skidmore roadway.



In mining very thick veins on steep pitches, it will

Fig. 7. Method of Working the Mammoth Vein, as Viewed at Right Angles to the Pitch. No. 4 Slope, Fourth Level, West Skidmore, North Dip Gangway, Lansford Colliery

always be possible, even though the most improved methods are used in the original mining, to win some coal by re-mining, but the cost of obtaining what remains will depend upon market and wage conditions, and may be prohibitive.

Many years ago no coal except that of the very best fracture and best appearance was mined, because it was the only kind found salable. Also, only sizes above chestnut (made over a 7/8-in. round screen) could be sold. In recent years, all sizes including No. 4 buckwheat (made over a 1/16-in. round screen) are easily salable, and as a consequence, territory that years ago could not possibly be mined at a profit can now be made to pay.

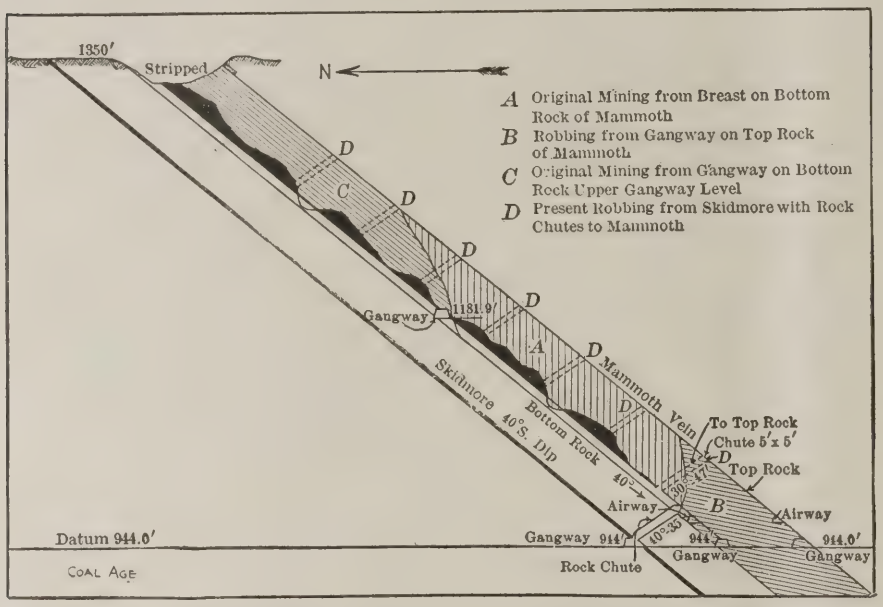

FIG. 8. CROSS-SECTION SHOWING ORIGINAL MINING AND PRESENT ROBBING OF MAMMOTH VEIN, WATER LEVEL, COAL DALE COLLIERY

THE USE OF PANELS

It has been found of great advantage to make panels of a territory where coal is virgin or where the distance between the Skidmore and the Mammoth veins is too great for practical use of rock holes. The length of these panels depends upon the distance between the veins, in some cases being 600 ft., and varying up to 1200 ft. The paneling system has been much extended during the last five or six years in the Panther Creek field, and the results have been so satisfactory that the new lifts are being laid out and worked on this plan. At practically all points, none of the veins underlying the Mammoth are workable.

The haulageway is being made in the Skidmore vein, which varies from a thin leader to 3 ft. in thickness, and tunnels are being driven at 1000-ft. intervals from the Skidmore to the Mammoth, Primrose, and Orchard veins, and gangways opened in both directions off the tunnels, thus making a section of about 500 ft. of each gangway which can be mined and robbed. This will allow an increased number of working faces, and also will greatly reduce the time during which the gangways must be maintained. In years to come this will result in a great saving in the mining of the Mammoth vein.

Where a panel tunnel is driven a pillar is left over it, this pillar being recovered when the gangway is being robbed out. At every 10 breasts a solid block of coal is left; that is, the coal which would be mined by the eleventh breast is left solid with the exception that the gangway and airway are driven through it. This block is mined on the retreat. It is left on the advance so that in case of a mine fire a solid piece of coal is available from which to begin operations. These pillars also tend to stop a "creep."

ROBBING PROGRESS SHOULD BE SLOW

Experience has shown that the best results in robbing the Mammoth gangway, where the vein is 50 ft., or thicker, are obtained when the face is brought back 80 to 120 ft. per year. To many people this has seemed unnecessarily slow, and many attempts have been made to hasten the work, but in every case these has been a decided loss in the amount of coal recovered. This is due to the disturbance of the thick vein matter, causing a general squeeze a considerable distance back from the point of actual robbing. This makes the maintenance of the gangway not only costly but almost a physical impossibility. In some instances a couple of hundred feet of gangway has been lost, owing to quicker robbing than that mentioned.

THE NEED FOR PANELING METHODS IN NEW WORK

When opening a new colliery or a new lift at an old colliery, the question often arises whether it is not better to drive gangways and airways to the boundary limits before opening breasts; also whether it is advisable to open two lifts instead of one. I believe that with the proper system of paneling better results can be attained, because it is possible to have several working faces instead of one, permitting a quicker development. These panels can then be robbed out in a reasonable time, thus preventing heavy timber maintenance cost.

With the system of driving the gangways to the limit there is a period when nothing but development work can be done, and later nothing but robbing work, whereas in the paneling system some sections can be robbed while others are being developed, thus keeping the product of more uniform quality.

The driving of the gangways and airways in the Skidmore vein has not only reduced the timbering expense, but it has improved the ventilation, for the reason that, the vein being so thin, there are no falls to block the airways.

Let Us Publish a View of Your Mining Plant

COAL AGE invites all its readers to send in large photographs, showing either outside or interior views of coal-mining plants. These pictures will be reproduced on our front cover, and a liberal payment will be made for them. If one photograph alone is used, it must be as high, or a little higher than it is wide. All views should be as large and clear as possible.

West Virginia Coal Mining Institute Meeting

By J. T. Beard

The West Virginia Coal Mining Institute held its fourteenth semiannual meeting at Huntington, W. Va., Dec. 10 and 11, 1914. In the absence of Neil Robinson, president of the Institute, owing to his serious illness, the meeting was called to order at 10:30, Thursday morning, Dec. 10, by J. C. McKinley, one of the vice-presidents of the Institute. The meetings were held in the assembly room of the Frederick Hotel.

In a few well chosen words, Mr. McKinley welcomed the members and guests present and emphasized the importance and purposes of the Institute. No expense is spared by the West Virginia operator to establish ideal surroundings and conditions in and about the mines. He considers these essential in order to attract a high class of labor. He believes in educational extension and welfare work as a means of bettering the condition of his employees.

After these few remarks, the chairman of the meeting introduced Mayor Floyd S. Chapman, of Huntington, who made a brief address of welcome and was followed by H. A. Zeller, president of the Chamber of Commerce, who addressed the Institute, welcoming the members and guests present, and extending to them the privileges of the Elks Club, the Guyandot Club, and the Hippodrome, Lyric and Colonial Theaters. Mr. Zeller also stated that the jobbers and manufacturers of Huntington were arranging for a dinner at the Frederick Hotel, Friday evening, at 8 o'clock, at which all of the members of the Institute and their guests were cordially invited.

The Institute then listened to an interesting and valuable paper prepared and read by Richard Smethurst, Cincinnati, Ohio, on "Cost Accounting." This paper was followed by the reading of a paper entitled "Coöperation," which was presented by Col. Z. T. Vinson. This paper, as Col. Vinson stated later, was intended to draw the attention of the coal operators of West Virginia to the need of united action on their part for the purpose of fighting effectively the ever growing aggression of labor leaders. In his paper, Col. Vinson did not limit the effects of this aggression to the coal-mining industry; but stated that business men in general must take up the fight for the protection of their interests. He charged the United Mine Workers of America with being a socialistic body rather than a labor union. The discussion of the paper, following the noon recess, showed a decided unwillingness on the part of some of the members to go on record as indorsing in full the policy advocated, although the value of the paper was fully appreciated.

Following this discussion, in the afternoon, Frank Haas, Fairmont, read an interesting paper on "Mine Gases," which was thoroughly discussed by the members present. This was followed by an instructive paper entitled, "The Pottsville Measures West of the Kanawha and New Rivers," which was prepared and read by R. V. Hennen, Morgantown. Mr. Hennen illustrated his paper by reference to geological charts, showing the location and correlation of the coal measures in the state.

The Thursday evening session of the Institute was devoted almost wholly to the presentation of welfare work in coal mining. J. D. Van Scoten, Interstate Secretary for the Young Men's Christian Association in West Virginia and Maryland, with headquarters at Washington, D. C., offered a few introductory remarks, after which he presented Dr. Peter Roberts, New York City, who is a member of the International Committee of the Y. M. C. A., and is assigned to welfare work. The title of Dr. Robert's paper was "Teaching English to the Foreigner." Dr. Roberts explained his system of teaching the English language to foreigners and stated that this system had been quite generally adopted in different sections of the country. He emphasized the need of instruction in the commonplace details of everyday life and advocated discarding the use of textbooks prepared for schools and colleges.

An interesting paper entitled, "The Visiting Nurse," was read by Miss Mary K. Quick, Moundsville. Before adjournment was taken, a resolution was adopted expressing the sympathy and regret of the members, for the illness of Pres. Neil Robertson, who was detained at his home in Charleston. A committee was then appointed to prepare nominations for the election of officers the following day.

The Friday morning session opened at 10:30 o'clock and was devoted to the discussion of several important questions in coal mining, as follows:

1. What is the best roofing material for mine tenements?
2. Assuming the force system of ventilation, is a door regulator preferable to a box regulator?
3. Has the wisdom of the Compensation Law been proven by results so far obtained?
4. Are oil safety lamps to be preferred to electric safety lamps in gaseous mines?
5. Which is the best method of caring for the accumulation of dangerous gases in gob sections?

Officers Elected for the Ensuing Year

The discussion of these questions occupied a portion of the afternoon session. The election of officers, which followed, resulted in the choice of J. C. McKinley for president, for the coming year. In order to represent more satisfactorily the several mining districts of the state, the number of vice-presidents of the Institute was increased to five, and the following persons were chosen from the districts named:

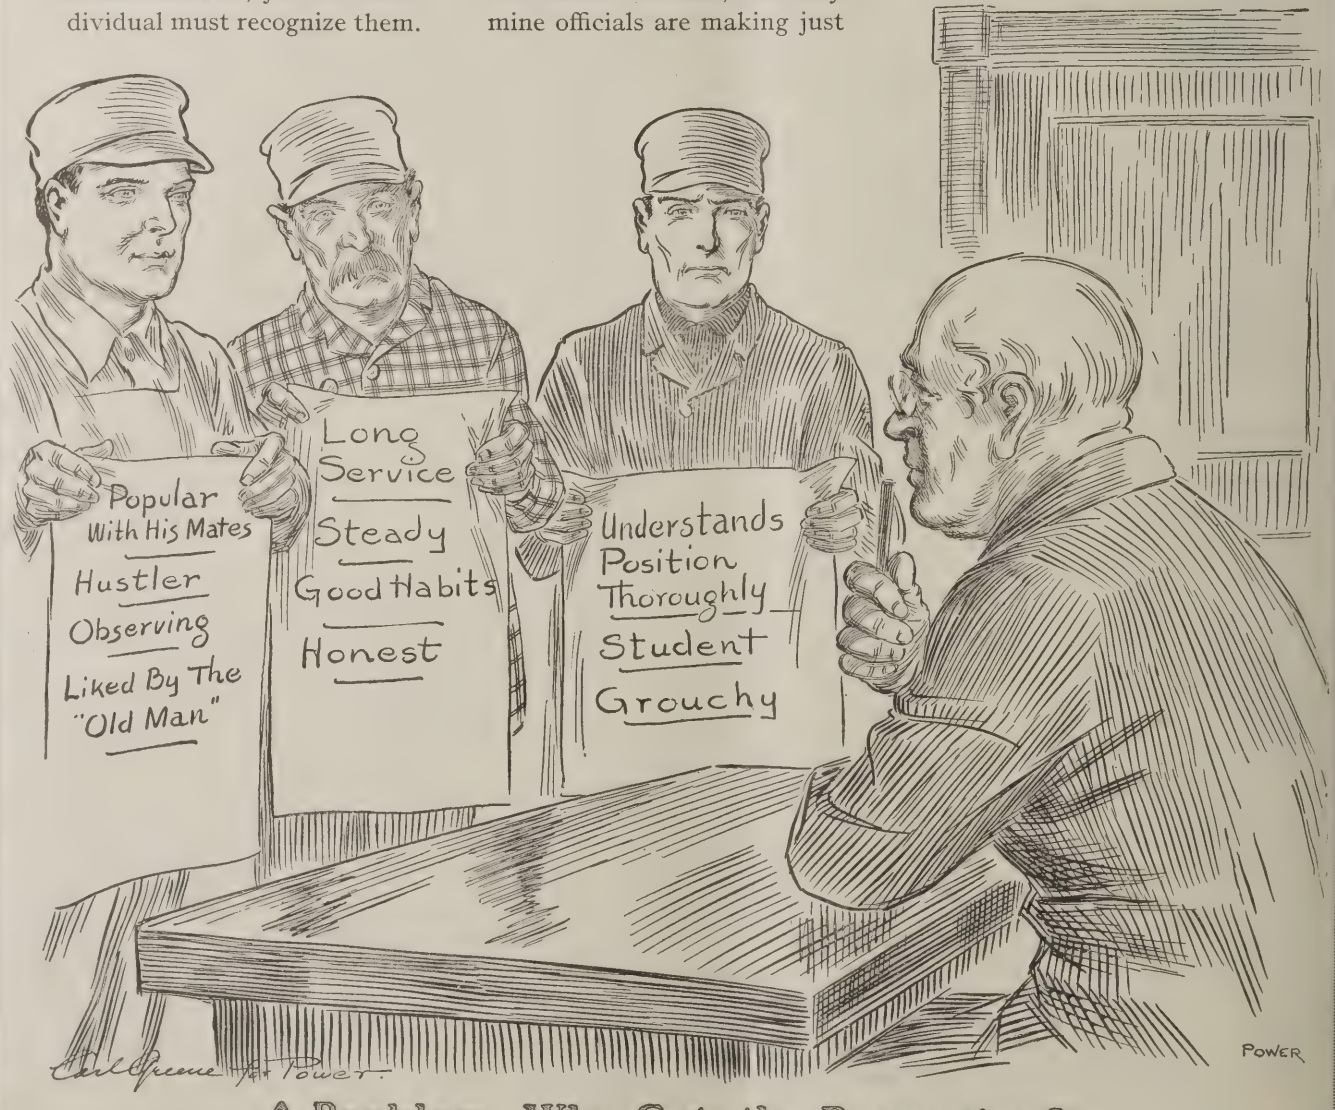
Pocahontas district, Col. William Leckie, Leckie.
Kanawha district, Earl A. Henry, Charleston.
New River district, E. E. White, Glen White.
Fairmont district, George T. Watson, Fairmont.
Upper Potomac district, J. W. Bischoff, Elkins.

Prof. E. N. Zern, Morgantown, was reëlected secretary-treasurer. By the action of the Institute, Prof. Zern was authorized to secure the services of a stenographer to aid him in his arduous duties in promoting the interests of the Institute. In this connection, the members discussed the need of bringing the work of the Institute to the attention of the coal operators throughout the state, in such a manner as to impress them with its importance and advantage to the industry. Valuable suggestions were made by the members in respect to awakening a new interest and securing a more general attendance and support not only of the operators but of all mining men within the state. Some good work may be expected to be done along this line in the coming year.

What Would You Do If You Were the Boss?

THE problem illustrated in the cartoon from *Power* published below is one that every mine official has to meet on frequent occasions. It is an interesting and somewhat complicated situation that confronts the boss. All of the men before him are competent, loyal, of good character and good health.

The man in the chair is balancing in his mind "company duty," for he knows that a corporation must be human and recognize obligations of service, just as an individual must recognize them.



He is also carefully weighing the future value of each man's service; his ability to rise and meet unusual occasions, and his skill in dealing with his fellow-men.

The boss knows full well that his own success depends in large measure on his ability to surround himself with competent subordinates. Their mistakes reflect on him, and he must be responsible to the man higher up for *all* errors of the organization he has built.

The problem shown in the cartoon is a live one, for many mine officials are making just such decisions today. Therefore, it is worth discussing in Coal Age, *and we will pay* $10 *for the best answer reaching us before Jan.* 9. Other answers than the one taking first prize will be published and paid for at a liberal rate.

Each reply must be concise and contain not more than 500 words. The author's name will be published or withheld, just as he chooses.

Let us have answers from everyone to this most interesting question.

A Problem—Who Gets the Promotion?

Editorials

A Spurious Patriotism

We have a friend, who is not versatile but merely unstable. He has wandered around from one form of activity to another, lured by the specious brilliancy of projects he did not really understand and casting carelessly behind him opportunities more substantial, merely because he was able to weigh them more or less truly and, as a result, knew they would never prove bonanzas. He could believe anything he chose about distant, imponderable benefits, though they usually proved not merely delusive, but even actually unattainable, when pursued.

Our friend reminds us of one Commodus, who wore the imperial purple in Rome, who might have sought the dignity of being the greatest and most beneficent of a long line of emperors, few of whom were either great or beneficent. But, instead, enamored of the glitter of the amphitheater and the plaudits of the multitude, he chose to enter the arena and become a third-class gladiator.

With this preface we wish to speak of the enthusiastic spirit with which Americans have been urging themselves to enter into foreign markets. Look, we are told, at the success of Great Britain and Germany. Why should we not secure some of the trade which comes to them?

So one of our enterprising magazines, *System* by name, asked Sir George Paish's views on this subject. "It is all very easy to secure foreign trade," he replied in effect, "if you will only finance foreign enterprise. Pour your dollars into South America; give the merchants and manufacturers a long line of credit; build their railroads; erect their opera houses; open their harbors—and their trade will be yours."

And this is surely good advice—if we have the money to spend. Let us build up the Southern Hemisphere if we are satisfied that our work in the Northern is measurably complete. But if we think not, if we believe that we prefer to spend our money at home where we can watch it in businesses and among people we understand, we will not be so anxious to do what England and Germany have done.

In fact it has been stern, unrelenting, regrettable necessity which has forced the British and the Germans to do a world-wide trade. They did not have enough at home. We Americans would do better to congratulate ourselves on our home business, our home requirements, which have enabled us to conduct our enterprises without depending in large degree on foreign markets and getting the almost inevitable trimming which is the fate of those who invest in alien securities.

Some of us remember how the Barings and the Mildmays lost millions in South American securities and how other English bankers dropped other millions in the South after the Civil War. These are merely single instances of losses, for there is a continuous drain from all sources; oil, for example, in Calgary, rubber all over the tropical world and coal mines in the United States have severally removed the hard-earned cash from the pockets of the English, German, Dutch, French and Belgian people.

Let us then realize that American conditions are on the whole satisfactory and will not be modified materially until necessity causes a change. As profits decline in America, foreign investments will be more desirable and foreign trade will follow. Some of our products will be so desirable that they will make their way even where the British, German and other flags fly and also in those countries where the flags of those industrial nations are not seen outside the harbors and consulates.

We will not deny that there are some wonderful opportunities abroad, but we also know that there are splendid chances to lose money, much of it in fact destined by the investor to be expended abroad has been known to get little further than New York. Certain it is that our industries here need the money and can best be conducted with American capital. Why build up South America with United States savings and borrow five billions of British money to create our own industry?

We should not consider war as normal, but rather so regard peace; but this is certain—that while the war has crippled us severely, it would have been far more terrible had we a large foreign trade, investments in the lands of warring nations, larger indebtedness to belligerents and a merchant marine tied up in our harbors.

As good a creed as "America a world merchant" is "America for the Americans; our capital for our industries; our products for our people." However, it is not a very lofty or a very profitable gospel. It is as noble as "Every man for himself" and pursued to its ends would not rear a very lordly people.

So perhaps we might best continue to muddle along as before without any principles regarding foreign commerce, assured that when the times are mellow, Americans will, unquestionably, show their usual scent of an opportunity. Meantime, let us sympathize with the British and other nations, forced to risk their money abroad, compelled to rake the remote corners of the earth with a fine comb, needing to keep large fleets to protect their commerce and fearful lest a war should remove the basal supplies of their industries.

Reforming at the Wrong End

The principal duty of the Bureaus of Mines and Standards and the Geological Survey is to instruct. To do this they must first inquire. But on the whole of what good is inquiry if the person who makes it keeps the results to himself?

A regulation, newly enacted, requires all U. S. bureau officials to pay their own expenses when they attend conventions, unless those conventions are agricultural. The larger part of the work of governmental bureaus is not to add to knowledge but to disseminate it. How this can be done by officials kept immovably at one spot we cannot see. In fact, in view of these regulations we wonder whether Congress has these bureaus merely for the gratification and glorification of Washington, D. C., or

to promote the advance of industry where men are actually at work.

In fact, all our economy today involves the idea that anything wasted on the public outside the big cities is to be deplored whether it be money on a post office at Punxsutawney, Penn., or the time of a lecturer at Terre Haute, Ind. But after all, the people who live in these rural communities *are* worthy of some consideration. They *also* pay taxes and also, as has been often deplored, have votes.

Congress has shown its sense of this fact by relieving the agricultural convention from bureaucratic absenteeism. Let the national legislature also show it by making it possible for the Bureau of Mines and the Geological Survey and other like organizations to do their work effectively wherever voters who are interested are to be found. Incidentally the members of those bureaus will learn something about mining and geology and even about the plain people which they could never learn in the civic centers to which Congress would confine them.

Many organizations are doing work as valuable in their sphere as is the federal government. One of them, the American Mine Safety Association, was even fathered by the federal Bureau of Mines itself, and was an attempt to induce the operator to second the efforts of the United States government. Now even the officials of that organization who are still U. S. employees cannot look to the government for their traveling expenses and from the very first have had to be relieved of membership dues. This is a disgraceful situation for a government which is always condemning the coal industry for a lack of liberality.

The Congressional—we will not say the national—attitude to learned and beneficial societies contrasts unfavorably with that of some foreign countries. There a subsidy is given or a secretary is paid, and the educational work is thus gratefully acknowledged. We do not, however, urge any such contribution to our institutions.

The dues in none of our national institutes are paid for their employees by the government. The officials must appear either as guests who are unwilling to pay their due part of the score or, if prominent officials, must expend their already inadequate salaries in the membership fees of a dozen different national organizations for the good of their niggardly master.

It is all wrong. Bureaus are intended to instruct industry and to that end to become acquainted with it. If not for that, let them be swept away. What use is there in our expending our money on them?

A Little Help Would Be Welcomed

It is doubtful if there has been a time within the memory of any of us when there have been as many coal miners on the verge of actual want as are to be found at the present time.

It is true that there are not many idle miners, but most mines are running on very slack time, so slack in fact that the employees are hardly able to buy meat and bread with their earnings.

Miners are as a rule rather improvident, and no matter how large their previous earnings, slack work always finds many of them unprepared.

The circumstance that brought the condition of our miners most forcibly to our attention was the attitude of the coal-mining camps toward the Belgium relief fund. When it comes to raising funds for the relief of the distressed, coal-mining communities have always given most liberally; in fact, it is doubtful if any other class of men give as liberally, taking everything into consideration. But just now our coal miners have nothing to give, and the Belgian solicitors, in most cases, have met with disappointment.

The coal-mining industry never fails to get its share of publicity, but in the present crisis, it seems to have escaped.

The papers have been full of details about lack of employment in the steel industry, the iron industry, and manufacturing industries of all description, but that there is suffering in the mining camps has escaped their notice.

A little publicity of the right sort, just now, might be welcomed. Among other things it would show that company stores and company houses have been responsible in many cases for men without funds or credit being able to keep the wolf from the door and the door under a roof.

Judge Dayton Protects Coal Interests

The decision of Judge Dayton continuing the receivership of the Four States Coal Co., of West Virginia, for six months longer meets the hearty approval of coal men everywhere. This judicial ruling affords the company a new lease of life, and may save several hundred thousand dollars to the company's unsecured creditors.

The Four States Coal Co. is a valuable property and in normal times should be able to rapidly liquidate its burden of indebtedness. John H. Jones, the chief figure in the development and operation of the company's mines, is a coal manager of long experience and recognized ability. It is to be hoped that before the new extension in time has elapsed, the company will effect a satisfactory reorganization so that no such serious losses will be brought to the present stockholders.

It is gratifying to know that some of our courts are ready and willing to recognize that the present time is not propitious for the forced sale of valuable mining or industrial property if such an unfortunate outcome can in any way be avoided or postponed. It is the duty of everyone, in these times of stress, to extend a helping hand whenever and wherever possible. We, therefore, commend the wisdom and forbearance of Judge Dayton's decision.

Carl Scholz Again Heads Mining Congress

The American Mining Congress, at its recent meeting in Phœnix, Ariz., reëlected Carl Scholz, of Chicago, as president. No more fortunate selection could have been made, for Mr. Scholz has proved himself an organizer and executive of superior rank. Some of the most important work in its history was accomplished by the "Congress" during the past twelve months, and its finances have been immeasurably strengthened. We congratulate the Congress and Mr. Scholz and prophesy that 1915 will be the best year in the life of the American Mining Congress.

The 40c. Reduction in Anthracite Freights to Philadelphia

SYNOPSIS—After a rather weak defense on the part of the railroads, the Pennsylvania State Commerce Commission has ordered a heavy cut in freights to Philadelphia. Preparations are under way to carry the case to higher courts.

The decision of the Pennsylvania Public Service Commission that the anthracite roads must reduce their freight rates to Philadelphia 40c. per gross ton, is one of the most sweeping reductions in rates ever made. That the railroads will appeal from this decision and carry it to the Interstate Commerce Commission and the courts if necessary, is a foregone conclusion; they cannot afford to do otherwise.

The amount of anthracite coal consumed in Philadelphia in 1913 was 3,775,701 tons, practically all of which was used for domestic purposes and for heat, light and power in office and store buildings, apartment houses and hotels; the use of anthracite as a steam fuel for manufacturing plants has almost entirely given way to the bituminous coals of lower ash and higher heat value, or to mixtures of anthracite and bituminous, the former added in order to lessen possible smoke production.

The reduction in freight of 40c. per ton applies to pea coal and all prepared sizes; for the smaller sizes, the reduction is from 21 to 25c. per ton. Taking the proportions of these sizes as shipped from the mines in 1913 and applying these figures to the Philadelphia consumption (for which no tonnage of different sizes is available) we have the following:

	Gross		Philadelphia
	Tons	%	Tons
Prepared sizes	43,688,694	61.7	2,329,607
Pea	8,142,571	11.2	422,878
Sizes smaller than pea	18,927,047	27.1	1,023,216

On this basis, the total freight reduction would amount to about $1,356,798. How much of this amount will be saved to the people, remains to be seen.

The railroads do not seem to have made a very strong defense of their position. The fact stated by the Commission in its opinion, that the present rates had been in existence for between 17 to 24 years, without any revision must have told against them.

The admission of the railroad officials that they did not know, nor had they ever tried to ascertain the cost of transportation on anthracite coal to Philadelphia, that it was practically impossible to ascertain this cost, was certainly a rather unwise statement, to say the least.

The Question of a Differential

Charging a lower rate on coal for shipment "beyond the Capes" than that for local delivery is entirely in line with the practice elsewhere under similar conditions and its reasonableness has not been questioned. The Norfolk & Western, for instance, as well as the Chesapeake & Ohio and Virginian Railways have always had a lower rate on coal for shipment beyond limits of Chesapeake Bay than for Norfolk or Newport News, $1.40 per gross ton being the rate for outside coal as against $1.50 per net ton for local delivery.

The basis of such differentials is, of course, the necessity of meeting competition at points beyond the Tidewater shipping port. But on all the prepared sizes of anthracite, their is no competition except with anthracite; it is only the small steam sizes that compete with bituminous coals in the coastwise markets.

As far as the exports of anthracite coal from Philadelphia are concerned, the amount is so small that they need not be considered, only 63,481 tons last year. And there never will be a foreign market for anthracite. It is not used in South America and the European countries can get their supplies from Great Britain, which has a better grade of anthracite than any in this country.

A similar differential between local and outside rates exists at Philadelphia on bituminous coals, but no mention is made of this fact in the decision, although the rates per ton-mile for export and outside bituminous coal are given.

The findings of the accounting experts, employed by the Commission, as to the transportation costs on anthracite coal to Philadelphia, as compared with rates per ton-mile on other roads, apparently told strongly against the anthracite railroads' case. The rate of $1.55 per gross ton, a 2.5 mills per ton-mile on the Chesapeake & Ohio Ry. from Marrowborn, Ky., to Newport News, a distance of 623 miles (not 673 as given) is rather beside the question, as no coal is shipped over that route.

Prejudice against the Hard-Coalers

There is another point that does not seem to have been considered by the Commission which is, that it costs the railroads more to deliver anthracite coal to local points by rail than to the coal piers. This is due to the greater amount of switching on local deliveries, as well as to the interest and depreciation on city tracks and switches.

As to the opinion of the people generally, there can be no question but that there is a deep-rooted feeling among all classes against the anthracite roads and this feeling was bound to have an effect upon the Commission and to have had a certain influence. The statement by the Commission that the evidence in this case points strongly to the conclusion that the respondent railroad companies exercise an extended influence over the output and disposition of anthracite coal, is certain to intensify the general feeling of distrust.

If the opinion of the Commissioners is to be contested by the railroads, they should put up a much stronger line of evidence than they did and they should make greater efforts to educate the general public as to the true state of affairs from their standpoint.

The "Boston News Bureau" makes the following comment on the decision: "The new order will disturb a number of transportation questions which have been thought to have been settled in the past 15 years by legislation and regulation, state and national. The long and short haul, lake and rail rates, the interchange traffic between railroads, all questions as to competitive water and rail business and many other apparently settled transportation problems are reopened by the order. The possibility that the Interstate Commerce Commission may at any time hand down a decision in reference to interstate anthracite rates does not tend to make the future clearer."

Discussion By Readers

Mining Laws, Legislation and Mine Regulations

Letter No. 12—I have been much interested in reading the many letters relating to mining laws and mine regulations. I want to say, here, that the Bituminous Mine Law (1911) of Pennsylvania is, in my opinion, the best that I have ever read. I am fully convinced that, if the requirements of this law were fulfilled, there would be very few mine accidents, notwithstanding the recognized hazard of this industry. When one reflects on the importance of taking precautions to secure and maintain certain conditions in the mine, it is strange that mine officials will permit gross violations of the law to pass unnoticed. An experience gained in 16 mines of this state allows me to say that the requirements of the mine law are not fulfilled in any one of them.

I recall an accident that is a simple illustration of what occurs almost every day in our mines. In this case, the fireboss had inspected the mine for the second time that day, while the men were at work. The assistant mine foreman had also made an examination of the workings the same day; but neither of these men had found anything wrong. It so happened that in one of the rooms, in this mine, a thin rib of coal had been left to shut off the gob and prevent the coal that was mined from mixing with the waste. At the time to which I refer, two men were drawing back the rib in this room; and they had evidently decided to mine this thin rib of coal next to the gob, to a sufficient depth to enable it to fall before morning. While engaged in this work, the coal toppled over and caught one of the men, injuring him so badly that he died three hours later.

In this case, the question may be asked, Who was to blame? I may say that the superintendent and mine foreman severely censured the fireboss, since the two miners had loaded from eight to ten wagonloads of coal off this barrier, after the fireboss had examined the place. I may add, however, that if this fireboss had found danger to exist in the place, he would have withdrawn the men and placed the required danger signal at the entrance to prevent anyone from entering the room without being warned of the danger.

In the same connection, I want to say that, in my opinion, "assistant mine foreman," referred to in Letter No. 8, COAL AGE, Dec. 12, p. 958, after discovering the need of securing the roof in a working place in the mine, should have remained long enough to see that his orders were carried out and the place made safe for work. While it is true that many mine officials would hesitate to take action against the man who escaped injury, in the first case mentioned, I believe this should be done in order that he will not try the same trick again, and thereby endanger not only his own life, but the lives of all in the mine.

According to statistics, the majority of mine accidents are caused by falls of roof and coal. It is clear, therefore, that mine laws and regulations should be specific in regard to the removal of dangerous coal, rock and slate; and that these laws should be strictly enforced and obeyed. In my opinion, the miner should be held responsible, to a certain degree, for the condition of his working place; and if he neglects to timber or otherwise make his place safe for work, I believe that he should be compelled to serve a jail sentence, without the necessity of prosecution.

Let me say that it matters not what is preached or taught, we must face the fact that accidents still continue in mines. Then, let us have legislation that will compel miners and mine officials to make a more thorough inspection of working places and to secure all dangerous roof and coal. In other words, let us fix a higher standard of inspection of all working places and the most improved methods of timbering the roof and coal. I believe the adoption of this policy in every mine would soon put a stop to miners taking the risks they are prone to assume, especially if examples were to be made of neglect or willful violation of the known rules and regulations in our mines.

It is not my desire, in what I have said, to lay the blame wholly on the miner, as much of the blame must be laid at the door of the superintendent, mine foreman or his assistant and the firebosses employed in mines. However, there is too great a tendency to shift the blame, in such cases. Therefore, mine legislation should be such as to hold the employer and employee proportionately responsible for the maintenance of safe conditions throughout the mine.

PENNSYLVANIA FIREBOSS.

———, Penn.

Letter No. 13—I was much impressed by Letter No. 8, relating to mining laws, COAL AGE, Dec. 12, p. 958. I read this letter with careful attention. It certainly teaches every coal-mining man of wide experience, regardless of whether he is a miner or an operator, that it is useless to have good laws compelling the safe operation of a mine, unless the miners themselves will obey the laws and observe carefully the mine regulations designed for safety.

No doubt many will argue that any miner who will refuse to obey the company's rules, or who neglects to follow the mine foreman's orders, is an "undesirable" mine worker and should be punished to the full extent of the mine law. In some few cases, perhaps, a miner guilty of disobeying orders or violating rules and regulations is discharged and not permitted to again enter the mine; but, too often, no notice is taken of the matter further than to reprimand the offending miner, who is then permitted to return to his work.

It is easy to see that such law-violating miners are constantly taking chances, because they know the time when the mine foreman, or one of his assistants, is liable to visit his working place. As soon as his place has been inspected, such a miner will proceed at once to follow his own inclinations; and, as a result, a "windy shot"

occurs or a loose piece of slate falls, owing to the miner's neglect to follow the foreman's orders to stop work at once and set the necessary posts to secure the top. I would like to ask, Can anyone tell me who is responsible for such acts of recklessness and disobedience of orders? In most cases, the law does not indicate who is the responsible party.

Considering the mine as a whole, the greatest number of accidents happen in the working places, after these have been inspected, and in the absence of any mine official. There are, in fact, comparatively few accidents that happen on the main roads and entries of mines, caused by defective installation of electric wires, or improper timbering, or lack of timbering, or insufficient ventilation, or other cause that can be attributed to the improper management of the mine.

I witnessed such an accident some time ago, where a driver was squeezed between the car and the rib, because sufficient room had not been provided at the side of the track for one to pass the cars. For such an accident, the management of the mine should be held responsible. Another instance of company liability is where an incompetent foreman permits a man to work in a place that is dangerous, or orders him to draw timber where an accident is liable to occur.

The employment of a large number of foreigners, in a coal mine, makes it important for the mine foreman in charge to carefully inspect the work of this class of employees. He must acquaint himself with their habits and methods. He can judge largely from their output of coal and the appearance of their working places. For example, in respect to shooting the coal, two experienced miners can dislodge from 100 to 135 tons of coal, per keg of powder used, assuming a 4-F grade of black powder and a reasonable thickness and shooting quality of the coal. Estimating on such a basis, an intelligent foreman can soon tell who is "bumping" his coal off the solid without properly mining the seam. Such practice is particularly dangerous in a gaseous mine.

In every coal-mining state there should be a law compelling all miners to have a certificate showing their capability to mine coal in a safe and proper manner. Many Austrian and Italian miners, now employed in mines in this country, never saw the inside of a mine before coming here. They are unacquainted with the requirements of the mining law and, in many cases, cannot speak, read or write the English language. It requires a closer watch to see that these men do nothing to endanger themselves and other workers in the mine. This is one of the hardest problems the mine foreman has to meet.

In most cases, when a man is injured or killed as the result of his own neglect or disobedience of orders, he or his family are led to blame the company; and suit is frequently brought to recover damages. An example of this recently occurred in one of our mines where a man was crushed under a fall of slate, owing to his own neglect to properly support the roof. In another instance, a company recently paid the injured man $500 and all incidental expenses for an accident that was easily attributable to his own carelessness and neglect. I have offered these comments in the hope that they may help to secure the needed improvements in state mining laws, for the protection of both the employer and the employed.

———, Ala.

The Foreigner in Mining

Letter No. 10—I have been greatly interested in reading the previous letters relating to the foreigner in coal mining. I understand the term "foreigner," as used in this connection, to refer to that class of immigrants that come from central or southern Europe, such as Poles, Slavs, Austrians and Italians.

While the letters discussing this subject have been interesting, most of them showing a broad knowledge of the subject, they have all emanated from those who view the condition of the foreigner from one and the same standpoint. These letters have come from those in direct contact with the foreigner and, in many cases, from the employers of this class of labor. I believe that the views of the more educated foreigner would be interesting and valuable. There are, in America, thousands of foreign-born mining men who have become Americanized, and who have been educated according to American ideas, and have adopted American standards of living.

My aim in the present letter is to appeal to this class of the foreign element to give us the benefit of their suggestions. Such educated and Americanized foreigners should know the best methods to adopt to reach the uneducated classes of their races. They should be able to suggest what treatment will lead the foreign immigrant to an appreciation of American conditions and American culture. They should be able to point out clearly the methods often employed that may, however well intentioned, embitter the very ones they are intended to interest and educate.

Knowing the impartiality of Coal Age, I make this suggestion in the full assurance that such contributions will be gladly welcomed. Such an intelligent summing up of the needs, aspirations and difficulties encountered by the foreigner in his transition from his previous environment to American citizenship, as told by those who have successfully passed through the ordeal, cannot fail to interest all coal-mining men and especially employers, superintendents, and foremen who are in daily contact with this class of labor.

At this time, especially, when so many improved methods and so much improved equipment are being used in mining, requiring intelligence and skill on the part of the worker, any suggestion relating to the training and education of mine employees is worthy of earnest consideration and effort in their behalf. This work has gained a great impetus in recent years and bids fair to accomplish much, in the future, for all classes of coal-mining men.

My own experience with the foreigner is somewhat limited, and, for this reason, any theory I might advance, as to their treatment, would necessarily lack weight. However, I am fully convinced of the great value of education, in the treatment of the foreigner. The methods and details of proceeding must, of course, be suited to conditions as they exist. My experience in life has taught me that *education is the greatest leveler of humanity.* Therefore, whatever methods are used to improve the condition and to utilize to greater advantage this class of labor in mining, the first aim should be to *educate them.*

In studying the question of foreign labor, we must remember that ignorance cannot appreciate knowledge,

but knowledge can always measure ignorance. It is therefore incumbent on those who have enjoyed the advantages of education to do everything possible to uplift those whom adverse conditions have deprived of this advantage. It must be remembered that whether or not there is a desire to learn, the faculty of learning exists; and the task of teaching is not, therefore, a hopeless one, though it may have limitations.

In closing, I want to relate an incident that may not only be suggestive but helpful. I recall a man of my acquaintance who had a college education and had reared and educated a family of children, instilling into them *an appreciation of the best things* and *a desire to accomplish great things.* Until, one day, he told me something of his earlier life, I could not understand his genuine sympathy with the "knights of the road." Hoboes, tramps of all sorts and conditions were received by him and given food, clothing and shelter; but, more than this, he conversed with them easily and willingly, as with those of his own circle and acquaintance. The early life of this college-educated, cultured man was associated with the gypsies. Born in a covered wagon while his father was on a horse-trading trip, his boyhood was passed in a community where the men spent their time in smoking and were supported by the women who wove baskets for a living.

The picture was a familiar one to me as it recalled a summer's vacation spent near a village of low huts, with earth floors, a few boxes for seats and a bunk for a bed. The women were barefooted, unkempt and clad in faded and dirty clothes and surrounded by dirtier children. On the outskirts of the village were picketed a few raw-boned half-starved horses. Calling to mind this picture, I could not but wonder how this man had escaped such an environment. He could not explain, except to say that he had *a desire to grow, to know and to accomplish.* Not only had he risen himself, but he had elevated his children to a higher plane of living, so that they never knew the ignorance, drudgery and immorality that marked their father's early life.

The same uplift is possible in respect to the foreigner. Educate him and he'll see to it that his children are educated. Instruct him in better and more sanitary ways of living, and his children will follow. Teach him the principles of American citizenship and culture, and a generation of good citizens will be produced.

America is, in a sense, *the melting pot of nations,* and it is important to recognize that education is a factor that makes for higher ideals and a higher standard of living, morally and industrially.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Sinking Pumps—The class of pumps commonly known as "sinking pumps" differ from other types only in their form of construction, which adapts them to hanging in a shaft, during the process of sinking.

SINKING PUMP

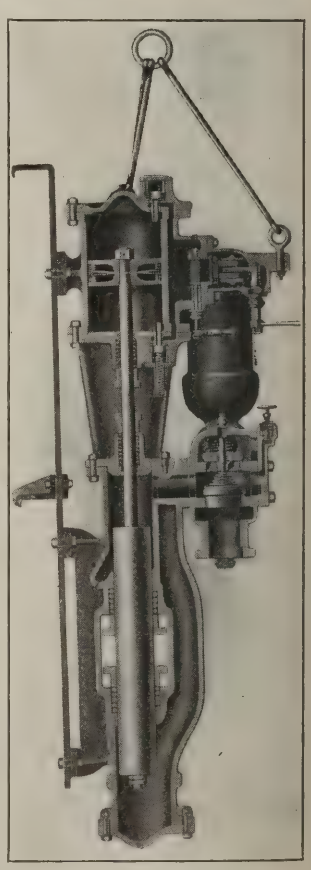
Sinking pumps are mostly of the **plunger type,** because this class is less subject to wear in the handling of the shaft water, which always contains more or less sand and grit. In the **Cameron pump** shown in a front view on this page and in vertical section on the opposite page, the wear of the packings is greatly reduced by the sand pockets, located above the single stuffing-boxes.

Another distinguishing feature of this pump is the form of hinged bolts used to secure in place the suction and bottom covers, the valve-chest bonnet and stuffing-box caps.

In this pump, also, the discharge or column-pipe and air-chamber connections are interchangeable. Also, the steam supply and discharge lines can be connected on either end of the steam chest. These simple provisions greatly facilitate the handling of the pump in a shaft where room is limited and every possible means must be employed to save time and labor and economize space. This pump is an outside center-packed plunger pump.

The two valves shown above the valve chest are for the purpose of priming the pump. It is claimed that these priming valves, as arranged in the Cameron pump, are a distinct advantage over the usual arrangement, inasmuch as they permit the water from the column pipe to flow into the valve chest and thence into the pump barrel, without entering the suction hose of the pump. As the latter is designed to resist collapse only, it would frequently be in danger of bursting if subjected to the full pressure of the column pipe when priming the pump.

The Coal Age Pocket Book



Use of the Sinking Pump—Sinking pumps are designed to be suspended in a shaft while the operations of sinking are in progress. Attached to the end of a cable, the pump is lowered to within 15 or 20 ft. of the bottom, where it is hung on cross-timbers or buntons, by means of the suspension frame or hangers shown in the accompanying figures. The pump is then ready for operation when the steam lines and suction hose are connected.

Operation of the Pump—To start the pump, steam is turned on, slowly at first, and the priming valves opened to allow the water in the column pipe to fill the valve chest and the pump barrel. As soon as the pump begins to draw or "takes water," the priming valves are closed and no further attention is required. It is important when shutting down a pump in cold weather to open the drips so as to enable the water to drain off and avoid trouble from freezing.

Requirements in Sinking Pumps—A sinking pump, above all, must be strongly built to withstand the rough usage it will receive in the shaft, owing not only to collision with shaft timbers when lowering or hoisting the pump, but because of possible injury from the blasting of rock to which it is constantly exposed. There must be no projecting valves, levers or other light parts that may be easily broken off by contact with timbers or flying rock.

The construction of the pump must be simple and such as to give ready access to all valves and stuffing-boxes, for the purpose of removing any obstruction or renewing worn parts or packing.

The size of the pump shown here is 12x7x13 in.; its weight is 3400 lb.; and its capacity at ordinary speed is 200 gal. per min.

SECTIONAL VIEW

Inquiries of General Interest

Hoisting in Slopes and Shafts

If an engine of 300 i.hp. will hoist a load of 30 tons, gross weight, from a slope having a grade of 45 per cent., how many tons, gross load, will the same engine hoist in a vertical shaft? Assume the length of the slope and the depth of the shaft are each 500 ft.

JUSTUS VOLK.

Boswell, Penn.

In answering this question, we will assume that, in the slope, the gross weight W_1 includes the weight of the loaded cars and the rope; and, in the case of an unbalanced hoist in a single-compartment shaft, the gross weight W_2 includes the weight of the loaded cars, cage and rope hanging in the shaft; or in the case of a balanced hoist in a double-compartment shaft, the gross weight W_2 includes only the unbalanced weight of the coal hoisted and the rope hanging in the shaft.

Then, assuming that the engine is operated at the same speed and develops the same power when hoisting in the shaft as when hoisting in the slope; but that the arrangement is such as to provide the required speed of winding or velocity of rope, v_1, in the slope, and v_2, in the shaft; and taking the inclination of the slope or the slope angle as A, we have, since the work performed is the same in each case,

$$W_2 v_2 = W_1 v_1 \left(sin\ A + \frac{cos\ A}{40} \right)$$

Applying this formula to the case in hand, it is necessary, first, to calculate the slope angle for a 45-per-cent. grade. Estimating the grade as the vertical rise per 100 ft. horizontal distance, the tangent of the slope angle for a 45-per-cent. grade is $tan\ A = 0.45$; and $A = 24°\ 14'$. Hence, $sin\ A = 0.41045$ and $cos\ A = 0.91188$.

Now, assuming a speed of hoisting in the slope, $v_1 =$ 8 ft. per sec., and in the shaft, $v_2 = 20$ ft. per sec., and substituting values in the above formula, we have, for the gross load W_2 that can be hoisted in the shaft, by this engine, under the assumed conditions,

$$W_2 = \frac{30 \times 8}{20} \left(0.41045 + \frac{0.91188}{40} \right) = say\ 5\ tons$$

In considering such a question as the above, it is important to remember that winding engines such as are ordinarily used for hoisting coal from slopes or shafts, are commonly designed for a piston speed varying from 600 to 800 ft. per min. In coal-mining practice, the speed of the mine cars commonly varies from 475 ft. per min., or 8 ft. per sec. (5.4 mi. per hr.), to 625 ft. per min., or 10.4 ft. per sec. (7.1 mi. per hr.).

On the other hand, the speed of hoisting in vertical shafts may vary from 15 to 50 ft. per sec., depending on the depth of the shaft and the general equipment and requirements in respect to the desired output of coal. In the above solution, we have assumed as the speed of winding, in the slope, 8 ft. per sec., and, in the shaft, 20 ft. per sec. It is possible to assume other speeds and obtain varying results by substituting other assumed values in the above formula.

The Ramsay Revolving Car-Dump

I was greatly interested in the article of H. S. Geismer, COAL AGE, Sept. 12, p. 412, describing the Ramsay revolving car-dump, in operation at the Woodward iron mines. I notice it was also stated that several of these dumps are in operation at coal mines in different states; namely, Pennsylvania, Tennessee, Alabama and Utah. Mr. Geismer has described a number of the advantages of this style of dump, but failed to mention the *disadvantages* of which some doubtless exist.

There are several questions that arise in my mind, in regard to which I should like more information. For instance, how is rock or other waste handled; or, is this dump adapted only to the handling of material containing no waste?

Another question is, what kind of coupling is used between the cars? An ordinary link-and-pin coupling could not be used evidently, as the pin would fall out when the dump turned over. If a pin is used having any sort of locking device, would it not be necessary to have a man inspect the trip as it comes from the dump, to make sure that none of the pins have worked loose, which would allow a portion of the trip to run wild down the slope?

When and how are the cars oiled; and does the use of this style of dump very materially reduce the working force required on the tipple, as compared with that required in the operation of the crossover dump? These are some of the questions I would like answered.

M. L. O'NEALE,
Coal City Mining Corporation.

Coal City, Ala.

Replying to the above questions which were submitted to him, Mr. Ramsay states that where it is desirable to provide for the handling of waste material, this can be accomplished by installing a movable apron that could be adjusted to carry such material to the proper chute. This was not done at the Woodward mine, as there was no waste material to be handled.

Mr. Ramsay also states that the inclination of the track on the Woodward dump provided a sufficient tension in the car couplings to prevent the pins from dropping out when the dump turned over. In this arrangement of the dump, there is no necessity for a locking device to secure the pin, and no inspection of the trip is required after dumping. In the use of this dump, no accident from this cause has ever been reported.

The H. C. Frick Coke Co. has recently installed one of these dumps at one of their mines in the Connellsville region. The dump has a capacity for handling 18 cars at a time. The cars are oiled in the mine and but one man is required on the tipple to weigh and dump the trips and remove the checks from the cars.

Examination Questions

Miscellaneous Questions

(*Answered by Request*)

Ques.—How should explosives and detonators be handled and taken into a gaseous mine?

Ans.—Detonators should never be carried into the mine in contact with or in the same receptacle with powder or other explosive. Detonators should be carefully wrapped and carried in a small box or tube where they will be protected from an accidental blow or friction with other material.

Only sufficient dynamite or powder should be carried into the mine, at one time, for use during that shift. This amount should not ordinarily exceed 5 lb. The explosive should be carried in a small canister or closed can, which must be carefully protected from any undue jar or blow, or from contact with electric wires. Any receptacle containing detonators or explosives should be kept in a wooden box and away from open lights. Dynamite cartridges when not in use should be laid down and not stood on end, as in the latter position the nitroglycerin has a tendency to leak from the cartridge.

Ques.—The water-end of a certain pump has a diameter of 8 in. If this pump is run at a piston speed of 100 ft. per min. and the efficiency of the water-end is 90 per cent., how many gallons of water will the pump discharge in a minute?

Ans.—The sectional area of this pump is $0.7854 \times 8^2 = 50.26$ sq.in. At a speed of 100 ft. per min., the piston displacement is $50.26 \times 100 \div 144 = 34.9$ cu.ft. per min. If the water-end of the pump has an efficiency of 90 per cent., the discharge is $34.9 \times 0.9 \times 7.48 =$ say 235 gal. per min.

Ques.—If the water-end of a pump is 10 in. in diameter and its stroke 4 ft., the efficiency of the water-end being 85 per cent., how many gallons per minute will this pump discharge when making 48 strokes per min.?

Ans.—The sectional area of the water-end is $0.7854 \times 10^2 = 78.54$ sq.in. The efficiency of the water-end of the pump being 85 per cent., the discharge of this pump is

$$\frac{0.85\ (78.54 \times 4 \times 12 \times 48)}{231} = \textit{say } 666 \textit{ gal. per min.}$$

Ques.—Describe, in detail, the duties of a mine foreman.

Ans.—To describe a mine foreman's duties, in detail, would require a small volume. They are, briefly, as follows: A mine foreman should devote his entire time to the supervision of the operations and equipment of the mine in his charge. He should hire and personally examine all the miners employed in the mine. He must have a thorough acquaintance with the provisions of the mining law and a thorough knowledge of every portion of the mine and its equipment. He must so order the mining operations that the work will be conducted with the greatest safety to the men and the largest output of coal be produced at a minimum cost.

As far as possible, he must personally superintend the operation of the mine and inspect all working places, haulage roads, travelingways, giving particular attention to the condition of the timbers supporting the roof in the entries and working places throughout the mine. He must see that the mine is properly ventilated and that the air is conducted to the working face in such quantities that there shall be no dangerous accumulations of gas in the workings or in any of the abandoned and void places in the mine. He must see that the mine is properly drained and that all needed material is promptly supplied to the miners at their working places. He must examine and sign the daily reports of the firebosses, to assure himself that the mine is being operated in compliance with the requirements of the law. He must attend to the prompt removal of all dangers reported to him or withdraw the men from such places until this can be accomplished.

Ques.—In what velocities of the air current do the respective safety lamps used in mines become unsafe?

Ans.—The unbonneted Davy lamp is unsafe in a current having a velocity exceeding 360 ft. per min. The unbonneted Clanny lamp becomes unsafe when the velocity exceeds 480 ft. per min. Different types of bonneted safety lamps have been found to withstand velocities varying from 1500 to 2000 ft. per min., depending upon the particular form of construction of the lamp and chimney. The type of safety lamp known as the Marsaut, multiple-gauze chimney, has been found to safely withstand current velocities varying from 2000 to 3000 ft. per min. These represent the principal types of lamps, now in use, in numerous varieties, in coal mines. The velocities given refer to pure air. When gas or dust is present in the air, the safe limit of current velocity to which the lamp is exposed is reduced. Much depends, also, on the condition and degree of perfection of the lamp.

Ques.—Is it possible for an explosion in a safety lamp to be of sufficient force to pass the flame through the gauze?

Ans.—Yes. This is most apt to occur when withdrawing a lamp from a body of "sharp" gas or where the proportion of gas to air is such that the mixture is above the maximum explosive point. The entrance of fresh air into the combustion chamber of the lamp when the latter is being withdrawn from such a mixture increases the explosive condition within the lamp chimney; and, as a result, a violent explosion may occur in the lamp that will force the flame through the gauze of the chimney.

Ques.—Why is it that marsh gas is generally found lodged near the roof and carbon dioxide near the floor in a mine?

Ans.—This is because of their relative specific gravities. Marsh gas being lighter than air (sp.gr. 0.559) has a tendency to accumulate at or near the roof. For the same reason, carbon dioxide, being heavier than air (sp.gr. 1.529), has a tendency to accumulate at the floor or in other low portions of the workings.

Coal and Coke News

Washington, D. C.

The Interstate Commerce Commission has handed down its decision in the so called 5 per cent. rate case, granting to the roads the desired 5 per cent. advance east of the Mississippi River except as to certain selected commodities. But as already forecast, these exceptions include practically all the heavier products, including first and foremost coal and its associated products for reasons already familiar to every student of the coal industry and its problems.

The essentials of this important decision in so far as they affect the coal industry (after the language in which the Commission announces the granting of the advance), are as follows:

While we differ as to the relative importance to be attached to the various considerations presented, we agree in the conclusion that, by virtue of the conditions obtaining at present, it is necessary that the carriers' revenues be supplemented by increases throughout official classification territory. Whatever the consequences of the war may prove to be, we must recognize the fact that it exists, the fact that it is a calamity without precedent, and the fact that by it the commerce of the world has been disarranged and thrown into confusion. The means of transportation are fundamental and indispensable agencies in our industrial life and for the common weal should be kept abreast of public requirements.

The original report, besides approving a rate increase in central freight association territory, suggested 10 sources of additional revenue for all carriers throughout official classification territory; the present report, recognizing the existence of a new situation since July 29, acquiesces in a territorial extension of the relief granted to the central freight association lines by permitting the carriers to file tariffs providing, with certain exceptions specified herein, for horizontal rate increases in official classification territory. It is expected that the constructive work suggested in the original report for the purpose of conserving and augmenting the net revenues of the carriers generally will be carried forward without interruption.

Carriers will be required to keep an account of the additions to their revenues from increases in rates subsequent to July 29, 1914, and from new charges, and to report separately thereon to the Commission at the end of 12 and 24 months, respectively.

For various reasons we shall except from the proposed increase the following rates:

1. Rail-lake-and-rail, lake-and-rail, and rail-and-lake rates. It is shown on the record that since the rail carriers acquired ownership and control of the Lake lines successive increases have been made in the rates via Lake tending to lessen the differences between them and the all-rail rates.

2. Rates on bituminous coal and coke. Not long since these rates were investigated and maximum rates were prescribed by the Commission. The key rate upon bituminous coal—the rate from the Pittsburgh district to Youngstown, and the rate on Lake cargo coal to Ashtabula—have been fixed in the light of the various factors which enter into the transportation of such coal. The prevailing rates are remunerative, and the financial condition of the principal bituminous coal carriers is in marked contrast with that of many of the other carriers in official classification territory.

Twice in the not distant past the rates on bituminous coal have been increased 5c. a ton, and would seem now to be as high as may fairly be allowed. It must be remembered also that the carriers are not seeking general increases in rates on anthracite coal, and both kinds of coal are used in competitive markets. As to coke, the rates controlling the greater volume of traffic now moving in official classification territory have recently been set by the Commission upon a basis which was specifically designed to guard against shrinking the carrier's revenue therefrom, and which really resulted in substantial additions to their earnings on that traffic.

3. Rates on anthracite coal and iron ore, largely because they are before us for review in other proceedings.

4. Rates held by unexpired orders of the Commission.

In our original report we declined, for reasons there stated, to allow increased rates in central freight association territory on cement, starch, brick, tile, clay, and plaster. On further consideration, in the light of the existing situation, these rates may be increased throughout official classification territory under the limitations herein set forth.

Joint rates between official classification territory on the one hand, and southeastern territory, the Southwest and points on or east of the Missouri River on the other, may be increased not to exceed 5 per cent. of the division of the rate accruing to the carriers in official classification territory. If these increases involve a change in the relationship under the long-and-short-haul rule between intermediate points and more distant points outside of official classification territory relief from the fourth section of the act must first be secured on regular application.

HARRISBURG, PENN.

The coal operators of the state are much interested as to the outcome of the new river and harbors appropriation bill which carries the appropriation of $1,500,000 for the Delaware channel and a provision for the survey of the Schuylkill River with a view to dredging it to a depth of 35 ft., provided there is coöperation by the city of Philadelphia and the state of Pennsylvania. The Schuylkill carries a good share of the Philadelphia port's commerce, but it has been passed over heretofore by the general Government in its river improvements on the ground that Philadelphia and the state should take care of it. The latter have spent money on it and will be encouraged to spend more if the general Government will give its aid as it should to improve navigation of that river.

There is grave danger that the entire bill will inspire the same opposition that the last river and harbors bill did. The total of $34,006,000 is about as much as was cut out of the last bill to overcome the opposition in the Senate. It may be that the worst features of last session's bill do not appear in this, but a rivers and harbors bill in a short session is not difficult to kill if there is any strong opposition to it.

Many Accidents Are Preventable

Verdicts rendered during the recent past in mine cases investigated are notable in that they point to ignorance or negligence on the part of mine employees. In one case it was found that a miner had tamped an overcharge of powder with an iron drill and in another that a miner shortened a squib in order to hasten the explosion. The explosion came before he could get out of the way.

The public often reads startling statements in the newspapers by state and federal officials about the astounding number of preventable casualties in the coal mines. They agree that at least one-half of all the accidents are preventable. The first thought is that the operators are negligent in not having provided proper safeguards, and new laws are constantly suggested to overcome delinquencies.

The operators are not blameless, but the miners themselves are responsible for a large percentage of the preventable casualties. They are constantly in the midst of danger and become accustomed to it. Most of the accidents are caused by falls, yet some employees persist in working in places where roofs are threatening. They strike matches in gaseous places, shorten squibs, do not give sufficient warning to those in close proximity when a blast is about to be fired, and commit other indiscretions. One great trouble is that employees are too anxious to get through with their work, and take chances that sometimes result disastrously, especially when getting on cages.

It is almost impossible to bring about greater caution through legislation, but a remedy that is always available is seldom tried—the prosecution of employees who are wilfully and grossly negligent in endangering the lives of fellow workmen.

A Far-Reaching Decision

In a decision rendered Dec. 21, in reference to transportation rates on anthracite from the Schuylkill, Lehigh and Wyoming regions to Philadelphia, the Public Service Commission of Pennsylvania ruled against the railroads, and announced that it shortly will issue an order compelling the coal carrying lines in the state to cut their rates 40c. a ton on all anthracite delivered to Philadelphia. The decision was written by ex-Governor Pennypacker for his fellow members of the board. The reduction order affects all sizes of coal down to pea, and stipulates that coal under that size shall be carried for the same rate as pea. The ruling carries with it a lowering of rates of between 25 and 30 per cent.

The decision places Philadelphia on an equality with other great American cities and enables dealers there to get their coal at prices on a par with that charged for its delivery there for transportation to other points.

The railroads affected by the ruling are the Philadelphia & Reading, the Pennsylvania, the Central Railroad of New Jersey, the Lehigh Valley and the Delaware, Lackawanna & Western. From the railroads' standpoint the commission's ruling, if put into effect means a nullification, in this state, of the increased revenues made possible by the Interstate Commerce Commission's grant of a 5 per cent. increase in freight rates. The roads were barred from raising the rates on coal, coke and ore, and a reduction in anthracite rates practically means a wiping out of the additional revenue on merchandise tonnage allowed by the Commerce Board.

Furthermore the commission recites the rates of delivery on barges makes them equal in amount to the rates heretofore designated for local delivery. In its findings the commission submitted a statement showing the cost to the railroads of carrying anthracite per ton. It adds also a table showing the new rates on the various sizes of coal, which it will make mandatory on the railroads.

A considerable proportion of anthracite coal intended for local delivery in Philadelphia is carried by the various companies to points upon the Delaware and Schuylkill Rivers, and there unloaded upon barges, which transport it to the wharves and other places of final delivery along these rivers. For this service the barges make a charge of 25c. per ton or some other definite sum.

The respondents have heretofore so arranged their rates that they, together with the barge charges, shall be substantially equal to the charges for local delivery by rail. It is the opinion of the commission that the rates of delivery upon barges shall be so reduced as to make them, with the added expense of the barges, with respect to each class of coal, equal in amount to the rates heretofore designated for delivery by track service.

PENNSYLVANIA

Anthracite

Larksville—The new $75,000 high school building, which is here in course of construction, was badly damaged recently, by a mine-cave in the Boston Colliery of the Delaware & Hudson Co., whose mines are beneath the site of the building. When the force reported for work one morning, it was discovered that the building was about 7 in. out of plumb. Investigation showed the surface to be settling, and since then the structure has sunk a depth of 18 inches.

Shamokin—When workmen at the Hickory Ridge colliery of the Susquehanna Coal Co. discovered on Dec. 15 that the increase of fare would not be rescinded they refused to go to work. The colliery is now tied up. The rate from Shamokin to the colliery is double the old fare. It is feared that unless the company grants the miners less than a first-class passenger rate more collieries will be made idle.

Hazleton—Admitted to the State Hospital three months age with a leg so hopelessly crushed by a fall of coal in the Drifton mines that amputation seemed the only expedient, Peter Marley, a miner, recently walked out of the institution with a new leg bone constructed out of splices taken from healthy bones and grafted to the splintered member This is the first instance of bone grafting in the Hazleton coal fields, where many miners lose limbs by falls in the mines

Coaldale—It is reported that "all fire bosses, foremen and other lesser officials of the Lehigh Coal & Navigation Co. must from now on refrain from participation in politics, or give up their jobs."

Mauch Chunk—Since the Lehigh Coal & Navigation Co.'s Lehigh canal was opened in 1851 nearly 35,000,000 tons of anthracite coal have been transported over that waterway through the locks here. The canal has been in operation every year since 1851, except in 1902, when it was out of commission on account of the excessive floods during February and March, when portions of the banks were washed away.

Wilkes-Barre—In a special report, the War Department which investigated flood conditions of the Susquehanna River in Wyoming Valley, places much of the blame for existing conditions on the great amount of culm in the bed of the stream. For years coal companies have dumped their refuse into the river until the bed is well filled. The investigators find that the construction of levees, elimination of the Nanticoke dam, removal of culm and other refuse from the channel, changing the course of a few creeks and the construction of basins, etc., are necessary to eliminate flood conditions in this end of the anthracite coal field.

Bituminous

Star Junction—Announcement has been made by the Washington Coal & Coke Co. that it would fire 100 ovens at once and 100 more by the first of the year at its Washington Nos. 1 and 2 plants. The further statement was made that the company expects to go on full time after the first of the year.

Jerome—In spite of the prevailing depression in the coal business in this vicinity, some of the operators are supremely confident that the worst is over and that from the first of the year on conditions will improve rapidly and steadily They point to the fact that many of the mines in the southern part of Somerset County have already been reopened and are taking in a good run of orders and that this condition appears to be spreading rapidly to other workings Some of the mines have been long idle and are now working on full or nearly full time, with a good supply of orders

Barnesboro—Three men were fatally burned in an explosion of powder while at work in the powder house of a privately owned coal mine here on Dec. 17. In some manner the powder in five different kegs became ignited and each apparently exploded at the same moment. The powder house, a small building, was blown to atoms.

Boswell—The big tipple of the Merchants Coal Co., which went out of commission recently, when something went wrong with the hoisting machinery has been repaired. It is expected that operations will be resumed in a short time. The mine had been busy up to the time of the accident, and there is said to be plenty of business in prospect to keep the mines busy for some time to come.

Uniontown—At a receivers' sale on Dec. 15, the American Steel Co. of Pittsburgh purchased the Cyrilla and Francis No. 1 coke plants of the Francis Rocks Coal & Coke Co. for $1 and the assumption of a $100,000 obligation, consisting of mortgages, etc. The Cyrilla plant consists of 100 coke ovens and 110 acres of coal land, while the Francis No. 1 plant consists of 200 ovens and 100 acres of coal lands. The purchase for the steel company was made by Eugene Riley, president of the firm. Before leaving Uniontown, President Riley said that fires in both plants would be started by the first of the year, and that each would run at full capacity. The plants have been in the hands of a receiver for some time and idle for a year.

Connellsville—Coke operators are elated over the decision in the Eastern railroad freight rate case. The fact that no advance in coke rates has been allowed naturally pleases the coke men, who would have reopened their fight had the rates gone up. Independent coke operators believe the railroads will now place their steel orders.

WEST VIRGINIA

Clothier—About 150 miners in the employ of the Coal Valley Mining Co., at this place, returned to work recently, after a week of idleness. The men went on strike after the company had discharged a miner for the alleged loading of dirty coal. The company refused to reinstate this man but the miners agreed to return to work, and in the meantime the discharge case will be taken under consideration by the board of arbitration.

Rosemont—The 200 miners employed by the Weaver Coal Co. have returned to work after having been on strike for about two weeks. They left the mine following a disagreement over the employment of a check weighman, and the alleged wrong done them through the operation of the docking system. The company has agreed to the employment of a check weighman at a later date and the docking system will be taken under consideration at a conference to be held in the future.

Charleston—The Department of Mines of West Virginia, for November recorded 25 deaths from mine accidents as compared with 34 for the previous month. Eleven deaths were caused by falls of roof and slate, 4 by mine cars, 3 by locomotives, 3 by electricity, one by a mining machine, one by an explosion, while one death was due to scalding outside of the mine and one to blood poisoning following a slight injury.

Coalwood—West Virginia coal interests are much pleased with the report that George L. Carter has arranged to transfer his general offices from Johnson City, Tenn., to Coalwood, where the Carter Coal Co. has extensive operations. This firm has made the announcement that it will invest $750,000 for opening new mines and making Coalwood the center of activity in that region.

ALABAMA

Montgomery—Because of the fact that the production of coal in Alabama is not sufficient to warrant the appointment of an additional state mine inspector, the Governor has announced that he will not fill the vacancy on the board caused by the expiration of the term of office of Judson F. Webb, of Quinton.

Birmingham—W. H. Skeggs, of Chicago, recently sold a large tract of coal land near Berry. This land is a part of 30,000 acres in the Corona field, all of which is underlaid with the Corona bed of coal varying in thickness from 5 to 7 ft., and occurring at a depth of from 400 to 700 ft. About a year and a half ago part of this tract was sold to the Bessemer Coal, Iron & Land Co. and a half interest in the balance to Henry L. Badham, president of the above named firm. This is one of the most valuable tracts of coal land in Alabama.

Bessemer, Ala.—Coal mining in the Blue Creek district shows somewhat of an increase. The mines of the Tennessee Coal, Iron & Railroad Co., at Sumter and Johns, are now operating five days per week, with a prospect of running six days after the beginning of the year. The indications are that there will be good business shortly at all mining camps.

TENNESSEE

Jellico—The coal mines in this section have been running only a few days per week in the past. Operators now hope to start the new year with six days per week. Already the Bon Jellico Coal Co. is working six days, while the Gatliff Coal Co. and the Mahan-Jellico Coal Co. are endeavoring to operate full time. The Louisville & Nashville R.R. Co. is experiencing some trouble on the Pine Mountain branch, in keeping train crews from working over time. Another crew will probably be added upon this branch to take care of the passenger and coal traffic.

KENTUCKY

Harlan—Guthrie Bros. & Norval have taken a lease from Denver Cornett of the Harlan Home mine and will improve the equipment and increase the scale of operations. The lessees are Alabama operators who have met with success in that section.

Lexington—Fifteen men have received certificates as mine foremen out of the 16 who recently took the examination conducted here under Dean C. K. Norwood, of the State College of Mines and Metallurgy, Thomas Robinson, a graduate of this year's class, headed the list and since receiving his certificate he has been made mine foreman by the Northeastern Coal Co. First, second and third class certificates were given, the first class fitting the holder to serve as foreman in any mine and second class certificates to serve in that capacity only in non-gaseous mines.

Sturgis—A 10-day shutdown is all that will be necessary at the mines of the West Kentucky Coal Co. near here as a result of the burning of the tipple several days ago. Mine run coal will be taken out for the time being and reconstruction of the tipple will be pushed. Defective electric wiring is blamed for the fire which caused a loss of $10,000 partly covered by insurance.

Sebree—There were no bidders when the property of the Sebree Coal & Mining Co. was cried at the courthouse door in Dixon several days ago, the first sale of the property having been disallowed.

Hemphill—The K. S. Potter tract of coal lands on the Lexington & Eastern branch of the Louisville & Nashville R.R., has been leased by White L. Moss and others, of Pineville, Ky. The company, after the first of the year, will begin to develop on a large scale and proposes an initial capacity of 1200 tons daily. Mr. Moss is manager.

OHIO

Bellaire—Twenty-five mules formerly used at the Blaine mine of the Lorain Coal & Dock Co. were recently removed from the mine and shipped to a point in the interior of the state. This completes the partial abandonment of three of the Lorain Coal & Dock Co.'s mines. It is not known yet whether any of the machinery from these operations will be removed. It is intimated that the three mines of the company are to be abandoned and the machinery moved to West Virginia, where this firm is believed to have recently made extensive purchases of coal lands.

Columbus—Receiver Charles Cohenour of the Maple Gallia Coal Co. will sell all of the assets of the company at public auction, Jan. 9, at the courthouse, in Columbus. The main part of the assets consists of mines at Nelsonville and Clarion.

INDIANA

Evansville—The mines at Spottsville, Ky., on Green River, owned largely by capitalists of Evansville, will be abandoned. They were flooded recently and all efforts to clear them of water have been in vain. Two hundred miners have come here to seek other mine work.

Jeffersonville—The advance guard of large consignments of coal is arriving from Pittsburgh, the first since May 1, on account of low water in the Ohio river. It is estimated that 10,000,000 bushels are loaded on barges at Pittsburgh. Most of this will go to the South.

ILLINOIS

Chicago—Leases under which 11 coal mines in Illinois and Indiana, owned by the Chicago & Eastern Illinois R.R. were operated by coal companies, have been canceled, and the mines will hereafter be operated for the railroad company by receivers Bering, Peabody and Wooley, who are executive heads of the lessee companies. The output of these mines will, however, continue to be marketed through the same coal organization.

OKLAHOMA

Wilburton—Property of the Great Western Coal & Coke Co. was recently seized by Sheriff Lawrence upon writs of execution issued in the District Court to satisfy judgments amounting to $40,544.05 growing out of the deaths of six men who lost their lives in an explosion in one of the company's mines in April, 1909. The original amount of damages awarded was $34,500, which with interest and costs to the present time amounts to the figure above named.

FOREIGN NEWS

Fernie, B. C.—The demand for coke from the Crows Nest Pass Coal Co. is increasing and 100 ovens were recently started at the Michel colliery. It is expected that additional ovens will be fired there soon. The mines have also been working much more regularly than heretofore, and while they are only producing slightly over a third of their capacity, the prospect is more favorable than it was a short time ago.

PERSONALS

Mark Storen, the new United States marshal for Indiana, has named as his first deputy, Frank Barnhart, a miner of Farmersburg.

William Farrell has been made general manager of the Holliday Coal Co., operating in the Nuttalburg coal measure. For the past 10 years, Mr. Farrell has been with the New River Co. as a mine superintendent.

Paul C. Mansfield, formerly of Clarksburg, W. Va., has taken a position as traveling representative of the Sidenfeld-Hammond Coal Co., of Columbus. He will cover northern Ohio, southern Michigan and a portion of Indiana.

Harry F. Butler, for several years sales agent of the Pittsburgh Coal Co., at Buffalo, N. Y., has resigned to go into other business. He has been succeeded by E. Seymour Whitley, for some time salesman connected with the Buffalo office.

Delwyn Wolfe has been promoted by the Lehigh Valley Coal Co. from division engineer of the Delano division to district inside superintendent, with headquarters at Hazleton, to succeed Thomas R. Jones, who has taken charge of the Mahanoy division.

O. B. Tanner has been placed in charge of the new office of the Goulds Manufacturing Co., in the Third National Bank Building in Atlanta, Ga., as district manager. This company is one of the largest manufacturers of triplex, centrifugal, hand and spray pumps.

John Rowlands of the Lehigh Valley Coal Co., employed as general outside superintendent, has tendered his resignation. This will go into effect the first of the year. For many years he has been in the employ of the concern and previous to that was an employee of the Coxe Brothers Company.

Martin Bolt, for many years chief clerk of the State Mining Board of Illinois, has resigned. John E. Jones, the newly appointed state mine inspector for the third district, will fill this position temporarily until James F. Morris, recently appointed to this place by Governor Dunne, can take charge.

Thomas L. Lynch, president of the H. C. Frick Coke Co., was suddenly taken ill with peritonitis on Dec. 16. An operation was performed early the next morning. At the present writing he is at his home in Greensburg, Penn., and is reported to be doing as well as may be expected under the circumstances.

Captain Charles J. Menges, river manager at Cincinnati for the Monongahela River Coal & Coke Co., was the guest of honor at a dinner recently given at the Business Men's Club by members of the Cincinnati Coal Exchange, the occasion being Captain Menges' early departure for New Orleans, where he will take charge of the company's rapidly developing export trade.

Arthur E. Jackman has been appointed manager of the machinery department of the Walter A. Zelnicker Supply Co., of St. Louis, in the place of J. J. Hilpirt, resigned. Mr. Jackman has had a wide experience and possesses much practical knowledge of steam and electrical machinery and equipment, which will be of considerable benefit to his employer's customers in his present position.

M. D. Royer has resigned his position with the Lehigh Valley Coal Sales Co. and accepted that of traffic manager of the Manila R.R. Co. at Manila, Philippine Islands. He will leave for his new post immediately after Christmas, sailing

from San Francisco, Jan. 9, for Manila by way of Hong Kong. Before accepting the position with the Lehigh Valley Coal Sales Co., Mr. Royer was for several years assistant general manager of the Galloway Coal Co., of Birmingham, Ala.

C. W. Brooke, an engineer of long experience in sales and advertising campaigns in the Pittsburgh and Buffalo districts, recently acquired an interest in the Chamberlain Co., of Detroit, Mich. In keeping with the policy of expansion on the part of this firm, Mr. Brooke goes to it as secretary and treasurer. The Chamberlain Co. has for some time past retained a number of the largest and most attractive accounts in the power plant field of technical publicity.

James E. Roderick, chief of the Department of Mines, on Dec. 15 named Mine Inspectors M. J. Brennan, Pottsville; P. C. Fenton, Mahanoy City; and P. J. Friel, of Shamokin, as a commission to investigate the Lansford No. 4 mine disaster of last summer when seven men were killed by gas. Mine Inspector Davies, of Lansford, and President Thomas Kennedy, of District No. 7, United Mine Workers of Hazleton, were authorized to accompany the commission when it enters the mines and holds its sessions.

OBITUARY

Harry K. Preston, mining engineer, and formerly owner of extensive coal operations, committed suicide on Dec. 17, in his home, 532 West School Lane, Germantown, Penn.

John C. Haddock, president of the Plymouth Coal Co., of Wilkes-Barre, Penn., died in New York, Dec. 20, of acute stomach trouble. Mr. Haddock for years had been involved in intricate litigation over freight rates. He testified on one occasion before the Interstate Commerce Commission that he had lost $800,000 in 8 years through discrimination against him by a coal road. He was born in Ireland in 1850.

Shirley Leisure, general electrician of the Consolidation Coal Co., at the Columbia mine, was accidently electrocuted Dec. 15. Mr. Leisure, in order to make certain necessary repairs, pulled the switch controlling the high tension wires, but failed to notice that because of the cold weather prevailing, the connections were not broken. Grasping the wires he was immediately killed. Mr. Leisure was 22 years of age, and had been employed by the one company for 11 years, beginning as a water boy. He was unmarried, but is survived by his father and two sisters.

Senator Robert Jaffray, of Toronto, a prominent Canadian financier, died on Dec. 16, in his 83d year, the immediate cause of death being the bursting of a blood vessel. He was born in Scotland in 1832, and came to Canada in early life, settling in Toronto. Since 1883 his attention was given to financial affairs and industrial development. He was president of the Imperial Bank and the Globe Printing Co. and a member of the directorates of the Nova Scotia Steel & Coal Co., the Canadian General Electric Co., the Canadian Allis-Chalmers, Ltd., and several other corporations. Mr. Jaffray took a leading part in the organization of the Crows Nest Pass Coal Co., of Fernie, B. C., one of the pioneers in the development of the coal deposits of the interior of western Canada, which was incorporated in 1897. He held the vice-presidency of the company for many years, retiring in 1909. Mr. Jaffray took a keen interest in politics as a leading member of the Liberal party and was appointed a member of the Canadian Senate in 1906. He is survived by two sons and two daughters.

CONSTRUCTION NEWS

Greenville, Ky.—The Gibraltar Coal Co. is constructing an addition to its power house and installing new machinery.

Carrollton, Ohio—The Inter-State Mining Co., which was organized several weeks ago at Akron, with a capital of $300,000, will develop a large tract of coal land near Carrollton. It is planned to open at once an electrically equipped mine with a capacity of 1500 tons daily. John P. Jones, of Canton, is president; August Blissman, treasurer, and C. W. Wickline, secretary.

Hazard, Ky.—The Hazard Town Coal Co. has arranged with the Louisville & Nashville R.R. Co. to install a tipple alongside the yards at the lower end of Hazard. Installation work will be begun by the coal company in the near future, the plan being to operate the No. 4 seam and carry the coal across the river to the tipple in large bucket conveyors. John B. Eversole is part owner of the tract on which the mine has been opened and is actively pushing the work.

Huntington, W. Va.—It is reported that during the coming year the Chesapeake & Ohio R.R. will follow the example of the Norfolk & Western in the field between Bluefield and Vivian, and will electrify its Guyandotte Valley branch, installing either a trolley or a third-rail system. The first of the dozen electric locomotives which will be used by the N. & W. on the section between Bluefield and Vivian has been received at Bluefield, and its size and power made a considerable impression. It is said that the electrification of the Guyandotte Valley branch of the C. & O. would be an easy matter, and that it would immensely simplify the moving of large tonnages of coal in that section.

Pine Knot, Ky.—Promoters of the Jellico Coal & R.R. Co., which owns 15,000 acres of rich mineral land in this (McCreary) county, have been engaged for a week or so in a survey of the property which, it is announced, they intend to develop at once. In this connection it is stated that the company will build a 16-mile railroad from the mouth of Capachine Creek to intersect the Cincinnati, New Orleans & Texas Pacific R.R., either at this point or a short distance south of here. The company has been taking options through this section for the past four years and, it is said, now owns most of the property through which the railroad will pass. Much of the coal is in 7-ft. beds and is all easily accessible by drift mining. Several large bodies of virgin timber are included in the area.

NEW INCORPORATIONS

Tuscaloosa, Ala.—The Riverside Coal Co. has been organized with a capital stock of $162,000.

Charleston, W. Va.—The Whyel Coal Co., of Uniontown, Penn., has been incorporated in West Virginia with a capital stock of $250,000, by George Whyel, Harry Whyel, H. L. Robinson, and John L. Robinson, of Uniontown, and F. E. Waddell, of Scottdale, Penn. It will engage in mining.

Lynchburg, Va.—The Alpha Pocahontas Coal Co. has been organized to develop Pocahontas coal field property. The capital stock is limited to $125,000, and the officers are F. M. Lee, president; S. P. Halsey, vice-president; and G. H. Wilkins, secretary-treasurer. These officers together with R. C. Scott, L. Lazarus, R. S. Terry, and F. T. Lee, compose the board.

INDUSTRIAL NEWS

Boston, Mass.—The Consolidation Coal Co., Inc., has turned over its floating equipment, steamers, tugs and barges, to a new corporation known as the Consolidation Coastwise Co. recently organized under the laws of Massachusetts.

Martins Ferry, Ohio—The largest verdict returned locally in a personal injury suit for some time was awarded in Common Pleas Court recently against the Johnson Coal Co. of Bellaire. The suit was that of Henry Unterzuber against the Johnson company and the verdict amounted to $4500. Unterzuber sued for $15,000.

Washington, D. C.—Congressional investigation of charges that the Southern Ry. discriminates against independent coal operators in the Virginia, Tennessee, and Kentucky coalfields in the interest of a coal trust was adjourned recently until Jan. 6. Upon that date, Mark Potter, president of the Clinchfield Ry., will cross-examine Frank C. Wright, of Bristol, Tenn., who has been giving testimony to support these allegations.

Bluefield, W. Va.—The comptroller of the Norfolk & Western R.R. recently made public the statement of coal shipments for the month of November compiled from the records of his office. They show from the Pocahontas field 837,577 tons, Tug River, 263,975, Thacker, 235,080, Kenova. 90,772, Clinch Valley, 237,831. Other Norfolk & Western territory 3849 tons, or a total from Norfolk & Western fields of 1,659,084 tons. There was also derived from the Williamson & Pond Creek Division 62,505 tons and from other railroads 131,269 tons, making a grand total of 1,852,858 tons. The total shipments for the corresponding month of 1912 were 1,896,817 tons, and in 1913, 2,184,338 tons. Shipments for 1914 compared with 1913 in the month of November have consequently fallen off 332,480 tons or about one seventh.

Coal Trade Reviews

General Review

Anthracite consumers becoming urgent about prompt deliveries. Bituminous quiet with sellers concerned mostly about new contracts. Effects of the customary year-end curtailment already being felt, but colder weather stimulates the domestic trade.

The continued low temperatures in all parts of the country have created an active situation in the retail end of the anthracite trade. Consumers in all directions are becoming urgent about prompt delivery, but on the other hand there is a notable absence of the insistent demand on the mines that is usually characteristic of the first winter's cold snaps. New contracts on the steam sizes are now being negotiated with prices ruling on about the same basis as last year. The feature of the anthracite trade this week was the heavy reduction in freight rates into Philadelphia, ordered by the Pennsylvania State Commerce Commission.

While bituminous is showing some well defined indications of improvement, there is still a complete absence of any important activities, and the Eastern agencies are now chiefly concerned with the new contracts expiring Jan. 1. In view of the low prices that have ruled since early spring, there is a marked tendency on the part of consumers to hold off for the time being at least; as a matter of fact, spot buyers have been practically in control of the situation over the past six months. The outlook on prices is indeterminate so far, and the opening negotiations will be watched with interest.

In the meantime the accumulations continue large, though an occasional shortage has recently been reported, due to the congestion on the railroads and the heavy storms at sea, which has given a temporary stimulus to the trade. But the mines are working on such short time that the usual slowing down over the holidays will scarcely be noticed. The usual year-end curtailment at industrial plants is being noted, but with the favorable decision in the famous 5 per cent. rate case and other constructive developments, there is a distinctly optimistic feeling noted.

Manufacturing demand in the Pittsburgh district has suffered severely as a result of the holiday cessations, but this has been partially compensated for by an increased domestic consumption, due to the colder weather. There is a notably better tone in the Ohio market due in part to the favorable interpretation placed on the Interstate Commerce Commission's ruling on the freight rate decision and also to the more seasonable weather conditions. Surplus stocks are being cleaned up rapidly, while orders held up at the mines are now being released, and occasional urgent requests for immediate shipment are coming in. There is much interest in contracts for the new year, some of the large ones expiring shortly.

The Middle Western situation has also improved considerably and running schedules at the mines have been tuned up to nearly full capacity. The screenings situation continues the feature of the market, though domestic buying stiffened up rapidly under the influence of the colder weather, and this in spite of the fact that stocks on hand were unusually large. There are well defined indications of an improvement in manufacturing and with the added stimulus of the rate increase to the railroads, the outlook is more hopeful than for some time.

ATLANTIC SEABOARD

BOSTON

Slightly better tone to bituminous but accumulations continue large. Canvassing already in progress for 1915 business but buyers are not encouraging. Georges Creek gets farther behind on shipments. Pennsylvania grades still face a restricted market.

Bituminous—Seasonable weather has caused a slight improvement in the market. Contract demand, in view of the slow movement of cargoes coastwise, is notably better, and in scattered instances there is inquiry for spot shipment. The general state of the trade is not enough better, however, to make shippers relax any in their efforts to place the tonnages that come to all the terminals in undiminished volume. Accumulations are still heavy at Hampton Roads, and while spot cargoes would command somewhat higher prices the range is very little in advance of a fortnight ago.

Pocahontas and New River interests are beginning to get actively interested in 1915 business and it is possible that January will see some interesting developments. New England buyers are likely to be conservative next season in view of the low prices that have ruled since last May and June when the contract-placing season was practically over. As a matter of record the buyers who have purchased from time to time as required have done better this season than have those who made contracts; this applies to the ordinary plant where the consumption is not so large that a continuous supply is an important consideration. Unless something unforeseen occurs, however, the early part of 1915 will probably be rather a slow season for placing yearly contracts.

At Boston, Providence, and other distributing points, on-car prices have declined somewhat on account of free arrivals the past few days, but figures now are about the same as a week ago. For a short period spot coal was scarce and a slight premium was paid.

Georges Creek shipments are getting farther and farther behind. A succession of storms has seriously interfered with tows along the coast.

The Pennsylvania grades have shown some improvement in the demand all-rail, but the Tidewater market is still much restricted. Practically all the shippers have coal standing at the piers and concessions have to be made to move it.

Water Freights are somewhat firmer on account of the weather; 70@80c. is now about the rate on vessels and barges, 3500 tons upward, Hampton Roads to Boston.

Anthracite—The retail trade is about normal and occasional requisitions find their way to the wholesalers. Stove size is in plentiful supply with all the shippers, egg and chestnut continuing to be offered by independent operators at prices considerably off the circular.

Current quotations on bituminous are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*.....	$0.85@1.45	$1.15@1.50	$1.67@1.77	
Philadelphia*.....	2.10@2.70	2.35@2.70	2.92@3.02	
New York*.....	2.40@3.10	2.65@3.05	3.22@3.32	
Baltimore*.....	.....	.....	2.85@2.95	
Hampton Roads*.	.....	.....	.....	$2.55@2.75
Boston†.....	.....	.....	.....	3.50@3.73
Providence†.....	.....	.....	.....	3.35@3.63

* F.o.b. †On cars.

NEW YORK

Congestion on railroads causes a temporary shortage of bituminous but the market continues generally heavy. Colder weather has stimulated the anthracite situation.

Bituminous—Some of the railroads have been badly congested for the past week and deliveries from the mines to Tidewater are coming in slowly. This condition caught a few companies with a short supply. The recent heavy weather interfered greatly with the movement of bottoms and there was some little demand for spot float coal.

Outside of this business is still quiet. The bunker business continues in fair volume, with the exception, of course, of the regular lines which are tied up. There is considerable competition for the few contracts that are in the market for closing on January first. This is the usual period of contracting

for bunkering business, the commercial contracts being largely closed on April first.

The market is not quotably changed from the past several weeks which we continue as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The recent low temperatures have greatly stimulated buying. This is more noticeable particularly in the local Tidewater market. Retail dealers report a good volume of business and with continued cold weather the demand should remain good. The outlying districts, where stocks were heavy, have not come in with the demand experienced at tidewater. The buying at this season of the year, from this branch of the trade, is confined more to car lots, where earlier in the season heavier orders were placed. Chestnut appears to be the strongest size while stove is quite plentiful and egg continues to sell slightly off circular.

The market is quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	5.00@5.35	5.30	4.80@5.30
Stove	5.35	5.25@5.35	5 30	5.20@5.30
Chestnut	5.60	5.45@5.60	5.55	5.40@5.55
Pea	3.55	3.45@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.50@2.80	2.50@2.75	2.15@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.35@2.25
Barley	1.80	1.60@1.80	1.75	1.25@1.75

PHILADELPHIA

Cold weather stimulates demand in retail trade, but wholesale market is still quiet and without tone. Suspension in production owing to holidays. Situation in bituminous shows little improvement in demand, but prices are unchanged.

Anthracite—While the retail trade report that there seems to be a better demand for coal, owing to the cold weather, supplies are so ample that the expected improvement in the wholesale market has not as yet materialized. Pea coal is in especially better call, and the large companies have commenced to draw on their reserves. Broken and egg continue to lag, but stove and chestnut are moving well, and with the usual holiday suspensions at the mines, the output is likely to be well taken care of.

The feature of the week was the announcement of a heavy reduction in the rates on anthracite coal to Philadelphia, and vicinity. Many contracts are made at a delivered price, and as the announcement came at a time when many of these contracts were about to be closed up, there is considerable speculation as to the results in event of the railroads submitting to the cut; this is not likely, however, as it will probably be fought to the bitter end, and it may be a year or more before the proposition is placed on a definite basis. Dealers here are of the opinion that the reduction to the consumer should not be the full amount of the cut, and the question of the saving to the public may still be an open one. It must be remembered that a short time ago there was a threatened increase in retail prices which did not materialize and the commission's ruling, even if effective, may simply result in the dealers standing pat on their present prices.

Contracting for the steam sizes for next year is now in order, and the various companies report that renewals are coming in on the same basis as last year, with few protests as to prices. The apathetic condition of the steam coal trade during the year 1914 led many to believe that there might be some modification in prices, but as a rule, they are on the same basis as follows: Broken, $3.25; pea, $2.25; buckwheat, $1.25 and rice, 85c.

Bituminous—There seems to be a slightly better demand for the better grades of soft coal. Contrary to conditions prevailing at the Tidewater ports a month or six weeks ago, it is understood that the fleets of barges sailing from this city are carrying quite large quantities of the various grades of coal for New England consignment. This reflects a better call for coal, doubtless due to improved weather conditions, and to the fact that the manufacturing interests report that conditions are slightly improved, so that what little coal they have on hand has been depleted, and further supplies are required.

BALTIMORE

Bituminous demand poor and shows little indication of improvement until after the holidays at least. Rate decision may bring some relief.

No improvement is to be noted in the soft-coal trade. The usual slowing up in operations, due to Christmas and New Years, will scarcely be noticed. Where coal is being produced on a two-, three- or four-day basis, it is mostly to meet contract demand.

West Virginia gas coals are still selling at from 75c. to 90c. Steam coals bring from 85 to 90c. In Pennsylvania some low-grade fuels are to be had in limited lots below the dollar mark at times, while medium-grade fuels sell for $1.05 to $1.15 and best grades around $1.30.

At the piers here considerable coal is again being loaded on foreign account and December is expected to make a fair showing on exports. If the month's total reaches 80,000 it will bring the shipments on foreign account for this year to nearly 100,000 more than the record for 1913

In many quarters it is hoped that the railroad rate decision will prove an aid to the coal trade by stimulating business generally. The Maryland Steel Co. officials, for instance, are said to expect a number of rail orders to be released shortly as a result of the settlement of this long drawn out affair.

BUFFALO

Anthracite stimulated with the coming of severe weather, but bituminous is still slow. Railroad men predict a stir after the middle of January. Loading winter cargoes.

Bituminous—The cold weather has done something for this trade, but as a rule shippers say that it will take a genuine revival of business to make much impression. The business situation improves, but so slowly that it may be months before it will amount to anything. Shippers look for something better now that the railroads have their long-demanded advance in freight rates. It is already reported that Canada is more active, not only on war orders, but in some other directions. This is naturally the dullest part of the business year and when it is past there should be some improvement and it is likely to be considerable. For the present there are reports everywhere that many factories are going to be idle during the last half of the month, so that if coal sales keep up even fair it will mean that there will be a good demand when the business starts up after the first of the year.

The mines tributary to this market are running not over half-time, as a rule, and there is often difficulty in disposing of even this restricted output. Some consumers have taken more stock than they should and others are refusing to take more than they must have, which reduces sales to their lowest in both cases. There is a better tone to the bituminous market, though it is based largely on a general belief that all business is going to be better soon. Slack is steadily growing stronger and sizes are following to a certain extent. Quotations remain on the basis of $2.80 for best Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny Valley sizes about 25c. lower.

Anthracite—The demand is good, though it is noted that the big shippers have not the amount of orders on their books that they commonly have at this time of the year. As a rule they are fairly swamped with orders with the setting in of good fall weather. Quite an amount of the usual insistence on deliveries has been eliminated by the activity of bituminous shippers who handle independent anthracite. Sales are made at regular circular prices.

The shutting down of the Lakes for the season has not stopped the loading of coal into vessels. There is quite a large surplus of egg here that is not required and this is being put afloat to get it out of the way. One shipper has loaded two cargoes and has half a dozen more chartered.

TORONTO, CAN.

Colder weather has started a better domestic movement and steam demand is increasing slightly.

The setting in of cold weather has brought about a revival of activity in the coal trade, and stocks are moving freely. The market for steam coal is only fair, as many plants are still closed down or curtailing their output, but conditions are slowly improving largely on account of extensive orders for war supplies. Quotations are as follows, with a stiffening tendency as regards slack. Retail anthracite egg, stove and nut, $8; grate, $7.75; pea, $6.75. Bituminous steam, $5.25; screenings, $4.35; domestic lump, $6; cannel, $7.50. Wholesale f.o.b. cars, three-quarter lump, $3.68; screenings, $2.54.

HAMPTON ROADS

Movement from Hampton Roads only fair. Government loadings about 15,000 tons during week. Movement confined mostly to contracts.

Dumpings over the Tidewater piers for the week have been about fair; export cargoes have gone to Canal Zone, Rio de Janeiro, Valparaiso, Port of Spain, Havana and Buenos Aires while coastwise movement has been principally to the New England market. Two government colliers have been taken care of, their cargoes amounting to about 15,000 tons.

There has been little, if any, change in the prevailing circular and the demand has been light, the greater part of the coal moving having been on old contracts. The

amount of coal in the railway yards is still somewhat above normal and there is only a small amount of tonnage in port waiting to be loaded.

On account of high rates for steam tonnage sailing vessels are in more demand than they have been for some time. The schooner "Frontenac" has loaded a coal cargo for Rio which is quite a departure from the ordinary for this class of tonnage.

Indications now are that figures for December will show a decline when compared with previous months as well as with the corresponding month of last year.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Oakley C. Curtis		Norfolk	Portland	2000	
Dorothy Palmer		Hampton Roads	Searsport	2315	
Luigi	Italian	Baltimore	Brindisi	2260	

Note—Steamers are indicated by **bold face** type, all others being schooners.

OCEAN FREIGHTS

Steamer rates stiffen up still further.

The freight market is considerably firmer than a week ago, with but few steamers available for Bermuda, Kingston or Cuba, at less than the rates quoted below, except small boats, carrying 800 to 1500 tons each. The two large sailing vessels that were reported as having been chartered to take coal to Rio only secured $4.50 and $4.37½ clear form of charter, and not as previously reported; $6 is offered for coal steamers to Rio, but this rate can be shaded for Montevideo.

We are in a particularly fortunate position to name favorable rates on coal to Valparaiso, or other West Coast ports, either by single cargo or on contract. Steamers employed in this trade carry about 6000 and 7000 tons each.

OHIO VALLEY

PITTSBURGH

Retail demand much improved, but manufacturing demand correspondingly diminished on account of the holidays, operations remaining at slightly under 40% of capacity. Prices continue irregular.

The cold weather of the past ten days, the temperature ranging between zero and 40°, has given a great stimulus to the retail coal demand, which has been by far the best of the season thus far, but an influence in the opposite direction has practically counterbalanced this improvement, as the demand from the iron and steel mills has very considerably decreased, owing to quite general closing of plants over the holidays. In many instances plants will close Thursday, Dec. 24 and not resume until Monday, Jan. 4.

Railroad demand is about the same as formerly and on the whole the mines of the Pittsburgh district have been unable to increase their operations, but are dragging along at an average rate slightly under 40%. Some are doing much better than this while others are operating light two days in the week only and a few are closed entirely. Prices are as irregular as formerly, even slack not having reacted to the full nominal price of 90c., and about 80c. seems to be a fair average quotation. What may be called regular asking prices, subject frequently to concessions of about 10c. a ton, are as follows: Slack, 90c.; nut and slack, $1; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district.

TOLEDO

Surplus stocks being cleaned up and the situation is distinctly better. Same important contracts coming up.

The cold weather has brought a better demand for both domestic and steam coal. The steam dealers have been picking up track coal for economy's sake and are now in the market for supplies. Some of the large automobile concerns in Detroit are also in the market for coal on contract and it is said that many other concerns which have not yet contracted are now ready to come in. The better situation in the eastern Ohio fields is regarded favorably here, especially among operators having mines in that territory, and it is hoped that strike difficulties will soon be a thing of the past.

CINCINNATI

Continued cold weather has maintained the market. Dealers' stocks apparently large. Steam business remains dull.

The flurry of business due to the cold snap has subsided, despite the continuance of the most severe weather of the winter during the past week. The necessity for shutting off the local gas supply to large industrial consumers indicates the increased consumption of fuel, both coal and gas, and also gives promise of an early betterment in the steam market, as more than a hundred large consumers have had to go back to coal. However, dealers seem to be well supplied with coal, and it will take more cold weather to bring them into the market. The decision of the Interstate Commerce Commission in favor of higher rates for the railroads is expected to be a factor of importance. More liberal buying by the carriers will relieve the situation to a considerable extent, and will be of great assistance in reviving industry in general. These favorable changes are expected to materialize shortly after the first of the year, but at present, with a slow demand from the trade, plenty of coal, both rail and river, the market is in rather poor shape, and this has resulted in some price concessions.

COLUMBUS

The cold wave has stimulated the trade. Domestic demand increased though the steam business is still slow. Retailers are having a rushing business.

More favorable weather has had a marked effect on the coal trade. Domestic business has been stimulated and prices strengthened all along the line On the whole there is an improvement in the tone of the market with future prospects growing brighter.

Retail trade became quite active as soon as the cold spell arrived. Dealers' stocks were generally low and as a result operators and jobbers began to receive orders; in many cases there were requests for immediate shipment and where orders had been held up, instructions were given to permit shipments to come forward Retail prices have been firm at the same levels and there is some likelihood of an advance if the favorable weather conditions continue

The steam business is still dull and manufacturing must improve before any marked change will be noted. Consumers of steam grades are buying on the open market in many instances. A number of contracts will expire after the first of the year and an effort will be made to renew them at the old figures. The tonnage required for railroad consumption is not large.

The circular price list is still quoted but cutting on practically all grades continues; this is especially true of mine-run which is one of the weakest grades The small sizes are still strong as the production of lump is limited.

Production has been increased in most of the Ohio mining districts. The Hocking Valley produced about 70% of the average and Crooksville, Cambridge and Jackson about 60% normal The output from Pomeroy Bend district is about 90% of normal and in some instances full time was worked.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump.....	$1.55	$1.65	.....
Inch and a quarter.....	1.50	1.55	$1.40
Three-quarter inch.....	1.35	1.40	1.35
Nut.....	1.15	1.25	1.15
Mine-run.....	1.10	1.15	1.10
Nut, pea and slack.....	0.65	0.65	0.60
Coarse slack.....	0.55	0.55	0.50

CLEVELAND

Cold weather and light receipts have braced the market and prices are 5 to 10c. higher. Retail trade beginning to come into the market.

The ruling price on track here is $1.75 for high-grade slack. A few cars were sold at the opening of the week at $1.65 to clean up coal held over Sunday, but slack is none to plentiful and operators and jobbers are holding all that does not move readily.

Coarse coals are showing more strength; generally, three-quarter coals are 5c. higher, and in some instances as much as 10c. The cold weather has increased the demand to a small extent, and the retail trade is beginning to run short of some grades. Another week of cold weather would bring the market up.

Pocahontas on track has been well cleaned up and circular is being asked for spot coal. Youghiogheny inch and a quarter is being held at $1.45, mines. The spot market on all coals is equal to shipment quotations.

The local market has been relieved by West Virginia No. 8 being consigned to Buffalo. Factories are buying for immediate needs and will be closed over the holidays. This will

reduce the demand to a large extent the last of this week and most of next.

Prices for shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmount	W. Va. No. 8
Lump	$3.35	.....	.....	.....	.....
Lump, 6 in.	.....	.....	$2.45	.....	.....
Egg	3.35	.....	.....	.....	.....
Egg, 6 in.	.....	.....	2.10	.....	.....
Lump, 1¼ in.	.....	$2.45	2.25	.....	.....
Lump, ¾ in.	.....	2.30	2.10	$1.95@2.00	$1.95@2.00
Mine run	2.55	2.25	1.95	1.85@1.90	1.90
Slack	2.40	1.80@1.85	1.75	1.85	1.80

COKE

CONNELLSVILLE

Two big furnace coke contracts placed, practically winding up the contracting movement for the present, with 250,000 tons a month closed. Production and shipments about stationary.

Corrigan, McKinney & Co. have closed with W. J. Rainey for their entire furnace coke requirements for 1915, the understanding in the trade being that the price is $1.75. The firm is operating four furnaces, requiring about 40,000 tons a month, but has two idle furnaces that may be started later, making about 60,000 tons involved in the contract. The Youngstown Sheet & Tube Co. is understood to have practically closed for its coke, placing a contract for one active and one idle furnace with J. H. Hillman & Sons Co., and a similar contract with the Producers Coke Co. The idle furnaces are expected to be started within a few months, so that each contract involves 30,000 to 32,500 tons a month. The gossip in the trade is that the first named contract was at $1.75 and the other at $1.70.

With business already reported, the total contracts placed on this movement, during the past six weeks or so, is about 250,000 tons a month, mostly for the year 1915, but two contracts, on a sliding scale, run over two years, and a few are for first-quarter or first-half only. Nearly all the furnaces now operating have covered for their coke. The Pittsburgh Steel Co. has a twelvemonth contract with six months yet to run. There are many idle furnaces and these, of course, have been unable to contract. The market is quotable as follows: Prompt furnace, $1.60; contract furnace, $1.65, $1.70 and $1.75 respectively for three months, six months and one year; prompt foundry, $2@2.20; contract foundry (nominal, for best brands), $2.35@2.50, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Dec. 12 at 196,275 tons, an increase of 700 tons, and shipments at 200,058 tons, an increase of 3901 tons.

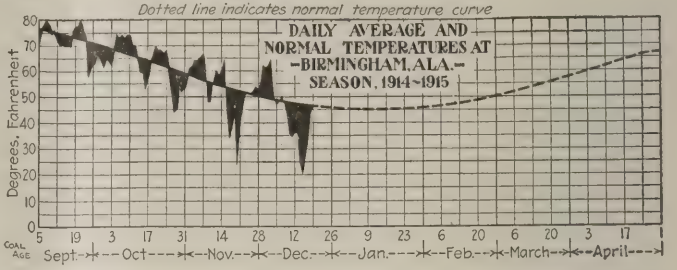
BUFFALO

The coke activity has been so long delayed that if it does not appear before long the trade will come to the conviction that it is not coming at all. Prices remain at what are apparently bottom figures, $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

BALTIMORE

Coke is in poor call and sells in the Connellsville region to the trade here at from $1.75 to $1.90 for furnace, and around $2.45 for foundry. West Virginia furnace is quoted at $1.50 and foundry at $2.

CHICAGO



There has been considerable activity this week in the domestic trade sizes, and the market is stronger for furnace and foundry coke. Prices, however, are about at the same level as last week, as follows: Byproduct, $4.75@4.95; Connellsville, $4.75@5; Wise County 72-hr. (select), $5; gas coke, $4.25@4.50; furnace coke, $4.50@4.75.

SOUTHERN

LOUISVILLE

Market toned up appreciably in the past week.

Exceptionally cold weather, and a general easing up of labor conditions in the mining field, have done a good deal for the Kentucky coal market and operators are now looking forward to a good January business. Price quotations already show an advance on most grades, in some cases as much as fifteen or twenty cents a ton. The best grade block coals are selling around $1.85; block and lump $1.60; egg and nut, though hard to dispose of, from $1 to $1.25, while nut and slack ranges from 60 to 70c. for the better grades and around 40c. for the poorer, all prices f.o.b. mines.

MIDDLE WESTERN

CHICAGO

Cold wave stimulates trade. Mines on full-time schedules. Domestic demand stronger. Screenings still tending upward. Anthracite steady with fair buying.

The advent of freezing winter weather has greatly benefited local market conditions. The thermometer ranged around the zero mark for several days. Domestic buying showed an immediate better tone, and while the stocks in Chicago coal yards, which are unusually large at this time of the year, have not been depleted to any great extent as yet, the out-of-town purchases were considerable. Throughout Illinois and Indiana the mines have been working on full-time schedules during the past week. Householders, apartment and office buildings have been laying in considerable stocks of coal during the past few days, which has perceptibly added to the stronger undertone.

The steam trade shows betterment. Less domestic coal has been offered to steam buyers, and in addition some of them have been obliged to use fuel for heating purposes, resulting in generally increased consumption. Screenings are being absorbed rapidly, and prices are holding firm around 75c. to 80c., even in the face of a heavy increase in the output of fine coal due to better domestic demand.

There is a shortage here of chestnut anthracite, and the better demand recently has reduced the surplus of egg and stove sizes. Prices are firmly held at circular quotations.

Franklin County coals have shown an improvement this week, and operators are asking full circular prices. The demand for steam coal is particularly strong.

The country dealers favored Indiana operators with an increased number of orders for domestic coals, and the mines were able to make prompt shipments, being amply supplied with cars.

Smokeless coals have been fairly strong and all demurrage shipments have been eliminated.

Hocking grades have improved; surplus shipments have been moved and prices are generally on the circular basis.

West Virginia splint shipments have all been cleaned up, and no demurrage coal is now on hand. The country buying in these coals has been good.

Springfield screenings are at a high level, touching 85c. per ton in some cases. The demand for Springfield domestic sizes has been very active at good prices.

Eastern Kentucky coals have been in good demand, although prices have varied widely.

Prevailing quotations are as follows:

	Franklin Co.	Springfield	Sullivan	Clinton	Carterville
Lump	$1.50@1.75	$1.50	....	$1.50@1.60	$1.75
4-in. lump	....	....	$1.60@1.75	....	....

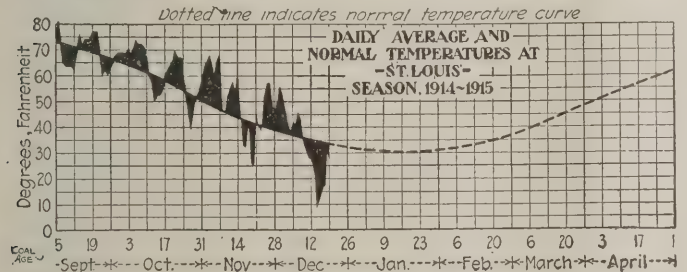
ST. LOUIS

Stimulating effects of cold weather have passed off. Screenings continue the feature of the market. Influence of the 5% rate decision.

During the few days of cold weather prices on domestic sizes advanced 10 or 15c. a ton in many cases, but the rise was not warranted and the market is back to the level of the past few weeks. Even if the weather is cold through Christmas week, it will hardly cause any change in domestic prices. Steam sizes are in good demand, with screenings from 70 to 80c., and Nos. 2, 3 and 4 nut are hard to get, while premiums are the rule in both fields. Washed coal shows some improvement.



In the Standard field 2-in. lump has been down as low as 90c., with the average at $1. This on account of the extraordinary demand for screenings, which find a ready market at 55 to 60c., and indications are that they will go higher.

There is nothing moving in the way of anthracite or smokeless.

The 5% increase in freight rates has made the outlook brighter now than for many months. St. Louis being the center of a great manufacturing district will be benefited to a great extent. Activity in many industries that consume a large tonnage of coal is expected after the first of the year.

Market is quotable on the following basis:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	....	$1.25	$0.95@1.05	$1.10
3-in. lump	.....	....	1.40	....	.....
6-in. lump	$1.30@1.50	....	1.50	1.15@1.25	1.25
Lump and egg	1.85@2.15	$2.25	.....	....	1.35
No. 1 nut	1.15@1.35	....	.....	0.90@0.95	.....
Screenings	0.50@0.55	....	0.80@0.85	0.55@0.60	0.60

No. 4 washed nut	1.10@1.15	....	.....	....	.....
No. 5 washed nut	0.75@0.80	....	.....	....	.....

INDIANAPOLIS

Cold weather has caused an improvement. Mines on better time and more men at work. Slack selling at full prices and all the output covered. Railroad buying slightly larger.

With snow on the ground and the railroad rate increase in effect, there is a better feeling in the coal industry. The first, accompanied by temperature that went below zero, made the immediate demand for domestic and steam coal better with the result that running schedules have been increased, and there are more miners at work than for several weeks; some companies would now be making full time were it not for a shortage of hopper cars.

Slack is in good demand and quite easily disposed of at 80c.; operators are of the opinion that the strength is due to increased orders rather than to a shortened supply. They believe they see an improvement in industrial conditions and they expect this to increase, following the railroad rate decision. In the block field, small mines have profited from the short running time or shut-downs at the big mines, slopes and gin shafts getting the local trade. There has been some cutting of prices, best quality selling at $1.80 to $2.60 a ton as against the usual $2.75.

KANSAS CITY

Seasonably cold weather and snow have stimulated orders. Prices are firming up.

The advent of winter weather has resulted in moving much of the large accumulations and there is no coal now on demurrage, while all grades are strong. There has been no change in price lists, but coal is generally selling higher than during the previous three or four weeks. While no definite announcements have been made, it is expected that coal companies will advance prices the first of the year. Domestic deliveries have been hampered by heavy snows. Kansas slack has been the feature of the market for the week, and at times the demand overtook the supply. Illinois coal remains weak.

Prices are now quotable on the following basis: Missouri lump, $2.25; Illinois lump, $1.75; egg, $1.50; nut, $1.50; Kansas lump, $2.25; nut, $2.10; slack, $1.40; mill, $1.65.

PORTLAND, ORE.

First cargo of anthracite via Panama Canal is now en route. Colder weather stimulates business.

The first cargo of anthracite coal to come to Portland from the Atlantic coast by way of the Panama Canal is now en route, the American steamer "Cricket" having sailed from Philadelphia for the Columbia River Dec. 1. The coal is expected to arrive here the latter part of this month. It is all egg size and will be retailed at from $14 to $15 per ton. Heretofore, egg anthracite of this kind has commanded from $18 to $20 per ton, so that the water freight rate will reduce the cost about $5 per ton, which, it is believed, will mean a considerable increase in the demand. This will probably be the only shipment to come here this winer from the Atlantic coast, but a large movement is anticipated next season, when the opening of the Celile Canal in the Columbia River will enable the trans-shipment of coal on barges into the Inland Empire, where the consumption of coal is about six times as large as here. The canal, which will remove the obstructions to navigation in the upper Columbia, is expected to be open for traffic next year without fail. As a result of this reduction on anthracite, the Western roads may reduce their freight rates from the mines in Washington, Utah and Wyoming to this district. This in turn would be followed by lower prices all around and an increase in the coal consumption.

During the past week the temperature droped sharply, and as a result the coal business was stimulated considerably.

PRODUCTION AND TRANSPORTATION STATISTICS

IMPORTS AND EXPORTS

The following is a comparative statement of imports and exports of the United States for October, 1913-14, and for the ten months ending October, 1912-13-14, in long tons:

	10 Months			October	
Imports from:	1912	1913	1914	1913	1914
United Kingdom	4,864	5,259	8,672	662	262
Canada	1,169,702	897,489	840,447	69,476	69,289
Japan	20,718	89,115	50,099	10,040	5,560
Australia and Tasmania	140,502	141,578	187,537	20,192	23,213

Bunker coal	6,151,280	6,483,020	6,285,770	719,436	573,822

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for June and the three months of the years 1913 and 1914:

	April		May		June	
State	1913	1914	1913	1914	1913	1914
Missouri	204,255	179,723	186,366	165,395	187,723	185,731
Kansas	444,142	378,192	407,124	370,097	412,371	490,561
Arkansas	136,153	87,002	130,020	95,749	145,306	133,350
Oklahoma	246,155	239,443	252,901	241,180	255,481	273,692
Totals	1,030,705	884,360	976,411	872,421	1,000,881	1,083,334

This statement only covers the tonnage of members of the association, which is estimated to be at least 95% of the entire production.

CHESAPEAKE & OHIO RY.

The following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for October and the four months of the fiscal years 1913 and 1914, in short tons:

	October				Four Months			
Destination	1914	%	1913	%	1914	%	1913	%
Tidewater	377,280	19	238,780	15	1,362,981	17	1,058,046	17

[1] Includes coal received from connecting lines.
[2] Includes company's coal.
[3] Does not include company's coal hauled free.
Note:—The Southern Railway hauled 316,945 short tons of bituminous coal during July, 1914, and 2,264,415 short tons during the seven months ending July 31, 1914.

Coal Contracts Pending

Contracts listed in this department are authoritative in every respect except where the source of information is questionable, in which event it is noted. All contracts are listed promptly on receipt and only repeated when additional information becomes available or in the last issue previous to the day on which bids will be closed. Liberal remuneration will be paid for all legitimate notices of this kind sent in.

Contract No. 14—Panama, C. Z.—This contract (pp. 814, 854, 892, 933), which calls for furnishing all or any part of the requirements of the Panama R.R. Co., estimated at 500,000 tons of coal, has been awarded to William C. Atwater & Co., Inc., 1 Broadway, New York. The bid of this company was for 350,000 tons of Pocahontas semi-bituminous steam coal, at $2.70, delivery to be made at Lambert's Point (at the option of the Panama R.R. as to an increase in the amount to be supplied). From a report of the Bureau of Mines, Washington, D. C., is stated that this bid—the cost being figured on a basis of 1,000,000 B.t.u.—was the lowest submitted. The coal is to be taken from the Thelma and Nora mines of the Virginia Pocahontas Coal Co. at Colwood, McDowell County, W. Va.; also from Mine No. 1 of the Lake Superior Coal Co. near Huger, McDowell County, W. Va. Address R. E. Rutherford, Assistant Purchasing Officer, Panama Purchasing Department, 24 State St., New York.

Contract No. 20—New York—This contract (pp. 892, 933, 972), which provides for furnishing and delivering 300 gross tons buckwheat coal No. 1, has been awarded to Joseph P. O'Connor, at $3.66 per ton. Address Auditor, 400 East 29th St., Borough of Manhattan.

Contract No. 22—Philadelphia, Penn.—The date for receiving bids on this contract (pp. 933, 952, 1009) has again been extended to 12 o'clock noon, Dec. 24. This action was taken in order to provide the prospective bidders with an opportunity to make due allowances for the new freight rate schedule recently put into effect by the State Commerce Commission. Press reports are to the effect that this contract involves 140,500 tons of anthracite, and 269,000 tons of bituminous coal, and that the gross consideration will aggregate more than $1,000,000. Address Director Loeb, Room 225, City Hall, Philadelphia, Penn.

Contract No. 32—New York—The bids on this contract (p. 1009), which provide for furnishing, delivering, storing and trimming coal in the Borough of Queens, were as follows: Smith, Lineaweaver & Co., $14,015; Charles B. Norton & Co., $13,400; John W. Peale, $13,540; Meeker & Co., $15,545; Burns Bros., $14,280; George D. Harris, $13,700. Address William Williams, Commisisoner, Department of Water Supply, Gas & Electricity, Room 2351, Municipal Building, Manhattan.

Contract No. 35—New York—Sealed bids will be received by the Board of Trustees, Bellevue Hospital, until 3 p.m., Dec. 31, for furnishing fuel supplies under specification No. 2. The surety required will be 30% of the total amount of the bid, and a deposit of 1½% shall accompany each bid. The time for completing this contract shall be from Jan. 1 to Mar. 31, 1915. Blank forms and further information can be obtained on application to the Auditor, 400 East 29 St., Borough of Manhattan.

Contract No. 36—Pittsburgh, Penn.—Bids are requested for furnishing the penitentiary with its fuel supply for one year from Jan. 1, 1915. Bids will be open Saturday, Dec. 26. The board reserves the right to reject any and all bids. Address, John Francies, Warden, Western Penitentiary of Pennsylvania, Pittsburgh, Penn.

Contract No. 36—New York—Sealed bids are requested by the Department of Corrections, until 11 a.m., Dec. 30, for furnishing and delivering anthracite and semi-bituminous coal. The amount of security required is 30% of the amount of the bid, and deliveries are to be completed before Jan. 15, 1915. Blank forms and further information may be obtained at the office of the Department of Corrections, Municipal Building, Borough of Manhattan.

Contract No. 37—New York—Sealed bids will be received, until 10.30 a.m., Dec. 28, for furnishing and delivering bituminous coal at the Fire Department buildings as follows: Manhattan, 150 tons; Brooklyn, 150 tons; Bronx, 75 tons; Richmond, 25 tons. The amount of security required is 30% of the amount of the bid, and the time for completion of the contract is Dec. 31, 1915. Blank forms and further information may be obtained at the office of the Fire Department, 11th floor, Municipal Building, Manhattan. Robert Adamson is fire commissioner.

Contract No. 38—Hamilton, N. J.—Bids are requested for furnishing the pumping station of the Standard Oil Co. with 5000 tons of No. 1 buckwheat coal for delivery during the year 1915, in equal monthly proportions. Proposals will be received until December 28, 1914. Address J. L. Hutchison, Coal Purchasing Agent, 26 Broadway, New York City.

FOREIGN MARKETS

GREAT BRITAIN

Dec. 11—Tonnage is arriving more freely and there is a rather steadier tendency in regard to all classes of coal. Quotations are approximately as follows:

Best Welsh steam	$4.80@5.04	Best Monmouthshires	$3.96@4.02
Best seconds	4.32@4.56	Seconds	3.84@3.90
Seconds	4.08@4.20	Best Cardiff smalls	2.70@2.72
Best dry coals	4.32@4.56	Cargo smalls	1.56@1.80

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage and for cash payment.

Freights—Tonnage is offering more freely, but loading turns are becoming difficult to arrange. Rates are approximately as follows:

Gibraltar	$3.00	Venice, Ancona	$5.22	Singapore	$5.28
Malta	3.24	Alexandria	4.68	Las Palmas	2.88
Marseille	4.06	Port Said	5.04	St. Vincent	3.12
Algiers	4.29	Aden	5.04	Rio Janeiro	3.90
Genoa, Savona	4.08	Colombo	5.16	Monte Video	3.48
Naples	3.96	Sabang	5.04	River Plate	3.72

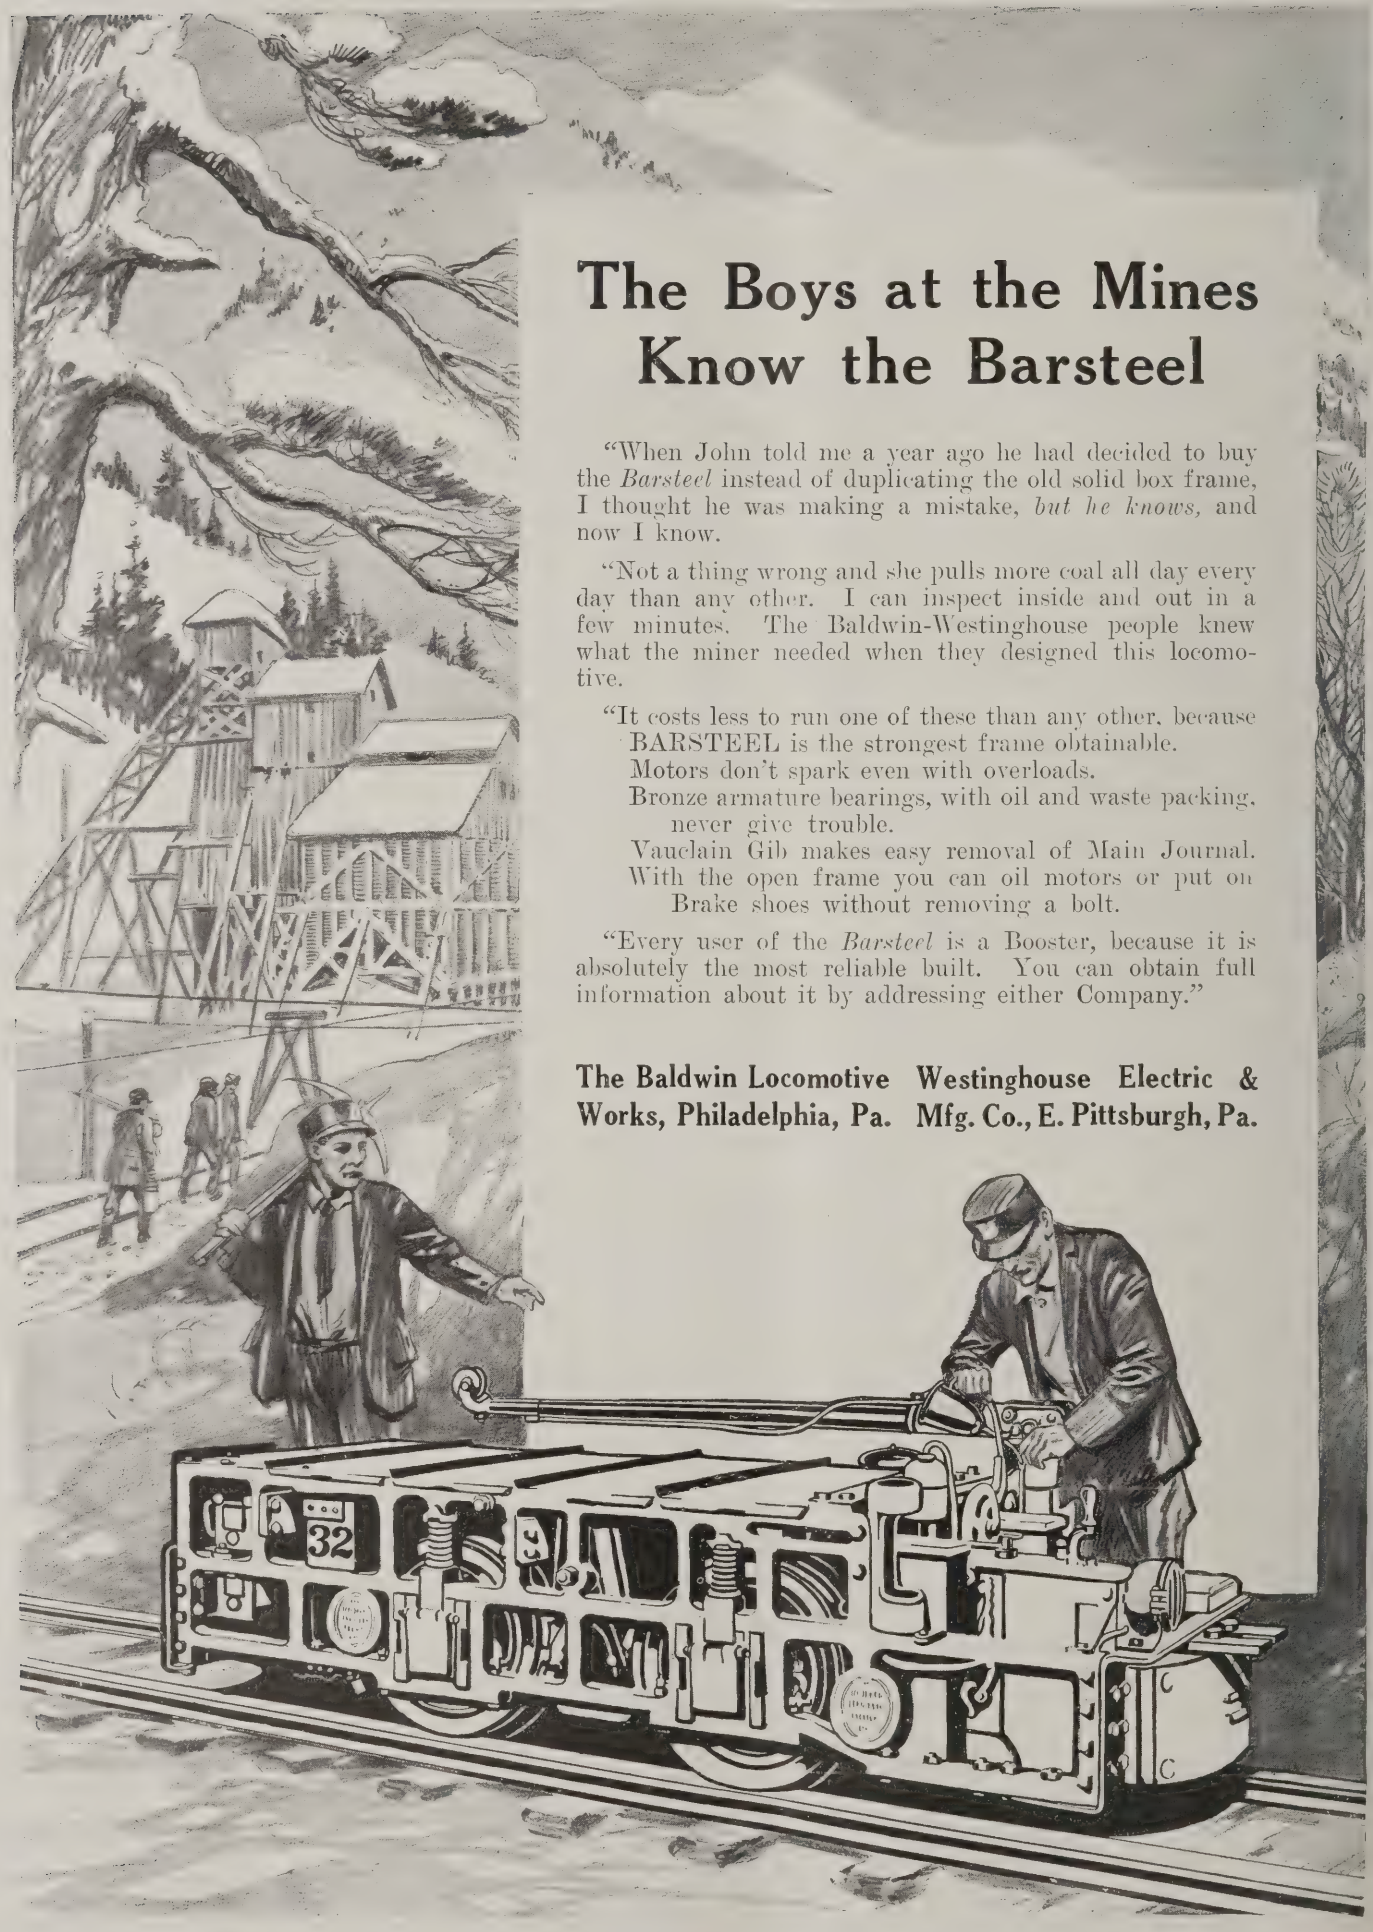
The Boys at the Mines Know the Barsteel

"When John told me a year ago he had decided to buy the *Barsteel* instead of duplicating the old solid box frame, I thought he was making a mistake, *but he knows,* and now I know.



"Not a thing wrong and she pulls more coal all day every day than any other. I can inspect inside and out in a few minutes. The Baldwin-Westinghouse people knew what the miner needed when they designed this locomotive.

"It costs less to run one of these than any other, because
BARSTEEL is the strongest frame obtainable.
Motors don't spark even with overloads.
Bronze armature bearings, with oil and waste packing, never give trouble.
Vauclain Gib makes easy removal of Main Journal.
With the open frame you can oil motors or put on Brake shoes without removing a bolt.

"Every user of the *Barsteel* is a Booster, because it is absolutely the most reliable built. You can obtain full information about it by addressing either Company."

The Weekly Ad-Talk Page

"The 'substitutor' is a mean cuss"

"Substitution" is the evil encountered by many advertisers.

Especially those whose goods have been for years on the market.

The "substitutor" is a mean cuss.

Avoid him.

He is trading on the other fellow's reputation, which has been years in the making.

He's a confidence man of the first water.

And the fellow he fools with his "just-as-good," or his palpable imitation of the real thing—that man is the goat.

Be sure you get what you ask for.

* * * *

There's just as much art in being a good buyer as there is in being a good seller.

If you care to consult Mr. Dun and Mr. Bradstreet you'll find out that there is about one concern in fifty which succeeds in business.

And if you could study the *successes* from an inside point of view, you'd learn that *good buying* had a lot to do with it.

You can't become a good buyer unless you keep constantly in touch with the best things being sold in your line.

And you can't do this unless you read the ads.

The day is past when ads. are merely *tolerated*, like the train-boy who tries to sell you everything from hemp cigars to souvenir post cards.

Most of the ads. in this paper are *good sellers*—and weekly association with them is bound to make *good buyers*.

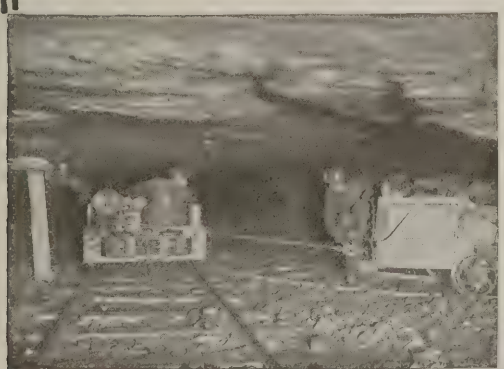
Someone once truly said, "Proportionately as a man's backbone weakens his 'wishbone' develops."

Good buyers have good backbones —and reading the ads. in Coal Age each week is a good spinal developer.

Jeffrey Storage Battery Locomotive, pulling car out of room neck, Grant Coal Mining Co., New Goshen, Ind.

Each Locomotive Gathers an Average of 218 Cars Per Day

Jeffrey Storage Battery Mine Locomotives



are a pronounced success at the mines of the Grant Coal Mining Co.

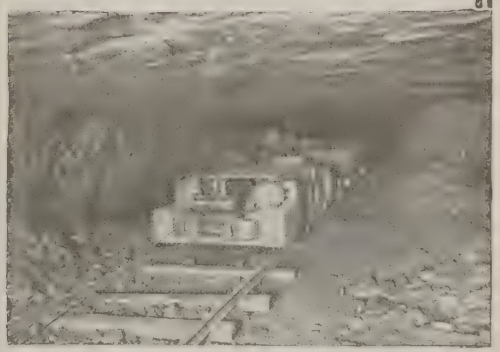
Six 5-Ton Locomotives are used to distribute the empty cars and gather the loaded cars to the double partings on the entries, which are worked on the panel system, the average grade being about one per cent.

Each locomotive is handling an average of 392 tons of coal in eight hours, taking care of from 50 to 62 men.

Cost of repairs on the oldest of these locomotives, which has been in operation for one year, does not exceed $5.00, and only after a year of continuous service was it found necessary to replace the electrolyte in the battery.

Jeffrey Storage Battery Locomotives are especially adapted for gathering purposes where the average grade is not excessive; our Electric Cable Reel or Crab type being the most suitable and practical under certain conditions.

Electric Crab Locomotive; can also be furnished with Combination Crab and Cable Reel.



Give us full particulars about conditions in your mine and let us recommend the locomotive best suited to your needs.

Bulletins mailed upon request.

Jeffrey Mfg. Co.

Columbus, Ohio

New York, Boston, Philadelphia, Pittsburgh, Charleston, W. Va., Birmingham, Chicago, Duluth, Denver, Montreal 19-26-14

Electric Cable Reel Locomotive; can be furnished with various types of reels to suit conditions.

If you heard of a drill that could be installed anywhere an electric wire can be run at less than one-third the cost of pipe lines and can be operated and moved by two men, wouldn't you be interested?

If you learned there is a drill that will actually save 70% to 90% of your present rock excavation costs and advance the work almost ten times as fast as it can be done by hand, wouldn't you be anxious to learn the particulars about it?

If we claim the Fort Wayne Electric Rock Drill will do all this and offer to send you a Bulletin that explains all about the design, construction and operation of the drill, don't you think it would be worth writing for?

THE BULLETIN IS NO. 1144 AND IT'S FREE FOR THE ASKING.

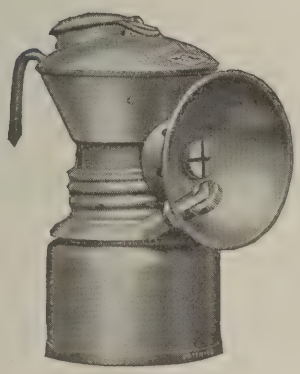
At Last, a Carbide Lamp Burner That Won't Stop Up!!



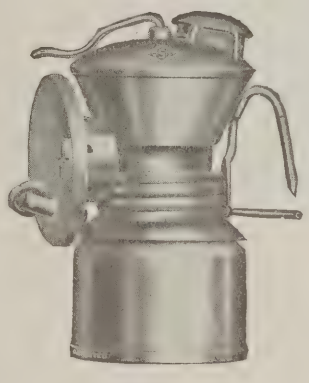
As usual it was up to us to find a means of overcoming the trouble caused by the burners stopping up.

Well, we've perfected a burner that won't stop up. This only proves once again that we are constantly on the job, that we are giving the mining industry our very best efforts and that the really good things, the important improvements, are always found first on the

Non-Cloggable Burner

BALDWIN
THE MINER'S LIGHTING BUG

Rigid Removable Reflector



Brush Burner Cleaner

Case is made of brass and contains a sliding base into which are solidly set sixty non-rusting wires. The knob allows the brush to be locked into position.

This cleaner can be used on any burner, using a single wire as you would an ordinary needle. When used on our new burner it should be used as a brush to remove any deposit on face of burner or from the slots.

This burner is made of a solid piece of brass, slotted on the face. These slots serve two purposes.

1st. They permit of air reaching the base of the flame, this air mixing with the gas lifts the luminous part of the flame away from the burner. The flame at the burner is blue and will not carbonize (make soot) only when the flame gets very low; even then the soot deposits on the face of the burner, ***it does not get down into the gasway and clog it.***

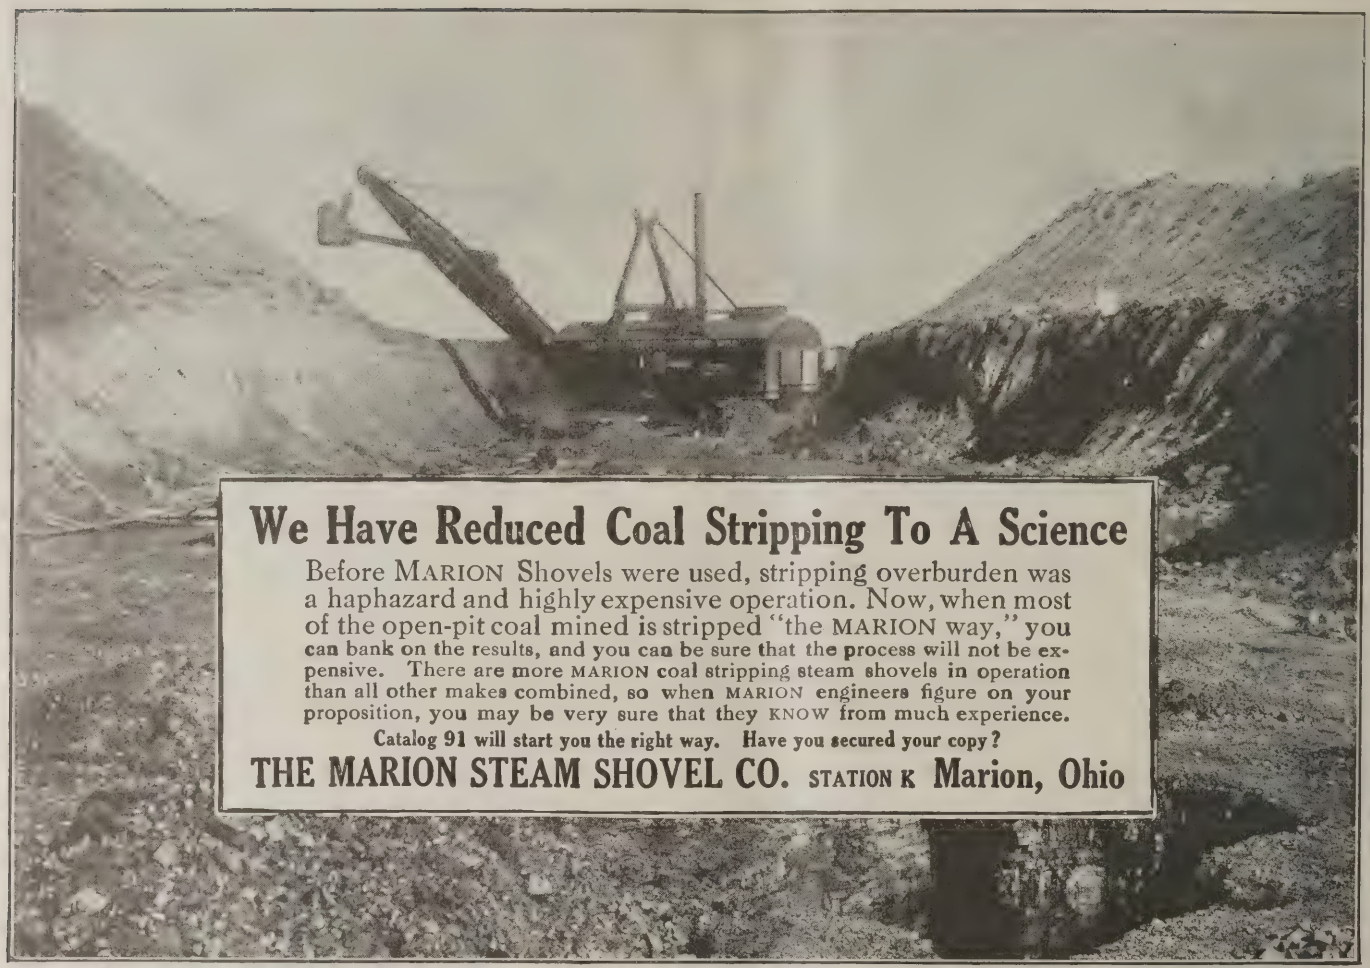
2nd. The slots serve the same purpose as the slot in the head of the screw, and the burner is put on and taken off, just as you would an ordinary screw.

The shape of the burner, makes the sparker lighter more effective, as the burner rides close to the reflector and as the face of the burner is flat the spark from the lighter can get to the gasway. It works every time, there's never a miss.

The reflector is attached to the lamp as securely and rigidly as if soldered—still removable. This is a decided improvement on the permanently fixed reflector for several reasons.

1st. Should the reflector become damaged it can be replaced with a new one.

2nd. Different kinds of work require different kinds of light. For some, concentrated light is best, for others, partial diffusion of light is most desirable and still others, general illumination is needed.



The only practical way to obtain these variations is to use different shaped reflectors—hence the need of a removable reflector.

Note please, the brass reinforcing shell, back of the reflector. This more than doubles the strength of the reflector. You cannot bend or twist the reflector when unscrewing the carbide container and it will take more than an ordinary bump against the roof or wall of the mine to seriously injure it.

We Have Reduced Coal Stripping To A Science

Before MARION Shovels were used, stripping overburden was a haphazard and highly expensive operation. Now, when most of the open-pit coal mined is stripped "the MARION way," you can bank on the results, and you can be sure that the process will not be expensive. There are more MARION coal stripping steam shovels in operation than all other makes combined, so when MARION engineers figure on your proposition, you may be very sure that they KNOW from much experience.

Catalog 91 will start you the right way. Have you secured your copy?

THE MARION STEAM SHOVEL CO. STATION K Marion, Ohio

Lansing No. 5 Concrete Mixer

Especially Adapted for Work in and Around the Coal Mine

This portable, low-priced concrete mixer is particularly suited to conditions in and around the Coal Mine. It is designed to work in confined places, but at the same time is of large capacity, is sturdily built and will stand rough usage. It will enable you to make permanent repairs, to prevent cave-ins and other expensive losses. The price is so low that anyone can afford to operate one, costing only $185.00 complete with engine, all ready to run; or $90.00 for the mixer on skids equipped for hand or belt power. **Let us tell you more about concrete for mine work.**

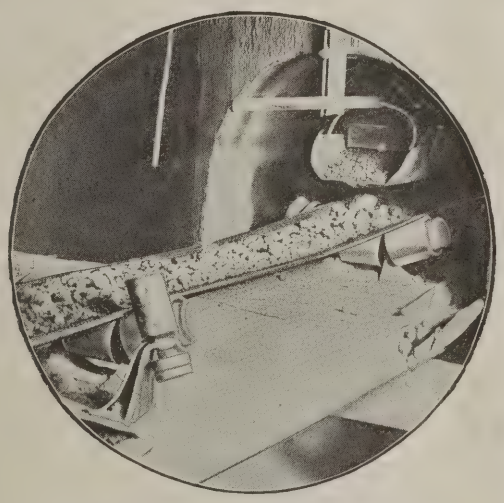
Stop Those Leaks with

MONEL METAL



Mine Pump Rods!

Pump leaks such as this are avoided by the use of Monel Metal pump rods. They are stronger than steel, less corrodible even than bronze, and retain a polished, glassy surface, which does not wear out the packing. There is no scoring or pitting of Monel Metal rods.

Mine purchasing agents should communicate with us at once for pump rods made to meet their exact requirements.

Write for the Monel Bulletin.

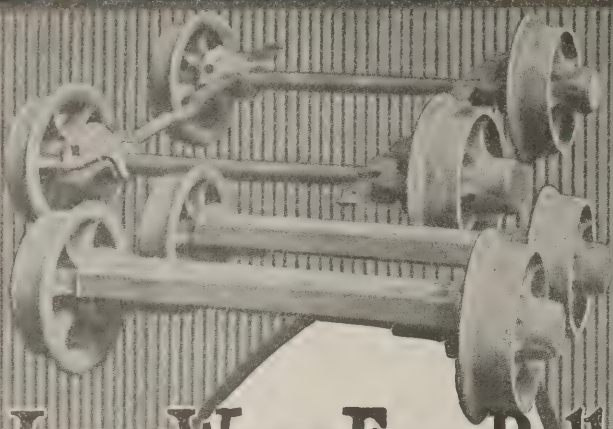
BALL BEARINGS

Is It Worth While?



Is it worth while to reduce break-downs on motors as far as possible? This is almost the same as asking—Is it worth while increasing production as far as possible?—since interruptions in the movement of coal in and outside of the mine, clog output decidedly.

And if it is worth while to reduce breakdowns, is it worth while to install the ball bearings which assure that bearing wear on armature shafts is really reduced as near nil as human skill can reduce it?

A lot of prominent coal mining concerns have answered "Yes" to this question—and specified Hess-Brights.

The Hess-Bright Mfg. Co.
Front Street and Erie Avenue Philadelphia, Pa.

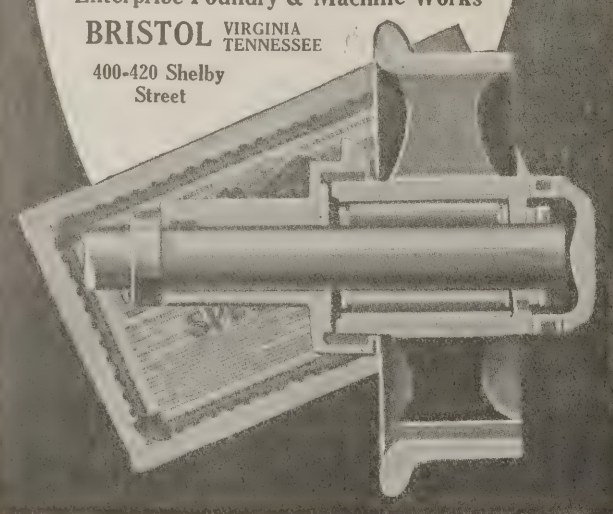
Long-Wear, Easy-Pull Enterprise Trucks

"Long Wear and Easy Pull"—that's the nut-shell story that tells a mining man just what he wants to know.

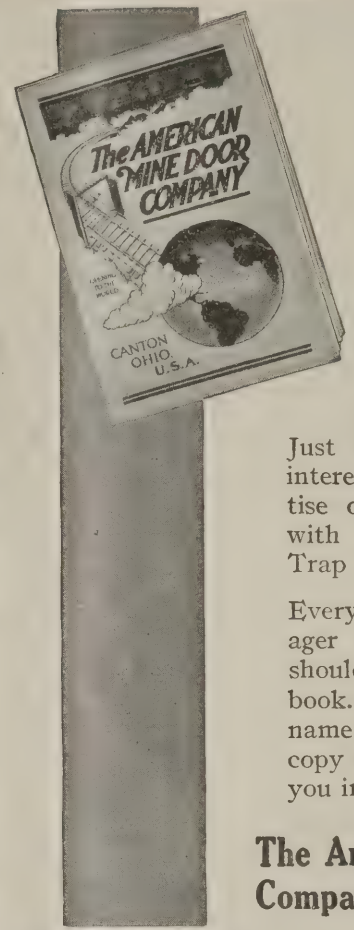
"Long Wear and Easy Pull" covers every point that any mining man can raise, for unless a truck has **every** desirable quality, "long wear and easy pull" **can't** describe that truck.

"Long Wear and Easy Pull" describes Enterprise trucks perfectly, because they roll on

Enterprise Chilled Car Wheels



—the only kind that are unqualifiedly backed up by the most comprehensive and longest-lived guarantee of any truck made. For **five years** the user is protected by us and our reputation as mine car wheel manufacturers against wheel breakage, tread flange or hub wear, wheel failure of **any** kind; against lubrication more than **twice a year.** And it is absolutely guaranteed that the very best plain bearing truck will consume 80 to 100% more power than one using Enterprise Roller Bearing Wheels.



"Long Wear and Easy Pull" is the result of perfect wheel balance and perfect wheel metallurgy. The lower engraving shows the balance exactly. But let us tell you and prove to you about the **metallurgy that you cannot see.**

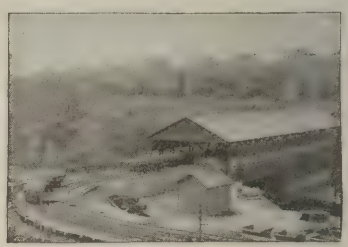
500 H.P. G-E Motor Driving Underground Hoist. Nourse Mines—In use 6 years. No delays.

500 H.P. G-E Motor Driving Underground Hoist, Silver King Coalition Mines Co., Park City, Utah.

700 H.P. G-E Motor driving Hoist. Crow's Nest Mines Keystone Coal & Coke Co. 2½ years in use, 65% overloaded. No delays.



300 H.P. G-E Motor Driving Hoist, Iron Blossom Mining Co., Eureka, Utah. In successful use over 2 years.

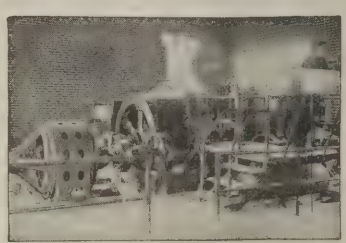
Hoists in Use Years No Delays—No Repairs

Many reports are coming in from hoists driven by G-E motors. One was designed for 24 trips per day but has hoisted 40 for 2½ years without a delay. Another has been in use six years, while others still have been in use two years or more and in every case the report was the same. "Operation satisfactory. No delays due to electrical causes."

Mine hoists driven by G-E motors using purchased power have low operating costs because, first, there are no boilers to be fired night and day, second, the absence of vibration on rope—increasing its life and that of the head gear, etc., and, finally, because the power consumption is nothing during idle moments, but always available when needed.

Send for new hoist bulletin "Mine Hoist Equipment."

Tipple and Track Arrangement, Crow's Nest Mine. 75,000 tons per month. In use 2½ years.



Electrically operated Tipple and washer with belt conveyor. J. K. Dering Mine, Clinton, Ind.

For What Do You Look in a Hoist?

First, you want capacity to haul your load at the most economical speed. Then you want sufficient overload capacity to enable you to haul at higher than general speeds, or heavier loads at the usual speed. The gear ratios must be such as to reduce current consumption to the lowest figure. The proportions of the hoist must be such as to withstand the severe grind of continued operation at full load. Parts should not wear quickly, nor should bearings run hot; and the manufacturer must be reputable, must be one that you *know* can build hoists and stay in business. You want EFFICIENCY!

Vulcan Hoists

are known throughout the mining world to give just what you, and every other mining man, are looking for. The thousands that have been successes on the most difficult hoisting jobs in the world are your guarantee of the service you can expect from any VULCAN Hoist, providing we have had a chance to look thoroughly into your conditions. You are free to utilize our engineering department whether you buy or not.

"LITTLE TUGGER" HOIST

The "Little Tugger" is a brand new idea in portable hoists. It is the result of a close study of the needs of the mine manager for some quick and reliable means for hoisting and lowering machines, timbers, drill steel and other mining appurtenances.

The "Little Tugger" Hoist

It is a tool of convenience. It saves you work. It saves the time of your men for other purposes and in that way saves you money.

It is something more than merely a hoist, although in this work alone, it soon saves its cost. It is used as a light haulage engine, pulling empty and loaded cars in and out of drifts and tunnels.

It is easily attached to mine column, shaft bar, timber, flooring or other means which may be at hand.

It is furnished for operation by air or steam.

Every mine should have this work, time and money saver.

SOME SPECIAL TRAMWAY NOTES

Our correspondence develops the fact that some points still remain to be made clear.

SINGLE AND MULTIPLE TERMINALS—The impression still prevails that we can load at only one terminal and discharge at only one terminal. On the contrary, when conditions require and by a very simple adaptation **the automatic tramway will load at any number of points,** either grouped together or scattered anywhere along the line;—and **will discharge at any number of po nts along the line** in addition to the final terminal discharge. This therefore nables the material to be dumped to fo m a long pile or in separate bins for grading.

EXTENSION DUMP TERMINALS—The Lawson Tramway can advance its dumping terminal at will,—**an advantage not possessed by any other tramway.** For instance, in dumping spoil material, the spoil bank gradually extends itself. By a simple arrangement, **the dumping terminal can follow it up a few feet at a time** and so carry the spoil bank out to any length. The additional cost is almost nominal.

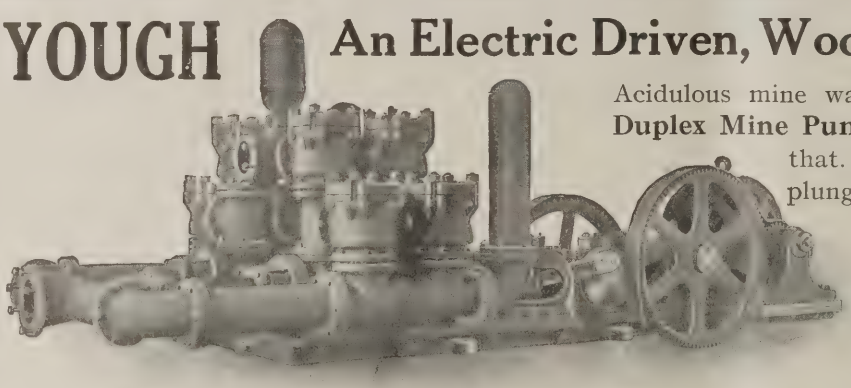
ANGLES—**The Lawson Tramway is practically independent of angles** as a restricting condition. To illustrate —we have built three tramways for special service which were continuous;—that is, in which the total curvature was a compl te circle, the tramway being, so to speak, a closed circuit.

The arrangement of anchorages is such that no lateral strain whatever comes on the curves. Unlike every other tramway, **the additional cost is tr fling** and no special attendant at the curve is required as in some.

CAPACITY OF CARS—Our Bulletins hitherto have dealt with only one capacity of car, namely,—4½ cubic feet. Experience has shown that this capacity covers 90 per cent. of the various applications.

We are, however, manufacturing a standard car containing 10 cubic feet, whose dimensions are 38″ x42″ x 12″. This car is used for comparatively light material like coal, earth, etc.

We are also designing a **"Jumbo" Tramway** in which each car will carry one cubic yard. This is intended for heavy contract work.



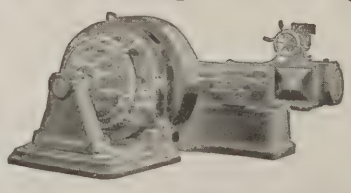
SLOPES—**All cars can be so modified that they ride horizontally on any slope.**

THE COMPLETE TRAMWAY—Unlike any of our competitors **we will contract for Tramways delivered and erected complete,** including power if desired. We can do this because we are Construction Engineers and not merely manufacturers.

Very Respectfully,

THE AMBURSEN COMPANY (Tramway Department)
61 Broadway, New York.

YOUGH An Electric Driven, Wood-Lined Mine Pump



Acidulous mine water does not impair the **Yough Duplex Mine Pump**—the wood-lining takes care of that. Its double action and double plunger make this pump especially efficient. The Yough is sure to effect important savings in your pumping costs.

The Slogan of the Cameron—"Character: The Grandest Thing"

LONG LIFE IS THE BIG FEATURE OF

CAMERON PUMPS

Regular Pattern

Long continuous service under working conditions that would quickly put the average pump out of business finds Cameron Pumps easily holding their own.

Simply because Cameron Pumps are **made for hard work.** They are strong, sturdily constructed pumps, have few parts and no working parts exposed.

Their upkeep cost is consequently very low—in fact, considered from the standpoint of service, operating cost, or repair cost, they are the ideal pumps for the exacting service encountered in mine work.

The full story, with valuable pump data, in Bulletin No. 104. It's free.

McGowan Pumping Equipment has always been designed with a view of meeting requirements of users who appreciate good pumps which afford continuous and lasting service.

Pumps affording low maintenance cost can not be built to compete with those designed for the trade and sold on price alone. An impartial investigation of McGowan Pumps will show that they are well worth the difference. They save the time of the operating engineer in looking after packing troubles, adjustments and replacements usual with pumps of the competitive class and give him the opportunity of devoting more attention to other plant details.

Steel Ties for Coal Mines

Steel cross ties have many advantages over wood ties for mine use. Some of the principal advantages are:

HEAD ROOM. Track laid with steel ties results in more head room than when laid with wood.

LONGER LIFE. Steel ties will last ordinarily three or four times as long as wood ties.

FIREPROOF. Elimination as far as possible of combustible material from mines increases safety to both life and property.

SCRAP VALUE. Even after steel ties have rendered their maximum service, they have a scrap value of about one-third of their original cost.

"Ship Two Same As Last"

That's what a satisfied customer wired us then wrote us this letter.

PREMIER POCAHONTAS COLLIERIES CO.

Premier, W. Va. Aug. 18, 1911

The J. C. Stine Company,
J. C. Stine, Mgr.,
Tyrone, Pa.

Dear Sir:—

Fan installed and doing fine work. Wired you today;—"Ship two fans same as last; rush one all possible.

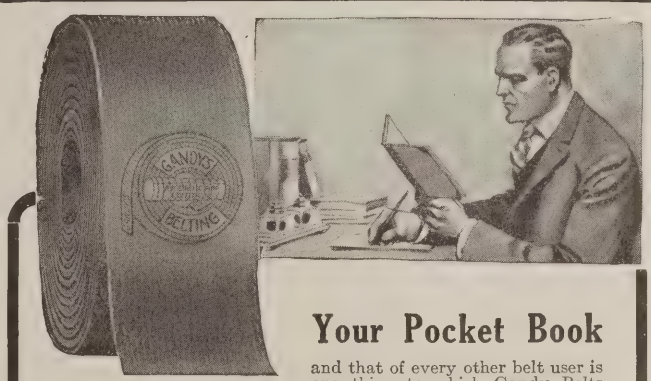
Now beg to confirm same. Let one come at once if two not ready. If ready, ship two at once. Trace for delivery. Prepay to Premier, W. Va. on N. & W. Railroad. Yours truly,
(signed)
Frank P. Harman, President.

After using three fans for over 15 months he ordered two more, making five J. C. Stine fans which are giving him splendid service every day in the year.

This is not the only customer. Here's one that has six of our silent chain type. Read what he says:—

THE WHEELING & LAKE ERIE COAL MINING COMPANY.
Mt. Pleasant, Ohio, May 26, 1911

The J. C. Stine Company, Mr. J. C. Stine, Mgr.,
Tyrone, Pa.



Dear Sirs:—Replying to your very kind favor of the 19th inst. with reference to a report as to how your fans are doing in our mines.

I beg to advise that I cannot sing their praises too highly as they certainly do all you claim and anyone making purchase of this fan for the purpose for which it is intended I assure you is making no mistake.

I wish to again thank you for the good treatment and good service I received from you while installing our fan. Very truly yours,
(signed)..... Michael Gallagher, Gen'l. Mgr.

These fans are made in ten sizes from 3 to 8 feet in diameter. They are the cheapest and most efficient ventilators in the world.

The J. C. Stine Company, Tyrone, Pa.

Your Pocket Book

and that of every other belt user is one thing to which Gandy Belts make a strong appeal. And it's not merely because they cost less in the first place, but because their permanence also makes them a profitable investment when you figure your belt expenses at the end of the year.

Men in practically every part of the country have told us that Gandy Belts stand up to the strenuous work required of them under even the most severe conditions.

Their experience (related in letters we can send you if you wish) is positive proof of Gandy quality.
Yet

The Gandy Belt

costs you only 1-3 the price of leather and 25% less than the price of rubber belting.

If the belt you buy hasn't the Gandy trademark, it isn't a Gandy. It is costing you more money than you need to pay, yet cannot give you better service.

We have a sample of the belting here to send you, together with full information about prices, etc.

Your request on a post card mailed to us will be given immediate attention.

The Gandy Belting Company

May We Send You These Books for Free Examination?

If your work calls for modern, practical data on compressed air these books will help you. They cover all phases of modern compressed air practice. Whatever your problem—design, selection of machinery, transmission or operation—one or more of these works will assist you.

We ask your permission to send these books to you for free examination. We do this because of our faith in the books and belief in their value to every engineer interested in compressed air. Verify our claims by accepting a copy for free examination without obligations to buy.

Richards—Compressed Air Practice (Nov. 1913)

By **Frank Richards,** Managing Editor "Compressed Air Magazine."

330 *pages, 6x9, illustrated,* $3.00 (12/6) *net, postpaid.*

A simple, practical discussion for the operator of compressed air plants and compressed air machinery. It tells all about operation and equipment from the viewpoint of the man in charge of the plant. Mr. Richards' wide experience makes him well-fitted for handling the subject. He has written a book that is of direct aid to a better understanding of the whole problem.

Simons — Compressed Air — Production —Transmission—Use (April, 1914)

By **Theodore Simons,** E. M., C. E., Professor of Mining Engineering, Montana State School of Mines; Member American Institute of Mining Engineers.

173 *pages, 6x9, fully illustrated,* $1.50 (6/3) *net, postpaid.*

A condensed manual for those who select and operate compressed air machinery. It covers the natural laws and physical principles underlying the *production, transmission* and *use* of compressed air.

The author does not attempt to give extensive descriptions of existing types of compressors, but only examples which illustrate the principles, and which enable the student and investigator to solve the theoretical problems arising in the use of compressed air.

The book is fully illustrated, and contains a great many carefully selected problems. These problems help both the student and the reader to grasp and retain the underlying principles and laws.

Part I. Production. Part II. Transmission. Part III. Use. Part IV. Air Compressors and Accessories.

Thorkelson—Air Compression and Transmisson (April, 1913)

By **H. J. Thorkelson,** Assistant Professor of Steam Engineering, University of Wisconsin.

207 *pages, 6x9, 143 illustrations,* $2.00 (8/4) *net, postpaid.*

Gives a clear treatment of the fundamentals, and a comparison of systems, their advantages and limitations.

It contains clear, simple explanations and illustrations of the thermodynamic phenomena involved, together with detailed descriptions and explanations of air pumps, fans of various kinds, piston compressors of single- and multi-stage type.

Harris—Compressed Air (1910)

By **Elmo G. Harris,** C. E., Professor of Civil Engineering, Missouri School of Mines.

123 *pages, 6x9, illustrated,* $1.50 (6/3) *net, postpaid.*

Prof. Harris' manual is the best available work for the designer and those who wish a full statement of the theory and computations.

PERFORATED METALS
of every description

Perforated Steel Screen Plates

For Coal and Coke, Crushed Stone, Phosphate Rock, Gravel, Sand, etc.

With perforations round, square or oblong of any size to ten inches in diameter and from No. 10 U.S.S. Gauge to ½ inch thick, according to the size of holes.

The Plates are made flat for shaking screens, rolled to radius for cylindrical, or cut into sectors for conical screens, and made for either lap or butt joints with bolt holes as required.

For Bituminous Coal Screens, Coal and Ore Washing Plants, etc., the variation in diameters of round sizes is about as follows: from 1-16″ to ⅜″ dia. by 32nds; ⅜″ to ¾″ by 16ths; ¾″ to 1½″ by ⅛ths; 1½″ to 4″ by ¼ths; and 4″ to 10″ by ½ inches, with many intervening sizes, all standard centers—and the same in a measure with oblongs and squares.

Variations in thickness of metal run from No. 18 U.S.S. Gauge (1-20th in.) to one-half inch, according to size of holes.

Manganese Bronze Screens for Sulphurous Mine Waters.

Please send detail specifications with your order or inquiry.

THE HARRINGTON & KING PERFORATING COMPANY
628 North Union Street, CHICAGO, ILL.
New York Office: 114 Liberty Street

Small Anthracite Can't Slip Through This Grate

The mesh of grate is so small (3-32″ width, if desired) that the finest anthracite may be thoroughly burned. The edges of the bars are beveled and overlap so that it is impossible for the fine coal to sift away. There are many advantages to the McCLAVE GRATE. Investigation will prove this.

WATER SOFTENING OR FILTRATION

FOR BOILER FEED AND ALL INDUSTRIAL USES

WM. B. SCAIFE & SONS CO. PITTSBURGH, PA.

And with Whitcomb Haulage Savings—

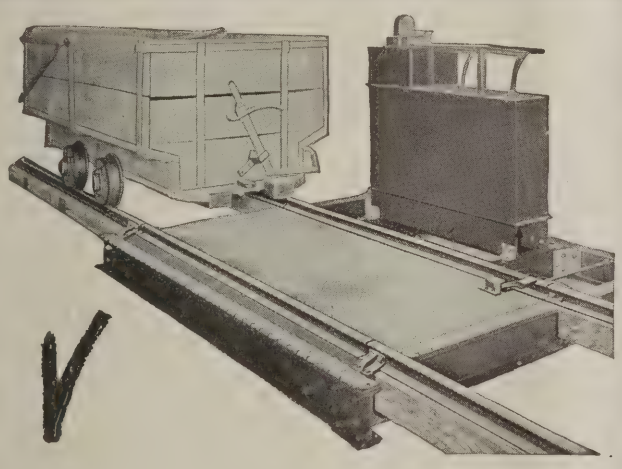
Whitcomb Gasoline Mine Motors

Reduce Haulage Costs 10 to 50%

which have been proved *positive* in over 200 mines, you get haulage service as reliable and as satisfactory as any other haulage system.

There is no sacrifice of any convenience, ease of operation or any other feature of good haulage, to secure low operating costs.

The economy of Whitcomb haulage is perfectly logical—the result of the successful adaptation of the gasoline motor to mine use.



Lower in first cost, maintenance cost and operating cost, it must necessarily produce a saving.

Exact Comparative Data Tells the Tale

We have the service reports of users—their own figures—to show you how Whitcomb haulage costs compare with various other systems, from mule haulage up. These figures are available for your use, and we will be glad to send them to you.

Why not write us for them ?

Geo. D. Whitcomb Co., Box D, Rochelle, Ill.

Check—

Every carload of coal that comes upon the tipple scale—get its weight with **automatic and mechanical** accuracy—a printed record that is infallibly correct because it is not subject to human error, dishonesty or carelessness.

A Streeter-Amet Weight Recorder gives this service—ends disputes and troubles of tipple weighing and once and for all ends the practice of paying for more coal on the tipple than you are able to sell at the cars.

31 mines are pocketing the savings of Streeter-Amet service.

Let us tell you how and show you exactly what you may gain by their use. **Write us.**

Streeter-Amet Weighing & Recording Co.
605 Hartford Bldg. **Chicago, Ill.**

A Triumph for The Long Reach Manierre Loader

It has been proven that this loader

Loads Coke at Less Than 3c. a Ton

The actual figure is $.029?, as shown by one year's test at a prominent plant. This includes operating labor, repairs, power, belt renewals and replacements. During this year, 152,205 tons of coke were handled.

It Loads Coal at Half This Figure.
